Kitle iletişim teknolojisindeki gelişmeler, bilgi ve mesajları bütün insanlığa iletmelerine katkıda bulunmuştur. Farklı nedenlerle kapsama alanlarını dünyanın her yanına yaymak isteyen bireyler, küreselleşmenin iletişim ağlarının yoğunlaşması ile kendilerini ifade etme imkânı bulurlar. İletişim alanındaki bu gelişmeler yeni iletişim düzeni olarak tanımlanan bir durumun esasını oluşturmaktadır (Timisi, 2003). Ayrıca kitle iletişim teknolojisindeki karşı konulmaz gelişmeler kişinin bireysel ya da kendi akranları ile vakit geçirmesini kolaylaştırıcı etkenler olmuştur. Bu durum yeni sosyo-kültürel bağların ortaya çıkmasına, dolayısıyla bu insanların dini veya ruhçu birtakım gruplar içinde yer almasına ortam sağlamıştır (Arslan, 2006). Bu nedenle, iletişim belirli sınırlar içinde gerçekleşen bir etkinlik olma niteliğini aşmıştır. Yeni medya olarak tanımlanan teknolojiler, özellikle internet küresel bir düzen haline gelmiştir. Yaşanan gelişmeler, dönüşümler ve internetin sunduğu olanaklar, insanların ve özellikle gençlerin iletişim yollarını, sosyalleşme araçlarını ve çevrimiçi dünyadaki hareket alanlarını etkilemiştir. Sosyal etkileşim, iletişim ve bilgi edinme için öncü ve tercih edilen bir ortam haline gelen internet, genç insanların hayatında artan bir şekilde daha fazla yer bulmaktadır (Gemmill ve Peterson, 2006; Wang vd. 2010).

Araştırmanın Amacı

Yapılan çalışma ile üniversite öğrencilerinin Facebook algıları incelenmesi ve anlaşılması amaçlanmıştır. Bu kapsamda, Facebook algıları arasındaki ilişkiler ve Facebook algılarının çeşitli değişkenlere göre farklılık gösterip göstermediği araştırılmıştır. Bu amaç doğrultusunda aşağıdaki araştırma sorularına cevap aranmıştır.

Araştırma Soruları

1. Üniversite gençlerinin, Facebook'a yönelik algıları nedir?
2. Üniversite gençlerinin, Facebook'a yönelik algıları:
   a. Cinsiyete,
   b. Yaş aralığına göre,
   c. Yaşadıkları yere göre farklılık,
   d. İkamet ettikleri kişilere göre
   e. Facebook'tan haberdar olma durumuna,
   f. Facebook'a üyelik süresine göre,
   g. Facebook'a üye olma nedenine,
   h. İnterneti kullanım amaçlarına,
   i. İnternete duydukları güvene göre farklılık göstermekte midir?

YÖNTEM

Bu bölümde sırasıyla araştırmanın modeli, evren ve örneklemi, veri toplama araçları, verilerin analizi yer almaktadır.

Araştırma Modeli

Bu araştırmada üniversite gençlerinin bir sosyal paylaşım sitesi olan Facebook'a yönelik algılarını belirlemek amacıyla nicel araştırma metotlarından tarama modeli kullanılmıştır. Tarama modelleri, geçmişte olmuş ya da hâlen var olan bir durumu, var olduğu biçimiyle betimlemeyi amaçlayan araştırma yaklaşımlarıdır. Araştırmaya konu olan birey ya da nesne, kendi koşulları içinde ve olduğu gibi tanımlanmaya çalışılır (Karasar, 2002).

Çalışma Grubu

Araştırmanın çalışma grubunu 2010-2011 öğretim yılı bahar döneminde Sinop Üniversitesinde öğrenim gören 17-25 yaş grubundaki.180 öğrenci oluşturmaktadır.

Veri Toplama Aracı

Veri toplama aracı olarak, Karakoç ve arkadaşları (2008) tarafından geliştirilen "Facebook Algı Ölçeği" kullanılmıştır.32 maddeden oluşan bu ölçek formunun ilk 20 maddesi beşli likert tipinde hazırlanmış ve seçenekler kesinlikle katılıyorum (1), katılıyorum (2), kararsızım (3), katılmıyorum (4), kesinlikle katılmıyorum (5) aralıklarında düzenlenmiştir. Geriye kalan 12 madde açık uçlu olarak sorulmuştur. Bunlara ek olarak yalnızca beş kapalı uçlu sorunun son maddesinde "diğer" seçeneğiyle birlikte, yanıtlayan kişinin ayrıntılı yazabileceği açık uç bırakılmıştır. Açık uç olarak kodlanan "diğer" seçenekli yanıtların bulunduğu sorularda, tüm seçenekler kapalı uçludur.

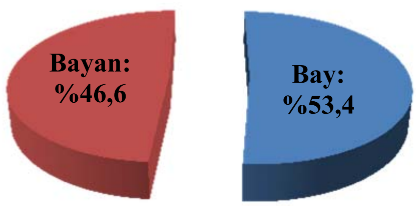
Anketin genel güvenirliği Cronbach's Alpha değeri ile tesbit edilmiştir. Ölçeğin tamamı için hesaplanan Cronbach Alpha iç tutarlılık katsayısı 0.83 olarak bulunmuştur. Test için elde edilen güvenirlik değerleri, ölçeklerde kabul edilen katsayı değeri olan 0.70'in üzerindedir. Ölçeğin tümünden ve faktörlerden elde edilen iç tutarlılık katsayılarının, güvenirlik aralığına çok yakın ve ideal güvenirlik değerinin üstünde olduğu görülmektedir (Creswell, 2005). Elde edilen güvenirlik katsayıları, ölçeğin güvenilir olduğunu göstermektedir.

BULGULAR

Katılımcılara İlişkin Bulgular

Araştırmaya konu olan kitle hakkında daha sağlıklı yorumlarda bulunabilmek için örnekleme girenlerin; yaşları, cinsiyetleri, öğrenim görmekte oldukları fakülte-yüksekokul ve bölümleri gibi durumların bilinmesi bir zorunluluk arz etmektedir. Bu sebeple, bulgular kısmında, örneklemede yer alan bireylerin bu tür özellikleri öncelikli olarak ortaya konulmuş, bundan hareketle öteki değişkenlerin anlaşılmasına ve genel durumların aydınlatılmasına çalışılmıştır.

Şekil 1: Öğrencilerin Cinsiyet Dağılımı



Şekil 1'de görüldüğü gibi, çalışmanın örneklemesini oluşturan öğrencilerin karakteristikleri incelendiğinde; araştırmaya katılan öğrencilerin % 53,4'ü bay (96), % 46,6'sı bayan (84) olduğu görülmektedir. Bu dağılımda bayan öğrenci sayısının erkek öğrenci sayısına yakın olması aranan verileri elde etme şansı açısından elverişli bir durumdur.

Kişilerin toplumsal konumlarını ve rollerini belirlemede yaş önemli bir faktör olarak görülmektedir. Ayrıca yaş faktörü, kişilerin sergiledikleri tutum ve davranışların anlaşılması ve anlamlandırılmasında da oldukça önemlidir. Bu çalışmada yaş faktörünün önemli bir unsur olarak ele alınabileceği düşünülmektedir.

Tablo 2'de araştırma kapsamındaki öğrencilerinin yaş durumuna göre dağılımları verilmektedir.

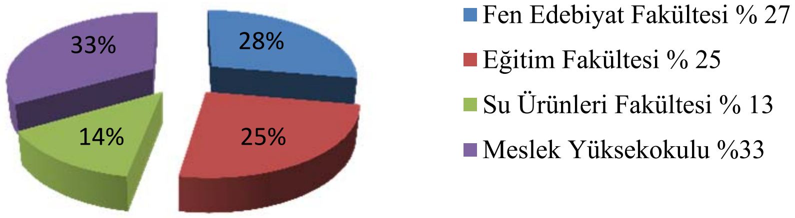
Tablo 2: Öğrencilerin Yaş Durumu

Yaş Durumu	Frekans	Yüzde
17-20	93	51,7
21-25	87	48,3
Toplam	180	100,0

Bu araştırmanın kapsamını üniversite öğrencileri oluşturduğundan, yaş aralığı çok geniş değildir. Tablo 2'de kullanıcıların genel olarak 17-25 yaş aralığında kümelendikleri görülmektedir.

Katılımcıların eğitim gördükleri fakülte ve yüksekokullara göre dağılımları şu şekildedir; 50 kişi (% 27,7) Fen-Edebiyat Fakültesi, 45 kişi (% 25) Eğitim Fakültesi, 25 kişi (% 13,8) Su Ürünleri Fakültesi, 60 kişi ise (% 33,3) Meslek Yüksekokulunda eğitim görmektedir.

Şekil 2:Öğrencilerin Öğrenim Gördükleri Fakülte ve Yüksekokul Türü



Bireylerin gelişim süreçleri, kişilik ve toplumsal statüleri, sosyalleştikleri kültürel ortamları, belirlemede yaşadıkları yerleşim birimleri önemli rol oynamaktadır. Bireyin bilinçaltında yer edinip ilerideki yaşlarda kişilik, davranış ve tutumlarını etkileyecek olan yaşantıların büyük bir kısmı; doğup büyüdüğü coğrafyada gerçekleşmektedirler. Bunun için, sosyolojik araştırmalarda bireylerin hayatlarının büyük kısmını geçirdikleri yerleşim birimlerinin incelenmesine ihtiyaç duyulmaktadır. Öğrencilerin, hayatlarının en büyük bölümünü geçirdikleri yerleşim birimlerine dair dağılım Tablo 3'te görülmektedir.

Tablo 3: Öğrencilerin En Uzun Süre Yaşadıkları Yerleşim Birimleri

Yerleşim Birimi	Frekans	Yüzde
Şehir	74	41,1
Taşra	106	58,9
Toplam	180	100,0

Tablo 3'te görüldüğü gibi, öğrencilerin büyük bir bölümü, şehirde yaşamışlardır.

Araştırmaya konu olan kitlenin Facebook kullanım alışkanlıklarının ve Facebook'un onların hayatlarındaki yerinin anlaşılmasında, aileleri ile birlikte aynı meskende birlikte yaşayıp yaşamadıkları, nasıl bir ortamda barındıkları ve kaldıkları mekânları kimlerle paylaştıkları gibi sorulara da cevap bulunması gerektiği düşünülmektedir. Öğrencilerin kimlerle yaşadıkları Tablo 4'te görüldüğü gibidir.

Tablo 4: Öğrencilerin Oturdukları Yer/İkamet Durumları

İkamet Ettiği Yer-Kişi	Frekans	Yüzde
Ailemle birlikte	62	34,4
Arkadaşlarımla birlikte	118	65,6
Toplam	180	100,0

Tablo 4'te görüldüğü gibi, öğrencilerin büyük bir kısmı arkadaşlarıyla birlikte kalmaktadır.

Tablo 5: Öğrencilerin Facebook Sosyal Paylaşım Sitesi İle Tanışma Durumlarının Dağılımı

Facebook Sosyal Paylaşım Sitesini İlk Nereden Duydunuz?	Frekans	Yüzde
Arkadaşlarımdan	118	65,6
Medyadan	72	34,4
Toplam	180	100,0

Üniversiteli gençlere Facebook sosyal paylaşım sitesini ilk nereden duydukları sorusu yöneltilmiştir. Tablo 5 incelendiğinde öğrencilerin % 65,6' sının arkadaşlarından , % 34,4'ü medyadan duyduklarını belirtmiştir.

Tablo 6: Öğrencilerin Facebook'a Üyelik Sürelerinin Dağılımı

Ne kadar zamandır Facebook Kullanıyorsunuz?	Frekans	Yüzde
1-2 yıl	82	45,6
3 yıl ve üzeri	98	54,4
Toplam	180	100,0

Tablo 6'dekiverilere göre, üç yıl ve üzeri Facebook üyeliğine sahip kullanıcı oranı % 54,4 bir ya da iki yıldır kullanıcı hesabı olanların oranı % 45,6'dır. Veri dağılımından da anlaşıldığı üzere son 3 yıldan bu yana Facebook sosyal paylaşım sitesi kullanım oranı yüksektir.

MADDELER	Kesinlikle Katılıyorum		Katılıyorum		Kararsızım		Katılmıyorum		Kesinlikle Katılmıyorum

Üniversite Gençliğinin Facebook Algılarına İlişkin Bulgular

Tablo 7: Üniversite Öğrencilerinin Facebook Kullanma Eğilimlerine İlişkin Yüzde ve Frekans Değerleri

somutlaştırarak daha anlaşılır kılınmasını sağlamak için de bulgular frekans ve yüzde değerleri Tablo 7'de verilmiştir. Elde edilen bulgularla araştırmanın amacına yönelik sorulara cevap aranmıştır.

Araştırma Sorusu 1: Üniversite gençlerinin, Facebook'a yönelik algıları nedir?

"Facebook eğlenceli içerikler sunuyor." maddesi öğrencilerin Facebook' u eğlenmek için ziyaret ettiklerini belirlemek amacıyla katılımcılara yöneltilmiştir. Tablo 7'de öğrencilerin vermiş olduğu yanıtların yüzdesine bakıldığında öğrencilerin % 86,1'inin bu görüşe katıldığı görülmektedir. Facebook'un içeriğinde yer alan oyun oynama, video, müzik paylaşımı ve gruplara katılım gibi çeşitli uygulamalar Facebook kullanıcıları tarafından eğlenceli bulunmaktadır.

“Facebook eski arkadaşlarıma ulaşmamı sağlıyor.” maddesine katılımcıların % 53,9’u kesinlikle katılıyorum ve % 41,7’si katılıyorum şıkkını işaretlemiştir. Bulgular katılımcıların genel olarak aynı düşüncede olduklarını ortaya koymaktadır. Eski arkadaşlarını bulabilmek amacı ile Facebook’a üye olma nedeni de öğrenciler arasında yaygın olarak görülmektedir.

“Yaşadığım çevreyi, toplumu yansıtan bilgiler edinmemi sağlıyor’’ maddesinin sonuçlarına baktığımızda katılımcıların % 70,6’sı bu görüşe katıldıklarını beyan etmişlerdir. Aynı çevrede yaşayanların, kendileri gibi sanal ortamda olanlar ile bağlantı kurmada, çevre ve toplumu tanımada Facebook’tan yararlanmaktadır.

Tablo 7’ye bakıldığı zaman % 67,8 kişi Facebook içeriğinin meraklarını giderdiklerini belirtmiştir. Bu durum azımsanmayacak orandadır. Arkadaş listesinde yer alanların paylaşıma sunduğu etkinlikler fotoğraflar ve bunlara yapılan yorumlar hem kullanıcıların merakını gidermekte hem de keyifli zaman geçirmede tercih edilen bir seçenek olarak yer almaktadır.

“Facebook kendimi ifade etmemi sağlıyor” görüşüne katılan kullanıcı yüzdesi ile bu görüşü desteklemektedirler (% 56). Bu oran Facebook’un kullanıcılarına daha özgür ifade etme alanı sağladığını ortaya çıkarmaktadır. Günlük hayatta kendini ifade etmekte güçlük çeken utangaç, göz göze gelmekten çekinen bireyler Facebook’ta sanallığın vermiş olduğu güçle daha özgüvenlidirler. Bulgulardan elde edilen sonuçta bu görüşü desteklemektedir.

“Facebook boş zamanlarımı değerlendirmemi sağlıyor.” maddesi Tablo 7’de öğrencilerin vermiş olduğu yanıtların yüzdesine bakıldığında öğrencilerin % 98,6’ sı bu görüşü destekleyerek genel olarak azınlıkta olmadıklarını göstermektedirler. Bu sonuçtan yola çıkarak bireylerin Facebook’un sunmuş olduğu kültür ve entelektüel faaliyetlerle (oyun, chat üyelerin paylaştığı birbirinden farklı videolar ve birçok paylaşımlarla) boş zamanlarını değerlendirerek hoş vakit geçirdiklerini dile getirebiliriz.

Facebook “İnsanlar arasında daha kolay fark edilmeme imkân sağlıyor.” maddesine katılımcıların % 58,3’ü olumlu yanıt vermişlerdir. İnsan var oluşunun gereği olarak fark edilmek ister. Bunu da birçok bireyler Facebook aracılığıyla yerine getirmektedir.

“Facebook aile üyeleri ve arkadaşlarla bir arada olmamızı sağlıyor.” maddesine öğrencilerin % 67,2’si yakınları ile sanal ortamda bir araya geldiklerini, Facebook’u aile bireyleri veya arkadaşları ile buluşmaya ortam sağladığı için tercih ettikleri yorumunu yapabiliriz.

“Facebook ders bilgilerimi paylaşmamı sağlıyor” görüşüne öğrencilerin % 62,7’sinin katıldığı bulgular sonucu ortaya çıkmıştır. Kullanıcıların büyük bir bölümünü üniversite öğrencilerinin oluşturduğu Facebook, özellikle sağladığı aktif katılım ve işbirliği ile eğitsel bir ortam olarak kullanıma uygun olması nedeniyle öğrenme aracı olarak tercih edilmektedir.

Tablo 7’ye baktığımız zaman “Gün içinde zaman geçirmeme yardımcı oluyor” görüşüne % 82,8 kişinin katıldığı görülmektedir. Facebook hoşça zaman geçirmek isteyenler için tercih edilen bir sosyal paylaşım sitesidir.

Yapılan anket sonucundan “Facebook kendi video ve fotoğraflarımı insanlarla paylaşmak hoşuma gidiyor.” maddesine öğrencilerin % 53,9’unun katıldığı ortaya çıkmıştır. Bu durum internetteki videoların kullanıcılar açısından önemini ortaya koymaktadır.

Tablo 7’deki frekans sonucuna göre anket katılımcılarından % 58,9’u yeni arkadaşlara sıcak bakmaktadır. Bu durum insanların arkadaşa ve arkadaşlığa duydukları ihtiyacı Facebook’un karşıladığı ve tanımadığı kişilerle arkadaş olma konusunda tereddütlerinin olmadığı ortaya çıkarmaktadır. Bireyler Facebook kullanarak sadece belli gruplarla sınırlı kalmayıp, yeni insanlarla tanışma ve fikir paylaşımı olanağına sahip olmaktadırlar.

“Sıkıntılarımı unutturuyor” maddesine öğrencilerin % 48,9’unun katıldığı görülmektedir. Yukarıdaki Tablo 7’de görüldüğü gibi, öğrencilerin Facebook kullanmalarının en önemli sebeplerinden birinin, gündelik sorunlardan uzaklaşma isteği olduğunu ifade etmişlerdir. Burada Facebook’un kullanıcılar açısından rahatlama, dertleri öteleme gibi gerçek hayata alternatif bir çözüm aracı olarak da işlev görmektedir.

Tablo 7’ye bakıldığında öğrencilerin % 82,2 gibi büyük bir kısmının Facebook’u gündemdeki gelişmeleri arkadaşlarıyla paylaşma ve bu gelişmelerle ile ilgili düşüncelerini ifade etmek için kullandıkları gözlemlenmektedir. Bu orandan hareketle kullanıcıların çoğunun aktüel gelişmeleri diğerleriyle paylaşmak ve tartışmak için Facebook’tan yararlanmaktadır.

“Arkadaşlarımın fotoğraflarına bakmak ve onların değişimlerini görmek hoşuma gidiyor” maddesi Facebook’un öğrenciler tarafından kullanılmasında görsel öğelerin kullanım biçimini ve kullanıcıların bundan ne kadar faydalandıklarının tespit edilmesi için katılımcılara yöneltilmiştir. Öğrencilerin % 77,3 ‘lük kısmı Facebook’u bu doğrultuda kullandıkları yönünde düşüncelerini ortaya koymuşlardır.

“Facebook hoşça vakit geçirtiyor” düşüncesine öğrencilerin % 67,8’si katılmaktadır. Facebook diğer kişilerle iletişim kurma, bilgi alış-verişinde bulunma gibi daha çok ihtiyaç giderme amacının yanı sıra sunduğu bazı eğlenceli kullanım özellikleriyle de kullanıcılara hoşça vakit geçirtebiliyor. Kişiler eğlence zevklerine göre Facebook’un sunmuş olduğu alternatiflerden yararlanarak uzun süre online olabiliyorlar.

“Bir gruba aitmiş hissine kapılmamı sağlıyor” maddesi öğrencilerin sanal ortamda aidiyet hissi üzerinde Facebook’ un etkisini saptamak amacıyla katılımcılara yöneltilmiştir. Bu noktada Facebook hangi alanda olursa olsun herkesin kendinden bir şeyler bulabileceği, çok değişik grupları bünyesinde barındırmaktadır. Tablo 7’ye bakıldığında kesinlikle katılıyorum ve katılıyorum diyenler aynı doğrultuda değerlendirildiğinde % 51,0 gibi bir oran bu düşüncenin açık destekleyicisi durumundadır.

“Beni sıkan insanlardan kurtulmamı sağlıyor” maddesine katılımcıların büyük bir çoğunluğu (% 62,8) bu görüşe katılmamaktadır. Bu durumda bireylerin kendisini sıktığını düşündüğü veya muhatap olmak istemediği kişilerden bir kaçış yeri olarak Facebook kullandıkları kanısına varmak doğru olmaz.

Araştırma Sorusu 2: Üniversite gençlerinin, Facebook’a yönelik algıları bazı değişkenlere göre farklılık göstermekte midir?

a) Üniversite gençlerinin cinsiyete göre Facebook’a yönelik algıları

Üniversite öğrencilerinin Facebook’a yönelik algılarının cinsiyet değişkeni yönünden bir fark gösterip göstermediği t-testi kullanılarak incelenmiş ve sonuçlar Tablo 8’de gösterilmiştir.

Tablo 8: Cinsiyet Değişkenine Göre t-Testi Sonuçları

	Cinsiyet	N	$\bar{X}$	S	t	p
Eğlenceli içerikler sunuyor.	Kız	84	3,95	,805	2,409	**,017**

	Erkek	96	3,94	1,044		
Hoşça vakit geçirtiyor.	Kız	84	3,43	,960	2,806	**,006**
	Erkek	96	3,81	,862		
Bir gruba aitmiş hissine kapılmamı sağlıyor.	Kız	84	2,52	1,047	,531	,596
	Erkek	96	2,44	1,122		
Beni sıkan insanlardan kurtulmamı sağlıyor.	Kız	84	2,64	1,199	,187	,852
	Erkek	96	2,68	1,252		
Oyun oynamama yardımcı oluyor.	Kız	84	2,70	1,429	5,925	**,000**
	Erkek	96	3,84	1,108		

“Facebook’un oyun oynamama yardımcı oluyor” fikrine % 58,4’ü katılırken % 37,8’i katılmamaktadır. Facebook’un içerdiği oyunları kullanıcıların büyük bir çoğunluğu tercih etmektedir. Facebook’ta geliştirilen çeşitli oyunlar sosyal ve interaktif özellikleri ile birlikte Facebook kullanıcılarının hem oyun oynayarak eğlendikleri hem de bu oyunlar vasıtasıyla etkileşime geçerek sosyalleştikleri bir aktivite haline gelmiştir.

Tablo 8 incelendiğinde, Facebook algı ölçeği “Eğlenceli içerikler sunuyor”, “Kendimi ifade etmemi sağlıyor.” ,“Bu tür siteleri kullanmak hoşuma gidiyor.” , “Boş zamanlarımı değerlendirmemi sağlıyor.”, “İnsanlar arasında daha kolay fark edilmeme/tanışmama imkân sağlıyor.” ,“Yeni insanlarla tanışmamı sağlıyor.” , “Hoşça vakit geçirtiyor.” , “Oyun oynamama yardımcı oluyor.” maddelerinde cinsiyete göre Facebook’a yönelik algılarında anlamlı farklılık bulunmuştur. Anlamlı farklılık bulunan maddelerin hepsinde erklerin bayanlara göre Facebook’a yönelik algıları daha yüksektir. Diğer 12 maddede ise öğrencilerin cinsiyete göre Facebook algılarında anlamlı farklılık bulunmamıştır.

b) Üniversite gençlerinin yaş aralığına göre Facebook’a yönelik algıları

Üniversite öğrencilerinin Facebook’a yönelik algılarının yaş değişkeni yönünden bir fark gösterip göstermediği t-testi kullanılarak incelenmiş ve sonuçlar Tablo 9’da gösterilmiştir.

Tablo 9: Yaş Değişkenine Göre t-Testi Sonuçları

	Yaş	N	$\bar{X}$	S	t	p
Eğlenceli içerikler sunuyor.	17-20	93	4,10	,795	-,150	,881

	Taşra	106	3,42	1,302		

Tablo 10 incelendiğinde, Facebook algı ölçeği “Yaşadığım çevreyi, toplumu yansıtan bilgiler elde etmemi sağlıyor.”, “Kendimi ifade etmemi sağlıyor.”, “Kendi video ve fotoğraflarımı insanlarla paylaşmak hoşuma gidiyor.” maddelerinde yaşanılan yer değişkenine göre Facebook’a yönelik algılarında anlamlı farklılık bulunmuştur. Anlamlı farklılık bulunan bu maddelerde taşrada yaşayanların şehirde yaşayanlara göre Facebook’a yönelik algıları daha yüksektir. Diğer 17 maddede ise öğrencilerin Facebook’u ne zamandır kullandıklarına göre Facebook algılarında anlamlı farklılık bulunmamıştır.

e) Üniversite gençlerinin ikamet ettikleri kişilere göre Facebook’a yönelik algıları

Üniversite öğrencilerinin Facebook’a yönelik algıları ikamet ettikleri kişiler yönünden bir fark gösterip göstermediği t-testi kullanılarak incelenmiş ve sonuçlar Tablo 11’de gösterilmiştir.

Tablo 11: Üniversite Gençlerinin İkamet Ettikleri Kişilere Göre t-testi Sonuçları

Üniversite öğrencilerin Facebook'a yönelik algı anketinde üye olma nedenleri olarak sunulan "Arkadaşlarım üye olduğu için", "Merakımı gidermek için", "Gündemde olduğu için" seçeneklerine verdikleri puanlar incelenmiştir. Tablo 14 incelendiğinde, öğrencilerin Facebook'a üye olma nedenlerine göre Facebook algı ölçeğindeki sorulardan elde ettiği ortalama puanlar arasında istatistiksel olarak anlamlı fark bulunamamıştır.

i) Üniversite gençlerinin interneti kullanma amaçlarına göre Facebook'a yönelik algıları

Üniversite öğrencilerinin Facebook'a yönelik algılarının interneti kullanma amaçları yönünden bir fark gösterip göstermediği varyans analizi (One-Way ANOVA) kullanılarak incelenmiştir.

Üniversite öğrencilerin Facebook'a yönelik algı anketinde interneti kullanma amaçları olarak sunulan "E-maillerime bakmak", "Haber takibi", "Eğlence", "Araştırma yapmak" seçeneklerine verdikleri puanlar incelenmiştir. Tablo 15 incelendiğinde, öğrencilerin interneti kullanma amaçlarına göre Facebook algı ölçeğindeki sorulardan elde ettiği ortalama puanlar arasında istatistiksel olarak anlamlı fark bulunamamıştır.

TARTIŞMA ve SONUÇ

Bu çalışma kapsamında elde edilen veriler ışığında Facebook'un her geçen gün artan kullanıcı sayısı, sosyalleşme sürecinde internette en yaygın olarak tercih edilen sosyal paylaşım sitesi olduğunu kanıtlamaktadır. Bir diğer önemli olgu da, Facebook'un geliştirdiği yeni kullanım özellikleri ve paylaşım alanları ile kullanıcılarını ve kendi içerisinde geliştirdiği sosyalleşme sürecini sürekli olarak yeniden ürettiği gerçeğidir.

Sonuç olarak;

Küreselleşmenin hız kazanmasında önemli roller üstlenen iletişim teknolojilerinin aynı zamanda kültürel alanların da yeniden şekillenmesinde önemli işlevleri olmuştur. İletişimsel süreçler ve kültürel kimlikler, küreselleşmenin değerlerine göre yeniden yapılanmıştır. İnternetin yeni bir kültürel mekân, özgürlük alanı ve ekonomik bir pazar olarak ortaya çıkması, küresel formların, kültürel değerlerin, kimliklerin, alışkanlıkların hızlı bir şekilde dolaşıma sokulmasını sağlamıştır. İnternet kullanımında gelinen son nokta ise dünyadaki insan kümelerini bir ağ üzerinden birbirine bağlayan sosyal paylaşım siteleridir. Sosyal paylaşım siteleri normal bir iletişim alanı olmaktan öte kendine özgü kuralları olan, paylaşım alanı geniş bir sosyal olguya dönüşmektedir. Sosyal paylaşım sitelerinden en çok rağbet gören Facebook sınırsız, korunaklı, özgürlükler alanı ve hiyerarşinin olmadığı yenilikçi yapısıyla özellikle gençler için bir çekim merkezi haline gelmiştir. Kullanıcılar Facebook sayesinde kendilerini özgürce ifade etme ve toplumsal baskıdan uzak herhangi bir sorumluluk taşımak zorunda olmadıkları yeni aidiyet alanları oluşturma imkânı bulurlar. Facebook, sanal ortamda kültürel bir mekân olarak kullanılmanın yanı sıra gençler için önemli bir toplumsal etkileşim alanı olduğu için de tercih edilmektedir.

Teknoloji ve bilgisayar kullanımına ilişkin herhangi bir engeli bulunmayan üniversite öğrencilerinin Facebook kullanma alışkanlıklarının belirlenmeye çalışıldığı bu araştırmada şu sonuçlar dikkat çekicidir.

Bireylerin Facebook kullanım alışkanlıklarının nedenleri:

- ✓ Bireylerin arkadaşları ile bağlantı kurabilmeleri, eski arkadaşlara ulaşmak istendiğinde yardımcı olması,
- ✓ Yeni arkadaşlıklar keşfetme olanağı sunması,
- ✓ İnsanların düşüncelerini paylaşmaları ve birbirleriyle kolayca etkileşime girmeleri,
- ✓ Kişisel bilgi ve fotoğraf içeren profil sayfası oluşturarak toplum tarafından fark edilme ihtiyacının karşılanması,
- ✓ Günlük yaşamın her alanının tartışmaya açılması ve neredeyse parodileştirilmesi ve tartışma konularındaki sınırsızlığa herkesin katkısının bulunabilmesi,
- ✓ Online olarak sağladığı ücretsiz ve eğlenceli oyunlarla oyun sevenleri memnun etmesi,
- ✓ Sınırsız video paylaşımına olanak sağlaması,
- ✓ Kullanıcıların fotoğraf albümleri paylaşmasını sağlayarak kişileri etkilemesi ve fotoğraflara yorum yapmaya açık olması,
- ✓ Her kullanıcının katkılarıyla gerçekleştirilen kolektif bir oluşum olması,
- ✓ Meraklarını, ortak profesyonel hedeflerini, dostluklarını paylaşabilmeleri,
- ✓ Mail ağı oluşturmaya yardımcı olması,
- ✓ Kişinin profilindeki arkadaşlarla (chat) sohbet edebilme imkânı sunması olarak sıralanabilir.

Araştırmada Facebook kullanımı belirli kriterlere göre değişiklik göstermekle birlikte genel olarak Facebook ile gündelik yaşam arasında birbiri içine geçmiş bir ilişkinin varlığı yadsınamaz bir durum haline geldiği gözlenmiştir.

ÖNERİLER

Bu çalışmada yoğun rağbet görmesiyle sosyal paylaşım ağlarına yeni bir biçim kazandıran Facebook'un, üniversite gençleri tarafından kullanılma nedenleri belirlenmeye çalışılmıştır. Çalışmanın devamı olarak, nicel araştırma ve nitel araştırma paradigmaları birleştirilerek her bir amaç doğrultusunda anketin yanı sıra her bir öğrenci ile görüşme yapılarak katılımcılardan derinlemesine bilgi toplanabilir. Ayrıca, farklı bir örnekleme grubu analiz edilerek karşılaştırma yapılabilir. Örneğin lise kademesinde ki gençler de ankete tabii tutularak, ortaya çıkan sonuçlar karşılaştırılabilir.

Çalışma Sinop Üniversitesi öğrencileri ile sınırlı olduğundan diğer üniversite öğrenciler kapsam dışında bırakılmıştır. Araştırma her bölge için yapılabilir. Üniversite öğrencilerinin Facebook kullanım nedenlerinin bölgeler arasındaki farklılıkları kıyaslanabilir.

Facobook örneği üzerinden yapılan sosyal iletişim ağlarının kullanımına ilişkin bu çalışma diğer sosyal iletişim ağları (badoo, blogcu, dailymotion, twitter vb.) üzerinden de yapılabilir. Daha sonra bulgulara dayanarak sonuçlar arasında karşılaştırma yapılabilir.

EXAMİNİNG THE ITEM-WORDİNG EFFECT ON THE SELF-REPORT SCALE

Kuan-Mıng CHEN

Tsung-Hau JEN

In any assessment negatively phrased items are initially used as a strategy to disrupt acquiescence or affirmation bias, and supposedly measure the same construct as positively phrased items do. There are two perspectives when the responses to the negatively phrased items deviate from the responses to the positively phrased items in an assessment. The first explanation attributes the deviation to the method effect or response bias. For example, the negatively phrased items require respondents' cognitive ability to apply inverse reasoning (e.g. Marsh, 1986). The other supports that the negatively phrased items represent a construct different from the positively phrased items (e.g. Spencer-Rodgers, Peng, Wang, Hou, 2004). By analyzing the Taiwanese 4th-grade and 8th-grade students' responses to TIMSS 2011 questionnaires on positive attitude toward mathematics and self-confidence of learning mathematics, the present research suggests that the negative wording items represent a construct different from the one reflected by the positive wording items.

Keywords: item-wording effect, TIMSS, self-concept, self-confidence, self-attitude toward mathematics

ÖZET: : Bu araştırmanın amacı; ortaöğretim öğrencilerinin matematik kaygısı ve endişesinin cinsiyet, sınıf düzeyi ve okul türü bakımından incelenmesidir. Araştırmada Ikegulu(1998) tarafından geliştirilen, Özdemir (2011) ve Gür (2011) tarafından geçerlik ve güvenirlik çalışması yapılan Matematik Kaygısı ve Endişesi Ölçeği (MKEÖ) kullanılmıştır. Araştırmanın verisi İzmir ilindeki iki farklı okuldan toplam 256 öğrenciden toplanmıştır. Okullardan biri devlet okulu diğeri ise özel okuldur. Devlet okulundan 214 öğrenci, özel okuldan 42 öğrenci ile çalışılmıştır. Araştırmada ortaöğretim öğrencilerinin cinsiyet, sınıf düzeyi, okul türünün matematik kaygısına ve endişesine etkisi incelenmiştir. Elde edilen bulgular incelendiğinde cinsiyet açısından anlamlı bir fark bulunmazken sınıf düzeyi ve okul türü açısından anlamlı bir fark bulunmuştur.

Anahtar sözcükler: matematik kaygısı ve endişesi, ortaokul öğrencileri

ABSTRACT: With the increase in the importance of mathematical sciences today, studies on math anxiety and apprehension have also increased. The aim of this research is to analyze the math anxiety and apprehension of secondary school students on gender, class level and school type. In this study, Math Anxiety and Apphension Scale , which was developed by Ikegulu (1998) and tested for reliability and validity by Özdemir (2011) and Gür (2011), was used. The data have been collected from 256 students from two different schools in Izmir, Turkey. One of the schools is a public school, and the other is a private school. 214 students from the public school and 42 from the private school participated. While analyzing the data, T-test and the Analysis of Variance have been carried out. In this study, the effects of math anxiety on secondary school students in terms of gender, class level and school type have been analyzed. After the evaluation, no significant differences have been found regarding gender, whereas class level and school type affected the level of anxiety dramatically.

Key words: math anxiety and apprehension , secondary school students

ÖZET: Bu araştırmanın amacı, üniversite öğrencilerinin matematiğin temellerine ilişkin felsefi görüşlerini belirlemektir. Araştırmanın çalışma grubu iki devlet universitesinin Fen-Edebiyat fakültelerinin Matematik bölümlerine ve Eğitim Fakültelerinin İlköğretim Matematik Öğretmenliği programlarına kayıtlı 486 öğrenci oluşturmuştur. Araştırmada yöntem olarak tarama modeli kullanılmıştır. Öğrencilerin görüşlerini belirlemek amacıyla araştırmacılar tarafından bir ölçek geliştirilmiştir. Ölçeğin kapsam ve yapı geçerliliği faktör analizi, güvenilirliği iç tutarlılık yöntemi ile sağlanmıştır. Araştırmanın verilerinin analizinde parametrik olmayan testler kullanılmıştır. Bu araştırmada, öğrencilerin farklı matematik felsefelerini benimsediği belirlenmiştir. Ayrıca, öğrencilerin felsefi görüşleri, cinsiyet ve akademik başarıya göre farklılık göstermezken, Matematik felsefesi ve matematik tarihi vb dersleri alma durumlarına ve öğrenim gördüğü fakültelere göre farklılık göstermiştir.

Anahtar sözcükler: Matematik felsefesi, matematiğin doğası,yarı-deneyselcilik, mutlakçılık.

ABSTRACT: The aim of this study is to determined the philosophical views of the university students. The research subjects consists of 486 students in the Mathematics Departments of Art&Science Faculty and Elemantary School Mathematics Teacher programmes of Education Faculty in two State University. In this study, descriptive survey method is used as a research method. A scale is developed by the researchers in order to determine students' views. The validity and reliability of the scale are provided by factor analysing and internal consistency; respectively. Non-parametric tests are used at the data analysis stage.In the result of study, it is determined that students recognize different philosophy of mathematics. Also, there are not differences among the students' opinions about philosophy of mathematics in terms of gender and academic achievement wheras there are differences in terms of they take some lessons related to the nature of mathematics and faculties which they were students.

Key words: Philosophy of mathematics, nature of mathematics, quasi-empiricism, absolutist.

BİREYSEL GELİŞİM DOSYASI, ÜSTBİLİŞSEL FARKINDALIK ve AKADEMİK BAŞARI ARASINDAKİ İLİŞKİNİN İNCELENMESİ

EXAMINING THE RELATIONSHIP BETWEEN PORTFOLIO, METACOGNITIVE AWARENESS AND ACADEMIC ACHIEVIMENT

ÖZET: Günümüzde ölçmenin öğretimin bir parçası olması gerektiği görüşü performansa dayalı ölçme araçlarının önem kazanmasına sebep olmuştur. Bu araçlardan biri bireysel gelişim dosyasıdır. Bireysel gelişim dosyaları, öğrencilere derin öğrenme ve kendilerini değerlendirme imkanı tanımaktadırlar. Bu çalışmanın amacı, bireysel gelişim dosyası hazırlamanın Fen Bilgisi öğretmenliği programında öğrenim görmekte olan öğrencilerin üstbilişsel farkındalık seviyeleri üzerindeki etkisini ve üstbilişsel farkındalık seviyeleri ile akademik başarıları arasındaki ilişkiyi belirlemektir. Bu amaçla öğrencilerden Genel Kimya Laboratuarı-I dersi kapsamında bireysel gelişim dosyası hazırlamaları istenmiştir. Elde edilen bulgular, öğrencilerin üstbilişsel farkındalık seviyelerinde uygulama sonunda anlamlı bir gelişme meydana geldiğini göstermiştir. Öğrencilerin akademik başarıları ile üstbilişsel farkındalık seviyeleri arasında anlamlı bir ilişki tespit edilememiştir. Elde edilen bulgulara dayanarak araştırmacılar tarafından yorumlar yapılmıştır.

Anahtar sözcükler: portfolyo, üstbilişsel farkındalık, akademik başarı

ABSTRACT: Nowadays, the argument that assessment and evaluation should be a part of education has given the performance-based assessment tools prominence. One of these tools is portfolio. Portfolios provide students with the opportunity of deep learning and assessing themselves. The aim of this study is to determine the effectiveness of portfolios on meta-cognitive awareness level and the relationship between meta-cognitive awareness level and academic achievement of students' who are enrolled in a pre-service science teacher training program. For this purpose, students have been asked to prepare a portfolio within the General Chemistry Laboratory-I. The findings showed that significant improvement occurred in meta-cognitive awareness level of learners at the end of the application. There were no significant difference found between the academic success and the meta-cognitive awareness level of the students. Comments were made based on these findings.

Key words: portfolio, meta-cognitive awareness, academic achievement

GİRİŞ

Öğrencilerin çabalarını, gelişimini ve başarılarını, bir veya daha fazla alanda sergileyen, öğrenci çalışmalarının amaçlı koleksiyonuna bireysel gelişim dosyası denir (Paulson, Paulson & Meyer, 1991).

Bireysel gelişim dosyaları, ölçülecek hedefleri, hangi ürünlerin/çalışmaların hangi hedefler için hazırlandığını belirten açıklamaları, değerlendirme kriterlerini, öğrencinin, dosyada yer alan ürünün/çalışmanın onun öğrenim hedeflerine ulaştığını nasıl gösterdiği ile ilgili olarak yazdığı yansıtıcı yazıları (her bir ürün için), öğrencinin öz değerlendirmesini ve öğretmenin değerlendirmesini içermelidir (Bekiroğlu, 2004).

Bireysel gelişim dosyaları derin öğrenmenin gerçekleşmesinde etkili öğrenme araçlarıdır (Demirören, Koşan & Palaoğlu, 2009) ve öğrencilerin kendi kendilerini değerlendirmelerini ve kendileri hakkında bilgi edinmelerini sağlar (Tezci & Demirli, 2004). Bu sebeple araştırmacılar bireysel gelişim dosyalarının öğrencilerin üstbilişsel gelişimlerinde de etkili olduğunu belirtmektedirler (Kovalchick, 1997; White, 2004; Bekiroğlu, 2004).

Herhangi bir şeyin farkında olma ve onu anlama biliş olarak adlandırılırken, herhangi bir şeyi öğrenme ve anlamanın yanı sıra onu nasıl öğrendiğinin farkında olma ise üstbiliş olarak adlandırılır (Senemoğlu, 2012). Üstbiliş öğretimi ile bireylerin bilişsel süreçlerini denetleyebilmeleri ve daha nitelikli bir öğrenme için bu süreçleri yeniden düzenleyerek daha etkili kullanmalarının sağlanması hedeflenir (Özsoy, 2008). Metabilişsel farkındalık ise, bireyin kendi düşüncesine yönelik derinlemesine düşünebilme ve öğrenme güçlüklerinin üstesinden gelmede problem çözme becerilerini kullanabilme yeteneğidir (Joseph, 2010).

Alanyazın incelendiğinde bireysel gelişim dosyalarının önemini vurgulayan çokça çalışma olduğu görülmektedir (Birgin, 2003; Ediger, 1996; Gezer, 2012; Kan, 2007; Moya ve O'Malley, 1994; Owings ve Follo, 1992; Valencia, 1990). Portfolyoyu konu alan çalışmalar genellikle portfolyoların akademik başarı üzerindeki etkisini araştırmaktadır (Okçu, 2007; Sezgin, 2008). Üstbilişsel farkındalık üzerine yapılan çalışmalar da özellikle son yıllarda artış göstermiştir. Bu çalışmalarda özellikle farklı öğrenim seviyesindeki öğrencilerin üstbilişsel farkındalık seviyeleri araştırılmakta veya üstbilişsel farkındalık seviyeleri farklı değişkenler açısından incelenmektedir (Memiş & Arıcan, 2013; Özsoy, Günindi, 2011; Yavuz & Memiş, 2010; Kiremitçi, 2013; Küçük, Cansız, Akgün, & İşleyen, 2014). Bununla birlikte çeşitli yaklaşım veya modellerin üstbilişsel farkındalık üzerine etkisinin incelendiği çalışmalar da mevcuttur. Örneğin Yurdakul & Demirel (2011) çalışmalarında yapılandırmacı öğrenme yaklaşımının üstbilişsel farkındalık üzerine etkisini araştırmışken, Feyzioğlu, & Ergin, Ö. (2012) ise 5E öğrenme modelinin üstbilişsel farkındalık üzerine etkisini araştırmışlardır. Kim (2005) ise yansıtıcı öğrenme aracının üstbilişsel farkındalık üzerine etkisini araştırmıştır. Portfolyoların üstbilişsel farkındalık üzerine etkisini araştıran çalışmalara ise literatürde az rastlanmaktadır (Meyer, Abrami, Wade, Aslan & Deault, 2010). Yine üstbilişsel farkındalık ve akademik başarı arasındaki ilişkiyi araştıran çalışmalara da alanyazında az rastlanmaktadır (Bağçeci, Döş, & Sarıca, 2013). Bu sebeple bu çalışmanın amacı bireysel gelişim dosyası hazırlamanın Fen Bilgisi öğretmenliği programında öğrenim görmekte olan öğretmen adaylarının üstbilişsel farkındalıkları üzerindeki etkisini ve üstbilişsel farkındalık seviyeleri ile akademik başarıları arasındaki ilişkiyi irdelemektir.

Bu çalışmada şu araştırma sorularına cevap bulunmaya çalışılmıştır:

1- Bireysel gelişim dosyası hazırlayan öğrencilerin üstbilişsel farkındalıklarında bir değişim olmuş mudur?
2- Üstbilişsel farkındalık seviyesi ile akademik başarı arasında bir ilişki var mıdır?

YÖNTEM

Çalışmanın amacına ulaşmak için nicel araştırma yöntemlerinden faydalanılmıştır. Çalışmanın ilk araştırma problemine cevap vermek amacıyla deneysel araştırma yöntemi kullanılmıştır. Deneysel çalışmalarda en azından bir bağımsız değişkenin, bir veya daha fazla bağımlı değişken üzerine etkisi incelenir (Fraenkel, Wallen & Hyun, 2012). Bu şekilde bireysel gelişim dosyası hazırlamanın üstbilişsel farkındalık üzerindeki etkisi incelenmiştir.

Çalışmanın ikinci araştırma problemine cevap vermek için ise korelasyonel araştırma deseni seçilmiştir. Korelasyonel araştırma, ilişkisel araştırmanın bir örneğidir. Bu tip araştırmalarda iki veya daha fazla değişken arasındaki ilişki araştırılır ve değişkenlere etki edilmez (Fraenkel, Wallen & Hyun, 2012). Bu sayede üstbilişsel farkındalık seviyesi ile akademik başarı arasındaki ilişkinin ortaya konulması amaçlanmıştır.

Örneklem

Çalışma fen bilgisi öğretmenliği programı birinci sınıfta öğrenim görmekte olan 35'i kız, 8'i erkek toplam 43 öğrenci ile gerçekleştirilmiştir.

Veri Toplama Araçları

Araştırma problemlerini irdelemek amacıyla üstbilişsel farkındalık envanteri ve başarı testi veri toplama araçları olarak işe koşulmuştur. Aşağıda bu veri toplama araçlarıyla ilgili detaylı bilgiler sunulmuştur.

Üstbilişsel Farkındalık Envanteri

Öğretmen adaylarının üstbilişsel farkındalıkları Schraw ve Dennison (1994) tarafından geliştirilmiş Bilişötesi Farkındalık Envanteri kullanılarak araştırılmıştır. Bilişötesi Farkındalık Envanteri 52 maddeden oluşmaktadır ve (1) Hiç bir zaman (2) Nadiren (3) Sık sık (4) Genellikle ve (5) Her zaman şeklinde 5'li Likert tipi bir derecelendirmeye sahiptir. Envanterin Türkçe formunun geçerlik ve güvenirlik çalışması ise Akın, Abacı ve Çetin (2007) tarafından yapılmıştır. Envanterin iç tutarlılık ve test-tekrar test güvenirlik katsayıları .95 olarak bulunmuştur. Üstbilişsel farkındalık envanteri uygulama başında ön test, uygulama sonunda son test olarak uygulanmış ve ön ve son uygulamalar arasındaki gelişimi görmek için bağımlı t testi uygulanmıştır.

Başarı Testi

Öğretmen adaylarının dersin amaçlarına yönelik başarıları ise bilgi, kavrama ve uygulama seviyesinde açık uçlu toplam 7 sorudan oluşan bir test ile belirlenmiştir. Test maddeleri araştırmacılardan biri tarafından geliştirilmiş aynı zamanda kapsam ve yapı geçerliliğinin arttırılması amacıyla üç uzmana incelettirilmiştir. Öğrencilerin başarı testine verdikleri cevapları değerlendirmek amacıyla cevap anahtarı oluşturulmuştur. Her bir soru eşit olarak puanlandırılmıştır ve testten alınabilecek maksimum puan 98'dir. Öğrencilerin üstbilişsel farkındalık seviyeleri ile başarı testinden aldıkları puanlar arasındaki ilişkiyi araştırmak amacıyla pearson korelasyon katsayısına bakılmıştır.

Ortam ve Uygulama Süreci

Uygulama 2013-2014 güz yarıyılında, Genel Kimya Laboratuvarı-I Dersi kapsamında gerçekleştirilmiştir. Laboratuvar dersleri haftada bir gün, iki saattir. Genel Kimya Laboratuarı I dersi kapsamında aşağıda konu başlıkları verilen toplam yedi deney gerçekleştirilmiştir: Alev testi, farklı sıcaklık ve kütledeki sıvıların karıştırılmasında ısı alışverişinin incelenmesi, konsantrasyonu bilinmeyen bir çözeltinin konsantrasyonunun tayini, çözeltilerin hazırlanması, asit, baz ve tuzların tanınması, naftalinin süblimleşmesi ve kristallendirme yöntemiyle saflaştırma.
Uygulama öncesinde öğrencilere üstbilişsel farkındalık envanteri ön test olarak uygulanmıştır. Uygulamanın ilk haftasında öğrencilere hazırlayacakları bireysel gelişim dosyaları hakkında bilgi verilmiş ve portfolyolarındaki ürünlerin nasıl değerlendirileceği açıklanmıştır. Öğrenciler yedi hafta boyunca portfolyo hazırlamışlardır. Öğrencilerden her deney öncesinde deneyle ilgili zihin haritası oluşturmaları (ilgili deneyin yapılacağı ders zihin haritaları kontrol edilmiştir), deneyden sonra ise arkadaşlarına deneyi anlatan bir mektup yazmaları ve son olarak da o hafta yapılan deney ile ilgili edindikleri kazanımlar ve oluşturdukları ürünler üzerine yansıtma yapmalarını sağlayacak yazılar yazmaları istenmiştir. Öğrencilerin arkadaşlarına yazdıkları mektuplar, arkadaşları tarafından, daha önceden araştırmacılarca hazırlanan rubrikler kullanılarak değerlendirilmiştir. Dersten önce hazırlanan zihin haritaları ve öğrencilerin bilgilerini ve ürünlerini değerlendirdikleri yansıtıcı yazılar ise çalışmayı yürüten araştırmacılar tarafından her hafta incelenmiş, geribildirim yazılarak, yine daha önceden araştırmacılar tarafından oluşturulmuş rubrikler kullanılarak puanlandırılmış ve öğrencilere teslim edilmiştir. Öğrencilerin hazırladığı bireysel gelişim dosyalarındaki ürünlerden aldıkları puanların ortalaması alınmış ve ikinci vize notu yerine sayılmıştır.

BULGULAR ve TARTIŞMA

Bu bölümde çalışmadan elde edilen bulgular iki başlık altında sunulmuştur. İlk bölümde öğrencilerin uygulama öncesi üstbilişsel farkındalık seviyeleri ile uygulama sonrası üstbilişsel farkındalık seviyeleri karşılaştırılmış ve elde edilen bulgular tartışılmıştır. İkinci bölümde ise öğrencilerin üstbilişsel farkındalıkları ve akademik başarıları arasındaki ilişki incelenmiş ve elde edilen bulgular tartışılmıştır.

Üstbilişsel Farkındalık Seviyesindeki Değişim

Bireysel gelişim dosyası uygulamasından önce ve sonra uygulanan üstbilişsel farkındalık envanterinden öğrencilerin aldığı puanların karşılaştırılması amacıyla bağımlı t testi uygulanmıştır. Elde edilen bulgular Tablo 1'de sunulmuştur. Tablo 1'de görüldüğü gibi öğretmen adaylarının uygulama sonunda üst bilişsel seviyelerinde bir artış görülmektedir. Yapılan t testi sonuçları uygulama öncesi ve uygulama sonrası üstbilişsel farkındalık envanterinden alınan puanlardaki bu artışın anlamlı olduğunu ortaya koymaktadır ($t=-3,213$; $p<0,05$).

Tablo 1. Öğrencilerin Üstbilişsel Farkındalık Ölçeği Öntest-Sontest Puanlarına Yönelik t-Testi Sonuçları

Testler	N	X	S	sd	t	p
Öntest	43	192,60	18,20	22,18	-3,705	,001
Sontest	43	205,14	22,18			

Bu analizlerden yola çıkılarak alanyazında belirtildiği gibi bireysel gelişim dosyaları hazırlamanın öğretmen adaylarının üstbilişsel farkındalıkları üzerine pozitif bir etkisi olduğu söylenebilir (Kovalchick, 1997; White, 2004; Bekiroğlu, 2004). Meyer, Abrami, Wade, Aslan ve Deault (2010) tarafından yapılan benzer bir çalışmada araştırmacılar e-portfolyo hazırlamanın 4-6. sınıf öğrencilerinin üstbilişsel farkındalıkları üzerindeki etkisini araştırmışlardır. Çalışmanın sonuçları, bireysel gelişim dosyası hazırlamanın üstbilişsel farkındalık üzerinde pozitif yönde bir etkisi olduğunu göstermiştir. Bu yönüyle çalışma sonuçlarımızla benzerlik göstermektedir.

Üstbilişsel Farkındalık Seviyesi ile Akademik Başarı Arasındaki İlişki

Öğretmen adaylarının üstbilişsel farkındalık envanterinden aldıkları puanlar ile başarı testinden aldıkları puanlar arasındaki korelasyona bakılmıştır. Elde edilen bulgular öğretmen adaylarının üstbilişsel farkındalık seviyeleri ile Genel Kimya Laboratuarı I dersindeki akademik başarıları arasında çok zayıf pozitif bir ilişki olmakla birlikte bu ilişkinin anlamlı olmadığını göstermektedir ($r=0,122$; $p>0,05$). Bunun sebebi, öğretmen adaylarının başarılarını belirlemek amacıyla ölçülen testte yer alan soruların bilgi, kavrama ve uygulama düzeyinde sorular içermesinden kaynaklanmış olabilir. Öğrencilerin daha üst düzey (analiz, sentez ve değerlendirme) seviyede sorular içeren bir testten alacakları puanlar ile üstbilişsel farkındalık seviyeleri arasında daha güçlü bir ilişki mevcut olabilir. Çünkü üstbilişin gelişimi, öğrencileri üst düzey bir bilişsel sürece ulaştırır (Victor, 2004). Bağçeci, Döş, & Sarıca (2013), çalışmalarında ilköğretim 7.sınıf öğrencilerinin üstbilişsel farkındalıkları ile Seviye Belirleme Sınavı (SBS) ve Yılsonu Başarı Puanları (YSBP) arasındaki ilişkiyi incelemişlerdir. Öğrencilerin üstbilişsel farkındalıkları ile SBS başarıları ve üstbilişsel farkındalıkları ile yılsonu başarı puanları arasında pozitif yönde anlamlı ilişki bulunmuştur.

Bu çalışmada akademik başarı ve üstbilişsel farkındalık arasında anlamlı bir ilişki tespit edilememiş olmasının sebebi ise öğrencilerin akademik başarı testinden aldıkları puanlardan kaynaklanmış olabilir. Tablo 2'de öğrencilerin başarı testinden aldıkları puanların betimsel analizinden elde edilen bulgular sunulmuştur. Görüldüğü gibi elde edilen puanların standart sapması 13,18 ve ranjı ise 57'dir. Standart sapmanın ve ranjın büyük çıkmış olması bu durumu açıklayabilir.

Tablo 2. Öğrencilerin Başarı Testinden Aldıkları Puanların Betimsel Analizinden Elde Edilen Veriler

Standart sapma	13,18
Ranj	57
Minimum	12
Maksimum	69

SONUÇ ve ÖNERİLER

Bu çalışmanın sonuçları bireysel gelişim dosyası hazırlamanın üstbilişsel farkındalığın gelişmesinde etkili olduğunu göstermektedir. Bu sebeple derslerde bireysel gelişim dosyası değerlendirme yöntemlerinden yararlanılması tavsiye edilmektedir.

Bununla birlikte bu çalışmada bireysel gelişim dosyalarındaki ürünler haftalık olarak hazırlanmıştır ve bu ürünler zihin haritaları, mektuplar ve yansıtıcı yazılardan oluşmaktadır. Farklı öğrenme araçlarının toplandığı bireysel gelişim dosyalarının öğrencilerin üstbilişsel gelişimleri üzerinde farklı etkiler yaratabileceği düşünülmektedir. Bu sebeple farklı çalışmalarda farklı öğrenme araçlarının toplandığı bireysel gelişim dosyalarının öğrencilerin üstbilişsel farkındalıkları üzerine etkisi araştırılabilir.

Bu çalışmada ayrıca öğrencilerin üstbilişsel farkındalık seviyeleri ile akademik başarıları arasında anlamlı bir ilişki olmadığı tespit edilmiştir. Bunun sebebi olarak öğrencilerin akademik başarılarının tespit edilmesinde kullanılan test maddelerinin üst düzey bilişsel sorulardan oluşmamış olması gösterilebilir. Bu sebeple farklı araştırmalarda, üstbilişsel farkındalık ile hangi farklı bilişsel düzeydeki öğrenmenin daha fazla ilişkili olduğunu ortaya koymak amacıyla çeşitli çalışmalar yürütülebilir. Bu amaçla Bloom taksonomisine göre farklı seviyelerde soru içeren testlerin öğrencilere uygulanması ile elde edilen puanların, öğrencilerin üstbilişsel farkındalık seviyeleri ile arasındaki ilişkinin araştırılması ve bunların karşılaştırılmasının etkili olabileceği araştırmacılar tarafından düşünülmektedir.

THE INVESTIGATION OF CONTENT KNOWLEDGE OF PRESERVICE ELEMENTARY MATHEMATICS TEACHERS ABOUT PROBABILITY

Gamze KURT
Middle East Technical University
gkurt@metu.edu.tr

ABSTRACT: Change in the middle school curriculum in Turkey necessitates the study of examination of knowledge of preservice elementary mathematics teachers about these highlighted subjects, namely probability. So, this study is significant in the needs of the Turkish mathematics education literature as well as it contributes to the consequences of curriculum efforts. In order to possess an understanding of probability and statistics concepts for preservice mathematics teachers and develop a comprehension, they must have both conceptual and procedural knowledge (Hiebert & Lefevre, 1986), where it is the main concern of this study. While using an instrument which considers probability knowledge as described in those two types of knowledge, researcher aims to understand to what extent preservice teachers are capable of conceptual and procedural knowledge of probability and statistics teaching. This paper deals with a part of data collected for the dissertation of the researcher.

Key words: Probability, content knowledge, preservice mathematics teachers

INTRODUCTION

This study aims to investigate the knowledge which is held by preservice elementary mathematics teachers in probability subjects limited with the elementary mathematics school curriculum in Turkey.

In our revised curriculum, which started to be instructed in middle-level schools in Turkey in September, 2013, the density of probability was reduced compared to previous curriculum, and its instruction is placed into the 8th grade level only with a superficial understanding of probability, such as determining the probable cases of an event, determining the cases whose probabilities are more probable, less probable or equiprobable, understanding that the probability of an event is between 0 and 1, and that of certain and impossible events, and computing the probability of a basic event. These can be called as ‘basic concepts of probability’. Moore (1997, as cited in Biehler, Ben-Zvi, Bakker, & Makar, 2012) recommends some changes from the statistical point of view, in that of content (more key concepts, and data analysis, and less probability), pedagogy (fewer lectures, more active learning) and technology (for data analysis and simulations). So, the new curriculum could be identified a well-reflection of Moore’s recommendation that it enhances more statistics and less probability while leaving the deeper conceptual knowledge to the high-school level, as compared with previous curricula with an integration of use of technology where available for teachers.

What earlier studies showed that preservice mathematics teachers have a less comprehension of probability compared with the other learning areas of curriculum, that is, they found probability subjects difficult to teach especially because of their lack of content knowledge related with them (Quinn, 1997; Stohl, 2005). Contemporary efforts are addressing the same issue as well so that teacher education should be enhanced while giving an attention to probability teaching for mathematics teachers (Stohl, 2005; Jones & Thornton, 2005). Change in the middle school curriculum necessitates the study of examination of knowledge of preservice elementary mathematics teachers about the highlighted subject, namely probability. Whether preservice elementary teachers have both conceptual and procedural level of understanding of probability in order to teach it has been understood (Star, 2005). So, this study is significant in the above needs of the Turkish mathematics education literature as well as it contributes to the consequences of curriculum efforts and will be a light for future considerations of this issue.

The research questions in this study are as follows: (a) to what extent are preservice elementary mathematics teachers capable of conceptual and procedural knowledge of probability subjects held in elementary mathematics curriculum in Turkey? (b) what are the main strengths and weaknesses of preservice elementary mathematics teachers in probability subjects held in elementary mathematics curriculum?

REVIEW OF RELATED LITERATURE

Before analyzing the knowledge for probability, it can be interpreted under the framework of mathematical knowledge for teaching (Hill, Ball, & Schilling, 2008). What this framework summarized the mathematical knowledge for teaching as in the following and Groth (2012) developed the framework from a stochastic knowledge point of view.

The framework formed by Hill, et.al. (2008). has two main dimensions for mathematical knowledge for teaching: first, subject matter knowledge which includes common content knowledge (CCK), specialized content knowledge (SCK) and knowledge at the mathematical horizon (Hill, et al., 2008); second, pedagogical content knowledge which includes knowledge of content and students (KCS), knowledge of content and teaching (KCT) and knowledge of curriculum. From the statistics point of view, CCK is considered as computing and interpreting the most frequent measures of central tendency; SCK is considered as special for teaching as which is best for which statistics term; Horizon knowledge is considered as working on populations will eventually emerge the working on samples, for example. For the second dimension, KCS can help teachers to catch the common strategies which students use in developing students' statistical reasoning; KCT deals with the content-specific strategies like knowing how to explain arithmetic mean as a fair share or as a balance point; and knowledge of curriculum can help teachers about structural properties that a curriculum possess (Groth, 2012).

Therefore, Groth has developed a framework for combining above terminology and suggested the following framework:

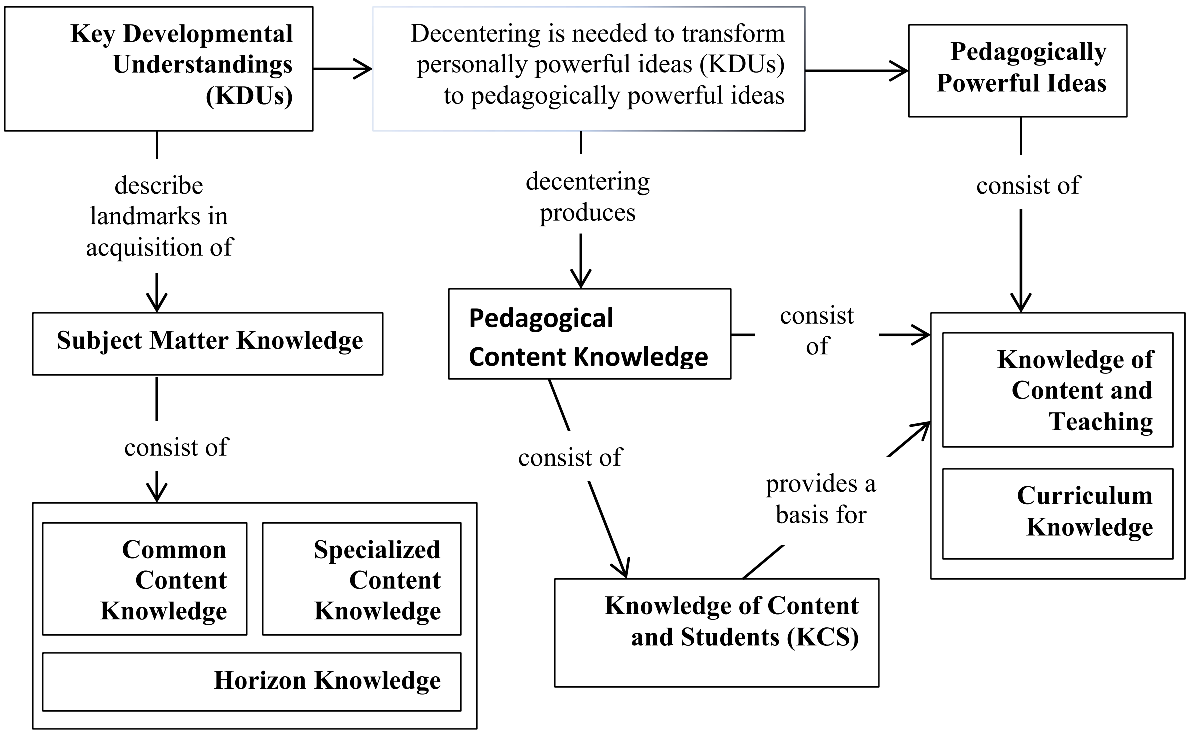

Figure1. Hypothesized SKT Framework Introduced by Groth (2013).

Based on the efforts in conducting the course which he was teaching, namely as Statistical Knowledge for Teaching (SKT) (including probability), he has developed the framework for SKT, while adding two new constructs to the statistical knowledge for teaching framework, one of which is key developmental understandings and the second one is pedagogically powerful ideas. Key developmental understandings were defined as "cognitive landmarks in the learning of fundamental ideas needed to understand content" (Simon, 2006, as cited in Groth, 2013). Pedagogically powerful ideas can be defined as ideas that occur as the result of transforming key developmental understandings into ideas that facilitate students' learning of the key developmental understandings. Groth (2013) in his hypothesized framework relates these two dimensions with the other existing dimensions of mathematical knowledge of teaching.

Another dimension highlighted in this study is the conceptual and procedural knowledge types, which they introduced by first Scheffler (1965), but expanded by Hiebert and Lefevre (1986) and Star (2005), where ‘procedural knowledge is characterized most clearly as knowledge that is rich in relationships, like a connected web of knowledge, a network in which the linking relationships are as prominent as the discrete pieces of information’ (p. 3). They also categorize the conceptual knowledge as primary and reflective. Apart from conceptual knowledge Hiebert & Lefevre (1986) also explains the procedural knowledge in two types: ‘one kind of procedural knowledge is a familiarity with the individual symbols of the system and with the syntactic conventions for acceptable configurations of symbols; the second kind of procedural knowledge consists of rules or procedures for solving mathematical problems’ (p. 7). In order to possess an understanding of probability concepts for preservice elementary mathematics teachers and develop this comprehension, they must have both conceptual and procedural knowledge (Hiebert & Lefevre, 1986). Ball (1988) described the subject matter knowledge similar to above; she names the procedural knowledge as substantive knowledge, which refers to ‘understanding of particular topics, procedures, concepts and relations among them’ (p. 4), and secondarily, knowledge about mathematics is named in place of conceptual knowledge. So, this type of categorization fits with the above expressions, as well.

METHODOLOGY

This study uses qualitative efforts in order to investigate its research questions. Researcher plans to collect data through face-to-face interviews (later transcribed verbatim and analyzed through data coding with the usage of qualitative data analysis techniques as Creswell (2007) outlined in his book). Participants will be determined from elementary mathematics education departments where researcher can reach. The 3rd or 4th grade preservice teachers were chosen since the courses related with teaching methods related with subject matter knowledge have been covered beginning with the 3rd year of elementary mathematics teacher education in Turkey. Then, 23 participants have been interviewed voluntarily, who 12 of them are 4th year students and the rest are in their 3rd year of elementary mathematics teacher education. 9 of participants are from Istanbul University and 14 students are from Boğaziçi University.

In order to investigate the understanding of preservice elementary mathematics teachers’ knowledge for probability, an instrument was used. It involves open-ended questions as well as multiple-choice items which deal with both the procedural and conceptual types of knowledge of probability. Specifically, it involves questions related to topics of probability of a basic event; certain, impossible and equally-likely events; theoretical and experimental probability. This instrument is organized with the questions taken Diagnostic Teacher Assessments in Mathematics and Science developed at the University of Louisville (CRiMSTeD-Center for research in Mathematics and Science Teacher Development). These assessments have established high levels of reliability and validity (Bush, et al, under review, as cited in Jacobbe, 2007). For this research, the questions, which are related with probability subjects framed by elementary mathematics curriculum in Turkey, were taken from CRiMSTeD. The items in this test are multiple-choice and open-ended questions and have been posed to the participants with a prepared sheet during interview. Besides, participants were also asked questions related with basic concepts in probability subjects covered in curriculum. The average duration for each interview was 45 minutes.

FINDINGS

During data collection period, participants were directed questions related with probability terminology such as the definition of probability, definitions of certain, impossible and equally likely events and calculation of probability of an event as well as they were asked to solve the test including 8 items related with the above subjects and additionally the difference/relation of theoretical and experimental probability. 5 of the items in the test are multiple-choice (choosing 1 among 4 alternatives) and the rest are open-ended questions.

During the interview, some of the participants defined probability as giving a method for calculation of it, it was not a complete definition, and some gave explanations with synonym words for probability. All of them knew that the measure of probability was between 0 and 1, which was another question directed through interview. They gave also complete explanations for certain and impossible events. For the definition of equally likely events, nearly half of the participants had a misconception that the probabilities of equally likely events are the same and ½.

Related with the question how a probability of an event is calculated, most of the participants did not use the expected terminology, such as the word ‘sample space’.

It is also worth to mention here that most of the participants have identified probability as the most troublesome topic for themselves, some were said that 'I know probability, but I don't know what I do in class while I am teaching it, since I don't know the logic behind it'. Most of them have mentioned also that they found probability as the least known topic by themselves, and when the researcher asked the reason for that, probability was the topic which was accepted as dealing with abstract issues more with respect to other subjects in the elementary mathematics curriculum, according to responses of participants. They pointed that they learned probability without knowing in their elementary school years, like memorization. For this reason, nearly all of the participants considered the change in the curriculum related with the probability subject as meaningful and stressed that probability was early to teach in elementary school because of its abstract nature.

For the secondary data for this research, i.e. the test, evaluation of open-ended items was performed through a previously prepared rubric such that a full response means that participant talked about all the expected terminology and provided all the aspects of the topic covered in it; an incomplete response means that participant did not provide all of the expected discussion and did not a satisfactory response as much as expected; a wrong response means that participant responded irrelevantly and did not mention about any of the expected aspects of the topic covered in the item. The findings were summarized based on these data as in the following table:

Table 1. Findings Based on the Items

Item #	Type	Related Topic	Ratio of achievement
Item1	Multiple Choice	Impossible Event	22 of 23 are correct
Item2	Multiple Choice	Finding the probability of an event	23 of 23 are correct
Item3	Multiple Choice	Theoretical vs. Experimental Probability	17 of 23 are correct
Item4	Open-ended	Finding the probability of an event	6 of 23 responded full, 17 of 23 responded completely wrong.
Item5	Open-ended	Sample space	12 of 23 responded full, 4 of 23 responded wrong. 7 of 23 responded incomplete.
Item6	Open-ended	Theoretical vs. Experimental Probability	6 of 23 responded wrong or gave no information. 6 of 23 have responded incomplete. 11 of 23 responded full.
Item7	Multiple Choice	Types of events	17 of 23 are correct.
Item8	Multiple Choice	Sample space	20 of 23 are correct.

The items 1 and 2 were analyzing the procedural knowledge related with impossible events and finding the probability of an event. While all participants have responded correct to the second item, only one participant had a mistake in her response for the first item. Another item, which participants had higher achievement with respect to the others, was the last one, i.e. 20 participants responded correct to it. Fifth item which is related with the last have not been resulted with the similar findings as in the last one, although they cover the same topic. Nearly half of the participants (12 of 23) responded full, the rest answered incomplete or wrong to this item.

17 participants have responded correct to the third item, which is related with the relation of theoretical and experimental probability. Similar success ratio can be seen in the sixth item, which is related with the same subject. In the sixth item, participants were directed to describe a class activity showing the difference between theoretical and experimental probability. While 15 participants responded full, the rest gave incomplete or wrong answers. Some of them had no idea about the difference between theoretical and experimental probability, some were gave irrelevant examples.

Seventh item is another item which has a higher achievement ratio among all of the items, and it is questioning the types of events, like certain events, impossible events and equally likely events. 17 of participants have correctly answered to this question.

Fourth item was dealing with the predicting the catfish population in a river through two consecutive hunts, i.e. in the first hunt biologists caught 138 catfish and they marked them and in the second one, they caught 241 catfish, 16 of them are pre-marked. The condition is that 138 marked catfish intermingled freely in the river with the unmarked ones, and during the period between these two hunts, neither new catfish added nor existing catfish died. This item was the most challenging one in the test, although the related multiple-choice item had a higher achievement, most of the participants (17 of 23) answered completely wrong, only 6 of them gave a full response. There was no incomplete response for this item.

DISCUSSION

The findings of this study show similar aspects mentioned in the above framework for content knowledge described by Groth (2013), Hiebert & Lefevre (1986) and Ball (1988). According to their categorization of content knowledge, three of the items directed as open-ended all in the test can be described as dealing with conceptual knowledge and the rest are dealing with the procedural knowledge and all of them are multiple-choice items. It can also be said that the questions directed to participants during the interview, they could not show their conceptual knowledge about probability since their answers were mostly procedural knowledge base.

In general, it can be claimed that preservice elementary mathematics teachers has a high achievement in procedural level of knowledge for probability subjects limited in Turkish national elementary mathematics curriculum. They mostly know that the concepts, such as definition of probability, types of events, difference/ relation between theoretical and experimental probability, definition of sample space. However, most of the participants have difficulty in answering the questions necessitating conceptual knowledge, which are related with the subjects of finding the probability of an event (catfish problem), sample space, and theoretical and experimental probability relationship. It can be claimed that the participants for this study have not an ability to connect what they know about probability and have not a higher-order comprehension needed for knowledge answering to the questions (Ball, 1988; Hiebert & Lefevre, 1986, Groth, 2013).

Based on the findings through interviews, definition of the probability of an event was performed procedurally, most of them used the sentence such as ‘it means the division of wanted events divided by all events’ although this definition has some terminological mistakes. For example, none of them used the word ‘ratio’ as defining it or the term ‘sample space’ as Green (1987) stated as one of the conditions of having an understanding of probability conceptually. For the definitions of certain and impossible events, all of them explained that a certain event has a probability of 1, and an impossible one has 0 as its probability. Some of them have provided examples for their definitions additionally and their examples were also appropriate. However, for the definition of equally likely events, nearly half of them explained that their probability is ½ and they mostly supported their explanations with the example of coin tossing, like having a tail and having a head are equally likely events. This also shows that participants have not used the knowledge for probability as conceptually since they could not use the concept in different situations, they could not relate it with higher order thinking abilities (Ball, 1988).

Findings related with considering probability as one of the most abstract issues in mathematics shows that preservice teachers have an understanding of probability as a subject roughly, not deeply, which can also be claimed the reason is that their knowledge level is in the procedural level and lack of conceptual knowledge, they found probability as abstract.

The findings based on the test tend to be similar to the findings based on interview obviously since their achievement ratios to the items regarding the type of items as conceptual or procedural knowledge for probability. There were 3 paired (one for procedural and one for conceptual) items for three subjects: sample space, finding the probability of an event and difference/relation between theoretical and experimental probability. When these pairs compared with each other, it can be seen that achievement ratio of items for procedural knowledge are higher than their pairs for conceptual knowledge.

For example, third item prepared for difference/relation between theoretical and experimental probability is asking the true alternative based on the results of an experiment, in which colored spinner is used. Using an elimination method among the alternatives, 17 of participants made correct decision on this item. However, its paired item related with the same subject was searching for a class activity which can help to the students in order to distinguish the relation between theoretical and experimental probability. Most of the participants had difficulty in describing an activity which includes specifically increasing the number of experiment. The participants responded wrong to this item, had no idea about the difference about them. Therefore, it can again be claimed that preservice elementary mathematics teachers lack of conceptual thinking, they prefer to solve procedurally, not deepening their comprehension process (Ball, 1988; Hiebert & Lefevre, 1986).

When we consider the possible reasons of why conceptual knowledge of preservice elementary mathematics teachers have been less-developed compared with procedural knowledge, the courses offered for teacher candidates during their university education are like ‘recipe-type’ or ‘rule-bound’ courses which only deals with the calculations and lead preservice teachers to memorize the subjects while underestimating the logic behind it, as Shaughnessy (1992) stressed out previously (p.466). He claims also that preservice teachers lack of opportunity to develop their stochastic reasoning in university courses with their misunderstandings about probability. Nearly half of the participants have stressed that they feel themselves not knowing very well about probability although they have taken a course namely as probability and statistics. The other half of the students have mentioned that they have a course related with teaching probability and statistics in elementary level, however, unless they learned about probability very well, they cannot teach it so first they need to know it, as they expressed and therefore corresponds with the arguments by Shaughnessy (1992).

So on the whole, this study discussed the content knowledge for probability held by preservice elementary mathematics teachers very well. Findings implied that content knowledge assessed by the items in the test and questions directed through interviews have two dimensions, procedural and conceptual knowledge, as discussed clearly by the researchers previously (Hiebert & Lefevre, 1986; Ball, 1988; Groth; 2013) and corresponds to the framework which was bounded before.

RECOMMENDATIONS

The implications of this study will be enlightening for the future research of the content knowledge of preservice elementary mathematics teachers in Turkey. The discussion of the findings can have an impact on teacher education programs in the universities. While some universities have currently specific courses related with pedagogical content knowledge for statistics and probability (like Boğaziçi University) including content knowledge needed for those subjects as well, some of them have not. This study can have positive influences on the development of elementary mathematics education programs in nationwide, and might affect the perspectives of teacher educators, who are responsible for training the teachers, as well.

ABSTRACT: Innovativeness is seen as the prior condition of the adoption and diffusion of the innovations (Rogers, 2003). Therefore, identifying individuals' innovativeness would be crucial in order to understand their tendency towards newness. Thus, this study aimed to investigate innovativeness profiles of pre-service early childhood teachers. Specifically, their level of innovativeness was examined within the four sub-dimensions namely, resistance to change, opinion-leading, openness to experience, and risk-taking. In addition, an effect of having Internet access on the sub-dimensions of innovativeness was explored as the second aim of this study. For this purpose, data were collected from 436 prospective early childhood teachers by using Turkish Individual Innovativeness Scale (TIS) (Kılıçer & Odabaşı, 2010). The gathered data were analyzed by conducting Multivariate Analysis of Variance (MANOVA). Based on the self-reported data, the results of the study indicated that pre-service early childhood teachers are open to experience and opinion leaders. On the other hand, they are neutral in risk-taking and resistance to change dimensions. Moreover, it was also found that having the Internet access has a statistically significant effect on the three sub-domains of innovativeness namely, resistance to change, opinion-leading, and openness to experience.

ÖZET: Orantısal akıl yürütmenin cebirsel akıl yürütmeye, geometrik akıl yürütmeye ve matematiğin birçok konusuna temel oluşturduğu bilinmektedir. Alan yazın incelendiğinde öğrencilerde orantısal akıl yürütmenin varlığının ve orantısal akıl yürütme düzeylerinin tespit edildiği araştırmalara sıklıkla rastlanır. Ancak, öğrencilerin gelişim özelliklerine göre orantısal akıl yürütmenin değişimi ve gelişiminin incelendiği araştırmaların az sayıda olduğu görülür. Bu araştırma ile 9 ortaokul öğrencisinin toplamsal ve orantısal problemleri çözerken kullandıkları stratejiler ve problem değişkenlerinin kullanılan bu stratejiler üzerindeki etkisi araştırılmıştır. Araştırma nitel araştırma yöntemlerinden durum çalışması deseni ile yürütülmüştür. Çalışma grubunu Ankara İli Yenimahalle İlçesi' nde bir devlet ortaokulunda öğrenim gören farklı dokuz ortaokul öğrencisi (2' şer tane 5, 6, 7.sınıf, 3 tane 8.sınıf) oluşturmaktadır. Veriler klinik görüşme yoluyla toplanmıştır. Görüşmelerde kullanılan problemler için alan yazındaki farklı çalışmalardan (Lamon 1995; Modestou ve Gagatsis 2010; Fernandez, Llinears, Modestou ve Gagatis 2010) yararlanılmış, adaptasyon ve uyarlama çalışmaları yapılmıştır. Verilerin analizinde betimsel yaklaşımlardan yararlanılmıştır. Araştırma sonucunda sınıf düzeyi ilerledikçe, öğrencilerin orantısal ve toplamsal durumları ayırmakta daha başarılı olduğu; ancak öğrenilen içler-dışlar çarpımı algoritmasının toplamsal problemlere de genellendiği gözlenmiştir. Öğrencilerin çözüm için uyguladıkları strateji seçiminde en etkili faktör problemdeki nicelikler arasındaki oranın çeşidi (tam sayı/tam sayı olmayan oran) olmuş; ancak öğrencilerin problemin orantısal ya da toplamsal oluşunu ayırt etmeden çözüme ulaşmaya çalıştıkları görülmüştür. Öğrenciler problemde nicelikler arasında oran tam sayı ise, probleme orantısal, nicelikler arasındaki orantı tam sayı değil ise probleme toplamsal bir problemmiş gibi davranma eğilimindedirler. Bununla birlikte problemdeki niceliklerin doğasının (sürekli ya da kesikli olması) strateji seçimine etki etmediği görülmüştür. Bu bulgular ışığında okullarda öğrencilerin orantısal akıl yürütme becerilerini geliştirmelerine yardımcı olabilecek ortamların nasıl yapılandırılabileceği tartışılacaktır.

Anahtar sözcükler: orantısal akıl yürütme, toplamsal ve orantısal stratejiler, problem değişkenleri

ABSTRACT: Proportional reasoning is known the basis of many topics and skills like trigonometry, algebraic reasoning, geometric reasoning etc.. Analyzing the literature, research that determine existence of proportional reasoning and the levels of proportional reasoning in students is quite common. However, there are few studies which investigate the change and development of proportional reasoning according to development of students. In this study, middle school students' strategies from 5th grade to 8th grade when solving proportional and additive problems and the effects of the problem variables on these strategies have been investigated. Its goal is to identify characteristics of the development of proportional reasoning and how the use of integer and non-integer ratios and the discrete or continuous nature of quantities influence this development. This research was one of the qualitative research methods and case study model was used in this study. The sampling of the research consisted of 9 students (2 5th grade students, 2 6th grade students, 2 7th grade students and 3 8th grade students) from an elementary school located in Yenimahalle, Ankara. Data were collected through clinical interviews. The data of the study was collected by the use of proportional and additional problems which was developed in previous research (Lamon 1995; Modestou ve Gagatsis 2010; Fernandez, Llinears, Modestou ve Gagatis 2010). With comments of experts, problems were adapted to Turkish. Descriptive approach was utilized to analyze the data. Depending on grade level progress, students were observed to be more successful in separating the proportional and additive situations. However, it was observed that in grade 8 students focus on the application of the cross multiplication strategy even in additive problems. Because students (especially 8th grade students) failed to determine the additional nature of the task and therefore applied proportional strategies for its solution. Similarly, it was seemed that the opposite is also true for 5th-6th grade students. The most effective factor effected the selection of the strategies applied for the solution was the type of ratio (existence of an integer or a non-integer ratio) between quantities. Besides, the discrete or continuous nature of quantities does not seem to have an influence on the characteristics of the development of students' strategies from 5th to 8th grade. Based on these findings, the ways to help students develop proportional reasoning skills were discussed.

Key words: proportional reasoning, additive and proportional strategies, task variables

THE USE OF ADOBE CONNECT AND OPENMEETINGS IN DISTANCE EDUCATION

Mehmet BEŞKİRLİ
Selçuk Üniversitesi
mehmetbes@selcuk.edu.tr

Ahmet Oğuz AKTÜRK
Necmettin Erbakan Üniversitesi
aoakturk@konya.edu.tr

ABSTRACT: Education is a process aimed at changing behaviors in the way desired and planned. It is expected to see some changes at the end of the education process in the behaviors, qualities and knowledge of the persons. Some answers are sought for the question; how to give better education or instruction to keep these expectations up. As a result of the researches, there has appeared the concept of "education everywhere" (distance education) due to developments in new technological instruction techniques. Distance education is a platform where lessons are done in a total virtual world by videos, sounds in interactive way. There have been some drastic changes in education arena due to developments in mobile devices and internet. These technological developments changed the roles of teaching personnel and put them into mediator role of presenting meaning construction and interaction. In distance education, students and lecturers are not in the same place. However, teaching and learning process is better as the process is maintained online and interactive. At the end of this process, students are expected to be self-producing and self-managing persons. Integrating distance education into mobile devices does not only provide a way for unlimited access to required information but also makes distance education independent of time and place. There are several software products to form online classes in distance education. In this paper, strong and weak aspects of Adobe Connect and OpenMeetings software used for online classes in distance education will be examined together with their mobile uses.

Key words: Distance education, Mobile learning, Adobe Connect, OpenMeetings

INTRODUCTION

Education is a system that starts from beginning and continues to the end of the life. Today, the term education has been a necessity for all people without time and place limit. In other words, distance education has appeared due to necessity rather than an alternative to normal education. The persons lacking an opportunity of formal education meet their education needs through distance education (Beldarrain, 2006). That is one of the features of distance education. Distance education is not only associated with persons. It has been an alternative in some cases due to limitations of educational regulations and the difficulty of conducting in-class activities. Distance education is a planned education form in which there is no need for teachers and students to get together physically and they can conduct classes in internet atmosphere with the help of technology. Besides, there is a central student interaction in this education system.

Distance education activities can be enabled both synchronously and asynchronously (Snow, Pullen, & Mcandrews, 2005). In asynchronous distance education, students watch existing course videos at any time they like and there is not a simultaneous interaction between student and teacher. In synchronous distance education, students have courses by seeing and hearing the teacher at a planned time and there is a simultaneous interaction opportunity between them (Schullo, Hilbelink, Venable, & Barron, 2007). According to McVay Lynch (2002) synchronous learning atmosphere enables students' motivation, instant interaction and feedback and personal improvement. Coghlan (2004) conveys that the majority of teachers and students tend to have an instant interaction. In time, the uses of synchronous tools have increased in web based training. Especially one of the online synchronous tools, the instant chatting app, has been used in many distance education studies (Cox, Carr, & Hall). It has been observed in a study about a course with synchronous chatting, students opt for communication via synchronous chatting apart from face to face communication and they are pleased with that method (Spencer & Hiltz, 2003). In distance education, attendants build learning communities by communicating via synchronous chatting to each other and they can easily convey their ideas (Duemer, Fontenot, Gumforty, Kallus, Larsen, Schafer, & Schaw 2002; Knupfer, Gram, & Larsen, 1997). In addition to web based synchronous chatting, web conference system (one of the new developments) is the newest computer based system that transmits video, picture and volume; enables sharing various applications, includes whiteboard applications and transmits information synchronously (Knupfer, Gram, & Larsen, 1997). Synchronous distance education is not the same as conventional education, but it is the most similar to it through these systems. Teachers can conduct virtual courses and students can see one another and their teachers via that technology. Interaction is enabled and the presentation becomes better through the use of whiteboard and other visual factors (picture, video, etc.) (Palloff & Pratt, 1999). To conclude, synchronous distance education is becoming more popular today because it gives students and teachers the opportunity to have an instant interaction.

In distance education, instruction activities are handled through many different communication tools. However, some of these tools are no longer used with the impact of technology and computer and internet has become the most popular communication tools today. It is also observed that the mobile use of distance education has increased with the development of mobile tools. Distance education is always in a shift. Many changes have been made and still continue in distance education. Some of these changes are due to previous limited applications of distance education. Thus, the term *online synchronous distance education* which is the most modern now has appeared. A great number of education institutions worldwide began to conduct web based online synchronous courses (Gürol & Atıcı, 2001). Even in Turkey, many universities handle online courses for synchronous distance education with the help of various programs.

In Turkey, online synchronous distance education became more common with increase in the use of internet. According to Turkish Statistical Institute's data, the use of personal internet always increases. Persons have the opportunity to access online synchronous distance education with the help of that increase. In Diagram 1, we can see that the ration of domestic access to internet has increased as 16-74 year old persons use computer and internet in Turkey. In addition, according to data of Information and Communication Technologies Authority, use of internet via mobile devices in 2013 has increased about 23% compared to 2012. While 19.720.341 persons used internet via laptops and phones at the end of 2012, that number has reached 24.173.143 at the end of 2013 (BTK, 2012; TÜİK, 2013). That is a great progress. Now, there are 24 million probable users for mobile use of online distance education.

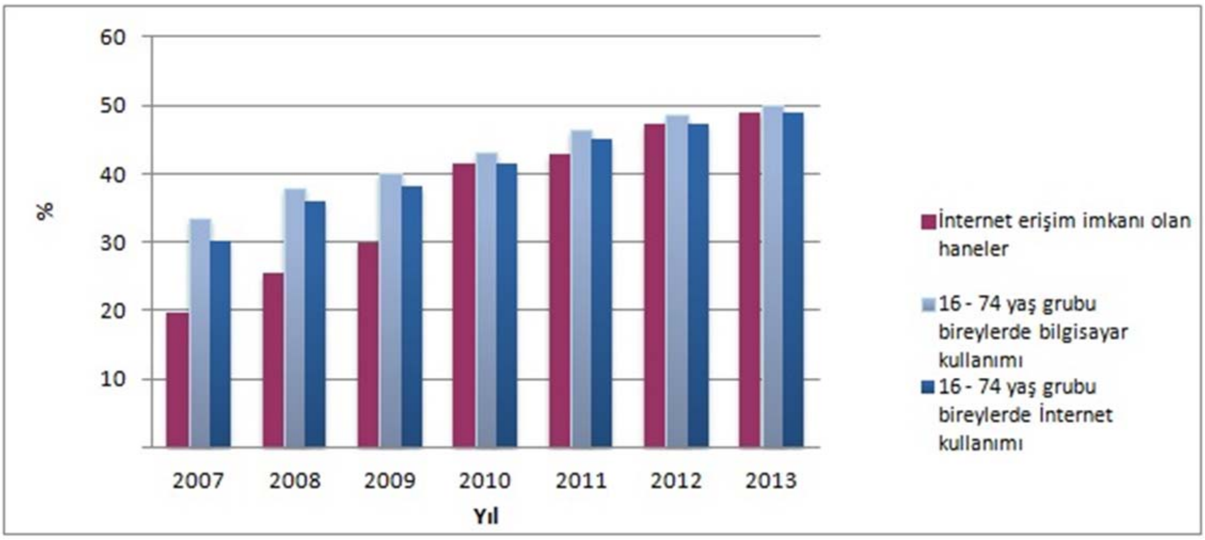

Diagram 1. Percentage of Houses with Access to Internet by Years

ADOBE CONNECT VE OPENMEETINGS

Adobe Connect and Openmeeting programs have common use aims such as distance education, teleconference, seminars and conferences with the help of volume and video. There are two ways to access to that use; first registered users, second guest users. Guest users can attend the meetings when the meeting host like.

Adobe Connect is a priced and licensed software that works through scanner and enables video conference in internet atmosphere. On the other hand, OpenMeetings works through scanner like Adobe Connect and enables video conference in internet atmosphere, but it is free and has a public code unlike Adobe Connect. These two softwares have the same goal but they work differently. We can see the general web interface outlook of OpenMeetings (Rayson & Aberdour, 2009) in Figure 1 and general web interface outlook of Adobe Connect in Figure 2.

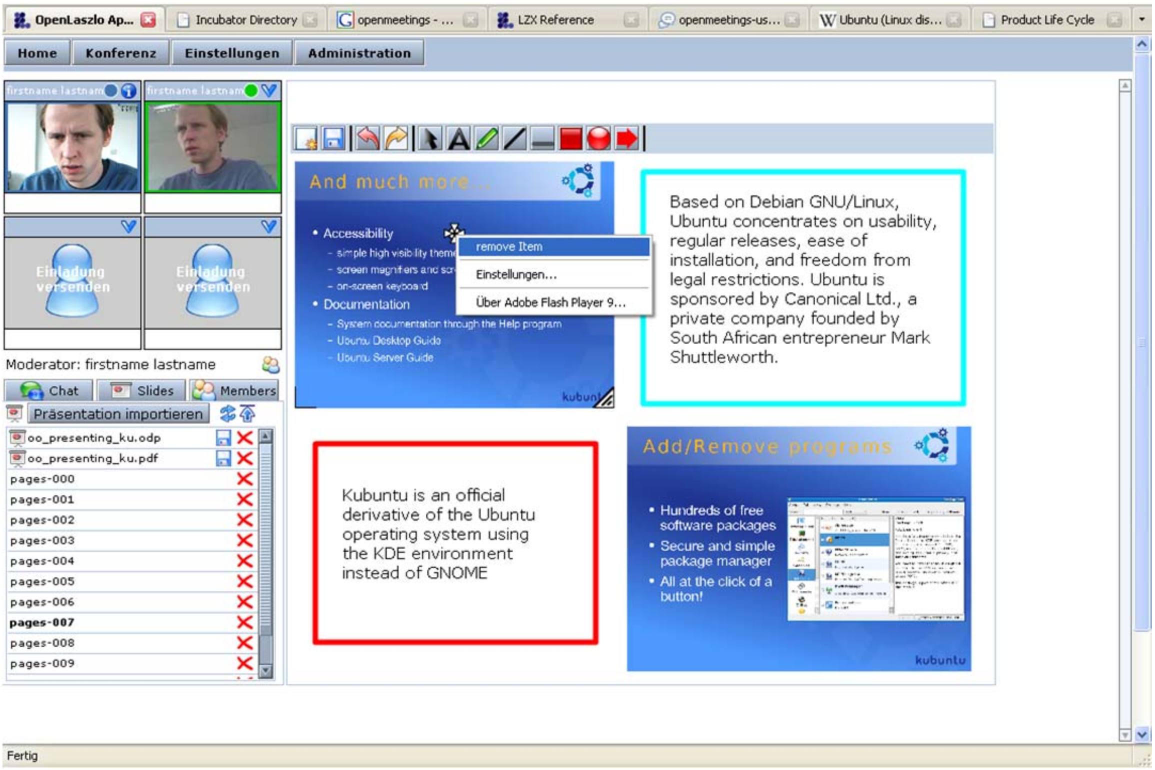

Figure 1. The General Web Interface Outlook of OpenMeetings

Figure 2. The General Web Interface Outlook of Adobe Connect

General Features of Adobe Connect and OpenMeetings

General features of two softwares and their pros and cons are stated below:

File Sharing

Both softwares permit file sharing. While Adobe Connect permits any file extensions, OpenMeetings permits such extensions as doc, .docx, .xls, .xlsx, .ppt, .pptx, .pdf, .jpg, .jpeg, .png, .gif, .txt, .psd, .bmp (Erturan, Çevik, Gürel, Çağıltay, 2012). Adobe Connect enables users to download any files that meeting host, or lecturer, upload.

Desktop Sharing

They both share desktop applications with users (students) by projecting desktop to the screen. Desktop sharing enables an interactive learning because any desktop application can be seen by every user at the same time. However, OpenMeetings has a limited screen sharing; it only enables full screen sharing. It is also possible to zoom during screen sharing in Adobe Connect. In addition, the meeting host has the possibility to interfere with users' desktop through share desktop; vice versa is also possible.

Whiteboard

Meeting host or permitted users can create text, line, square, circle and other drawings on this board simultaneously during the meeting. There are not many differences between Adobe Connect and OpenMeetings software in regard to whiteboard. Adobe Connect is more practical to use (Adobe, 2014; Şen, Atasoy, & Aydın, 2010).

Meeting Record

It is possible to save the meetings in Adobe Connect and OpenMeetings programs. Thus, especially students that missed the courses and the ones who want to watch the course again and again have the chance to watch any course they want from the archive. Users can only watch the missing courses but the meeting host has the opportunity to shorten the video durations if he/she wants. While both software are not too different on the subject of meeting record, in Adobe Connect, users can save the meeting to watch offline in addition to link in the course programs archive. The meeting host can send the meeting record to students via e-mail, in cd, dvd or floppy disc in FLV format, if he likes (Adobe, 2014).

Chatting

It is an interactive part in which attendants can ask and answer instant questions to the meeting host and one another during course. Both softwares have that feature but there are some differences, too. Meeting host or attendants can have instant chatting in Adobe Connect; in OpenMeetings, it is only possible to send private messages (Erturan et al., 2012; Adobe, 2014).

Here is a table about some features of Adobe Connect and OpenMeetings (Table 1) (Çınar, Tüzün, Yıldırım, Akıncı, Kalaycı, Bilgiç, & Yılmaz, 2011; Erturan et al., 2012; Wikipedia, 2014):

Table 1. Some Features of Adobe Connect and OpenMeetings

Product / **Quality**	**Adobe Connect**	**OpenMeetings**
License	Licensed	Eclipse Public License
User Capacity (User Number)	1-1500	1-125
Operation System	Linux, Mac OS X, Microsoft Windows	Linux, Mac OS X, Microsoft Windows
Sound Support	Available	Available
Video Support	Available	Available
Video Quality	VGA, HQ, HD	VGA

Security Access	Available	Unavailable

Mobile Use

Mobile learning is an education system in which students learn as much as they need, whenever they need, and however they want; there is a learner based education, education progress is handled totally or partly via mobile technologies (Ozan, 2013; Odabaşı, 2009). Mobile learning has some advantages. It motivates learners to ask and answer questions by increasing their self-confidence. It makes learning more productive, effective and permanent by increasing cooperation among learners. It enables education anytime, anywhere, and in motion (Özdamar Keskin, 2011).

Mostly served online, distance education can be followed with privately developed applications for mobile devices via mobile phones, tablets and other mobile devices. You can attend online virtual courses from anywhere or watch them again and again with the help of mobile devices. Education continues anywhere without hesitation with mobile use (Chuang, 2009).

There is only Adobe Connect's application for mobile devices. Online synchronous distance education could easily be used even with EDGE connection in our previous trials (Figure 4). Mobile use is a little different from web based software. In figure 3, we can see an overlook of connecting to the meeting via mobile device. In figure 4, we see an online course sample in mobile device. In Figure 4, five visual menus, top and bottom, are available on the left side picture. In this menu; 1- There is a course platform. 2- There is full screen access to whiteboard. 3- Attendants of meeting can be seen. 4- Footage is transmitted full screen. 5- There is a chatting screen.

Figure 3. Connecting to Adobe Connect Meeting via mobile device

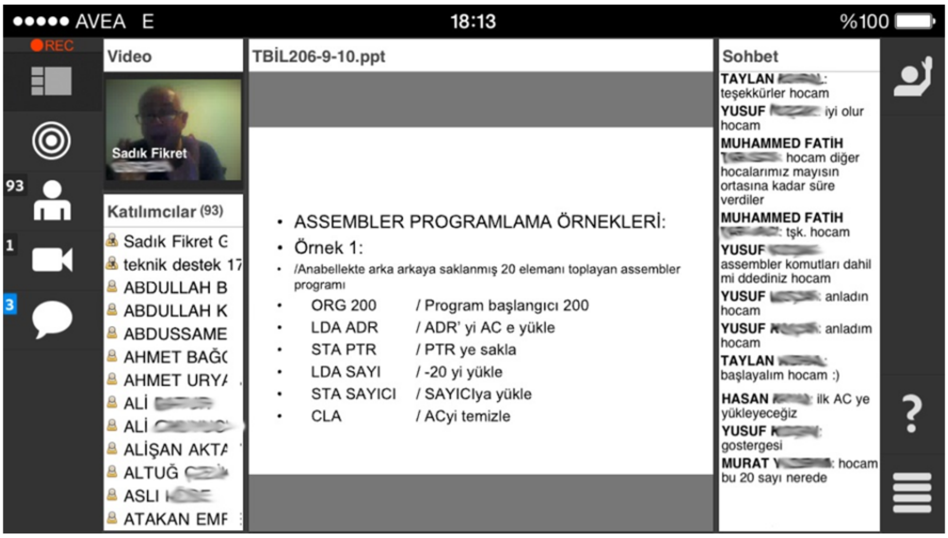

Figure 4. EDGE Connection to Meeting in Mobile Devices via Adobe Connect and General Outlook

CONCLUSION

Served on internet, distance education software has a great impact on education. Distance education software is an online and synchronous platform in which lecturer and students come together in an interactive atmosphere. With the help of these software, synchronous distance education contains all features of formal education in that it enables instant presentation sharing, use of whiteboard, chatting, the opportunity to attend with video and sound, file sharing (Ellingson & Notbohm, 2012; Işık, Karacı, Özkaraca, & Biroğlu, 2010).

Today, the use of mobile internet has increased with the increasing use of smart phones. Use of distance education as mobile has contributed to education at anytime and anywhere with the increase of mobile internet. It is also possible for users to have an interactive learning through the use of mobile distance education. It is possible to learn, without time and place limit, with access to distance education opportunities via mobile devices. Thus, access to information at any time is easier and it becomes permanent information because it is used immediately (Özdamar Keskin, 2011; Ozan, 2013).

Many software companies have prepared programs for synchronous distance education. Two of these softwares are searched in this study. Adobe Connect is thought to be more convenient in terms of distance education (Mavridis, Tsiatsos, & Tegos, 2011). It is thought that the mobile use of Adobe Connect has been more popular because of increasing mobile internet use.

SUGGESTIONS

Before using synchronous distance education software, no matter which one you use, a pilot study should be carried out. Possible problems should be solved; otherwise difficulties may alienate both meeting host and users from the system. As known, in addition to these two indicated programs, there are many virtual course applications and each one has different features. Firstly, we should choose a right program for desired education because our best choice may not be good for another organization. Thus, we should choose a program according to our target audience, technical infrastructure and needs (Schullo et al., 2007).

michael.carr@dit.ie

ABSTRACT: The Maths Learning Support Centre (MLSC) in the Dublin Institute of Technology (DIT) provides free mathematical support to all DIT students. This support is primarily delivered through a drop-in service, where students can receive one to one tuition in any area of mathematics. In the first semester of the 2013/14 academic year, a significant proportion of students enrolled in engineering programmes that availed of this drop-in service were mature students (approximately 42%) This is despite the fact that mature students constitute a relatively small proportion of the total student body (approximately 15%). This motivated the authors to examine the support offered to these students by the MLSC and also consider their attitudes towards this support. To this end focus groups were conducted in order to ascertain the attitudes of mature students in Engineering towards the MLSC. In addition some quantitative analysis was carried to determine what effect the MLSC had on student's academic performance.

Keywords: Mathematics Education, Mathematics Learning Support, Mature Students

INTRODUCTION

In recent years an increasing number of students in Irish Higher Educational Institutions (HEIs) are taking courses with mathematical and statistical elements. This is in part due to the widespread recognition that mathematics underpins many other disciplines (such as Science, Technology and Engineering) and the emphasis placed by the Higher Educational Authority on producing graduates who are highly literate in mathematics (EGFSN 2008, HEA 2004).

Hand in hand with this increase however has come the so called 'Maths Problem'- that is a decline in the mathematical proficiency of incoming first year students across HEIs in Ireland and elsewhere (Gill 2008, Almeida *et al*. 2012, Carr *et al.* 2013 & 2013). This in turn is having a detrimental effect on enrolment and retention levels in science and technology courses in HEIs (OECD 1999). In fact, it is widely acknowledged that the absence of a solid foundation in mathematics can be one of the key inhibitors for student progression in higher education (HEA 2008).

As part of the response to this problem, Maths Learning Support Centres (MLSCs), defined by Lawson *et al* (2003) as '*a facility offered to students (not necessarily of mathematics) which is in addition to their regular programme of teaching through lectures, tutorials, seminars, problems classes, personal tutorials, etc.'* have been set up in the majority of HEIs in Ireland (Gill *et al.* 2010). In the UK over 85% of HEIS surveyed offer some form of Maths Learning Support (MLS) (Perkin *et al.* 2012), up from 62.3 % in 2004 and 48% in 2001 (Perkin *et al.* 2004, Lawson *et al.* 2001). It is therefore clear that MLS has now become an integral part of the higher educational framework, both in Ireland and the UK.

However despite this, MLSCs in several HEIs exist precariously, often lack permanent funding and are regularly in the 'front line' for spending cut backs (Macgillivray *et al.* 2011, Mac an Bhaird *et al.* 2013). To ensure that the limited funding available for MLS is put to the best possible use and to establish 'Best Practice', much time and resources have been put into researching methods of evaluating MLSCs' activities. This evaluation can be undertaken using quantitative (usage figures, diagnostic testing, exam results etc.) and qualitative methods (focus groups, surveys, student feedback etc.) (Macgillivray *et al.* 2011). In a study on evaluation of the MLSC in Dublin City University, Ní Fhloinn found that a combination of both types of methods gave a more complete picture (Ní Fhloinn 2009). An extensive review of the literature on the evaluation of MLSCs can be found in (Matthews *et al.* 2012).

One important issue that arises from these evaluations is the non-engagement with MLS of so called 'at risk' students - those who are most in need of extra support. In a recent paper by Mac an Bhaird *et al.* (2013), details of a large scale study on student non-engagement with MLS across several Irish HEIs are given. The study found that the main reason students gave for non-engagement was that they did not need help. However this was more likely to have come from a student with a strong mathematical background. For the weaker 'at risk' students, issues with the structures of the MLS such as unsuitable opening hours or a lack of information were more likely to be cited as a reason for non-attendance. Symonds (2008) questions whether these reasons are valid and wonders if implementing the requested changes in structures would actually serve to increase the engagement levels of these students. This suggests that a deeper study into the reasons of student non-engagement with MLS, in particular for those 'at risk' students, is required to get to the root of the non-engagement problem.

In this paper, the authors seek to further this investigation by looking at the engagement levels of mature students with the MLSC in the Dublin Institute of Technology (DIT). In the DIT a mature student is defined as being '*any Irish or EU citizen who will be 23 years of age on the 1st of January of the proposed year of entry'* (DIT Website). The authors examine qualitatively the reasons behind both the engagement and non-engagement of this cohort of students with the MLSC, as well as performing a quantitative study on the effect of the MLSC on these students' academic performance.

METHODS

This study seeks to examine the reasons behind both the engagement and non-engagement of mature students with the MLSC in the DIT, as well as investigating how the MLSC has influenced the academic performance of mature students who have regularly availed of its services. The authors decided to use a mixed method approach by combining both quantitative and qualitative methods of research. Qualitative researchers are interested in understanding the meaning people have constructed from their lived experiences (Merriam, 2009). Hence, qualitative methods of enquiry and analysis are more suitable when humans are the instruments of enquiry. This is why the authors decided on a study of this nature. However, in order to evaluate the academic progress of mature students have been attending the Maths Support Centre a quantitative measure is needed. Much research supports this integration of quantitative and qualitative research. The use of multiple methods reflects an attempt to secure an in-depth understanding of the research and allows for broader and better results (Denzin and Lincoln, 2005).

Participants

The participants for this study comprised of mature students in their first year of an Engineering undergraduate programme in the DIT. As mentioned previously, in the DIT a mature student is defined as being '*any Irish or EU citizen who will be 23 years of age on the 1st of January of the proposed year of entry'*.

Qualitative Data

In order to get feedback regarding why students attend/do not attend the MLSC, two focus groups were conducted. The first group (Focus Group 1) was made up of mature students whose attendance in the MLSC was constant throughout the year. The second group (Focus Group 2) was made up of mature students who had never attended the MLSC. Each student was coded to ensure confidentially. There were ten students in Focus Group 1 (P1 – P10) and four students in Focus Group 2 (P11 – P14). Their responses were transcribed and analysed using NVivo software and arranged into themes by the authors.

Quantitative Data

In order to get a quantitative measure of how the MLSC influenced the academic performance of mature students who regularly availed of its services, the authors decided to compare the grades of mature students who attended the MLSC with those who didn't. The objective was to investigate if the MLSC had any effect on their grades. The authors understand that there may have been other variables which may have affected the students' grades throughout the year. The study focused on one particular group of students, who were undertaking their first year of an ordinary degree in mechanical engineering and compared the end of semseter exam results of those in this group who did and did not attend the MLSC in that semester. There were 20 mature students in this cohort. Of these students 8 had attended the MLSC and 12 had never attended.

RESULTS AND FINDINGS

Focus Group Findings

In this section the main themes that arose during the focus groups are outlined. There will be particular focus on the two topics most relevant to this paper namely what motives mature students to attend the MLSC and the reasons given by these students for non-attendance.

Motivation

During the course of the focus group, it became clear that the motivations of mature students who attend the MLSC were multi-faceted. The initial motivations that were raised were of a practical nature, such as financial motivation (not being able to afford private tuition) or simply a lack of availability of any other form of support

P1: *I didn't even do a Junior Cert and I'm doing mechanical engineering maths and I've had straight A's through and that's through the Learning Centre you know. I can't afford grinds you know.*

P2: *There's no other, no other help available. That's what I found. If you're looking for extra help as well, every door would be closed.*

An interesting theme that arose was the concept that it was the nature of mathematics itself, and its difference from other subjects, which motivated students to seek extra help. They experienced difficulties with self-study and keeping up with the pace of lectures.

P1: *Whereas maths, you have something at the start of a page and something at the end and if you don't understand the bit in the middle, unless somebody points their finger at it and says to you "this is what's happening". If you don't get it you don't get it.*

P1: *I find with maths in particular of all the subjects........Unless you get a hold of the stuff in September and you're doing October's work you haven't a hope, if you don't understand the basics of stuff you haven't a hope. So I found going to the learning centre each week, staying on top, learning whatever was current, you'd go in and you'd actually learn from the lecture as well.*

Related to this theme, some students stated that while they found self-study aids (such as textbooks or online mathematical resources) useful, it was their belief that these aids are not a replacement for one-to-one support, such as that offered in the MLSC.

P2: *They're all fairly good but you still need the one-on-one. Because you can keep pausing and rewinding and going backwards and forwards but you need the one-on-one....When you've got no basic level there's only so much a video or a book can teach you*

A widely held view among the participants was that the mature students' life experiences serve to motivate them to seek out the extra support offered by the MLSC.

P7: *because I'm guessing most of us have experienced what it's like to struggle through jobs and that kind of stuff and realise the importance of getting a decent qualification behind you and doing something you actually like.....*

P7: *it's that experience of having been at the bottom, you know and having to try and survive at the bottom, that you realise that when you get an opportunity like this, just how important it is to really avail of all the services, in my opinion the Maths Learning Centre being the most important that I've come across so far as an extra aid on top of your coursework and stuff like that.*

It is a stated aim of the MLSC (MLSC website) is to provide MLS to students in an informal, relaxed and non-judgemental manner. Such an environment enables the students to raise their confidence in mathematics and hence develop as independent learners. The responses of the focus groups show that this goal is being achieved.

P10: *You can ask the question three or four times say if you still don't get it, there's no kind of feeling embarrassed to keep on asking, they'll keep on explaining it to you until you actually understand what your actually doing so it is, it's a very relaxed environment so I find it very good that way.*

Finally, the participants noted that they are not just interested in passing the exams, but that they wish to gain a deeper understanding of the subject. They recognise, again possibly based upon their life experiences, the importance of possessing more than just a surface level knowledge of their chosen subject area.

P9: *but I want to be able to understand it you know, I want to be able to like if I go to a job interview and somebody puts a problem in front of me I want to be able to know what it's about…….I want to comprehend it* *basically and if I need that extra bit of support, which you do get in the Maths Support Centre then I'll take advantage of it.*

Reasons For Non-Engagement

This section outlines the main reasons given for the non-engagement of mature students with the MLSC. In a recent large scale survey on the issue of student non-engagement with MLS in Irish HEIs, it was found the main reason given by students who did not avail of service was that they did not believe they needed it (Mac an Bhaird *et al.* 2013). This finding was supported in our study.

P13: *I haven't really had a problem that I couldn't track down an answer to myself with google, youtube or any of that.*

Mac an Bhaird *et al* (2013) found that the second most common reason given for non-attendance were issues with the structural organisation of MLS in their HEI e.g. opening hours, room size etc. This theme also arose during our study.

P13: *if it was at a different time during the day that would suit me.*

P7: *I found that the only thing that kind of stopped me from going was the size of the room and at certain times because of how packed it is*

In Irish HEIs, several programmes are run to ease the transition of mature students back to education. During the focus groups, it was noted that mature students who have attended one of these transition programmes, appear to have less of a need for the services of the MLSC then those who have entered directly into their undergraduate programme.

P13: *Some mature students have a problem I think. Since they finished the LC and come back into college it has been 5-10 years. Not studied anything... I did last year mechanical engineering, this year I am ok.*

P11: *I wasn't too bad because I did Fetac 5 last year and it had engineering maths in it as well.*

Quantitative Findings

The study focused on one particular group of students, who were undertaking their first year of an ordinary degree in mechanical engineering and compared the end of semseter exam results of those in this group who did and did not attend the MLSC in that semester. There were 20 mature students in this cohort. Of these students 8 had attended the MLSC and 12 had never attended. Of the 8 students who attended, 2 dropped out of the course after the first few weeks so there was no data on their performance. For the 18 students who remained, theri performance in the semester 1 maths module was compared (See Table 1).

The average mark of those who attended the MLSC was higher but not significantly so (p=0.25). It is not possible to determine if the two groups were the same or different to begin with as many of these students are international students, and many of the Irish students had not finished secondary school. Hence there is no single metric to compare their mathematical ability on entry. There is a DIT mathematics diagnostic test given to many students on entry but it was not given to this cohort.

Table 1: A Comparsion Of End Of Semester Exam Results Of Those Who Did/Did Not Attend The MLSC.

Attended MLSC	N	Mean	Standard deviation
Yes	6	80.6	18.9
No	12	68.4	23

In addition, the proportion of the students who achieved a grade of more than 60% was examined (See Table 2). Using a two proportions test, there was a significant difference (p=0.046) between the students who attended the centre and those that did not.

Table 2: A Comparsion Of End Of Semester Exam Results Of Those Who Did/Did Not Attend The MLSC Who Achieved A Mark Higher Than 60%.

Attended Centre	N	>60	< 60
Yes	6	6	0
No	12	9	3

It is a limiation of this study that this analysis was only for a small number of students in one course. The two students who attended but dropped out early are excluded and and there is no metric for ranking the students on entry.

CONCLUSIONS

In this paper the authors investigated the reasons behind both the attendance and non-engagement of mature students with the MLSC in the DIT. Two focus groups were conducted with some interesting qualitative findings. The motivations of mature students were found to be multi-faceted, ranging from practical reasons, such as financial motivation, to more complex reasons such as their life experiences as adults motivating them to seek out extra help. The notion that mature students are interested not just in passing their exams, but also in gaining a deeper understanding of their chosen subjects was raised. The importance of one-to-one support in a student's development as an independent learner, even with the widespread availability of online resources, was also stressed.

For those students who did not avail of the services offered by the MLSC, the reasons given were mostly in line with the literature (Mac an Bhaird *et al* 2013), for example a lack of need for the service or issues with the structures of the MLSC. An interesting point raised was that mature students who have had a transition year prior to beginning their programme may have less need for extra support than those who have not attended such a course.

On the quantitative side, the authors examined the end of semester exam results of one group of students. They found that while the mean grade of those who attended the MLSC was higher than those who did not, the difference was not statistically significant ($p=0.25$). However when the results of those who got over 60% in the exam were compared, a significant difference ($p=0.046$) in the grades of those who attended compared to those who did not was found. These results must be viewed with a certain amount of caution however, as there was no common baseline for comparison of students' exams scores (e.g. diagnostic test results) and the sample size was small (18 students).

FUTURE WORK

The main question that arises when considering the positive engagement levels of mature students is why there are not similar engagement levels with traditional students. To investigate this further the authors intend to extend the work contained in this paper to include traditional students. The authors also wish to extend the quantitative analysis of this study to a much larger group of students as well as to benchmark students on entry using the DIT maths diagnostics test, in line with Carr *et al.* (2013).

ABSTRACT: Artificial Neural Networks (ANN) is an important data processing algorithm for students, researches, scientist, mathematicians, academicians and engineers which is inspired by human brain and human brain's learning methods. Complex nature and mathematical structures of ANN makes it difficult to learn. Due to this reason, new methods have to be employed to teach ANN. In this study, we design and develop web based educational software which combines advantages of examined works to teach artificial neural networks with the support of multimedia course content. In addition, relevant studies such as Neuro-Lab, EasyLearnNN, NeuroFuzz and related most popular professional commercial tools such as MATLAB, Statistica, Mathematica, NeuroSolutions, JOONE are also examined. Developed software will help researchers from students to scientist to train, test an ANN model and understand fundamentals of ANN.

Key words: artificial neural networks, simulation, web based

INTRODUCTION

ANNs are physical celled systems which imports, stores and uses experimental knowledge [1]. A neural network is a massively parallel distributed processor made up of simple processing units, which has a natural propensity for storing experiential knowledge and making available for use [2]. On the other hand, ANN is a computer program which simulates biological neural networks. ANNs through these features can solve optimization, classification, prediction, pattern recognition, associative memory and control problems effectively and easily [3-5].

Therefore ANNs are increasingly including in the Curricula of many engineering lessons at graduate and undergraduate level. But beside these problem solving skills, because of complex and mathematical nature ANNs are very hard to understand systems and algorithms for students which are also studying in engineering. Moreover, ANNs evolves during their design and training phases because of dynamic structure [6]. Traditional teaching approaches like classroom-teaching, books, lecture notes cannot help properly students to learn basics and working mechanisms of ANNs. At this point computer based teaching approaches like simulation software's provide an easy to use and understand environment to visualize working mechanism, designing and training phases of ANNs by students.

RELATED WORKS

MATLAB is a high level technical computing language and environment which is including a lot of tools for developing algorithm, analyzing data, computing complex mathematical formulas. Beside these tools MATLAB has also an ANN tool which named Neural Network Toolbox that providing environment to work with ANN. It supports a lot of most popular ANN models and related learning algorithms.

Statistica is a kind of statistic and analyze software which has many different integrated tools. Also Statistica has a tool for ANN like MATLAB. This tool provides easy to use environment to work with many wide used ANN models. Beside this, it helps users to design and develop suitable ANN models for solving their own problems.

NeuroSolutions is graphical neural network development tool that enable users to create ANN model for a particular user data. It has a lot of advanced input, attribute selection techniques like Genetic Optimization, Greedy Search, Back-Elimination, learning procedures like Levenberg-Marquart algorithm. It also supports programmers who are implementing their own application with Windows-based DLLs or source code.

Mathematica is another software that using by students and professionals for design and develop their own ANN models. This software also supports most common ANN models like MLP, SOM and Hopfield Network.

JOONE is open source development software which is designed by Java programming language. It is composed by a core engine, GUI editor and distributed training environment. It can be extended from programmers by implementing new modules to add new ANN models and relevant learning algorithms.

NeuroFuzz is an internet based ANN simulation tool [7]. So users can access it with a popular web browser from anywhere. The tool aims to teach working mechanism and fundamentals of ANN by give tasks to users and allow them solve problems with support of graphical features.

Internet based simulation software EasyLearnNN which including most popular ANN algorithms like MLP, SOM, LVQ, was developed to use in education of ANN [8].Working environment in the software that used design and develop ANN, represent all parts of ANN with a colorful graphical interface to allow students to use software in an intuitive and enjoyable way.

Neuro-Lab is a software-based environment to teach ANN was designed for support exploratory education in the artificial intelligence courses [6]. It allows users to change all properties of a network by graphical interface and trace how outputs are changing.

Yapay Sinir Ağları Eğitim Materyali is an educational tool for ANNs which is implemented with object oriented approach [9]. The tool has modules to add layer, neuron and select activation function, related learning algorithm. It allows users trace every step of training and test phases. Users can learn and gain experience of ANN with Effective and exploratory learning techniques by this software.

Although some of mentioned before are quite professional software's, most of them are not suitable for educational purpose because of these have complex design, distractive interface, a lot of irrelevant knowledge and features. On the other hand some of these are really effective to learn working mechanism and fundamentals of ANN. But we aims to design and develop software which is combined advantages of different related software's and help users to learn ANN properly.

METHOD

The software was developed in a modular way and these modules were put in learning and simulation panels.

3.1. Simulation panel

This panel is includes simulation, graphics and animation, data set import and examine modules.

Users can easily add data sets to learn or test of ANN by using data set import and examine modules. Developed system supports widely used file formats like .csv, .xls, .txt and .xml. Also it is considered difference punctuations. For example some countries use "." but some of them use "," to show decimal numbers. The other considered thing when implementing the system is converting class outputs to numerical values.

Users can use ANN simulate module which is the most important part of the system for understand working mechanism of an ANN. At this module, users can change parameters which is necessary to train a network, trace how the network acts. Simulate module and an example can seen in Figure 1.

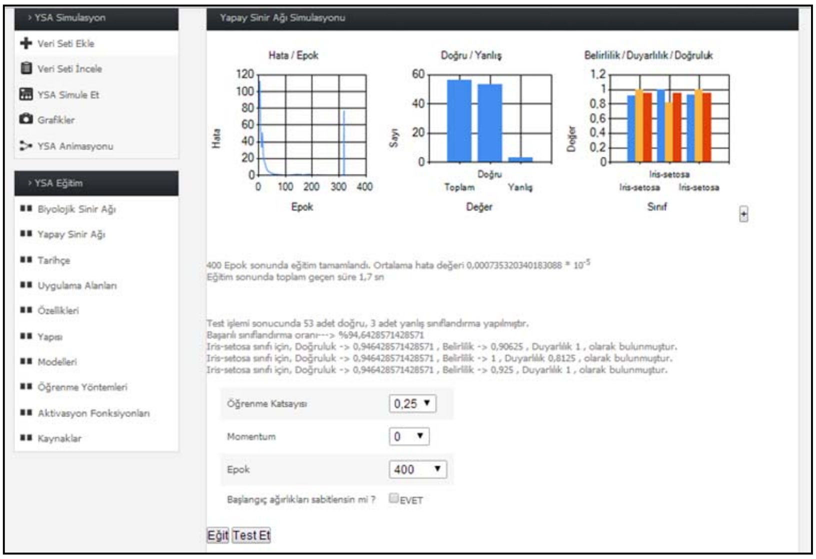

Figure 1. ANN Simulate Module

There is three different graphics top of the module, so users can trace training and test phrases. The graphic named Error / Epok is used for show error of the network epok by epok. True / False shows the results according to the test phrases. The last graphic named Performance graphic shows each class's determinacy, sensitivity and accuracy values.

Training of an ANN is a process occurs with the updating weights between neurons but it is very important to choose the initial values of the parameters during training phrase because the effect of parameters related to the output cannot predict before. Due to dynamic nature of ANN, the effect of parameters related to the output parameters can vary. Therefore, it is not easy to teach ANN by classical techniques. The system allows users to change parameters like learning rate, momentum, epok count by using controls in the module understand. How the network acts in different learning rate and momentum values easily can be seen by students like in the Figure 2. and Figure 3.

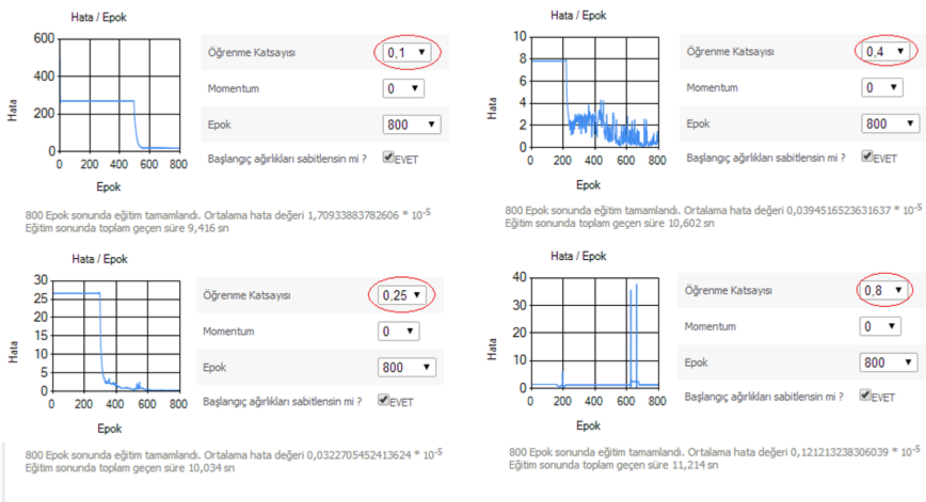

Figure 2. Results according to different learning rate values

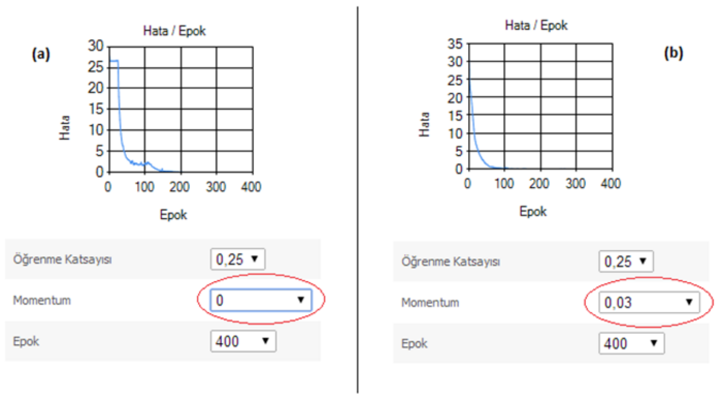

Figure 3. Results according to different momentum values

Users can easily save trained network and outputs, access these data's by graphic module.

Animation of a simple ANN can be watch in the animation module. So users can learn effectively by using both simulation and animations.

3.2 Education Panel

Users can access a lot of document from basics to training of ANNs to learn foreknowledge.

CONCLUSION

We designed easy to use, modular infrastructured, multimedia supported such as flash animation, web based educational software for ANN which can be accessed from anywhere at any time in the world. Developed software uses web 2.0 technologies such as XML, AJAX. It is used for two semesters in artificial intelligence lessons given at Çavdır Vocational High School in Turkey. %95 of these students thinks an educational tool is really useful to understand ANNs properly. According to %90 of these students, the developed software helps students to understand basics of ANNs easily and effectively.

ÖZET: Öğretmenlerin mesleğe adım atmadan önce ve mesleğe başladıktan sonra tabi tutuldukları alan bilgisi sınavlarının mesleki yeterlilik açısından önemli yer tuttuğu bilinmektedir. Söz konusu sınavlarda yönlendirilen soruların içerikleri ve kategorik olarak dağılımları bu sınavların amacına ulaşmasında belirleyici unsurlardandır. Dolayısıyla alan bilgisini ölçmeye yönelik yapılan sınavlarda yer alan soruların incelenmesi hem yapılan sınavların genel durumunu betimlemek hem de ileride yapılacak olan sınavlar için öneriler sunmak adına araştırılması gereken bir konudur. Bu çalışmada ülkemizde yapılan ve matematik alan bilgisini ölçmeyi amaçlayan sınavlardaki sorulara dönük bir analiz gerçekleştirilmiştir. Soruların analizi için Smith ve ark. (1996) tarafından geliştirilen MATH Taksonomi'den yararlanılmıştır. Çalışmanın birinci aşamasında, her üç sınavın matematik soruları iki yazar tarafından tek tek bireysel olarak taksonomi çerçevesinde analiz edilmiştir. İkinci aşamada üç yazar bir araya gelerek analizleri üzerinde ortak inceleme yapmış ve tutarlılık seviyesine bakarak var olan ayrışımlar üzerinde tartışmışlardır. Yazarların bireysel incelemelerindeki soru dağılımlarının tutarlılığı %80 civarında bulunmuştur. Çalışmadaki temel sonuç üç sınavda da soruların büyük oranda A kategorisinde sorulmuş olmasıdır.

Anahtar sözcükler: matematik öğretmeni, alan bilgisi, alan bilgisini ölçme, MATH taksonomi.

ABSTRACT: It is known that the field knowledge exams that teachers are subjected to, before and after they enter the profession, play an important role in assessing professional competence. The categorical range of said questions according to their content is a determinating factor in the success of these exams. Therefore, examining the questions asked in field knowledge exams is necessary, both to aquire a general understanding of the current exams and to offer suggestions for the future. In this study we have produced an analysis of the questions intending to evalute mathematical field knowledge in our country. The MATH (Mathematical Assessment Task Hierarchy) Taxonomy developed by Smith et. al., (1996) was used for the analysis of the questions. In the first stage of the study, the questions of all three exams have been analyzed seperately by two writers within the framework of the taxonomy. In the second stage the three writers have come together for a joint examination of their analyses and discussed the differences with regards to the level of coherency. The coherency of the separate examination of the writers has been found to be around 80%. The main result is that to a high extent the questions have been asked in the category of A.

Key words: Mathematics teacher, content knowledge, assessing content knowledge, MATH taxonomy.

GİRİŞ

Matematik bilimde, teknolojide ve günlük hayatımızda önemli bir enstrümandır. Matematiğin disiplinler arası bağlayıcı bir bilim dalı olmasının bilimin gelişmesinde ve teknolojik ilerlemelerde önemli bir katkısı olduğu bilinmektedir. Dolayısıyla günümüzde matematik bilmek ve öğrenmek temel bir gereksinim haline gelmiştir. Bu gereksinimi sağlamada en önemli rol şüphesiz öğretmenlerindir. Matematik öğrenmede rehber ve danışman niteliğindeki öğretmelerin bilgi ve becerilerinin dikkatle planlanması ve ölçülmesi gerekmektedir. Söz konusu ölçüm için ülkemizde öğretmenlerin mesleğe başlamadan önce ve sonrasında uygulanan bazı sınavlar bulunmaktadır. Bunlardan biri KPSS (Kamu Personeli Seçme Sınavı) olup bu sınavda genel kültür ve mesleki yeterlilik sınavları uygulanmaktadır. KPSS'de 2013 yılından itibaren ÖABT (Öğretmenlik Alan Bilgisi Testi) ile alan bilgisi ölçülmeye başlanmıştır. Alan bilgisinin ölçülmesini içeren bir diğer sınav öğretmenlerin meslek içinde tabi tutuldukları Fen, Sosyal Bilimler, Güzel Sanatlar ve Spor Liseleri ile Her Türdeki Anadolu Liseleri Öğretmenlerini Seçme Sınavı'dır. Bu tür sınavlarla meslek öncesinde ve mesleğini icra esnasında alan bilgisi açısından daha iyi seviyede olan öğretmenlerin seçimi amaçlanmaktadır. Ancak bu özellikle test tipindeki sınavlarla gerçekleştirilmesi kolay olmayan bir amaçtır. Buna karşın yine de test tipindeki sınavlardan tümüyle vazgeçmek de mümkün görünmemektedir (Uğurel, Moralı ve Kesgin, 2012). Öğretmen adaylarının alan bilgilerini ölçmeye dönük sınavlarda matematiksel bilginin nasıl ölçülmesi gerektiği son derece önemli bir sorudur. Peşi sıra başka sorularda gündeme gelebilir. Örneğin; "uygulanmakta olan bu sınavlardaki soruların sayısı, çeşidi ve niteliği yeterli midir? Bilgi düzeylerinin derinliği uygun mudur?" Sınavların kapsamı lisans öğreniminin başarısını ya da yeterliliğini ölçmeye uygun mudur?" Bu ve benzeri sorulara cevaplar sunmak, bu tür sınavlara yönelik politikaları belirleyen, sınavları hazırlayıp uygulayan resmi kurumların görevidir. Bununla beraber araştırmacıların da bu sorulara bilimsel yanıtlar araması gerekmektedir.

Biz bu düşünceden hareketle söz konusu sınavlara yönelik bir incelemeyi sunduğumuz bu çalışmayı gerçekleştirdik. Çalışmamızda yukarıda sözü edilen iki sınavdaki matematik alan bilgisi sorularının analizi için Smith ve arkadaşları (1996) tarafından geliştirilen MATH (Mathematical Assessment Task Hierarcy) Taksonomi (MT) temel alınmıştır. Matematiğe özgü olarak geliştirilen bu taksonomi ile daha sağlıklı bir değerlendirme yapmak mümkün olabilmektedir.

MATH Taksonomi

Smith ve arkadaşları (1996) becerileri ve kavramları test eden soruları içeren sınavları oluşturmak için bir taksonomi kullanmışlardır (Uğurel, Moralı ve Kesgin, 2012). Bu taksonomi MATH (Mathematical Assessment Task Hierarchy) Taksonomi (MT) olarak bilinmektedir. Bloom taksonomisinin matematiğe uyarlaması olan bu taksonomi matematik alanına yönelik yapılacak sınıflamalara daha uygun görülmektedir. MT, öğrencilerden göstermeleri istenen bilgi, beceri ve yeteneklerin ölçülüp ölçülmediğinin belirlenmesi için bir kontrol sağlar (Wood, Smith, Petocz ve Reid, 2002). Böylelikle yapılan sınıflama ile sınavlarda yönlendirilen soruların içerikleri ve kategorik olarak dağılımları sınavların amacına ulaşmasında belirleyici olmaktadır. MT'de A, B ve C olmak üzere üç grup ve her bir grubun kendi içlerinde var olan toplamda sekiz alt kategori bulunmaktadır (Wood & Smith, 2002). A grubu: bilgi ve bilgi sitemi, anlama ve rutin işlemleri, B grubu: bilgi transferi ve yeni durumlara uyarlama, C grubu: doğrulama ve yorumlama, çıkarımlar tahminler ve karşılaştırma ve değerlendirme kategorilerini içermektedir.

Şekil 1. MT Hiyerarşisi

(Uğurel, Moralı ve Kesgin, 2012: 428)

Bilgi ve bilgi sistemi, özel bir formülü veya tanımı hatırlamayı gerektirirken, **anlama,** bir formüldeki sembollerin önemini anlamayı ve matematiksel bir kavramın veya hedefin örneklerini ve karşıt örneklerini tanımayı gerektirmektedir. **Rutin işlemlerin kullanımı,** öğrencilerin sınıfta alıştırma olarak yaptıkları algoritmaları kapsamaktadır. **Bilgi transferi,** bilgiyi bir formdan başka bir forma, sözelden sayısala, nümerikten grafiklere gibi, dönüştürebilme yeteneğini göstermektedir. **Yeni durumlarda uygulama,** uygun metotları veya bilgiyi yeni durumlarda seçebilme ve uygulayabilme yeteneğini test etmektedir. **C grubu kategorileri** ise bir sonucu doğrulamayı, doğrulama, değerlendirme ve yargılamayla birlikte karşılaştırma ve çıkarımlar yapmayı kapsamaktadır (D'Souza & Wood, 2003:2 den aktaran Uğurel, Moralı ve Kesgin, 2012).

Analizi Yapılan Sınavlar

KPSS'ye yönelik 2012 yılında ÖSYM tarafından yapılan açıklamada aşağıdaki bilgilere yer verilmiştir.

Milli Eğitim Bakanlığında öğretmen istihdamı, KPSS Eğitim Bilimleri Testinin neticelerine göre gerçekleştirilmekle birlikte Bakanlığımızın talebi üzerine, MEB, ÖSYM ve Devlet Personel Başkanlığı (DPB) arasında, "Kamu Görevlerine İlk Defa Atanacaklar İçin Yapılacak Sınavlar Hakkında Genel Yönetmelik" kapsamında bir protokol imzalanarak aşağıda listesi verilen alanlarda öğretmenlerin atanabilmesi için KPSS Eğitim Bilimleri Testinin sonuçlarına ek olarak öğretmenlerin alan bilgilerinin de ölçülmesi amacı ile Öğretmenlik Alan Bilgisi Testi sonuçlarının da dikkate alınarak atamaların gerçekleştirilmesi kararlaştırılmıştır. Bu kapsamda, 2013 yılında Türkçe, **İlköğretim Matematik**, Fen Bilimleri/ Fen ve Teknoloji, Sosyal Bilgiler, Türk Dili ve Edebiyatı, Tarih, Coğrafya, **Matematik** (Lise), Fizik, Kimya, Biyoloji, Din Kültürü ve Ahlak Bilgisi, Yabancı Dil (Almanca, Fransızca, İngilizce) alanlarında Öğretmenlik Alan Bilgisi Testinin

(ÖABT) yapılmasına karar verilmiştir ÖSYM (2012).

Bu kapsamda 2013 yılında KPSS Matematik (Lise) Öğretmenliği (**S1**) ve İlköğretim Matematik Öğretmenliği (**S2**) branşlarında alan bilgisi testi uygulanmıştır. Bu testlerin içeriği: Alan Bilgisi Testi ve Alan Eğitimi Testi olarak belirlenmiştir. Testlerin her birinde 50 adet soru bulunmaktadır. Bunlardan 40'ar adedi Alan Bilgisi Testi'ne aittir.

İncelediğimiz diğer sınav farklı özelliklerdeki okullara atama yapmak için uygulanmakta olan Fen, Sosyal Bilimler, Güzel Sanatlar ve Spor Liseleri ile Her Türdeki Anadolu Liseleri Öğretmenlerini Seçme Sınavı'dır (**S3**). Farklı özelliklerdeki okullara atama sınavı diyebileceğimiz bu sınav en son 2012 yılında uygulanmış olup sınavda özel alan bilgisi olarak 50 soru yöneltilmiştir. Çalışmamızda soruların analizlerini yapmak üzere hem zamanlarının yakın olması hem de içeriklerinin benzerlik göstermesi sebebiyle bu üç sınav seçilmiştir. Seçilen sınavlardaki soruların kapsamı (lisans düzeyi) ile taksonomidekiler oldukça paraleldir ve sağlıklı bir incelemeye olanak sağlamaktadır. MT'nin oluşturulmasında ve içerisindeki kategorilerin örneklenmesinde tamamen üniversite düzeyinde matematik konuları temel alınmıştır. Seçilen sınavlardaki soruların kapsam ve dağılımları aşağıdaki tablolarda sunulmuştur.

Tablo 1. 2013 KPSS Alan Bilgisi Testi Matematik (Lise) Öğretmenliği ve İlköğretim Matematik Öğretmenliği Soru Kapsam ve Dağılımı

Lise Matematik Öğretmenliği					**İlköğretim Matematik Öğretmenliği**			
	Soru sayısı	Yaklaşık ağırlık (%)	Genel yüzde			Soru Sayısı	Yaklaşık ağırlık (%)	Genel yüzde
Alan Bilgisi Testi	**40**		80		Alan Bilgisi Testi	**40**		80
Analiz	12	24			Analiz	14	28	
Cebir	8	16			Cebir	9	18	
Geometri	8	16			Geometri	9	18	
Uyg. Matematik	12	24			Uyg. Matematik	8	16	
Alan Eğitimi Testi	**10**		20		Alan Eğitimi Testi	**10**		20

(ÖSYM, 2013)

Tablo 2. Fen, Sosyal Bilimler, Güzel Sanatlar ve Spor Liseleri ile Her Türdeki Anadolu Liseleri Öğretmenlerini Seçme Sınavı Soru Kapsam ve Dağılımı

Sınavın Kapsamı		**Yüzde (%)**
Özel Alan Bilgisi		**50**
Analiz		22
Cebir		9
Geometri		8
Uyg. Matematik		11
Öğretmenlik Meslek Bilgisi		15
Atatürk İlk. Ve İnkılap Tarihi		15
Türkçe		20

(MEB, 2010)

Tablolar incelendiğinde KPSS'deki soruların konu dağılımlarının genel hatları ile birbirine paralel olduğu, farklı okul türlerine yönelik yapılan sınavda ise analiz konularında daha fazla soru bulunduğu gözlenmektedir. 1. ve 2. sınavda 40'ar soru, 3. sınavda ise 50 soru bulunmaktadır. Aradaki fark analiz konularında artış sağlamıştır.

MT'ye Yönelik Yapılan Çalışmalar

MT'ye yönelik ilk çalışma Smith ve arkadaşları (1996) tarafından yapılmıştır. Smith ve arkadaşları bu çalışmalarında MT'ye neden ihtiyaç duyulduğunu, MT'nin matematikte kullanımının yararlarını, MT'yi oluşturan kategorileri ve her bir kategoride gerçekleştirilmesi gereken aktiviteleri tanımlamışlar ve bu aktivitelerin daha iyi anlaşılmasını sağlayacak olan örnek soruları sunmuşlardır (Uğurel, Moralı ve Kesgin, 2012). Bu çalışma dışında başka çalışmalarda bulunmaktadır. Bunlara, Wood ve Smith (2002), Wood, Smith, Petocz ve Reid (2002), Leinbach, Pountney ve Etchells (2002), Rizvi (2007), Blanco, Estela, Ginovart ve Saà (2009), Kesgin (2012) örnek gösterilebilmektedir.

Ülkemizde ise MT'ye yönelik ilk çalışma Uğurel ve arkadaşları (2012) tarafından gerçekleştirilmiştir. Uğurel ve arkadaşları çalışmalarında MT'yi tanıtarak OKS, SBS ve TIMSS matematik sorularını MT çerçevesinde karşılaştırmalı bir analizini yapmışlardır. Literatür incelendiğinde MT hem matematik hem de diğer alanlarda öğrenme durumlarının ölçümüne yönelik işlevsel ve etkin bir çerçeve sunduğu (Uğurel, Moralı ve Kesgin, 2012) ifade edilebilir.

Bu çalışmadan yola çıkarak bizler, ülkemizdeki matematik öğretmenliği alan bilgisinin ölçüldüğü üç sınavın soruların MT çerçevesinde bir analizini yapmayı amaçladık.

YÖNTEM

Bu araştırma ülkemizde uygulanan ve matematik öğretmenlerinin alan bilgisini ölçmeyi amaçlayan sınavlardaki sorulara yönelik bir betimsel incelemesidir. Veri grubunda sırasıyla 40, 40, 50 adet soru bulunmaktadır. Sınavlarla ilgili soru sayıları ve yüzdelik dağılımları tablo 1 ve 2 de verilmiştir.

Analiz

Çalışmamızda toplam üç sınavdan 130 adet soru incelenmiştir. Çalışmanın birinci aşamasında, ilk iki yazar her üç sınavın matematik soruları tek tek bireysel olarak taksonomi çerçevesinde analiz etmiştir. İkinci aşamada bu yazarlar bir araya gelerek analizlerini karşılaştırmış ve ortak incelemelerinde tutarlılık olmayan maddeler üzerinde tartışmışlardır. Bu aşamada üçüncü yazar da bulunmuş ve güvenirliği arttırmak için özellikle uyum olmayan sorularda inceleme ve görüşlerini sunmuştur. Böylece güvenirliğin arttırılması sağlanmıştır. Tartışmalar oturumu her soru için fikir birliğine varılıncaya kadar devam etmiştir. İki yazarların bireysel incelemelerinde, soruların MT ye yönelik kategorizasyonundaki tutarlılık oranı %80 civarında bulunmuştur. Daha sonra üç yazar tarafından sorular bir kez daha baştan sona incelenmiş ve kategorilere göre sınıflandırılmıştır. Elde ettiğimiz bulgular aşağıda sunulmakta ve alan bilgisinin ölçümü kapsamında tartışılmaktadır.

BULGULAR VE YORUM

İncelenen soruların MT çerçevesinde dağılımı için Tablo 3 oluşturulmuştur. Tabloda seçilen üç sınavdaki soruların MT kategorilerine göre sayısı ve yüzdelikleri verilmiştir.

Tablo 3. Seçilen Sınavlardaki Soruların MT Çerçevesinde Sayısal ve Yüzdelik Dağılımları

Sınavlar		A1	A2	A3		B1	B2		C1	C2	C3
S1	sayı	3	9	21		6	1		0	0	0
	yüzde	%7,5	%22,5	**%52,5**		%15	%2,5		%0	%0	%0
S2	sayı	4	3	31		0	0		0	2	0
	yüzde	%10	%7,5	**%77,5**		%0	%0		%0	%5	%
S3	sayı	2	2	35		8	1		2	0	0
	yüzde	%4	%4	**%70**		%16	%2		%4	%0	%0

S1 de en çok A kategorisinde soru varken, bunu B kategorisi izlemektedir. Bu sınavda C kategorisinde hiç soru bulunmamaktadır. S2 de ağırlıklı olarak A kategorisinde soru varken, B kategorisinde soru bulunmamaktadır. Ancak S1'in aksine S2'de C kategorisinde de 2 sorunun yer aldığı görülmektedir. S3'te yine ağırlıklı olarak A kategorisinde soru varken, bunu sırasıyla B ve C izlemektedir. S3'de diğer iki sınavdan farklı olarak her üç kategoride de soru bulunmaktadır. Üç sınavda da ortak olan nokta en fazla A, en az C kategorilerinde soru olmasıdır. Üç sınavın kategorilere göre genel soru dağılımı S1için A da 33, B de 7, C de 0; S2 için A da 38, B de 0, C de 2; S3 için A da 39, B de 9 ve C de 2 dir. İlk kategoride soruların daha çok A3 de, ikinci kategoride ise B1 de toplandığı görülmektedir. Bu durumda üç sınavda da soruların büyük oranda A kategorinde olacak şekilde sorulduğu ifade edilebilir. Soruların tamamını alt kategoriler altında inceleyecek olursa, 130 soru içerisinde A1 den 9, A2 den 14, A3 den 87, B1 den 14, B2 den 2, C1 den 2, C2 den 2 soru bulunurken C3 den hiç soru bulunmadığı görülmektedir.

SONUÇ VE ÖNERİLER

Ortaya çıkan temel sonuç her üç sınavda da çok büyük bir oranda A3 kategorisinde soru bulunmasıdır. A3 kategorisi rutin işlemleri içerdiği için üç sınavında karakteristik olarak rutin işlemlerin yapıldığı, algoritmaların ve soru içeriğindeki metodların doğru kullanılmasını gerektiren sorulardan oluştuğu ortaya çıkmaktadır. Bu durum söz konusu sınavlarda yüksek seviyedeki zihinsel becerileri hedef alan kategorilerde (B ve C) soruların çok az olduğunu ya da hiç olmadığını göstermektedir. S1 de C kategorisinde hiç soru olmaması ve S2 de B ve C kategorilerinde, S3 de C de toplam 2 sorunun olması ilginç bir sonuçtur. Bu noktada; bilgiyi bir formdan başka bir forma dönüştürebilme yeteneğini, uygun metotları veya bilgiyi yeni durumlarda seçebilme ve uygulayabilme yeteneğini, doğrulamayı, değerlendirme ve yargılamayla birlikte karşılaştırma ve çıkarımlar yapabilme yeteneğini ölçen soruların incelenen sınavlarda çok az (ya da hiç) yer aldığı gözükmektedir. Bu ise bize matematik öğretmenlerinin mesleğe ilk atanmalarında ya da farklı lise türlerine geçiş atanmalarında dikkate alınan bilgi düzeyinin (incelenen üç sınav bazında) düşük seviyede kaldığını göstermektedir. Bu sonuç üzerinde düşünmeyi ve tartışmayı gerekli kılmaktadır. MT'de üst düzey zihinsel beceri gerektiren basamaklarındaki soruların sorulmasıyla sınava girenlerin daha derin düşünmeye ve öğrenmeye itilmesi amaçlanmaktadır. Burada yüksek seviye ile kastedilen daha zor demek değildir. MT, soruların zorluk seviyesinden ziyade aktivitenin doğasıyla ilgilenir (Smith & Wood, 2000). Bu sonuçlardan yola çıkarak aşağıdaki öneriler sunulabilir;

Mesleğe başlarken (ilk atama için) uygulanan ve mesleğe başladıktan sonra lise türleri arasındaki geçişi sağlayan sınavlardaki alan bilgisi sorularının -ileriki yıllarda yapılacak olanları ile birlikte- daha ayrıntılı analizi yapılarak elde edilen sonuçlar ilgili mercilere bir rapor ile bildirilmelidir.

MT ile ilgili yapılan çalışmaların çoğu lisans düzeyine uygun olduğu için MT'nin lisans düzeyindeki öğretimde ve matematik sınavlarında dikkate alınmasını teşvik etmek ve desteklemek yararlı olacaktır.

Üniversite hocalarının ve araştırmacıların MT'ye göre çok sayıda soru yazmasını ve bunların bir platformda paylaşılmasını sağlamak ve desteklemek alan bilgisinin yapılandırılmasını ve ölçümünü daha nitelikli hale getirmede yararlı olacaktır.

Farklı seviyelere, konulara ve sınavlara yönelik MT'yi içeren akademik araştırmaların arttırılmasını sağlayacak destekler verilmelidir.

ÖZET: Bu araştırmada matematik eğitiminde biçimlendirici değerlendirmenin öğrencinin matematik başarısına ve hatırlamasına etkisini araştırmak amaçlanmıştır. Bu amaç doğrultusunda İstanbul ilinde bulunan bir ilköğretim okulunun 8. sınıf öğrencileri ile uygulama yapılmıştır. Uygulamada matematik başarı testi ve hatırlama testi veri toplama aracı olarak kullanılmıştır.

Araştırmada "ön-test son-test kontrol gruplu" deneme modeli kullanılmıştır. 47 katılımcıdan oluşan araştırmada (deney grubu 24, kontrol grubu 23 öğrenci) deney grubuna, uygulamaya katılmak için gönüllü öğrenciler seçilmiştir. Veri toplama aracı olarak 7 açık uçlu sorudan oluşan başarı testi kullanılmıştır. Başarı testi öğrencilerin hazırbulunuşluk düzeylerini belirlemek için ön-test, uygulamanın etkisini belirlemek için son-test ve hatırlama düzeyini belirlemek için hatırlama testi olarak kullanılmıştır.

Araştırmada elde edilen veriler bağımlı örneklem t-testi, bağımsız örneklem t-testi ve Pearson korelasyonu analizleri yardımıyla yorumlanmıştır. Sonuçlara göre başlangıç düzeyleri arasında anlamlı farklılık bulunmayan iki gruptan birine uygulanan biçimlendirici değerlendirmenin matematik başarısı ve hatırlama düzeyine olumlu etki yaptığı kanısına ulaşılmıştır.

Anahtar sözcükler: biçimlendirici değerlendirme, geri bildirim, matematik başarısı, hatırlama

ABSTRACT: The purpose of this study is to investigate effects of formative assessment on students' success and retention in mathematics education. An intervention had been made with the 8th grade students of a middle school, in İstanbul. In that intervention, mathematics achievement test and retention test were used as data collection tools.

"Pre-test, post-test with control group" model is used as a model of study. In the research, 47 applicants (experiment group: 24 students, control group: 23 students) had been chosen to experiment group in order to attend the application. Mathematics achievement test was used, in turn, as pre-test to determine students' academic level, as post-test to investigate effects of intervention and last, as retention test to specify retention level.

Data analized with t-test statistical methods. Considering results of analyses, formative assessment's positive effects on mathematics success and retention on groups whichhave same academic level before intervention had seen.

Key words: formative assessment, feedback, mathematics success, retention

GİRİŞ

Değerlendirme konusu öğretmenler için her zaman karışık ve önemli bir konu olmuştur. Öğretmenler, öğrencilerin neyi anlayıp anlayamadıklarını, hatırlayıp hatırlayamadıklarını bugüne kadar geleneksel yöntemler ile açığa çıkarmışlardır. Öğretmenlerin kullandıkları değerlendirme testleri bazen içeriğin tümüyle taranmasına yeterli olamamaktadır (Kamphaus, 1991). Resnick'e göre (1987), öğretmenlerin kullandıkları geleneksel değerlendirme testleri öğrencilerin bilişsel yeteneklerini dar bir alanda incelemekte ve onların edindikleri bilgileri günlük hayatlarında nasıl kullandıkları ile ilişkili olmamaktadır.

Öğrencilerin kültür farklılıklarının artması (Cushner; McClelland & Safford, 1996), öğrenme ihtiyaçlarının da farklılık göstermesine (Hallahan & Kaufman, 1997) ve öğrenme yöntemlerinin de farklılaşmasına neden olmaktadır (Dunn & Grigys, 1988). Öğrenme yöntemleri farklılaştıkça, öğrenmeyi ölçme ve değerlendirme araçları da farklılaşmaktadır.

ABD'deki, Ulusal Matematik Öğretmenleri Konseyi (National Council of Teachers of Mathematics [NCTM], 1989) yayınlamış olduğu standartlarda öğrencinin neyi yapıp yapamadığının yanında neyi bildiğini değerlendiren, matematik öğrenmesini destekleyen, yazılı, sözlü ve eylemsel olarak performansını açığa çıkaran çeşitli değerlendirme teknik ve araçların kullanılmasını önermektedir. Bu yüzden, öğrencilerin performanslarını değerlendirmek ve gelişimlerini takip etmek için geleneksel değerlendirme araç ve tekniklerinden farklı olarak alternatif değerlendirme tekniklerinin kullanmasına ihtiyaç vardır (NCTM, 1989; 1995).

Gipps'e göre (1994a) değerlendirmenin biçimlendirici fonksiyonu; Öğretmenin öğrencileri değerlendirme süreci, ders işlenişinde karar vermede yardımcı olurken, öğrencilerin neyi ve nasıl öğrendiklerini, ne şekilde öğretim yapılması gerektiğine ilişkin bilgilerin elde edilmesini sağlamasıdır.

Biçimlendirici Değerlendirme

Scriven (1967), değerlendirmenin oynayabileceği iki rol önerdi. Bir tarafta, "müfredatın sürekli gelişiminde bir rol oynayabilir"(s.41); diğer tarafta ise, "Değerlendirme süreci, okul yönetiminin, değerlendirmenin ilk rolü uyarınca düzenlenerek tümüyle tamamlanmış müfredatın var olan alternatiflerden belirgin düzeyde daha gelişmiş olup olmadığına karar verebilmesine hizmet eder."(s.41-42). Daha sonra Scriven, "biçimlendirici (formative)' ve 'düzey belirleyici (summative)' değerlendirme terimlerinin, değerlendirmeyi bu rollere göre nitelendirmek amacıyla kullanılması" gerektiğini önermiştir. (s.43)

Benjamin Bloom (1969) iki yıl sonra aynı ayrımın öğrenci öğreniminin değerlendirilmesi için de uygulanmasını önerdi. Testin öğrencileri yargılama ve sınıflamada oynadığı geleneksel rolü doğruladı ama değerlendirme için başka bir rol olduğuna dikkat çekti:

> "Biçimlendirici değerlendirme" öğretme ve öğrenme sürecinde her aşamada geri bildirim ve düzeltmeler sağlamak için kullanılır. "Biçimlendirici değerlendirme" ile bizim bahsettiğimiz, öğrenme sürecinde yardımcılar olarak öğretmen ve öğrenciler tarafından kullanılan kısa testler ile yapılan değerlendirmelerdir. Böyle testler değerlendirmenin yargılama ve sınıflama fonksiyonlarının parçası olarak notlandırılarak kullanılabilirken; biçimlendirici değerlendirmenin daha verimli kullanımını notlandırmadan ayrılıp esas olarak öğretmeye yardımcı olması için kullanılırsa görürüz. (s.48)

Bu erken dönem kullanımlarında açıkça, '*biçimlendirici'* terimi değerlendirmenin bir özelliği olamıyor. Bloom'un (1969), biçimlendirici ve düzey belirleyici süreçler için aynı testlerin kullanılabileceğini, öte yandan, eğer testler notlandırmanın birer parçası olacaksa biçimlendirici kullanımın daha az verimli olacağını ileri sürüyor. Biçimlendirici değerlendirmelerin en kritik vasfı Scriven (1967) ve Bloom (1969)'a göre, bilginin değişim yapmak için kullanılmasıdır. Müfredat veya öğrenci başarısı değerlendirilsin, eğer bilgi, bu bilginin yokluğunda ne olacağı hakkında değişiklik yapmak için kullanılacaksa değerlendirme biçimlendiricidir.

Biçimlendirici değerlendirme; öğrencinin öğrenme hızı veya güçlükleri hissedildiği zaman, öğretim durumlarındaki yetersizlikler ve hataların düzeltilmesi için öğretim sırasında yapılan bir değerlendirmedir. Son olarak da düzey belirleyici değerlendirmedir. Hem öğretimin etkililiğini, hem de öğrencinin istendik davranışları kazanıp kazanmadığını ortaya koymak için yapılmaktadır (Ertürk).

Harlen ve diğerlerine (1992) göre öğretmen tarafından yapılan biçimlendirici değerlendirmelerin temel rolü, günlük elde edilen veriler bazında öğrenmeyi takip edip ve öğretim sürecinde verilen kararlar› sağlamak olarak tanımlanmıştır (Harlen ve diğerleri, 1992). Öğretmen biçimlendirici değerlendirme için topladığı bilgiler ışığında sene sonunda öğrenci hakkında genel bir başarı değerlendirmesi yapar. Bu da öğretmen değerlendirmesinin düzey belirleme fonksiyonunu oluşturur (Daugherty, 1996).

Black ve William (1998a), biçimlendirici değerlendirmenin sınıftaki akademik standartları yükseltip yükseltmediğine dair çok daha büyük bir havuzdan derlenerek oluşturulmuş 250 makale ve kitap bölümünün kapsamlı araştırma incelenmesini yaptılar. Biçimlendirici değerlendirmeyi güçlendirici çabaların, öğrencilerin test sonuçlarındaki ortalama gelişimlerin kıyaslanmasıyla ölçülen ve aynı testte tipik gruplar oluşturacak aralıkların keşfedilmesine yol açan önemli öğrenim kazanımları ürettiği sonucuna vardılar. 0,4 ile 0,7 arasında değişen etki aralığında, biçimlendirici değerlendirme belirgin bir şekilde öğrenme güçlükleri olan öğrenciler ile birlikte düşük başarılı öğrencilere, diğer öğrencilere ettiğinden daha fazla yardım etmiştir. (Black and Wiliam, 1998b).

Biçimlendirici değerlendirme öğrenme sürecinde yer almalıdır. Ayrıca, öğrenmenin öğrenme üstüne inşası gibi biçimlendirici değerlendirme gerçekçi model üstüne inşa olmalıdır. Geometrik uzayda bir nokta gibi öğrenciyi değerlendirmek yerine, düzey belirleyici değerlendirmede olduğu gibi, öğrenciler bilginin belirli bir durumu olarak düşünülmelidir (Hunt, E., & Pellegrino, J. W, 2002).

Biçimlendirici Geri Bildirim

Biçimlendirici değerlendirmenin bir parçası olarak verilen geri bildirim, öğrenicilerin arzu edilen hedefleri ve mevcut bilgi, anlayış ya da becerileri arasında oluşacak herhangi boşluğun farkında olmalarına yardımcı olur; hedeflerine ulaşmak için gerekenleri yapmalarına rehberlik eder (Ramaprasad, 1983; Sadler, 1989). Ödev ve testlerdeki en yardımsever geri bildirim tipi hatalara dair özel yorumlar getirir, gelişim hakkında özel tavsiyelerde bulunur ve öğrencilerin doğrudan sadece doğru cevabı vermeleri yerine dikkatlerini itinayla konuya odaklamalarını sağlar (Bangert-Drowns, Kulick, & Morgan, 1991; Elawar & Corno, 1985). Bu tip geri bildirimler düşük başarılı öğrencilere kısmen yardımcı olabilirler, çünkü öğrencilerin doğuştan geldiği varsayılan kabiliyet eksikliklerine bağlı düşük başarıya terk edilmesi yerine çaba sonucunda gelişebileceklerini vurguluyor. Biçimlendirici değerlendirme tüm çocukların yüksek seviyelerde öğrenebilmesi umudunu desteklemeye yardım ediyor ve öğrencilerin kabiliyet eksiklikleriyle zayıf performans sergilemesiyle şevklerinin kırılarak ileri öğrenmeye karşı isteksiz olmalarına dayanan döngüye karşı koyuyor (Ames, 1992; Vispoel & Austin, 1995).

Geri bildirim genellikle öğretmen kaynaklı olsa da, öğrenciler de öz değerlendirmeyle biçimlendirici değerlendirmede önemli bir rol oynayabilirler. İki deneysel araştırma çalışması, öğrenme amaçlarını ve değerlendirme kıstaslarını anlayan ve işlerine yansıtma imkânı olan öğrencilerin, olmayanlara göre daha büyük gelişme kaydettiğini gösterdi (Fontana & Fernandes, 1994; Frederiksen & White, 1997). Okuma yazma anlayışlarına göre kendini izleme stratejileri kullanımı öğretilmiş öğrenme engelleri olan öğrenciler de performans kazanımları gösterdi (McCurdy & Shapiro, 1992; Sawyer, Graham, & Harris, 1992).

Öğrenciye verilen geri değerlendirme sürecinin en önemli bölümünü oluşturmaktadır. Biçimlendirici değerlendirmenin öğrenmeye olumlu yönde etki yapabilmesi dönütün öğrenciye karşı etkili bir şekilde kullanılması ile mümkün olmaktadır. Ayrıca öğrenci-öğretmen iletişiminde değerlendirme kendini bu dönüt sayesinde göstermekte ve bunun etkili kullanılması ile değerlendirmenin amacına ulaşmasını sağlamaktadır (Türnüklü, 2003).

Geri bildirimin anahtar bileşenleri şunlardır (Black, Harrison, Lee, Marshall ve William, 2005);

- Güncel seviyedeki verinin ölçülebilir davranıştan elde edilebilir olması.
- Bu davranışa ait verinin istenilen seviyeden olması.
- İki seviyeyi karşılaştırmak için bir mekanizma ve aralarındaki farkı ölçebilme.
- Farkı kapatmak için bilginin kullanılabileceği bir mekanizma.

Düzey belirleyici değerlendirme yaklaşımlarında öğrenciye verilen tek geri bildirim sınav notu olduğundan, dönem ya da yıl içinde belirli aralıklarla yapılan sınavlardan elde edilen notlar öğrenciye bildirilir ve bu geri bildirim yargılayıcıdır. Biçimlendirici değerlendirme yaklaşımlarında ise geri bildirim, öğretmenin çalışma hakkındaki yorumu demektir ve öğrenim süreci devam ederken verilir. Bu da öğrencinin kendisini geliştirmesine yardımcı olur. Bu şekilde verilen geri bildirimin öğrenciye ulaşması da kısa sürede olur. Fakat düzey belirleyici yaklaşımlarda sınav sonuçları ya da puanları öğrenciye haftalar sonra ulaşabilir (Tierney, 1991).

Biçimlendirici değerlendirme sayesinde öğrenciler neyi öğrenmekte ve neyi öğrenmemekte olduklarının farkında olabiliyorlar. Birinin kendi öğrenmesini kontrol etme yeteneği belki de biçimlendirici değerlendirmenin en önemli özelliğidir. Öğretmenlerin ulusal sınavlarda öğrenci başarısını arttırmaya yönelik kullandıkları tekniklerin öğrencilerin ileride bu bilgileri tekrar kullanmasına çok az etkisi olmaktadır. Uzun vadede önemli olan, "nasıl öğrendiğini öğrenme" yeteneğini kazanmaktır (Black, Harrison, Lee, Marshall ve William, 2005).

İyi bir geri bildirimin özellikleri şu şekildedir (Juwah, Macfarlane-Dick, Matthew, Nicol, Ross ve Smith, 2004):

- Öz değerlendirmenin gelişmesine imkan sağlar.
- Öğretmen ve akran diyaloglarını öğrenme çerçevesinde cesaretlendirir.
- İyi performansın ne olduğunu daha açık hale getirir (amaçlar, kriterler, beklenen standartlar).
- Gösterilen performans ve istenilen performans arasındaki farkın kapanmasına olanak tanır.
- Öğrencilerin öğrenmeleri hakkında onlara iyi kalitede bilgi sağlar.
- Kendine güveni ve pozitif motivasyon hakkındaki düşünceleri kuvvetlendirir.
- Öğretmenlerin öğretmelerini şekillendirmeleri için bilgi sağlar.

Biçimlendirici Değerlendirmenin Örnekleri

Biçimlendirici değerlendirmenin amacı öğrencilerin ne bildiğini ve ne bilmediğini anlamak olduğundan, öğretme ve öğrenmede duyarlı değişiklikler yapabilmek için testlerin ve ödevlerinin analizinde öğretmen gözlemi ve sınıf tartışması gibi tekniklerin çok önemli bir yeri vardır (Boston, 2002).

Black ve William (1998b) öğretmenleri, soru sormayı ve sınıf tartışmalarını öğrencilerin bilgilerini artırmak ve anlamalarını geliştirmek için kullanmaya teşvik etmektedirler. Ancak, öğretmenler soru sorarken basit ve bilgi içeren sorular yerine düşündürücü ve yansıtıcı sorular sormaya dikkat etmelidirler ve soru sorduktan sonra öğrenciye yeterli zaman vermelidirler. Herkesi kapsaması açısından bazı stratejiler önermişlerdir:

- Öğrencileri bir soru veya konu hakkında çiftler veya küçük gruplar halinde tartışmaya davet edin. Daha sonra, düşüncelerini daha büyük gruplara göstermelerini isteyin (bazen düşün-eşleş-paylaş diye adlandırılır).
- Bir sorunun birçok cevabını gösterin ve öğrencilerden onları oylamalarını isteyin.
- Her öğrenciden bir cevap yazmasını isteyin ve daha sonra seçilenleri yüksek sesle sınıfta okutun.

Öğretmenler öğrencilerin anlamalarını aşağıdaki yollarla da değerlendirebilirler:

- Öğrencilere kelimeler veya kavramlarla ilgili anlamalarını dersten önce ve sonra yazdırın.
- Öğrencilerden, dersin, tartışmanın veya okumanın ana fikirlerini kendi cümleleri ile özetlemelerini isteyin.
- Öğrencilere ders sonunda birkaç problem veya soru verin ve bunların cevaplarını kontrol edin.
- Öğrenciler problem çözerken onlarla bireysel olarak veya gruplar halinde görüşme yapın.
- Sınıfta yazabilecekleri kısa bir kompozisyon verin (bu kişi veya bu olay neden tarihte bu zamanı temsil eder gibi).

Bu sınıf içi etkinliklere ek olarak, eğer öğretmenler öğrencilerin anlamalarının nerede olduğunu analiz edecek ve onlara performanslarından ziyade onları geliştirmek için bireye özel ve odaklanmış geri bildirim vereceklerse testler ve ödevler de biçimlendirici olarak kullanılabilirler (Boston, 2002). Black ve William (1998b), bu konuyla ilgili olarak aşağıdaki önermeleri yapmışlardır:

- Sık sık yapılan kısa testler, uzun aralıklarla yapılan uzun testlerden daha iyidir.
- Yeni öğrenme bir hafta içinde test edilmelidir.
- Test sorularını oluştururken dikkatli olun ve en iyilerini seçmek için dışarıdan kaynaklar tarayın ve diğer öğretmenlerle birlikte çalışın.

Eğer öğretmenler ve öğrenciler dosyadaki çalışmaları yorumlayacak, büyümeyi gözlemleyecek ve pratik yapacaklarsa portfolyolar - öğrenci çalışmaları koleksiyonları - da biçimlendirici olarak kullanılabilirler (Duschl ve Gitomer, 1997).

Biçimlendirici Değerlendirme Neden Ciddiye Alınmalı?

Öğretmenlerin deneyimlerine ait araştırma sonuçları biçimlendirici değerlendirmenin sınıf çalışmasının güçlü bir özelliği olmadığını göstermektedir. İyi bir biçimlendirici değerlendirme uygulaması için öğretmenlerin sınıfta önemli değişiklikler yapmaları gerekir. Sınıfta yapılacak herhangi bir değişim, öğretmenin hem risk almasını hem de değişim süreci boyunca fazladan çalışmasını gerektirmedir. Öğretmenler biçimlendirici değerlendirmenin gelişimini içeren değişmeleri aşağıdaki nedenlerden ötürü önemli bulacaklardır (Black, Harrison, Lee, Marshall ve William, 2005):

- Değişimin öğrencilerin geleneksel testlerdeki notlarını yükselteceğine dair yeterli delil bulunmaktadır.
- Öğretmenlerin bu değişimi normal sınıf çalışmalarıyla başarılı bir şekilde birleştirebilecekleri uygun görülmüştür.
- Değişim sarf edilen eforun yeni bir dağıtımına yol açar: daha çok çalışmak değil, daha zekice çalışmak.
- Değişimler basamak basamak gerçekleştirilebilir. Riskli girişimler gereksizdir.
- Öğretmenler işlerinden daha çok zevk alacak ve işlerini daha tatmin edici bulacaktır çünkü değişimler onların profesyonel değerleriyle örtüşmektedir.
- Aynı zamanda, değişimin sonucu olarak öğrenciler derslerden zevk alacak, dersleri anlayacak ve öğrenimlerini daha çok kıymetlendireceklerdir.

Araştırmanın Amacı ve Önemi

Bu araştırmanın amacı matematik eğitiminde biçimlendirici değerlendirmenin öğrenci başarısına ve hatırlamasına etkisinin olup olmadığını araştırmaktır. Bu amaç doğrultusunda araştırmanın problemi 'biçimlendirici değerlendirmenin matematik başarısına ve hatırlamaya etkisi nasıldır?' şeklinde belirlenmiştir. Bu problem çerçevsinde şu sorulara yanıt aranmaktadır:

1. Deney ve kontrol grubu öğrencilerinin uygulama öncesi ve sonrası matematik başarıları arasında anlamlı bir fark var mıdır?

2. Deney grubu öğrencilerinin uygulama öncesi ve sonrası matematik başarıları arasında anlamlı bir fark var mıdır?

3. Kontrol grubu öğrencilerinin uygulama öncesi ve sonrası matematik başarıları arasında anlamlı bir fark var mıdır?

4. Deney ve kontrol grubu öğrencilerinin uygulama sonrası hatırlamalarında anlamlı bir fark var mıdır?

YÖNTEM

Araştırmanın Modeli

Bu çalışmada, araştırma modeli türü olan deneme modellerinden "öntest sontest kontrol gruplu" araştırma modeli kullanılmıştır.

Çalışma Grubu

Araştırmada tesadüfî veya seçkisiz olmayan örnekleme yöntemlerinden uygun/kazara örnekleme metodu kullanılmıştır. Uygun örnekleme yöntemine iki örnek olarak gönüllü katılımcıların kullanılması veya sadece orada olduğu için orada var olan katılımcıların kullanılması verilebilir. Soruları cevaplayan gönüllü katılımcılar genellikle gönülsüz olanlardan farklıdır. Çalışmaya daha motive olmuş veya daha ilgili olabilirler. Bütün ana kütle hem gönüllü hem de gönülsüz katılımcılardan oluştuğu için araştırmanın sonuçları tüm ana kütleye genellenemez (Gay, Mills ve Airasian, 2006). Uygun örnekleme metodunun bu özelliği bu araştırmanın sınırlılıkları arasındadır.

Bu araştırmada bulunan 24 gönüllü öğrenci araştırmanın deney grubunu, 23 gönülsüz öğrenci ise araştırmanın kontrol grubunu oluşturmuştur. Bu öğrenciler uygulama okulunda bulunan 8. Sınıf öğrencilerden seçilmiştir. Her iki gruba da müfredatın belirttiği şekilde ders işlenmiştir. Deney grubunu ile çalışmalar ders akışını etkilememesi ve süre sınırlamasına bağlı kalmamak için ders dışında yapılmaya çalışılmıştır.

Araştırma Süreci

Bu araştırmada, deney ve kontrol gruplarının kombinasyon ve permütasyon konusu hakkındaki bilgi düzeylerini belirlemek amacıyla ön-test; uygulama sonucundaki farklılıkları görmek için son-test uygulanmıştır. Öğrencilerin konuyu hatırlayıp hatırlamadıklarını belirlemek için son-test uygulamasından 8 hafta sonra öğrencilere hatırlama testi olarak son-test tekrardan uygulanmıştır. Seçilen her iki gruba da ön-test, son-test ve hatırlama testi uygulanmış ancak hazırlanan çalışma kağıtları sadece deney grubuna uygulanmıştır.

Çalışma kağıtları ve başarı testleri uzman görüşleri (bir öğretim üyesi, 2 uzman öğretmen) alınarak araştırmacı tarafından hazırlanmış ve MEB kitabında bulunan etkinliklerden yararlanılmıştır.

Uygulama 5 hafta sürmüştür ancak uygulama bittikten 8 hafta sonunda hatırlama testi ile birlikte süreç toplam 13 haftayı bulmuştur. Uygulamaya olasılık çeşitleri alt öğrenme alanın işlenmesi ile başlanmış ve sırasıyla olay çeşitleri ve olası durumları belirleme alt öğrenme alanları işlenmiştir.

Uygulamaya başlamadan önce; öğrencilere uygulamanın amacından, sürecinden ve neden yapıldığında bahsedilmiş ve gönüllü katılımcılar belirlenmiştir. Uygulama esnasında ders içi olduğu kadar ders dışı faaliyetlerde bulunduğu için okula ulaşım problemi olmayan, velilerinin okul dışında da kalmasına izin veren ve bu ders dışı faaliyetlere kendisi de kalmaya gönüllü olan öğrenciler seçilmiştir. Bu öğrencilerin ailelerinden sözlü olarak izin alınmıştır. Öğrencilerin kombinasyon ve permütasyon konusunu öğrenirken çektiği zorluklar göz önüne alınarak uygulamanın bu konular işlenirken yapılması araştırmacı tarafından uygun görülmüştür. Kombinasyon ve permütasyon konusuna başlamadan önce hem ünitede yer aldığı için hem de bu konulara giriş niteliğinde olduğu için uygulamaya olasılık çeşitleri konusu ile başlanmıştır. Konu işlenirken matematik başarı testi ön-test olarak uygulanmıştır.

Olay çeşitleri ve olası durumları belirleme alt öğrenme alanları işlenirken öğrencilere çalışma kağıtları dağıtılmıştır. Çalışma kağtlarını öğrenciler doldurduktan sonra uygulamacı tarafından toplanan çalışma kağıtlarına öğrencilerin cevaplarına göre geri bildirimler verilmiştir. Geri bildirimlere göre tekrar öğrencilerden çalışma kağıtlarını doldurmaları istenmiştir. İkinci defa toplanan çalışma kağıtlarında yer alan cevaplara göre ihtiyacı olan öğrencilere ihtiyaçları doğrultusunda ders dışında (öğrencinin uygun olmasına göre öğle yemek arasında veya okul çıkışında) bire-bir veya grup halinde çalışılmıştır. Bu öğrencilere diğer öğrencilere verilmeyen çalışma kağıtları veya testler verilmiştir. Araştırmacı bazen çalışmalara rehberlik etmiş bazen de sadece gözetmenlik etmiştir.

Uygulama sonucunda öğrencilere son-test uygulanmıştır. Bu uygulamadan 8 hafta sonra ise hatırlama testi öğrencilerin hatırlama düzeylerini ölçmek amacıyla uygulanmıştır.

BULGULAR

Çalışmada yer alan problemler nicel analizler sonucu elde edilen verilerle birlikte tablolar halinde anlatılmaktadır. Veriler normal dağılım gösterdiği için bağımlı örneklem t-testi ve bağımsız örneklem t-testi yöntemleri analizlerde kullanılmıştır. Grupların başarıları arasındaki ilişkiyi ve yönünü belirlemek için ise Pearson korelasyon katsayısı hesaplanmıştır

Gruplar Arası Araştırma Öncesi ve Sonrası Farklılıklar

Tablo1'de araştırmaya başlamadan önce ve tablo 2'de araştırmadan sonra deney ve kontrol gruplarının matematik başarı testi sonucunda elde edilen sonuçları yer almaktadır. Sonuçlar bağımsız örneklem t-testi analiz yöntemiyle elde edilmiştir.

Tablo 1. Grupların Ön-Test Sonuçları

	N	$\bar{X}$	ss	t	p

Deney Grubu	24	41,14	14,109	1,101	0,281
Kontrol Grubu	23	35,85	10,463		

Tablo 1'de yer alan sonuçlara göre uygulamaya başlamadan önce yapılan başarı testi sonuçlarına göre deney grubu daha yüksek ortalamaya sahip olmasına rağmen aradaki farklılık manidar değildir (p=0,28>0,05).

Tablo 2 incelendiğinde uygulamadan sonra yapılan başarı testi sonuçları görülmektedir. Bu sonuçlardan, deney grubunun kontrol grubuna göre oldukça yüksek ortalamaya sahip olduğu ve aradaki bu farklılığın anlamlı olduğu (p=0,00<0,05) fark edilmektedir.

Tablo 2. Grupların Son-Test Sonuçları

	N	$\bar{X}$	ss	t	p
Deney Grubu	24	74,43	17,814	4,658	0,000
Kontrol Grubu	23	47,54	11,148		

Deney Grubunda Araştırma Öncesi ve Sonrası Farklılıklar

Tablo 3, deney grubunun araştırmaya başlamadan önce ve araştırma sonrasındaki matematik başarı testi sonuçlarını içermektedir. Sonuçlar bağımlı örneklem t-testi analizleri ile elde edilmiştir. Öğrencilerin başarıları arasındaki ilişkiyi ve yönünü belirlemek için Pearson korelasyon katsayısı hesaplanmıştır.

Tablo 3. Deney Grubunun Ön-Test ve Son-Test Sonuçları

	N	$\bar{X}$	ss	t	p	r
Deney Grubu (Ön-Test)	24	41,14	14,109	-8,641	0,000	0,614
Deney Grubu (Son-Test)	24	74,43	17,814			

Tablo 3'e göre deney grubunun başarı ortalaması yükselmiştir. Deney grubunun ön-test ve son-test başarıları arasında anlamlı bir farklılık (p=0,00<0,05) vardır. Ön-test ve son-test sonuçlarının aritmetik ortalamaları incelenecek olursa son-test ortalamasının yüksek olduğu görülmektedir. Korelasyon sayısının verdiği sonuca göre ise pozitif yönde orta seviyede doğrusal korelasyon vardır. Bu durumda ön-test notu yüksek olan öğrencinin son-test notun da yüksek olduğu görülmektedir.

Kontrol Grubunda Araştırma Öncesi ve Sonrası Farklılıklar

Tablo 4'te kontrol grubunun araştırmaya başlamadan önce ve araştırma sonrasındaki matematik başarı testi sonuçları yer almaktadır. Sonuçlar bağımlı örneklem t-testi analizleri ile elde edilmiştir. Öğrencilerin başarıları arasındaki ilişkiyi ve yönünü belirlemek için Pearson korelasyon katsayısı hesaplanmıştır.

Tablo-4 incelendiğinde görülmektedir ki; kontrol grubunun ön-test ve son-test notları arasında anlamlı farklılık (p=0,00<0,05) vardır. Ancak, aritmetik ortalamalar incelenecek olursa kontrol grubunun son-test ortalamasının deney grubunun son-test ortalamasından düşük olduğu görülmektedir. Korelasyon katsayısı ise pozitif doğrusal yüksek korelasyon olduğu hakkında bilgi vermektedir. Bu korelasyon katsayısı, ön-test başarı testinden yüksek alan öğrencinin son-test başarı testinde de yüksek aldığına işaret etmektedir.

Tablo 4. Kontrol Grubunun Ön-Test ve Son-Test Sonuçları

	N	$\overline{X}$	ss	t	p	r
Kontrol Grubu (Ön-Test)	23	35,85	10,463	-5,622	0,000	0,761
Kontrol Grubu (Son-Test)	23	47,54	11,148			

Gruplar Arası Araştırma Sonrası Hatırlama Düzeyleri

Biçimlendirici değerlendirmenin hatırlamaya olan etkisini araştırma amacıyla son-test uygulandıktan 8 hafta sonra her iki gruba da uygulanan hatırlama testi ile ilgili analiz sonuçları tablo5, 6 ve 7'de verilmiştir. Deney grubunda 8 hafta sonunda bilgide kalıcılık yani hatırlama olup olmadığını ortaya çıkarmak için son-test ve hatırlama testi sonuçlarına bağımlı örneklem t-testi ve Pearson korelasyonu yapılmıştır.

Tablo 5 incelendiğinde deney grubunun son-test ile hatırlama testi notları arasında manidar bir farklılık olmadığı ($p=0,07>0,05$) görülmektedir. Hatırlama testinin ortalamasının daha düşük olmasına rağmen son-tets notları ile hatırlama testi notları arasında anlamlı farklılık olmadığı için deney grubunda hatırlama olduğu anlaşılmaktadır. Bu hatırlamanın biçimlendirici değerlendirmeden kaynaklandığı söylenebilir. Pozitif yönlü yüksek korelasyon belirten Pearson korelasyon katsayısı ile son-test notu yüksek olan öğrencinin hatırlama testinden daha yüksek sonuçlar aldığı anlaşılmaktadır.

Kontrol grubunda 8 hafta sonunda hatırlama olup olmadığını ortaya çıkarmak için son-test ve hatırlama testi sonuçlarına bağımlı örneklem t-testi ve Pearson korelasyonu yapılmıştır.

Tablo 5. Deney Grubunun Son-Test ve Hatırlama Testi Sonuçları

	N	$\overline{X}$	ss	T	p	r
Deney Grubu (Son-Test)	24	74,43	17,814	2,000	0,067	0,863
Deney Grubu (Hatırlama Testi)	24	69,43	17,917			

Tablo 6'da yer alan sonuçlara göre kontrol grubunun son-test ile hatırlama testi notları arasında manidar bir farklılık olduğu ($p=0,00<0,05$) görülmektedir. Hatırlama testinin ortalamasının daha düşük olması ve son-test ile hatırlama testi notları arasında manidar farklılık bulunması öğrencilerin konuyu unutmaya başladıklarının göstergesidir. Pozitif yönlü yüksek korelasyon belirten Pearson korelasyon katsayısı ile son-test notu yüksek olan öğrencinin hatırlama testinden daha yüksek sonuçlar aldığı anlaşılmaktadır.

Tablo 6. Kontrol Grubunun Son-Test ve Hatırlama Testi Sonuçları

	N	$\overline{X}$	ss	t	p	r
Kontrol Grubu (Son-Test)	23	47,54	11,148	5,089	0,000	0,799
Kontrol Grubu (Hatırlama Testi)	23	38,08	8,995			

Deney grubu ile kontrol gruplarının hatırlama testi sonuçlarını karşılaştırmak için yapılan bağımsız örneklem t-testi analiz sonuçları tablo 7'de yer almaktadır.

Tablo 7. Deney ve Kontrol Gruplarının Hatırlama Testi Sonuçları

	N	$\overline{X}$	Ss	t	p
Deney Grubu	24	69,43	17,917	5,674	0,000
Kontrol Grubu	23	38,08	8,995		

Tablo 7 incelendiğinde kontrol grubunun hatırlama testi sonuçlarının, deney grubu hatırlama testi sonuçlarına göre bir hayli düşük olduğu fark edilmektedir. Bu farklılığın 0,05 önem seviyesine anlamlı olduğu ($p=0,00<0,05$) görülmektedir. Bu farkın biçimlendirici değerlendirmenin etkisinden kaynaklandığı söylenebilir.

SONUÇ

Uygulama sonrasında deney ve kontrol grubu öğrencilerinin matematik başarıları arasında farklılık görülmüştür. Uygulamaya başlamadan önce elde edilen veriler, grupların matematik başarıları arasında farklılık bulunmadığını göstermekteydi. Ancak, deney ve kontrol gruplarının ön-test ve son-test analizleri ayrı ayrı yapıldığında her grubun işlenecek olan konu başlamadan ve konu bittikten sonra yapılan testlerdeki sonuçlarında da anlamlı farklılık görülmüştür. Bu durum da deney ve kontrol grubu öğrencilerin son-test verileri arasında bulunan anlamlı farklılık biçimlendirici değerlendirmenin etkisinin sonucu olarak yorumlanabilir. Kontrol grubunun ön-test ve son-test verilerindeki farklılığın nedeni öğrencilerin konuyu çok yeni işlemiş olmasından kaynaklanabilir. Bu sonuçlar Özçelik'in (1992:196) belirttiği dönüt ve düzeltme işlemlerinden etkili bir şekilde yararlanılması halinde, öğrenmeye ayrılan zamanın etkin öğrenme çabasıyla geçen kısmı artmakta ve artan bu zamanda daha çok öğrenilmesi istenilen davranışın denenmesi sağlanmış olmaktadır. Öğretme-öğrenmeye ayrılan zaman ve öteki kaynakların kullanılışındaki bu değişme, öğrencilerin öğrenme hızlarını artırmaktadır. Öğrenmeye ayrılan belli bir süredeki öğrenme hızı artınca bu süre içindeki öğrenmenin verimi de artmış olmaktadır düşüncelerle örtüşmektedir.

Uygulamanın öğrenciler üzerindeki hatırlamasında etkisine bakmak için uygulama bittikten 8 hafta sonra her iki gruba da hatırlama testi olarak matematik başarı testi uygulanmıştır. Öğrencilerin hatırlamalarına etkisinin olabileceği de göz ardı edilmemelidir. Kontrol grubunun hatırlama testi verileri ise öğrencilerin konuyu unutmaya başladığını göstermektedir. Çünkü kontrol grubunun son-test ve hatırlama testi verileri arasında anlamlı derecede farklılık vardır ve hatırlama testi ortalamaları daha düşüktür. Buradan da son-test ve hatırlama testi sorularının aynı olmasının etkisinin çok fazla olmadığı sonucuna varılabilir. Çünkü araştırmaya katılan her öğrenci aynı başarı testini ve hatırlama testini almıştır. Hatırlama sonuçlarına biçimlendirici değerlendirmenin yadsınamaz etkisi olduğu söylenebilir. Ayrıca, deney ve kontrol grubunun hatırlama verilerinin analizi ise bu iki grup arasında anlamlı derecede farklılık olduğunu göstermektedir. Deney grubunun hatırlama notları ortalaması, kontrol grubundan oldukça yüksektir.

Biçimlendirici değerlendirme öğretmenler için biraz zaman alıcı (hazırlama açısından) ve emek isteyen (geri bildirim ve ders dışı çalışma saatleri açısından) bir uygulama olsa da derslerde bütün konularda kullanılabilir.

Biçimlendirici değerlendirmede en önemli unsurlardan bir olan geri bildirim vermeye öğretmenler özen gösterebilirler ve geri bildirimi anında ve açık bir şekilde verebilirler.

Öğretmenler, mümkün olduğunca çok uygulama hazırlayıp öğrencinin derste aktif olmasını ve konuyu iyice pekiştirmesini sağlayabilirler.

Müfredatın tanıdığı süre çerçevesinde konuların işlenişi biçimlendirici değerlendirmenin tam olarak uygulanmasına olanak sağlamamasından dolayı, öğretmenler okul idaresi ile ortak çalışarak belli günlerde ders dışı çalışma etkinlikleri uygulayabilirler. Bu saatlerde geri bildirimler sayesinde öğrenme güçlüğü olan veya konuyu tam olarak anlayamayan öğrencilere daha fazla yardımcı olunabilir.

Öğretmenler öğrencilerin biçimlendirici değerlendirme uygulaması kapsamında hazırlanan çalışma kağıtlarına verdikleri cevaplara göre dersi şekillendirebilirler. Bütün sınıfça daha az anlaşılan konuya daha fazla zaman ayırıp, sınıfça iyi anlaşılan konuya daha az zaman ayırarak zamandan tasarruf yapılabilir.

Öğretmenler, öğrencilerin cevaplarına göre kendi öz eleştirilerini de yapabilirler. Sınıfın çoğunluğunun anlamada zorlandığı bir konuyu uygulanan çalışma kağıtları, düşünce kağıtları veya ara testler yardımıyla belirleyip öğretim metodunu değiştirebilirler.

Biçimlendirici değerlendirme öğretmenlerin, sınıfın veya öğrencilerin bir konuda zorluk yaşadığını sınav tarihi gelmeden çok daha önce tespit etmelerine yarar sağlayıp, öğrencilerin konuyu daha iyi anlamaları için öğretmenlerin erken müdahale etmelerine yardımcı olabilir.

Biçimlendirici değerlendirme, öğrencilerin konuyu hatırlamalarını olumlu yönde etkilediği için öğrencilerin öğretim yılı sonunda yapılan seviye belirme sınavlarında (SBS) daha başarılı olmalarını sağlayabilir.

ABSTRACT: This study was aimed to determined opinions of teacher candidates about their teacher training courses. Research sample consisted of 222 senior, who studied Science Education (n=170) and Mathematic Education (n=52) Departments. The data collected by asking courses that teacher candidates think they will not contribute to the teaching profession and think they should be in teacher training program. Teacher candidates' answers were analyzed by using content analysis. After content analysis, courses are considered that they do not contribute to the teaching profession were examined under four categories which are field, field training, liberal education, pedagogical knowledge. Also, courses are considered that should be in teacher education were examined under six categories that are art, personel development, sport, technology, field/ field training, foreign language. In the conclusion, it was seen teacher candidates in both departments want to learn basic concepts that they will use when they are teacher in their field.

Key words: teacher training courses, science teacher candidates, mathhematics teacher candidates

INTRODUCTION

Constantly changing and evolving nature of science, innovations in knowledge and communication technology brings along. Developing technology with the growing needs of individuals also requires the exchange of qualities expected of individuals. Therefore, the ability of individuals also varies expected. These skills should be given with systematic and purposeful education. The success of an education system depends on the quality and quantity of teachers who will operate the system (Arı, 2010). In the development of the country, for the growing of skilled manpower, in ensuring peace and security in society, socialization of individuals and social life in preparing, the society's cultural values transferring to the younger generation plays a key role in teachers (Sahin et al., 2013). Thus, the changing needs of society, and changes in technology and developments in the subject area, training programs and teacher training system also makes it inevitable constant revision and renewal (Aksu, 2005). Because teacher education, in general, the basic elements of human breeding scheme and is decisive (Basturk, 2011). As teachers enable to create a positive impact on students, to give them the necessary information, and to make positive contributions to personality, these teachers need to teacher training programs that are well structured and will develop the teachers themselves (Sahin et al., 2013).

History of education in Turkey, many teacher education models has been tried and implemented (Arı, 2010). On the grounds of train being away from necessary qualifications teachers in terms of topics, content and completeness features of the courses in teacher education programs of Education Faculty, were required the setup changes or recalculations in the system (YOK, 1998). The solution of problems and needs in teacher training in order to eliminate, which started in 1994 and completed in 1998, YOK / World Bank within the framework of Pre-Service Teacher Education Project was the restructuring of the Faculty of Education (Yavuzer et al., 2006). In the light of these and similar reasons, the teacher training programs are constantly updated. As result of this the courses in the program and the content of this course, are expected to be held by gaining qualifications prescribed to teachers (Sisman, 2009). Teacher as the positions facilitator, guiding, sharing with students the responsibility and excitement of access to scientific knowledge, and a guide also directs the research process in the classroom e.g. must be cultivated to win these skills (MEB, 2013). Therefore, teacher education programs that will save these skills are seen to be a subject of many studies.

Bastürk (2011) asked them to evaluate the teaching-learning process in faculties of education from mathematics teacher candidates. Teacher candidates stated that found more theory than the application of courses and their content it was uncertain. Arı (2010) have taken their opinions related to their level of knowledge and teacher candidates' skills won related to primary school curriculum in the education faculties, and concluded that teacher candidates graduated from without win this required skills. Inal and Buyukyavuz (2013) taken their views for the professional development of English teacher candidates and undergraduate education, and ultimately emphasized enough that the duration of internship, but the content was insufficient. Celik and Arıkan (2012) a qualitative work has been done about English teacher candidates how much prepared for foreign language teaching in to primary schools and has been stressed the weakest aspects of the program failure to prepare teachers in real classroom environment. Hismanoglu (2012) also have studied English teacher candidates teacher education programs and reached resultsabout the program that appropriate to teacher candidates' interests and needs, which provide a permanent learning, as appropriate to the level of development. Akbayır and Tas (2009) For mathematics education and teacher training in Turkey received the opinions of teacher candidates, and as a result of the data obtained through surveys, internship is successful and they are growing aware of the high school curriculum of teacher candidates were seen. Analyzing the relevant literature, it is seen that the majority of work for the program aimed at overall appearance opinions. Existing teacher training programs through the eyes of prospective teachers and teachers should be evaluated and have been made about the overall assessment.

Bulca et al. (2009) in the study were examined physical education teachers' opinions on the adequacy of teacher training programs. As a result of the study, teachers have found sufficient liberal education courses such as computer English and history and most of the pedagogical knowledge courses in terms of the content of professional experience. Yavuzer et al. (2006) have asked for evaluation courses in program to determine classroom teaching graduates the level of benefit from the teacher training program. Teacher candidates unable to take advantage of mainly science courses from Field Courses, foreign language from liberal education courses are determined. Sahin et al. (2013) asked them to evaluate of pre-school teacher candidates courses in the current program. Teacher candidates have been suggested in the method and content of the courses. Ozkan and Sahbaz (2011) examined Turkish teacher candidates for their opinions on the functionality of Field Courses. In conclusion, they were identified missing such as vocational content is not given and too many details. In these studies, it is seen that investigating teacher training courses in the program, the courses listed and the opinions and recommendations which have been asked. Among these studies, it was not found studies examined courses in teacher training programs in the science and math fields.

In this context, the aim of this study was to determine opinions of science and mathematics teacher candidates on undergraduate courses in teacher training program. Starting from this idea, sub-problems of the research are as follows:

1. Which are the courses Science Teacher Candidates and Mathematics Teacher Candidates think that they will not contribute to teaching profession, even thought they are in their teacher training program?
2. Which are the courses Science Teacher Candidates and Mathematics Teacher Candidates think that they should be in the teaching training program?

METHODS

In this study was used survey method. The most important feature of this research model is the definition an existing event or situation as it exists (Cepni, 2012). The main purpose is to observe without getting up to change. That is, this research approach aims to describe and define as it exists in the past or currently existing situation (Karasar, 2013).

Participants

Purposive sampling was used in sample selection. Purposive sampling is the most appropriate section of the research questions of the universe means to make a section of observation (Sencer, 1989). Thus, teacher candidates were selected last year students in order to evaluate their teacher training program. Research sample consisted of 222 senior, who studied Science Education (n=170) and Mathematic Education (n=52) Departments.

Data Collection Instruments and Data Analysis

The data collected by asking: Which are courses do you think that they will not contribute to teaching profession, even thought they are in your teacher training program? Which are courses do you think that they should be in your teacher training program? Teacher candidates’ answers were analyzed by using content analysis.

FINDINGS AND DISCUSSION

Findings Related to the First Sub-Problem of the Research

The teacher candidates were asked to evaluate teacher training program and were asked to indicate courses do not contribute to the teaching profession. Teacher candidates' answers on the basis of department analyzed separately, the following table has been created as a result of content analysis. Determination of the category in the content analysis, we were utilized the category of YOK which used to evaluate courses in the undergraduate program (Table 1).

Table 1. Courses will not Contribute on Teaching Profession

	Science Teacher Candidates			Mathematics Teacher Candidates		
Category	Courses	f	%	Courses	f	%
Field	Genetics and Biotechnology (1), Astronomy (29), Analytical Chemistry (24), Introduction to Modern Physics (18), Earth Science (26), General Physics (2), General Chemistry (5), Human Anatomy and Physiology (26) Evolution (5), Statistics (16), Organic Chemistry(6)	158	44,5	Topology (22), Functional Analysis (13), Real Analysis (10), Numerical Analysis (16), Abstract Mathematics (1) Abstract algebra (8), Complex Variable Functions (2), Linear Algebra (4), Analysis (2), Differential Equations (2), Partial Differential Difefansiyel Equations (2), Physics (6)	88	49,7
Field Training	Special Topics in Physics (18), Special Topics in Chemistry (12), Special Topics in Biology (3), Science Teaching Laboratory Practice (4) Nature of Science and History of Science (26)	63	17,7	Subject Area Textbook Review (8), Research Project in Field Education (1) History of Science (6)	15	8,5
Liberal Education	Scientific Research Methods (4), Service Learning Course (7), Ataturk's Principles and History (18th), Foreign Language-Eng. (14), Turkish (7) Computers (5), Elective Courses (37), History of Turkish Education (13)	105	29,6	Geometry-elective (2), Applied Mathematics- elective (1), Basic Concepts on Mathematics-elective (1), Elective Courses (7), Basic Computer Sciences (1), Computer Programming (6), Foreign Language (2), Ataturk principles and History of Revolution (2), Sevice Learning Course-choice (6), Scientific Research Methods-elective (3), Health Information and First Aid (24), Democracy and Human Rights (6)	61	34,5
Pedagogical Knowledge	Introduction to Educational Sciences (3), Teaching Principles and Methods (1), Educational Psychology (1), The Turkish Education System and School Management (13), Guidance (4), Special Education (4), Instructional Technology and Material Design (2) , Science and Technology Program and Planning (1)	29	8,2	Instructional Technology and Material Design (3) Introduction to Educational Sciences (1), Program Development and Training (5), the Turkish Education System and School Management (1), School Experience (3)	13	7,3

In Table 1, it is observed that both science teachers (44.5%) and mathematics teachers (49.7%) think will not contribute to the teaching profession field category more than others. It can said that Science teacher candidates not deems necessary in terms of the teaching profession field courses such as Astronomy (29), Analytical Chemistry (24), Earth Science (26), Human Anatomy and Physiology (26). Also, Mathematics teacher candidates not deem necessary in terms of teaching profession field courses such as Topology (22), Functional Analysis (13), Numerical Analysis (16). Özkan and Sahbaz’ (2012) studies examine the opinions of prospective teachers for the courses, and ultimately most of the courses' content has said they thought it was too much detail. In Table 1, it is observed that there are liberal education courses that they think will not contribute to the teaching profession. A liberal education is a system or course of education suitable for the cultivation of a free human being. Both science teacher candidates and mathematics teacher candidates find it not necessary to be said courses such as Scientific Research Methods, Service Learning Course, Ataturk's Principles and History, Foreign Language-Eng., Computers, Elective Courses for the teaching profession.

Examining pedagogical knowledge courses, it can said that teacher candidates think that courses such as Instructional Technology and Material Design, Introduction to Educational Sciences, the Turkish Education System and School Management do not contribute to the teaching profession.

In field training courses, it would be seen that Science teacher candidates Nature of Science and History of Science (26) and Maths teacher candidates the Subject Area Textbook Review (8) think do not contribute to in terms of teaching profession more than other courses.

Findings Related to the Second Sub-Problem of the Research

Teacher candidates were asked courses should be in the teacher education program. Examining the responses, the resulting categories are shown in the Table 2.

Table 2. Courses Should be in Teacher Training Program

	Science Teacher Candidates			Mathematics Teacher Candidates		
Category	Courses	f	%	Courses	f	%
Art	Art (1), Picture (17), Music (12), Caricature (1), Guitar (2), Piano (1), Photography (5) Theatre (1), Handcraft (1), Dance (1) , Sculpture(1)	43	24	Picture (2), Photography (2) Theatre (2), Radio and Television (2), Cinema (1)	9	10,2
Personal Development	Current Scientific Information (4) Personal Development (1), diction (12), Body Language (5), Fashion (1), Communication (3), Fine Writing (1), Mind Development (1), Reading Habits (1) Social Activity(1)	30	16,8	Liberal Education (3), Declamation-Diction (4) Ability for Empathy (1), Different Thinking Training (1), Social Activities-Trip (4)	13	14,8
Sport	Physical Education (20), athletics (2), Swimming (2), Mountaineering(1)	25	14	Swimming (1), Sports (1)	2	2,3
Technology	Information Technology Courses (1), Computer Programming (2), Animation Preparation (5), Smart Board Use (2)	10	5,6	Mathematical Programming (5), Web Design (4)	9	10,2
Field- Field Training	Food Science (2) Physiology (1) Quantum Physics (1), Basic Science Concepts (18), School Experience (14), Experimental Activity (6), Misconceptions in Science (9), Basic Physics (3), elementary Chemistry (2), Nature of Science (8)	64	35,7	Simple level / basic Math (17), Analysis (2), Basic Geometry (4), Misconceptions in Mathematics (8), Philosophy of Mathematics (2), History of Mathematics (2), Computer Aided Mathematics (1), More Teaching Practice (3)	39	44,3
Foreign Language	English (2), German (1), Multiple Languages (4)	7	3,9	English (1), Professional English (14), French (1)	16	18,2

Analyzing Table 2, the teacher candidates want to add to their teacher training program to the field/field training category more than others. It is seen that Science teacher candidates want to add to their program courses most often such as Basic Science Concepts (18), School Experience (14), and Misconceptions in Science (9). Mathematics teacher candidates mostly said that they wanted to add courses such as the level Simple / basic Math (17), Basic Geometry (4), and Misconceptions in Mathematics (8) to teacher training program. In addition, it can said that teacher candidates think courses such as arts, personal development and sports should be in their program. In Table 2, Even though teacher candidates have already received English lessons in their teacher training program, it is added in their program thinking that in the program should be. This situation may be due to they think that the content of the course needs to be replaced or increased hours of course. Mathematics teacher candidates use the expression that "vocational English" is noteworthy. As stated by Şahin et al. (2013), despite some of teacher candidates think that some courses are necessary for teacher training courses, its contents are to be organized according to the needs.

CONCLUSION

Results obtained by examination of the findings may be listed as follows:

1. It was determined that teacher candidates thought field courses more than others will not contribute to the teaching profession.
2. It was determined that courses such as Scientific Research Methods, Service Learning Course, Ataturk's Principles and History, Foreign Language-Eng., Computers, Elective Courses in liberal education category were common, and these courses were written by thinking that they will not contribute to the teaching profession.
3. It was seen that courses such as Technology and Material Design, Introduction to Educational Sciences, the Turkish Education System and School Management in pedagogical knowledge category were common, and these courses were written by thinking that they will not contribute to the teaching profession.
4. It was seen that Science teacher candidates thought Nature of Science and History of Science will not contribute teaching profession, mathematics teacher candidates thought Subject Area Textbook Review courses will not contribute to teaching profession in field training category.
5. It was seen that teacher candidates in both departments wanted to learn basic concepts such as basic science concepts, basic maths which will be used when they were teacher.

6. Even though they have already received courses such as English, art, music, school experiences, the nature of science in their teacher training programs, it was seen that these courses were added again in their trainin program.

RECOMMENDATIONS

At the end of the study, the following suggestions may be submitted:

1. Considering courses identified in the study, the reasons why think they will not contribute teaching profession can be ascertained.
2. It may be questioned why again added to the program courses such as English, art, music, school experiences, the nature of science.
3. Pedagogical knowledge courses are basic of teacher training program and are located in the teacher educational process. It is one of the interesting results that Teacher candidates think that Pedagogocal knowledge will not contributing to the teaching profession. Thinking that why not contribute to this course may be the subject of future research.

ÖZEL ÖĞRETİM YÖNTEMLERİ II DERSİNDE GERÇEKLEŞTİRİLEN UYGULAMALARIN KİMYA ÖĞRETMEN ADAYLARI TARAFINDAN DEĞERLENDİRİLMESİ

Faik Özgür KARATAŞ

Canan CENGİZ

Öğretmen adaylarına öğretmenlik mesleği ile ilgili bilgi ve beceri kazandırmak için planlanan ve eğitim fakültelerinde yürütülen derslerden biri Özel Öğretim Yöntemleri (ÖÖY) dersidir. ÖÖY I dersinde öğretmen adaylarının temel öğrenme ve öğretme teorileri hakkında bilgi edinmeleri amaçlanırken, ÖÖY II dersinde öğretmen adaylarının çağdaş öğretme yaklaşımlarına uygun öğrenme ortamları tasarlamada deneyim kazanmaları ve özel öğretim yöntemlerinin temel ilkelerini kimya öğretiminde uygun bir şekilde kullanabilmeleri amaçlanmaktadır. Bu çalışmanın konusunu, öğretmen eğitiminde önemli olan; mikro öğretim ve yansıtıcı öğretim yöntemlerine dayalı olarak gerçekleştirilen ÖÖY II dersinin ve öğretmen adaylarının bu derste gerçekleştirdikleri öğretimin kendileri tarafından değerlendirilmesi oluşturmaktadır.

Çalışma 2012-2013 eğitim-öğretim güz yarıyılında, bir eğitim fakültesinin kimya öğretmenliği programında öğrenim görmekte olan 24 öğretmen adayı ile yürütülmüştür. Bu ders kapsamında her hafta iki öğretmen adayı daha önceden kendilerine kimya öğretimi programından seçilerek verilmiş konulara yönelik 40 dakikalık bir ders planı hazırlayarak sunmuşlardır. Dersler mikro öğretim yöntemine göre işlenmiştir ve dersin sonunda öğretmen adaylarından kendi öğretim uygulamaları ve dersin işlenişine yönelik yansıtma ve değerlendirmeler yapmalarını sağlamak için 10 yönlendirici sorudan (promth questions) oluşan ve araştırmacılardan biri tarafından geliştirilen değerlendirme formunu doldurmaları istenmiştir. Değerlendirme formu aynı zamanda bu çalışmanın veri toplama aracı olarak kullanılmıştır. Öğretmen adaylarının değerlendirme formlarındaki sorulara verdikleri cevaplar içerik analizi yoluyla çözümlenmiştir.

Öğretmen adaylarının ÖÖY II dersinde gerçekleştirdikleri öğretim uygulamaları süresince karşılaştıkları problemler öğretim sürecine yönelik problemler, planlamaya yönelik problemler, iletişime yönelik problemler, sınıf yönetimine yönelik problemler ve alan bilgisine yönelik problemler olmak üzere beş tema altında toplanmıştır. Ayrıca bulgular öğretmen adaylarının genel olarak ÖÖY II dersinde mikro öğretim yönteminin kullanılmasına yönelik olumlu görüşleri olduğunu göstermektedir. Öğretmen adayları uygulama sayesinde acemiliklerini üzerlerinden attıklarını, heyecanlarının azaldığını ve kendilerine duydukları güvenin arttığını belirtmişlerdir. Çalışmadan elde edilen veriler doğrultusunda ÖÖY II dersinde mikro öğretim yöntemi kullanmanın öğretmen adaylarının gelişimlerini olumlu yönde etkilediği sonucuna varılmıştır.

One of the courses conducted in schools of education is Special Education Methods (SEM) which has been planned to make pre-service teachers gain knowledge and skills about teaching profession. In SEM courses, it is aimed for pre-service teachers to acquire knowledge about basic learning and teaching theories; while in SEM II course, the target is to make pre-service teachers gain experience in designing learning situations according to modern learning approaches and using the basic principles of special education methods in chemistry education. The subject of this research is constituted of SEM II course which was conducted based on micro-teaching and reflective teaching methods and the evaluation of the education in this course and self-evaluation by pre-service teachers.

The study is conducted in 2012-2013 fall semester, Chemistry teaching department of an education faculty with 24 pre-service teachers. Throughout the lesson each pre-service teachers prepared and presented a previously chosen topic from the chemistry teaching program for 40 minutes. The classes were conveyed according to the micro-teaching method and at the end of the class pre-service teachers were asked to fill an evaluation form with 10 prompt questions which is prepared by one of the researchers in order for the pre-service teachers to evaluate and reflect on their own teaching methods and the way that the class is conducted. The evaluation for is also used as the data gathering device of this study. The answers given by the pre-service teachers in the evaluation forms were analyzed by content analysis method.

Pre-service teachers' problems that they encountered during their teaching practices in SEM II Course are identified in five themes as problems related to the teaching process, problems related to planning, problems related to communication, problems related to classroom management and problems related to content knowledge. Also the findings shows that pre-service teachers have positive opinions about using micro teaching method in SEM II course. The pre-service teachers said that they get experienced and their excitement decreased and their self-confidence increased. Based on the finding of this study it can be said that using microteaching method in SEM II course effects pre-service teachers' development positively.

SOLVING A NUMBER PLACEMENT GAME USING RECURSIVE BACKTRACKING ALGORITHM ON THE GRAPH MODEL

Sema BODUR
Ege University
sema.bodur@ege.edu.tr

Sevcan EMEK
Ege University
sevcan.emek@ege.edu.tr

ABSTRACT: In this study, a number placement game has been developed. This application is designed on a graph model. Recursive backtracking algorithm was used in the solution of this game. Numbers on a board of *nxn* will be placed in a certain order under specified rules in finite time. With backtracking algorithm based on depth first recursive search method, finite number of possible solutions has been revealed. In this application that was inspired by 8-Queen problem, Knight's Tour, coloring a map, Knapsack problem and other search problems, advantages and disadvantages of this method have been discussed. The larger the board size, the much more the number of placement complexity. In further studies, the solution of this problem can be possible with the use of heuristic or informative search techniques.

Key words: Backtracking, Graph, Depth-first Search Algorithm

INTRODUCTION

Nowadays, in every sector, millions and billions of data is processed by computers. Weather forecasts from statistical analysis, patients' records sampling and finding suitable marrow, image processing and face recognition systems, training data from test drives, finding the correct way from different road routes, learning through entertainments etc. in almost every field of knowledge in computer processing have made important contributions to our daily life as well as to our future. Numerous data processed electronically in the fastest way using the least memory and few resources enabling to be accessible at a lower cost. Therefore, depending on the field of data used in the data structure to achieve the objective, mathematical model, applied algorithm and methods used are important.

In the real world, computer science contributions are very important in solving complex mathematical problems. In solving a problem, mathematical structure that are included in models must exist. Discrete structures such as trees, graphs, permutation and probabilities, equations and finite state machines are used in mathematical modeling. After modeling the problem, it is necessary to determine the best algorithm that will lead to a solution.

In this study, we are expected to place a sequence of all data set in an area of nxn in such a way that no gap is accommodated according to the specified rules. All possible solutions are searched by graph structures using backtracking algorithm. This application; maze problems, 8 queens are aligned on the chessboard while the knights are placed in L position in such a way that they don't eat each other [1] and likewise sudokupuzzle has been an inspiration in the development of such applications. Methods in application are used in detection of right path from the possible paths, the results and recommendations are discussed in details in the relevant sections.

Graph Theory

One of the branches of Mathematics known as Graph Theory, is commonly encountered in day to day life whereby in many cases the creation of a mathematical model that enables us to solve easily using different techniques from the common known methods. Expressing in a mathematical way, a G graph is formed by V; a set of elements of vertices and E; a set of elements of edges that connects any two non-binary vertices. Each elements of E is referred to as an edge(West, 2001). Directed graph is expressed by respective pairs of the vertices [2].

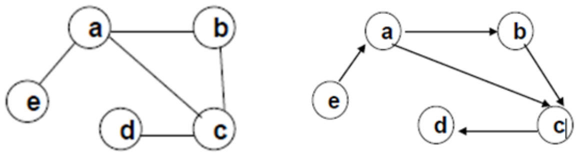

Figure 1. Graph and Directed Graph

In this study the matrix cells are formed by vertices of the graph while in a case where one cell is directed to another cell, the formation is by edges of the graph.

Backtracking Algorithm

In problems of achieving the goals, it is important to choose the right path. Backtracking algorithm tends to find a right path from the followed paths to reach the goal. All possible paths of the problem within the boundaries are tested. When unsuccessful path is followed or a path fails to reach a solution, it is abandoned and a previous step is followed to return back and that path is eliminated. Figure 2 shows the paths from the point of source to the goal.

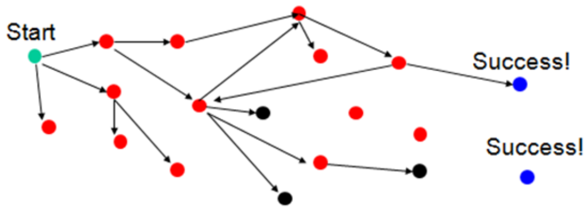

Figure 2.Backtracking Example [3]

Depth-first search algorithm is a very important part of Backtracking. Depth-first search (DFS) is an algorithm for traversing or searching tree or graph data structures.In DFS, a starting node is selected. Within the constraints of the problem, the nodes that are adjacent to neighboring nodes are added to form tree or a graph structure [4].A right path from the source to the goal is found from all possible paths using backtracking depth-first search algorithm. Figure 3 shows part of the nodes from the point of source to the goal.

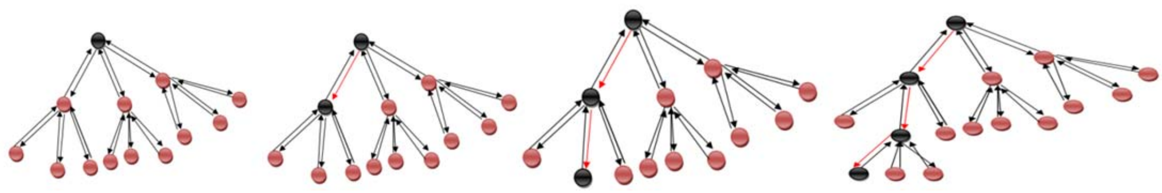

Figure 3. Application Example

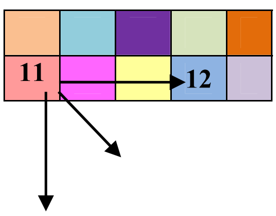
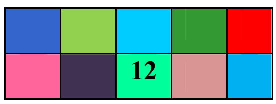
In this study all possible paths that lead to the goal are taken into consideration. Backtracking depth-first search algorithm is one of the best methods for this application [5].

DEVELOPMENT OF APPLICATION

Problem Definition

In developing this application, 5x5 board model is transformed to 5x5 matrixform. The numbers are placed in a matrix form in accordance with specified rules.





12				

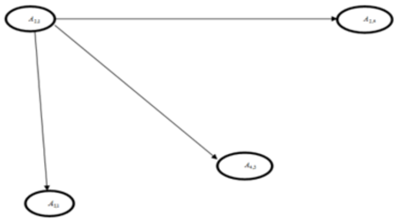


Figure 4. **Number Placement Rules**

In the figure $A_{2,1}$ above, the number placed on the vertex and the vertex that the next number can be placed on are shown. Our rules;

1- Numbers must be placed in sequential order starting from 0 or 1.

2- After placing a number, the next number to be placed can be placed in the same column or row after 2 empty gaps or in a diagonal way if there is free space.

3- For the game to end successfully, all numbers need to be placed.

Solution Algorithm

In our studies, the graph model of 25 vertices and 38 edges is shown in Figure 5.

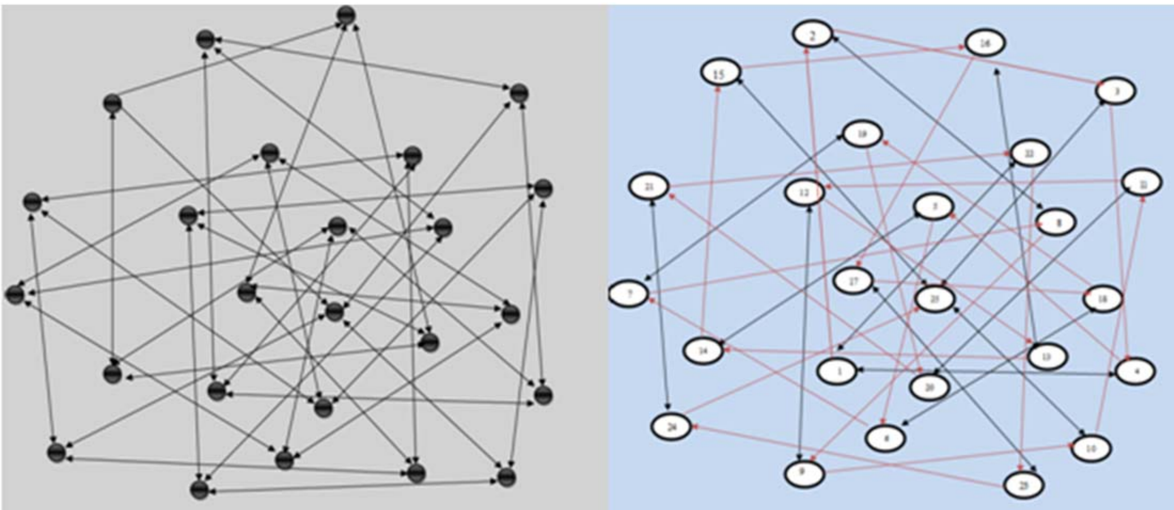

Figure 5. Number Placement Game Graph Model.

DFS pseudocode is as follows;[6]

```
public static void DFS (Graph g, Object vertex) {
        g.visit(vertex);
            Iterator itr = g.neighbors(vertex);
        while (itr.hasNext( ) ) {
                Object v = itr.next( );
                if (!g.isVisited(v) )
                DFS(g, v);
            }
        }
```

The most prominent feature of the problem is the placement pattern of the numbers on the matrix. In a square matrix being 5 x5, to go from the starting point or adjacent nodes, number of nodesis maximum 3 or 4. This condition is shown in Figure 6.

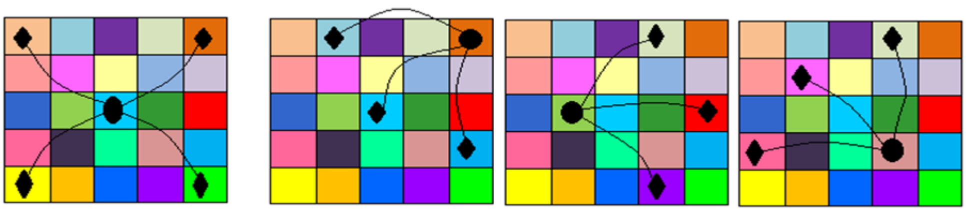

Figure 6. Destination Number of Nodes

In Figure 6, if the node position on the left is $A_{2,2}$, then the maximum number of 4 alternative nodes can be placed after itself. In the right table 3, maximum number of 3 alternative nodes can be placed.

In the process of programming our game, a sequence of rules is formed by defining the board size in x-y axis movement**.**

move_x = { 2, 2, -2, -2, 3, 0, -3, 0 };
move_y = { 2, -2, 2, -2, 0, 3, 0, -3 };

According to this x-y motion, all of the numbers are placed step by step in appropriate regions. Number of "*0"* is start point. Start node can be selected randomly. After number of "0" is placed in $A_{3,3}$, placement of number 1is decided. Number 1 can be placed (-2,+2) units after $A_{3,3}$ point . Then, number of "*2*" is placed in $A_{1,4}$ **.** As long as the correct spacing exists the remaining numbers can be placed.

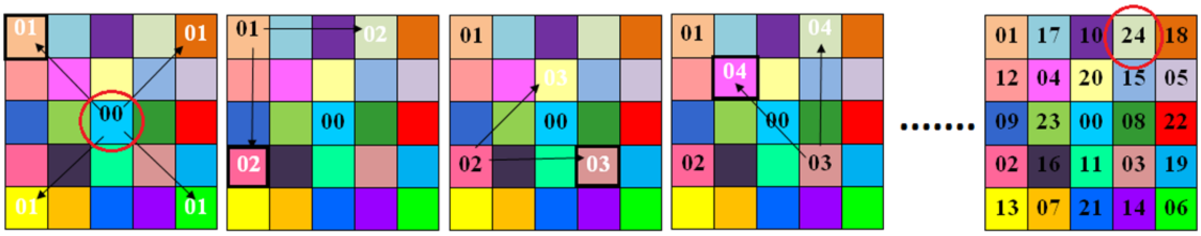

Figure 7. Step by step number placement

In solution process;

- Assigning of the movement point, in other words starting node,
- Calculation of new movement coordinates,
- Alternative nodes test or trial,
- Testing the validity of the new step coordinates,
- Not returning the previous node.

the steps above should be paid attention.

RESULTS AND FINDINGS

Position of starting node can be selected randomly on the board. Number of "*0"*surrounded by green is start node and number of "*24*"surrounded by red isgoal node. All of the numbers are placed according to rules. As shown below, all of the numbers from 0 to 24 have been placed successfully on the board. Figure 8shows the successful possible paths.

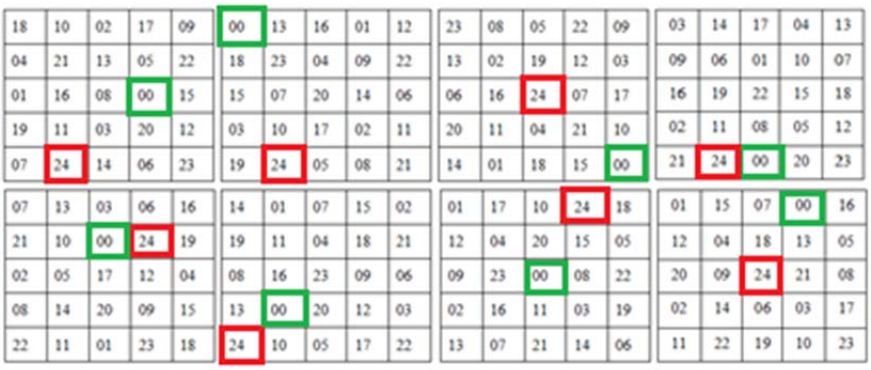

Figure 8. Numbers placed successfully

Figure 9 shows the steps of placing numbers according to their rules.

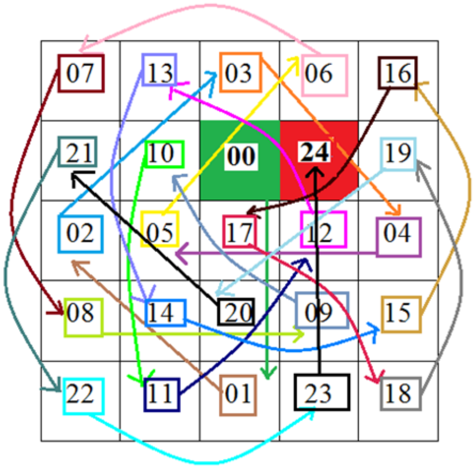

Figure 9. Example of a success path

Figure 10 shows unsuccessfully finished game with wrong paths. The numbers which are turned round by yellow colour in the cell can't move because there were no other number of steps to make a move it turns to the previous node with Backtracking. It evaluates other possible move. Thus, all possible outcomes are scanned in the search space.

Figure 10. Unsuccessful paths

Probability Calculations:Although the probability condition totals to *(25x24x23...1)/5!* , if we consider every possibility which doesn't contain solution, our searching space size would quite decrease.Considering our limitations;

After placing the first number on any of the 25 cells, the total number of moves sums to 23 and since at each move that can be made differently totals to 3, this makes the searching space size to be $25x3^{22}x2$

CONCLUSION AND FUTURE WORK

In this study, by placement of sequence of numbers in accordance with certain rules based on the board enabled us to develop a game. In this game, the player uses all numbers with an aim of finding possible solution paths. Thus, an individual's trial and error method of analysing different ways and decision making skills are provided and improved.

In this application, 5x5square has been tested on the board. The field can be expanded, hence possible paths are increased. Game rules defining the placement pattern of numbers can be changed.The dimensions of the playing field can be increased, 2 dimensional space can be transformed to 3 dimensional space. Exploration of our game on the possible right paths using heuristic algorithms based on learning methods may be put in trial. Thus unsuccessful paths can be avoided and the right paths can be found without selecting wrong paths.As we progress in our studies, this kind of applications can be used to compare methods based on informed and uninformed search algorithms.

ÖZET: Bu araştırmada; lise öğrencilerinin biyoloji derslerinde akıllı tahta kullanımına ilişkin tutumlarının belirlenmesi amaçlanmıştır. Tarama modelinin kullanıldığı araştırmada; çalışma grubunu 200 lise öğrencisi oluşturmaktadır. Veri toplama aracı olarak, Elaziz (2008) tarafından hazırlanan "Akıllı Tahta Kullanımına İlişkin Öğrenci Tutum Ölçeği" kullanılmıştır. Ölçeğin güvenirlik katsayısı 0,78; bu araştırmada ise 0,87 olarak hesaplanmıştır. Verilerin analizi sonucunda; öğrencilerin genel anlamda olumlu tutuma sahip olduğu söylenebilir. Sonuç olarak; akıllı tahta kullanımının biyoloji derslerinde özellikle; konuların daha kolay ve hızlı anlaşılması, zaman tasarrufu, görsel öğelerin etkisiyle ilgi ve motivasyonun artması vb. gibi avantajlar sağladığı söylenebilir. Öğrencilerin tutum puanları; "cinsiyet" ve "akıllı tahtanın kullanım süresi" değişkenlerine göre istatistiksel olarak farklılık göstermemektedir.

Anahtar sözcükler: Biyoloji, akıllı tahta, tutum.

ABSTRACT: The present study aims to determine the high school students' attitudes towards the use of interactive whiteboard in biology course. The survey model was used as research model. The study group included 200 high school students. As the data collection tools; students' attitudes scale towards the use of interactive whiteboard. Reliability coefficient of the scale was found Cronbach Alpha=0,87. For the analysis of the data, mean scores, t-test and ANOVA were used. The research results revealed that the use of interactive whiteboard especially in biology classes provide some advantages such as; understanding of the issues easier and faster, saving time, increasing interest and motivation with the effect of visual elements and so on. There was no significant difference between students' attitudes towards the use of interactive whiteboard in biology course with respect to gender and duration of use.

Key words: Biology, interactive whiteboard, attitude.

KARİKATÜRLERİYLE DESTEKLENEN FEN VE TEKNOLOJİ ÖĞRETİMİNİN ÖĞRENCİLERİN AKADEMİK BAŞARILARINA ETKİSİ

THE EFFECT OF SCIENCE AND TECHNOLOGY TEACHING SUPPORTED WITH CONCEPT CARTOONS ON STUDENTS' ACADEMIC ACHIEVEMENT

ÖZET: Bu çalışmanın amacı kavram karikatürleri ile desteklenen Fen ve Teknoloji öğretiminin öğrencilerin akademik başarıları üzerine etkisini belirlemektir. Araştırmada ön test son test kontrol gruplu yarı deneysel desen kullanılmıştır. Araştırmanın örneklemi 7. sınıflardan, deney grubunda 15 ve kontrol grubunda 16 olmak üzere toplam 31 öğrenciden oluşmaktadır. Dersler Güneş Sistemi ve Ötesi ünitesi süresince deney grubunda kavram karikatürleri ile desteklenerek, kontrol grubunda ise programın öngördüğü şekilde işlenmiştir. Araştırmanın verileri; akademik başarı testi ile elde edilmiştir. Toplanan veriler SPSS 16 programıyla analiz edilmiştir. Akademik başarı testlerinden elde edilen grup puanlarının karşılaştırılmasında parametrik olmayan istatistiklerin analizinde kullanılan Mann-Whitney U testinden faydalanılmıştır. Yapılan uygulama sonrasında, öğrencilerin akademik başarıları açısından anlamlı farklılık elde edilmemiştir. Kavram karikatürleri mevcut programla akademik başarı açısından benzer etkilere yol açmıştır.

Anahtar sözcükler: Fen ve teknoloji öğretimi, kavram karikatürleri, Güneş sistemi ve ötesi, Akademik başarı

ABSTRACT: The aim of this study is to determine the effect of science and technology teaching promoted with concept cartoons on students'academic achievement. Semi-experimental pattern with pre-test and posttest control group was used in the study. The study was conducted with 31 students in total, 15 of whom were in the experiment grup and 16 of whom were in the control group, who were studying at a 7 th grade primary school. In the control group, the lectures were given in line with the current Science and Technology curriculum, while in the experimental group they were supported with concept cartoons. The data of the research was collected via Academic Achievement Test. Data obtained were analyzed through the analysis program SPSS16. Mann-Whitney U test which use nonparametric analysis was used for group points obtained from the academic achievement test. At the end of the study, there isn't any meaningful difference academic achievement. There is no significant difference between The Solar System and beyond unit supported by the processing current program and by the concept cartoons in terms of academic achievement. But there is meaningful difference on the post-test scores of conceptual understanding test. It has been identified that application reduces students' misconceptions that are available, it doesn't reveal new misconceptions and it has provided students with a better understanding.

Key words: Teaching science and technology, concept cartoons, the Solar System and beyond, academic achievement

GİRİŞ

Bilim ve teknoloji her geçen gün ilerlemektedir. Gelişen bilim ve teknoloji uygulamaları, öğretim yöntemlerinin de düzenlenmesini gerektirmektedir. Dewey: "*Bize öğretilenler gibi öğretmeye devam ediyorsak çocuklarımızın geleceğinden çalıyoruz* demektir" ifadesini kullanarak öğretim yöntemlerinin revize edilmesinin gerekliliğini belirtmiştir. Öğrencilerin aktif olduğu, bilgileri sorgulayarak kendilerinin yapılandırmasına olanak sağlayan, öğrencilerin önbilgilerini, kavram yanılgılarını ortaya çıkaran yöntemler önem kazanmıştır. Fen bilimlerinin muhtevasının çoğunluğu soyut konulardan oluştuğundan öğrenciler Fen ve Teknolojideki kavramlara ait bilimsel doğrulardan farklı düşünceler oluşturmaktadırlar. Fen alanında yapılan araştırmaların çoğunluğu öğrencilerin kavram yanılgıları üzerine yapılmıştır. Kavram karikatürleri yapılandırmacı yaklaşıma uyan ve öğrencilerin önbilgileri açığa çıkaran bir yöntem olarak kullanılmaktadır.

Kavram Karikatürleri

Kavram karikatürleri bilimsel bir kavram ya da günlük bir olayla ilgili farklı görüşler belirtmek amacıyla yapılan karikatür tarzı çizimlerdir (Naylor & Keogh,1999). Kavram karikatürlerinde üç ya da daha fazla karakter bir konu hakkında tartışmaktadır (Şaşmaz-Ören, 2009). Kavram karikatürlerinde olabildiğince az sayıda şekil ve metinle konunun görsel olarak ifade edilmesi önem taşımaktadır (Baysarı, 2007). Kavram karikatürlerinde tartışan karakterlerden birinin görüşü bilimsel olarak doğrudur, diğer karakterlerin belirttiği ifadeler öğrencilerde bulunması muhtemel kavram yanılgıları ve yanlış anlamaları içermektedir.

Öğrenciler karikatürde verilen olayı düşünür, araştırır ve arkadaşlarıyla fikir alışverişinde bulunur (Demir,2008). Kavram karikatürleri tartışma ortamının oluşturulması, tartışmanın başlatılması ve devam ettirilmesinde etkili materyallerdendir. Kavram karikatürleri poster olarak, Fen ve Teknoloji derslerinde öğretim yöntemi ve materyali olarak kullanılabilir (Kabapınar,2009).

İlkokul ve ortaokul öğrencileri, öğretmenler ve öğretmen adaylarıyla yapılan görüşmelerde kavram karikatürlerinin kullanılmasıyla ilgili olarak katılımcılar olumlu görüş bildirmişlerdir (Keogh & Naylor,2013). Kavram karikatürleri, motivasyonu artırma, alternatif bakış açılarından haberdar etme, tartışmaya yöneltme, konuyu özetleme ve değerlendirme amacıyla kullanılmaktadır (Naylor & Keogh, 2010).

Kavram karikatürleri gündelik hayata uygun olmalı, çok fazla bilimselliğe odaklanılmamalıdır. Alternatif bakış açılarının yanında bilimsel doğrularda verilmelidir. Öğrencilerde bulunan farklı görüşleri öğrenmek adına karikatürlerde boş konuşma baloncuklara da yer verilmelidir. Kavram karikatürlerinde bulunan alternatif düşünceler eşit statüde verilmelidir. Kavram karikatürlerinde sık kullanılan kavram yanılgılarının öğrencilerde yaygınlaşmadığı, karikatürlerin kavram yanılgılarının giderilmesinde etkili materyallerden olduğu görülmüştür. (Keogh & Naylor, 2013).

Araştırmanın Amacı

Araştırmanın amacı: 7. sınıf Fen ve Teknoloji dersi Güneş sistemi ve Ötesi: Uzay Bilmecesi ünitesinde yer alan konuların kavram karikatürleriyle desteklenerek işlenmesinin öğrencilerin akademik başarısına etkisini ortaya çıkarmaktır. Bu çalışmada: Fen ve Teknoloji öğretiminde, ünitenin kavram karikatürleri ile desteklenerek işlenmesi ile mevcut programla işlenmesinde öğrencilerin akademik başarıları açısından anlamlı bir fark var mıdır? Sorusuna yanıt almaya çalışılmıştır.

YÖNTEM

Araştırmanın Modeli

Bu çalışmada ön test-son test kontrol gruplu yarı deneysel desen kullanılmıştır. Birbirine denk gruplardan biri deney, biri kontrol grubu olarak yansız bir şekilde atanır. Deney ve kontrol gruplarına uygulama yapılmadan ve uygulama yapıldıktan sonra test uygulanır (Büyüköztürk, Çakmak, Akgün, Karadeniz ve Demirel, 2010). Deney grubuna ve kontrol grubuna Fen ve Teknoloji başarı testi, ön test ve son test olarak uygulanmıştır.

Çalışma Grubu ve Özellikleri

Bu çalışma 2012-2013 eğitim-öğretim yılı ikinci döneminde Konya ili Bozkır ilçesi Dereiçi ortaokulunda 7. sınıf öğrencileri ile gerçekleştirilmiştir. Çalışmada 15 öğrenci mevcudu olan 7/B sınıfı deney grubu, 16 öğrenci mevcudu olan 7/A sınıfı kontrol grubu olarak rastgele atanmıştır.

Çalışmada Kullanılan Kavram Karikatürlerinin Geliştirilmesi

Kavram karikatürleri hazırlanmadan önce, ele alınacak ünitedeki kazanımlar incelenmiş daha sonra literatür taraması yoluyla konu ile ilgili olarak öğrencilerde olması muhtemel kavram yanılgıları tespit edilmiştir. Kazanımlar ve bu konulardaki kavram yanılgıları dikkate alınarak kavram karikatürleri geliştirilmiştir. Bazı karikatürlerin oluşturulmasında karikatür hazırlama sitelerinden yararlanılmış, diğerleri de elle çizilmiştir. Oluşturulan kavram karikatürlerinin uygunluğu alan eğitimcileri ve Fen ve Teknoloji öğretmenlerince incelenerek gerekli düzenlemeler yapılmıştır. Pilot uygulamalardan sonra nihai şekli verilen kavram karikatürleri toplamda 30 karikatür karesi olmak üzere 3 karikatür serisinden oluşmaktadır.

Kavram Karikatürlerinin Uygulanma Süreci

Kavram karikatürleri dersin başlangıç aşamasında öğrencilerde bulunan kavram yanılgıları ortaya çıkarmada ve öğrencileri derse güdülemede, dersi sunuş yapma, açıklama ve genişletmede ve dersin sonunda değerlendirme amacıyla kullanılmıştır.

Deney grubunda dersler kavram karikatürleriyle desteklenerek, kontrol grubunda ise mevcut programa göre işlenmiştir. Deney ve kontrol grubunda dersler aynı Fen ve Teknoloji öğretmeni tarafından yürütülmüştür.

Verilerin Toplanması

Konya Bozkır Dereiçi ortaokulu 7/A (kontrol grubu) ve 7/B (deney grubu) sınıfı öğrencilerine Fen ve Teknoloji başarı testi ön test ve son test olarak uygulanmıştır.

Başarı Testi

Güneş Sistemi ve Ötesi: Uzay Bilmecesi ünitesi konularına ilişkin geliştirilen başarı testi ön test ve son test olarak uygulanmıştır. Test geliştirilirken: Güneş sistemi ve Ötesi Uzay Bilmecesi ünitesine ilişkin kazanımlar listelenmiştir. Fen ve Teknoloji başarı testi araştırmacı tarafından hazırlanmış, test hazırlanırken Seviye Belirleme Sınavı(SBS) hazırlık kitaplarından, fen okulu, kavramabilgi, mebvitamin gibi internet sitelerinden yararlanılmıştır. İlk olarak 75 maddeden oluşan çoktan seçmeli test, geçerlik ve güvenirlik çalışmaları için Konya ili Bozkır ilçesindeki çeşitli okullardan Güneş Sistemi ve Ötesi ünitesini daha önceden ders olarak almış 212 ortaokul 8. sınıf öğrencisine uygulanmıştır.

Analiz sonucunda 35 soru testten çıkarılmış, 40 sorudan oluşan çoktan seçmeli Güneş Sistemi ve Ötesi başarı testi elde edilmiştir. Fen ve Teknoloji başarı testinin KR-20 güvenirlik katsayısı 0,86 olarak hesaplanmıştır. Ön uygulama ve uzman görüşü alma sonrasında geçerliliği ve güvenilirliği düşük olan sorular testten çıkarılmıştır. Akademik başarı testinin ortalama madde güçlük indeksi 0,441 olarak hesaplanmıştır. Testin ortalama madde ayırt edicilik indeksi 0,314 olarak bulunmuştur.

Verilerin Analizi

Uygulama sonrasında elde edilen veriler SSPS16 paket programına aktarılmıştır. Öğrencilerin Fen ve Teknoloji başarı testi ön test son test puanlarının karşılaştırılması, anlamlı bir farkın olup olmadığının tespitinde parametrik olmayan istatistiklerin analizinde kullanılan "Mann-Whitney U" testinden faydalanılmıştır. Mann-Whitney U testi, ilişkisiz ölçümlerde az denekli deneysel çalışmalarda puanların dağılımının normal olmadığı deneysel çalışmalarda sıklıkla kullanılır. İlişkisiz t-testinin alternatifi olarak da bilinir. Araştırmada anlamlılık düzeyi $p<.05$ olarak alınmıştır (Büyüköztürk, 2011). Çalışma bitiminde deney grubundaki öğrencilerin tamamına yarı yapılandırılmış görüşme uygulanmış, öğrencilerin sorulara vermiş oldukları cevaplar öğretim yöntemi, bilişsel özellikler, duyuşsal özelliklerle ilgili olmalarına göre kategorize edilmiştir.

Başarı Testi'nden Elde Edilen Verilerin Analizi

40 sorudan oluşan başarı testine verilen doğru cevaplar tam puan, yanlış cevaplar ve boş bırakılan sorular 0 puan olarak puanlandırılmıştır. Başarı testi, deney ve kontrol grubu ön test ve son test olarak uygulanmıştır.

BULGULAR VE YORUM

Başarı Testinden Elde Edilen Bulgular

Uygulama öncesinde deney ve kontrol grubu öğrencilerinin, Fen ve Teknoloji dersi "Güneş Sistemi ve Ötesi" ünitesine yönelik ön bilgi düzeyleri arasında istatistiksel olarak anlamlı farklılık olup olmadığını tespit etmek amacıyla öğrencilere akademik başarı testi ön test olarak uygulanmıştır. Testten elde edilen veriler Tablo 1' de verilmiştir.

Tablo 1. Deney ve Kontrol Grupları Başarı Ön-Test Puanlarının Karşılaştırılması

Grup	N	Sıra ortalaması	Sıra toplamı	U	P
Kontrol	16	14,13	226,00	90,000	.247
Deney	15	18,00	270,00		

Tablo 1'de görüldüğü gibi uygulama yapılmadan önce, deney grubu ve kontrol grubu akademik başarıları arasında istatistiksel olarak anlamlı bir farklılık olmadığı tespit edilmiştir (U=90,00; p>.05).

Tablo 2. Deney ve Kontrol Grupları Başarı Son-Test Puanları Karşılaştırılması

Grup	N	Sıra ortalaması	Sıra toplamı	U	P
Kontrol	16	14,25	228,00	92,000	.281
Deney	15	17,87	268,00		

Tablo 2' de görüldüğü gibi, son testte, deney ve kontrol gruplarının akademik başarı puanları arasında anlamlı bir farklılık yoktur (U=92,00; p>.05).

Kavram karikatürleri 7. Sınıf Güneş Sistemi ve Ötesi ünitesinde öğrencilerin akademik başarılarında mevcut programla benzer etkilere yol açmıştır, öğrencilerin akademik başarılarında anlamlı bir farklılık gözlenmemiştir.

SONUÇLAR VE TARTIŞMA

Bu bölümde, verilerin analizi sonucunda elde edilen bulgular göz önüne alınarak yapılan sonuçlar ve önerilere yer verilmiştir.

Akademik Başarı Testine ilişkin sonuçlar

Yapılan araştırmada Güneş Sistemi ve Ötesi ünitesi kontrol grubunda mevcut öğretim programıyla deney grubunda ise mevcut öğretim programı kavram karikatürleriyle desteklenerek işlenmiştir. Deney ve kontrol grubu akademik başarı son test puanları arasında anlamlı farklılık bulunamamıştır (U=92,00; p>.05). Kavram karikatürü destekli etkinliklerin öğrencilerin akademik başarıları üzerinde mevcut Fen ve Teknoloji öğretim programıyla benzer sonuçlar oluşturmuştur. Literatür incelendiği zaman benzer sonuçlar elde edilen araştırmalar bulunmaktadır. Baysarı (2007), Canlılar ve Hayat ünitesinde, Balım, İnel ve Evrekli (2008), Doğru ve Keleş (2010), "elektrik ünitesinde" kavram karikatürü destekli 5E modelinde, Yarar (2010), Sosyal Bilgiler dersinde flash programında hazırlanmış kavram karikatürleri ile destekli öğretimde, Çiçek (2011), 6. Sınıf öğrencileri ile yaptığı çalışmada kavram karikatürü kullanımı öğrencilerin akademik başarıları açısından anlamlı bir farklılık oluşturmamıştır.

Literatürde bazı araştırmalara göre farklı sonuçlar elde edilmiştir. Durmaz (2007),"Mitoz-Mayoz Hücre Bölünmeleri ve Kalıtım" ünitesinde, Özüredi (2009), İnsan ve Çevre ünitesinde, Eroğlu (2010), Maddenin Tanecikli Yapısı ünitesinde, Evrekli (2010), kavram karikatürü ve zihin haritalarının öğrenmeye etkisinde, Alkan (2010), sosyal bilgiler dersinde öğrencilerin akademik başarılarını artırmada kavram karikatürlerinin etkili olduğu sonucuna varılmıştır.

Araştırmadan elde edilen sonuçları şu şekilde özetleyebiliriz:

1)Kavram karikatürleri öğrencilerin derse güdülenmelerini sağladığı için öğretmenler tarafından dersin başlangıç aşamasında rahatlıkla kullanılabilir.

2) Kavram karikatürleri akademik başarıya oranla kavram yanılgılarını belirlemede daha etkili materyallerdendir.

3)Kavram karikatürleri özellikle çekingen öğrencilerin derse dâhil edilmesinde kolaylıkla kullanılabilir.

4)Kavram karikatürleri dersin başlangıcında, dersi sunumunda, ders sonunda değerlendirme aracı olarak kullanılabilir.

5)Kavram karikatürleri tartışma yoluyla öğrencilerin derse katılımını artırır.

6)Kavram karikatürleri kavram yanılgılarının belirlenmesi ve giderilmesinde etkili materyallerdendir.

7)Kavram karikatürleri konunun görsel olarak ifade edilmesini sağlar, öğrencileri alternatif görüşlerden haberdar eder, yeni kavram yanılgılarının oluşmasını engeller.

Öneriler

Kavram karikatürleriyle desteklenen Fen ve Teknoloji öğretiminin öğrencilerin akademik başarıları etkisi araştırmasından elde edilen veri analizlerine göre çıkarılabilecek öneriler şunlardır:

1) Kavram karikatürlerine ders kitaplarında sıklıkla yer verilip, poster şeklinde hazırlanıp sınıf duvarlarına asılabilir.

2) Kavram karikatürleri öğrencilere hazırlattırılabilir.

3) Kavram karikatürlerini öğrencilerin kavram yanılgılarının fazla olduğu konularda uygulamak daha etkili sonuçlar almayı sağlayacaktır.

4) Kavram karikatürleri ile yapılan araştırmalarda, kavram karikatürlerinin diğer yöntem ve tekniklerle beraber kullanılmasının etkisinin araştırılması daha olumlu sonuçlar almayı sağlayacaktır.

5) Kavram karikatürleri Fen ve Teknoloji dersi diğer ünitelerde ve diğer derslerde rahatlıkla kullanılabilir.

6) Kavram karikatürlerinin benzer şekilde ilkokul, lise, üniversite öğrencileri ve öğretmen adayları üzerine etkisi incelenebilir.

handandemircioglu@gmail.com

ABSTRACT: This study was aimed to determine teacher candidates' metaphors related to teacher education programs. Research sample consisted of 230 seniors, who studied programs in Elementary Science and Technology Education (n=170) and Secondary Mathematics Education (n=60) Departments. The data were collected by means of the teacher candidates' completion of the statement "Teacher education programs are like … because …". In this research phenomenological research design was used and data were analyzed by means of content analysis. In the analysis, it was eliminated invalid metaphors and determined categories which are thought to represent metaphors. In the light of the findings, It were shown that teacher candidates produce162 valid metaphor, and this metaphor collected in five categories in for action, tool/ material, environment, person have a profession, associated with life.

Key words: teacher education program, teacher candidates, metaphor

INTRODUCTION

Metaphors which are symbolic expressions create different meanings in individuals taking other meanings of words. (Dundar and Karaca, 2013). Metaphor is defined as "the word used in another meaning from the real meaning as a result of an interest or analogies, a word or use of other meaning than the accepted meaning of concept ofis" in Turkish Language Institution dictionary (TDK, 2008). Metaphors allow individuals to see a phenomenon as another phenomenon, and is a mental mapping mechanism to understand individuals' world (Karacanta, 2013). Shuell (1990: 102) stressed that "If a picture is worth 1000 words, a metaphor is worth 1000 picture." Because, while a picture provides only a static image, a metaphor provide a mental framework to think about the case. Therefore, using the metaphor we have stated our way of thinking about our understanding o concept or phenomena.

Its relationship of the analogy with metaphor is a known fact. However, metaphors and analogies are not completely overlaps. Both analogies and metaphors establish similes. However, this relationship is realized in different ways. While an analogy clearly compare two areas and show parts of their identify, metaphors highlighting features or associated attributes not changing in two areas, makes comparison implicitly, it not included high similarities or relationship among area (Duit, 1991). Therefore, metaphors have been used as a starting point in many scientific discovery and defined as a part of scientific process, and have been effective on the basis of know towards unknows in the process of reasoning (Demirci Güler, 2012). In this context, metaphors are seen to be subject to research for determining perceptions towards some concepts in education. Ates and Karatepe (2013-a) analyzed that university students' perceptions towards "environment" concept with the help of methaphors. Ates and Karatepe (2013-b) analyzed university students' perceptions towards "Global Warming" concept with the help of methaphors. Aydin (2010) examined that Owned Metaphors of Secondary Students related to the concept "geography". Akkaya (2011) researched on perceptions of 8th grade elementary students about "speaking" concept. In the literature, it is seen that the identification of metaphors for different concepts such as these. The overall purpose of this study investigation ascribe meaning to the image of individuals and depicted situation in the education field, thanks to metaphors reflect cultural values, attitudes and thoughts of individuals.

In the nowadays are experienced rapid developments, because the task of rising qualified individuals adapt to the process of change are given to education system, teaching profession has come to the fore. No matter how qualified teachers and thus the quality of trained individuals will increase. Hence, the importance of teacher education programs arises.

The training for prospective teachers adopts the role of a teacher based on teacher education. Carter (2001) stated that metaphors used as a powerful tool in eliciting teacher candidates' opinions on their experiences during their student years and their future thoughts about how they want to become a teacher. However, in the related literature studies examining metaphors for teacher education programs were not detected. Teacher candidates' beliefs about the program can explain the results consisting of experience with the help of metaphor. In this way, metaphors serve as a helpful tool transferring they want to tell.

In this context, the study has been conducted to reveal their metaphors of science and mathematics teacher candidates for teacher education programs. Starting from this idea, sub-problems of the research are as follows:

1. What are metaphors of science and mathematics teacher candidates related to teacher education program?
2. Which are conceptual categories that collected metaphors of science and mathematics teacher candidates related to teacher education program?
3. How are become different conceptual categories related to metaphors according to the department?

METHODS

In this study was used phenomenological research design. Phenomenography is a research method that dealing with people what they perceive phenomena encounter live in the universe and what are their experiences (Cekmez et al., 2012). Different individuals likewise do not understand the phenomenon. To experience or understand a phenomenon varies from person to person (Türkeli Sandir, 2006). Phenomenographic research is try to identify the key parts of this diversity (Trigwell, 2000).

Participants

Research sample consisted of 230 seniors, who studied programs in Elementary Science and Technology Education (n=170) and Secondary Mathematics Education (n=60) Departments.

Data Collection Instruments and Data Analysis

The data were collected by means of the teacher candidates' completion of the statement "Teacher education programs are like … because …". Teacher candidates' answers were analyzed by using content analysis.

FINDINGS AND DISCUSSION

When metaphors derived from the teacher candidates examined, the following was observed:

- 162 (including 45 from mathematics teacher candidates and 117 from science teacher candidates) has been found to be valid metaphor. 57 of these metaphors such as make a food (6), book(10), passenger bus(2), computer(3), encyclopedia(3), branched tree(2), factory(11), raise trees(2), vaccine(2), kitchen(2), hospital(2), library(2), construction(2), potter's workshop(2), sculptor(4), life(2) are common. The remaining 105 metaphor are represented by one person.

- 37 metaphors such as Rowing on the lake (1), Workout (1), Make to modify a car (1), Produce fabricated violin (1), Very fancy gift package (1), Closed box (1), Made in China products (1), Snowman (1), Cigarette (1), Have put a lot of water into the dough (1), Electrical installations in Schools (1), Blinkers (1), Robot (1), Factory(7), Farm (1), Cafe(2), One type of machine producing factory (1), Bank Note Printing House (1), Rest of the resort (1), Building (1), Guesthouse (1), Maze (1), Penitentiary (1), System that unchanging outcomes(1), Ineffective element (1), Platonic love (1), Anger (1), Chinese torture (1), Empty brain (1) are negative as the content, 15 metaphors such as Family(1), Sculptor(4), Information home(1), Sun(1), Newly planted seedings(1), Vaccine(2), To improve doctor's patients(1), Flower garden(1), Art workshop(1), Individual development book(1), Fruit trees(1) are positive as the content, and the rest of 110 metaphor was found to be neutral in the sense that the mutual processes.

- The metaphors derived from teacher candidates are categorized in terms of the meanings they contain, consisting of five categories shown in the table.

Table 1. Methaphors and Categories Related to Teacher Education Program

	Science Teacher Candidates			Mathematics Teacher Candidates		
Category	Mehaphors	f	%	Methaphors	f	%
As “an action”	Raise tress(1),Drink Water(1), Make a picture(1),Write articles(1),Read the book(1), To improve doctor's patients(1),Working in the office(1),Educating child(1),Baby's growth(1),Rowing on the lake(1), Make a pottery(1),Make a food (6),Exhausting marathon(1), Workout(1), Racing(1)	20	17,1	Raise tress(1), Make to modify a car (1), Produce fabricated violin(1), RNA synthesis(1), Raise flower(1), The building is to be constructed(1), Process of tree growth(1)	7	15,6
As a “a tool/ material”	Vaccine(1), Encyclopedia(1),Pyramid(1), Individual development book(1), Rungs of the ladder(1),Book(10), Very fancy gift package(1), Regular running machine(1), Passenger bus(2), Hour(1), Closed box(1), Made in China products(1), Computer(3), A car engine(1), Clothes(1), Bridge(1), Snowman(1)	29	24,8	Vaccine(1), Encyclopedia(2), Mud, clay(1), Notebook(1), Cigarette(1), Have put a lot of water into the dough(1), Electrical installations in Schools (1), Blinkers(1), TV(1),Robot(1), Macig wand(1),	12	26,7
As “ an environment”	Factory(5), Kitchen(1), Hospital(1), Industry(1),Beehive(1), Hotel(1), One type of machine producing factory(1), Hammam(1), Football Field(1), Building(1), Library(2), Bank Note Printing House(1), Water storage(1), Flower garden(1), Bakery(1), Construction(2), Market(1), Forest(1), Hairdresser(1), Maze(1), Home(1), Guesthouse(1), Space(1), Penitentiary(1), Repository(1), Refectory(1), Workshop(1), The shooting range(1), The foundation of building(1), Recycling center(1), Information home(1)	37	31,6	Factory(6), Kitchen(1), Hospital(1), Farm(1), Field(1),Cafe(1), Potter’s workshop(2), Rest of the resort(1), Art workshop(1), Center of a city(1)	16	35,5
As “ a person have a profession”	Sculptor(3), Cook(1), Worker(1), Tailor(1), Kindergarten teacher(1),Turtle tamer(1)	8	6,8	Sculptor (1), Pottery master(1)	2	4,4
As “related to life”	Life(2), Family(1), Face with life(1), Law(1), System(1), Preparation for life(1), Platonic love(1), Seasons(1), Human(1), Love(1), Mother(1), Recipe(1), Nervous, Anger(1), Chinese torture(1), Organ(1), Fruit trees(1), Branched tree(2), Sun(1), Empty brain(1), Our fingers(1), Plant(1)	23	19,7	Exams as SBS, LYS (1), System that unchanging outcomes(1), Computer program(1), Ineffective element(1), Survivor(1), Traffic signs(1), Newly planted seedings(1), Planted seed(1)	8	17,8
Total		117	100		45	100

Category 1: Teacher Education Programs as “Action”

In this category, there are 27 metaphors including 20 from pre-service science teachers and 7 from pre-service mathematics teachers. In category, at most, metaphors such as make a food (6) ve raise trees (2) were used. "Raiser trees" metaphor seems to be common at the departments. The following are some examples of metaphors:

“...smilar to educating child. When we came to the university we did not have information about teaching as children who do not know the new world. As children grow up and stand on their own feet obtain information about the world, we have learned through the program as a teacher.”
“...smilar to rowing on the lake. It likes to try getting way in a certain limit. It is certain where you go, but it is limited what you can do. Vain effort labored in vain.”

Category 2: Teacher Education Programs as “Tool/ Material”

In this category, there are 41 metaphors including 29 from pre-service science teachers and 12 from pre-service mathematics teachers. In category, at most, metaphors such as book (10), computer (3), encyclopedia (3), vaccine (2), and passenger bus (2) were used. Metaphors such as "encyclopedia, vaccine” seems to be common at the departments. The following are some examples of metaphors:

"...smilar to made in China products. These products are imitation of quality products and are suitable. This attractive comes. But after a while, you know it is useless. Teacher education programs are the same. It is a copy of the west. Convenient will be shown with minor changes."
"...smilar to passenger bus. Bus is education program. Money is information. Driver is a student. People are teachers."

Category 3: Teacher Education Programs as "Environment"

In this category, there are 53 metaphors including 37 from pre-service science teachers and 16 from pre-service mathematics teachers. This category is concerning maximum metaphors. In category, at most, metaphors such as factory (11), kitchen (2), hospital (2), library (2), construction (2), and potter's workshop (2) were used. It was seen that metaphors such as "factory, kitchen and hospital" common at the departments. The following are some examples of metaphors:

"...smilar to factory. Factory undergone various processes by taking the different materials from nature and makes it useful. While training, we will enter this teacher education program."
"...smilar to forest. There are many live in the forest. Lack of one of them will derange. Program, so it is the same. If without one of the courses that comprise the requirements for the teaching profession is incomplete or delays."

Category 4: Teacher Education Programs as "Person Have a Profession"

In this category, there are 10 metaphors including 8 from pre-service science teachers and 2 from pre-service mathematics teachers. This category is concerning minimum metaphors. In category, at most, metaphor sculptor (4) was used. The following are some examples of metaphors:

"...smilar to sculptor. Program the same as a sculptor, gives us the shape. -Shape of teacher-"
"...smilar to cook. There are a lot of ingredients in the kitchen at the restaurant. Cook chooses from these materials that are needed and does dishes. Teacher education program required for teaching in the selects and presents us."

Category 5: Teacher Education Programs as "Related to Life"

In this category, there are 31 metaphors including 23 from pre-service science teachers and 8 from pre-service mathematics teachers. In category, at most, metaphors such as life (2), branched trees (2) were used. Common metaphor which is used by teacher candidates doesn't have. The following are some examples of metaphors:

"...smilar to platonic love. You do not get the teacher education program needed for teaching. We came as high expectations, but the program can not response to me was for teaching."
"...smilar to Chinese torture.Teacher education programs involves taking force things that are not relevant in teaching. We are trying very hard to 5-minute presentations. But even worse is that they will not do any of my teachers in my life.

CONCLUSION

Considering the responses of teacher candidates, especially metaphors and examples of common answers, the positive and negative aspects of the program are emerging. If teacher how perceive teacher education program applied as become to teacher, they will create a profile in the minds of teacher in that direction. Therefore, in the light of the findings for the thoughts and perceptions of teacher candidates about the results of the program can be summarized as follows:

1. It was seen that both science teacher and mathematics teacher candidates thought teacher education programs as "an environment" at most. Metaphor most frequently used under environment category is the factory.
2. It was seen that both science teacher and mathematics teacher candidates thought teacher education programs as "person have a profession" at least.
3. Metaphors such as raise trees, encyclopedia, vaccine, factory, kitchen, hospital, and sculptor are common in both departments.
4. Although 37 metaphors are negative as content, 15 metaphors are positive and 110 metaphors are neutral. Thus, it can be said that teacher candidates' opinions will change with mutual relations. Because, in the 110 methaphor which are neutral, when installing analogy relations, bilateral relations

arising from the positive and negative sides have been talking about. If teachers offer students good research results, will form a good product or vice versa.

RECOMMENDATIONS

At the end of the study, the following suggestions may be submitted:

1. Metaphors for teacher training programs are examined deeply as the common metaphors can be examined by applying teacher candidates in the different departments.
2. Examining the perceptions of prospective teachers towards the program, may be provided the revision of teacher education programs.

ABSTRACT: The purpose of this study is to determine student teachers' views about REACT strategy. In the study, data gathered quantitatively by the clinical interviews in the academic year of 2012-2013 at the spring term. The clinical interviews were carried out with 11 student teachers from two different classes in elementary education department. In both classes, REACT strategy was used as a teaching method by the same researcher in General Chemistry Course. In the clinical interviews, students were asked that "What are your favorite aspects of the teaching method?", "What are the aspects that you do not like about the teaching method?", "What stage of the teaching method do you like most?", "What conveniences does the teaching method provide for your understanding of the topic?", and "What do you suggest about the teaching method?". The findings suggest that student teachers liked performing experiments at most, facilitating learning and making the topic concrete. Most of student teachers did not suggest anything for REACT strategy as a pitfall, a small number of student teachers complained about an increase in students responsibility, e.g. early class preparation and overcrowding classes. As a conclusion, it can be said that student teachers liked REACT strategy because it facilitates learning by providing science experiments.

Key words: REACT strategy, student teachers, context-based approach

INTRODUCTION

Context-based approach, which becomes popular in recent days, aims at constructing connections between the context of real life issues and content. Context-based courses do not only make students active but also offers hope for improving students' engagement in learning chemistry and perceiving relevance of chemistry (Bennett, Gräsel, Parchmann & Waddington, 2005; King, 2007). As described by Gilbert (2006), the context-based approach is application oriented within the cases, scenarios from students on going lives outside of the classroom, thus application strategy helps students to construct knowledge rather than memorization of knowledge. Additionally, the context-based approach helps to contribute to students' lives or the lives of others around the world and helps them to acquire a better understanding of natural environment (Bennett & Lubben, 2006; Ültay & Ültay, 2012). Thus, participants can answer the question: "Why do I need to learn this?" and the context based learning can respond to this by linking theoretical knowledge with real world (Demircioğlu, Demircioğlu & Çalik, 2009; Ültay & Çalık, 2012). Bennett et al. (2005) pointed out that in the context-based courses, contexts are the starting points in order to develop scientific understanding.

To get more engagement of students and to develop more interest in science are the goals of context-based approach (Fensham, 2009). Looking at the literature on the effect of context-based science instruction, it is seen that some of the studies indicate increase in academic success (Acar & Yaman, 2011; Demircioğlu, 2008; Ingram, 2003; Schwartz-Bloom & Halpin, 2003) and positive effect on students' attitudes and motivation (Ingram, 2003; Belt, Leisvik, Hyde & Overton, 2005; Bennett & Lubben, 2006; Campbell, Lubben & Dlamini, 2000; Barker & Millar, 2000). To implement the context-based approach to the learning-teaching process, one of the strategies is REACT strategy (Crawford, 2001). In REACT strategy five essential forms of learning can be defined as: Relating, Experiencing, Applying, Cooperating and Transferring. At "Relating" stage the new information is related to everyday situations. At "Experiencing" stage points out learning in the context of exploration, discovery and invention. The aim is to allow students to experience activities that are directly related to real-life work. At "Applying" stage students apply concepts and information in a useful context through projects, activities, labs, text, and video. The "Cooperating" stage points out learning in the context of sharing, responding and communicating with other learners. This can be actualizes via group activities such as projects, labs, problem-solving, realistic scenarios. At "Transferring" stage students transfer skills and knowledge from one setting to another (CORD, 1999). Ingram (2003) described the REACT strategy as grounding on the bases of the constructivism, in which student involve in critical thinking and problems solving activities in order to improve students' understanding of concepts.

Taking into consideration the literature, it is seen that the context-based chemistry education not only improves students' motivation (Bennett et al. 2005; Belt et al. 2005; Bulte et al. 2005; King, Bellocchi and Ritchie, 2008; Pilling and Waddington 2005) but also increases their enthusiasm towards the subject (Ramsden 1992) and positively changes students' attitudes towards chemistry (Demircioğlu et al. 2009; Dlamini and Lubben 1996). Starting from this point, the purpose of this study is to determine student teachers' views about REACT strategy which is an implementation form of context-based approach in the classroom.

The Research Question

In the current study, the research question is stated as "What do student teachers think about the effectiveness of the teaching method namely REACT strategy?"

METHODS

In the study, data gathered quantitatively by the clinical interviews in the academic year of 2012-2013 spring term. Clinical interviews were carried out with 11 student teachers (aged 17-20 years) from two different classes in elementary education department. In both classes, REACT strategy was used as a teaching method by the same researcher in General Chemistry Course during 2 weeks. Classes were coded as E and C. Students in class E were labeled as E1, … and E5, students in class C were labeled as C1, … C6. Five students from class E and six students from class C were participated in the interview. Voluntarism was taken as a basis in the interview and firstly it was planned that five voluntary students from each class would have been selected but in class C, six students wanted to participate in the interview.

In the clinical interview, three questions were asked to the students. Two science education experts controlled the questions readability and understandability. Questions are given in Table 1. Interviews were tape recorded and lasted for 10-15 minutes. The transcriptions of the interview data were made by one of the researchers. She classified the results into the similar categories and themes. After that, rest of the researchers controlled the themes and necessary changes were made in the themes.

RESULTS AND FINDINGS

To determine the student teachers' views about REACT strategy, clinical interviews were carried out and data obtained from the interviews are shown in Table 1.

Table 1. Findings of Clinical Interview

	Question	Themes	Class E		Class C	
			Students	f	Students	f
1.	A) What are your favorite aspects of the teaching method?	Performing experiments	E1, E4, E5	3	C2	1
		Making observations	E1	1	-	-
		Facilitating teaching	E2	1	C5	1
		Making the topic more concrete	E2, E5	2	C4, C6	2
		Making individual activities	E4	1	C5	1
		Enjoyable or funny learning environment	-	-	C1, C6	2
	B) What are the aspects that you	No pitfall in the teaching method	E1, E2, E5	3	C4, C5, C6	3

	do not like about the teaching method?	An increase in students responsibility, e.g. early class preparation	E5	1	-	-
		Anxious about the exam	E4	1	-	-
		Leeway in the laboratory	-	-	C1	1
		Overcrowding of classes	E4	1	C2, C3	2
	C) What stage of the teaching method do you like most?	Performing experiments	E1, E2, E4, E5	4	C2, C4, C5, C6	4
		Learning environment	-	-	C1	1
		Being good of all stages	-	-	C6	1
2.	What conveniences does the teaching method provide for your understanding of the topic?	Permanency	E1, E2, E5	3	C4, C6	2
		Providing awareness in daily life	E4	1	C4	1
		Facilitating teaching	-	-	C2, C4, C5, C6	4
3.	What do you suggest about the teaching method?	No suggestion	E2, E3, E4, E5	4	C3, C4, C5, C6	4
		Making all the classes in the laboratory	E1	1	C1, C2	2

According to Table 1, in the first question three sub-questions were asked students. In 1A question, student teachers' were asked the favorite aspects of the teaching method. In Class E, three student teachers found "performing experiments" and two student teachers found "making the topic more concrete" as favorite aspects of the method. In Class C, two student teachers stated that "making the topic more concrete" and "enjoyable or funny learning environment" were the favorite aspects of the teaching methods. In 1B question, student teachers were asked about the aspects that they did not like about the teaching method. In both classes, three student teachers from each stated that "there was no pitfall in the teaching method". However, one student teacher complained about "early class preparation", one student teacher complained about "the overcrowding of the class" and "anxious about the exam" in Class E. Also, two student teachers found the classes overcrowding and one student teacher did not like "the leeway in the laboratory" during the experiments in Class C. Meanwhile, four student teachers from each class liked "performing experiments" mostly. One student teacher liked "learning environment" and one liked "being good of all stages" mostly in Class C.

In the second question, it was asked student teachers that "what conveniences does the teaching method provide for your understanding of the topic?". Three student teachers from Class E said "permanency" while two student teachers said the same thing in Class C. Four student teachers stated that the teaching method "facilitated learning".

In the last question, suggestions for the teaching method were asked for the student teachers and four student teachers from each class did not "suggest anything". One student teacher from Class E and two from Class C suggested "making all the classes in the laboratory".

When the findings are considered, student teachers found REACT strategy effective because they stated that they liked performing experiments and daily life examples and materials helped them to make the topic more concrete (Ültay N, 2012). In context-based chemistry education the students are able to become more actively involved in their own learning processes (Stolk et al. 2009), so they will be more willing to learn. Also, their motivation affected positively and they enjoyed the classes. REACT strategy affects students' motivation and attitudes towards the course (Saka, 2011; Ültay N, 2012). Additionally REACT strategy contributed to get a more positive learning environment (Crawford, 2001; Coştu, 2009). In the current study, student teachers asserted that they learned the topics more permanent. Because some parts of REACT strategy enabled hands-on activities, student teachers had an opportunity to see some abstract knowledge more concrete. Therefore, their learning became more meaningful and permanent. Context-based chemistry education facilitates students' learning by linking chemistry to daily lives (Ültay and Çalık, 2012; TPSI, 1991) In context-based approach contexts that are the starting points for the development of scientific understanding (Bennett et al., 2005) are introduced to the students in order to excite their curiosity (Stolk et al., 2009).

Despite all these positive thoughts and feelings towards REACT strategy, some student teachers did not give up exam anxious. In Turkish educational system, because there are a lot of exams, student teachers hoped teachers make traditional teaching, i.e teacher writes on the board and students memorize the facts. But REACT strategy is based on context-based approach which takes students involvement and meaningful contexts as basis (Pilot and Bulte, 2006), some student teachers complained about what to do in the exam. For this negative point in REACT strategy, an explanation stage was suggested especially for Turkish educational context (Coştu, 2009; E. Ültay, 2012; N. Ültay, 2012).

CONCLUSION

The research findings reported here suggest that student teachers liked REACT strategy in the learning environment and the strategy facilitated their learning by the hands-on activities and daily life examples. Student teachers' attitudes and interest were also affected positively and this helped them to construct coherent mental maps about the topic. Despite the positive feelings, some student teachers felt the absence of explanation part of the strategy. For Turkish educational context, an explanation step can be added as an extra part or to all steps of the strategy. There is need to new studies about searching the effectiveness of REACT strategy in the literature.

FEN BİLGİSİ ÖĞRETMEN ADAYLARININ GELİŞTİRDİKLERİ BENZEŞİMLER (ANALOJİLER) ÜZERİNE BİR ARAŞTIRMA

INVESTIGATION OF PRE-SERVICE SCIENCE TEACHERS' GENERATED RESEMBLANCE (ANALOGY)

Prof. Dr. Ahmet AFYON
Necmettin Erbakan Üniversitesi, Ahmet Keleşoğlu Eğitim Fakültesi
aafyon42@gmail.com

Arş. Gör. Azize DİGİLLİ
Düzce Üniversitesi, Eğitim Fakültesi
azizedigilli@windowslive.com

ÖZET: Bu çalışmanın temel amacı, fen bilgisi öğretmen adaylarının fen bilimleri konularına ilişkin geliştirdikleri analojileri, Fen Bilimleri Öğretim Programı'nda yer alan öğrenme alanlarını ve analojilerin yapı ve çeşitlerini dikkate alarak incelemektir. Araştırmada veri toplama süreci 2013-2014 öğretim yılı güz döneminde gerçekleştirilmiştir. Araştırmaya Necmettin Erbakan Üniversitesi Ahmet Keleşoğlu Eğitim Fakültesi Fen Bilgisi Öğretmenliği Anabilim Dalı'nın 3 ve 4. Sınıfında öğrenim gören 286 (3. Sınıf=147, 4.Sınıf=139) öğretmen adayı katılmıştır. Anketin boş bırakılması ya da öğretmen adaylarının analojik ifadelerinin uygun olmaması sebebiyle 63 öğretmen adayının verileri analiz edilmemiştir. Bu yüzden araştırmada 223 öğretmen adayının verisi analiz edilmiştir. Öğretmen adaylarının fen kavramları ile ilgili geliştirdikleri analojileri belirlemek için verilerin analizinde içerik analizi kullanılmıştır. Verilerin analizi sonucunda; öğretmen adaylarının Fen Bilimleri Öğretim Programı'ndaki dört farklı öğrenme alanında da analoji geliştirdikleri bulunmuştur. Fakat öğretmen adaylarının en çok "Canlılar ve Hayat" öğrenme alanından analoji oluşturduğu tespit edilmiştir. Ayrıca araştırmada, geliştirilen analojilerin yapı ve çeşitlerine göre en fazla fonksiyonel analoji, sözel analoji, somut-soyut analoji ve basit analojiler olduğu tespit edilmiştir. Tüm bunlara ilaveten, strateji tanımı olan ve sınırlılıklarının belirtildiği analojiler olduğu bulunmuştur. Sonuç olarak, fen bilgisi öğretmen adaylarının fen konularına ilişkin geliştirdikleri analojilerin yapı ve çeşitlilik bakımından ve hedef kavramın içeriği bakımından sınırlı olduğu bu çeşitliliğin sağlanması için farklı uygulamaların yapılması gerektiği düşünülebilir.

Anahtar Kelimeler: Analoji, Fen Bilgisi Öğretmen Adayları, Fen Eğitimi

ABSTRACT: The core purpose of this study is to examine the analogies related to science concepts developed by the pre-service science teachers and to examine these analogies taking into consideration the kinds of learning areas located in Science Education Program in terms of the structure and types of analogies. The data was collected during fall semester of 2013-2014 academic years. The sample of the study constituted 286 pre-service science teachers enrolled in third and fourth grades of Elementary Science Education Department of University of Necmettin Erbakan, Ahmet Keleşoğlu Faculty of Education (3^{rd}=147, 4^{th}=139). Because of the fact that survey was leaved empty or pre-service science teachers' analogical expressions were unsuitable, 63 pre-service science teachers' data was not analyzed. Therefore, 223 pre-service science teachers' data was analyzed for this study. Data regarding analogies was analyzed by using content analysis. Results revealed that pre-service science teachers developed analogies in Science Education Program in four different learning areas. It is found that pre-service science teachers developed analogies mostly in "live and life" learning area. It is also revealed that in terms of the types of the analogies pre-service science teachers developed mostly functional, verbal, concrete-abstract and simple analogy. In addition to all these, it is also found strategy identification and the limitations of the analogy. As a result, pre-service science teachers' analogies are limited in terms of their target concept's content and the structure and type. To supply this diversity, different applications should be conducted.

Keywords: Analogy, Pre-service Science Teacher, Science Education

Mehmet Şen
Middle East Technical University
msen@metu.edu.tr

The purpose of this study is to portray in-class implementations of in-service science teachers from the eyes of the pre-service science teachers. Specifically, this study examines various science teaching components such as overcoming misconceptions, assessment of science learning, integrating nature of science aspects, using different science teaching methods etc. that science teachers use during instruction. Additionally, classroom management strategies of science teachers are also included. The data are obtained from the observations of pre-service science teachers. Thirty three pre-service and thirteen in-service teachers participated in the study. The observation protocols that pre-service science teachers filled will be analyzed to document the findings. A content analysis approach and descriptive statistics were used for the data analysis. The data revealed that science teachers have low levels of PCK and they generally use traditional teaching methods, strategies and traditional assessment techniques. Their NOS understandings are limited and classroom management strategies rely on discipline.

Key words: Pre-service science teachers, in-service science teachers, practice teaching course, science teaching

INTRODUCTION

Research on PCK has been common in science education since 20 years (Abell, 2008). The term was proposed by Shulman (1986, 1987) that is special mixture of pedagogical knowledge and content knowledge where none of these two components are sufficient to be a good teacher. Therefore, it is very important to teach any specific topic by use of suitable teaching strategies and assessment techniques. Shulman (1986) also claimed that students' understandings should be cared by the teacher where teachers transform their academic science knowledge into school science.

After Shulman claimed his ideas about teaching, others proposed different explanations for their PCK views (Grossman, 1990; Cochran et al. 1993; Magnusson et al. 1999; Veal & MaKinster, 1998). Kind (2009) reported that different theoretical explanations for PCK can be categorized by two different main models in terms of transformative models and integrative models. Transformative models claim that content knowledge and PCK are different knowledge domains. According to transformative models there is a mechanism that teachers transform their content knowledge into PCK. On the other hand, integrative models see content knowledge as part of PCK. Integrative models are lack of explaining the mechanism for PCK formation. According to integrative models, PCK develops by experience.

One of the most used PCK model is the Magnusson et.al (1999) PCK model. This model was inspired by Grossman (1990) study. According to this model, PCK has five different components in terms of orientation towards science teaching, knowledge of curriculum, knowledge of learner, knowledge of assessment, and knowledge of instructional strategies. Orientation towards science is about beliefs and attitudes towards science and this component shapes and controls other PCK components.

Due to fact that PCK develops with experience and it is a dynamic knowledge domain (Abell, 2008; Aydın & Boz, 2012) pre-service teachers have little or no PCK. However, most of the PCK studies were conducted with pre-service teachers too. On the other hand, number of the PCK studies that use in-service teachers as sample were less than studies examining pre-service teachers' PCK. Comparing with pre-service teachers, in-service teachers have better PCK because of their experience.

Teacher PCK was generally little according to previous studies, therefore science educators developed tools such as content representation tools and managed professional development programs in order to increase science teachers' PCK. Professional development studies which last long term were found successful in literature.

Content knowledge and PCK are also investigated by researchers. Researchers examined the relationship between these different knowledge domains. Content knowledge has two subcomponents in terms of substantive knowledge and syntactic knowledge. Substantive knowledge is related with theories, principles, concepts and their relationship with each other. On the other hand, syntactic knowledge is related with how the scientific knowledge is gained and developed and characteristics of knowledge. Syntactic knowledge refers to nature of science (Khalick et al., 1997). Studies found different results from each other both for the relationship between substantive knowledge and PCK and syntactic knowledge and PCK. Some researchers claimed that there is a positive relationship between content knowledge and PCK, some others found blurred relationship between content knowledge and PCK, and some science educators found no relationship between content knowledge and PCK as reported in Kind (2009) study.

Finally, researchers examined the interaction between PCK components. For example, Hanuscin et al. (2010) found that teacher knowledge of learner is affected by knowledge of assessment because better assessment let teachers to understand difficult points of students' understandings. In addition, knowledge of learner affects teacher knowledge of instructional strategies directly. When teachers know students' needs better, they prefer appropriate teaching strategies for selected topic. This result showed that teachers' PCK components are closely related with each other and researchers suggested studying all components of PCK instead of focusing of only one or some components of PCK.

In line with the related literature, the aim of this study is to portray in-class implementations of in-service science teachers from the eyes of the pre-service science teachers. Specifically, this study examines various science teaching components such as overcoming misconceptions, assessment of science learning, integrating nature of science aspects, using different science teaching methods etc. that science teachers use during instruction. Additionally, classroom management strategies of science teachers are also included.

METHOD

This study is a qualitative study in nature. In order to get detailed information about the in-class implications of science teachers, pre-service science teachers have made observations during their practice teaching course. In this course, they observe mentor teachers and make several presentations throughout the semester. For the purpose of this study, they were provided with observation protocols before they go to schools for observations. Thirty three pre-service and thirteen in-service teachers participated in the study. The observation protocols that pre-service science teachers filled were analyzed to document the findings. A content analysis approach and descriptive statistics were used for the data analysis.

Data Analysis Procedure

The data is gathered from the answers of pre-service science teachers to the questions of observation protocol. Then related codes and categories were formed depending on the PCK studies found in literature. The observation protocol includes questions about science teaching orientation, knowledge of curriculum, knowledge of learner, knowledge of assessment, knowledge of instructional strategies. In addition, science teachers integrating nature of science aspects and classroom management strategies are examined.

RESULTS AND FINDINGS

Results of the study showed that 84 % of the teachers preferred teacher centered orientation to science teaching such as didactic and academic rigor. Only 24 % of teachers adopted constructivist orientation such as guided inquiry. Teachers were successful for understanding of their students' prior knowledge and misconceptions. 54 % of participants both mentioned students' prior knowledge and identified their misconceptions. On the other hand, 32 % of the participants didn't talk about student's prior knowledge and their misconceptions. Teachers were generally informed about knowledge of curriculum. For example; 42 % of them covered the objectives related with STS, SPS and content knowledge. Similarly, 42 % of the participants noted SPS and content knowledge objectives in their teaching. Another aim of this study is to understand whether teachers integrate NOS into their teaching. Findings showed that teachers either don't mention NOS by 45 % or mentioned only one or two aspects of NOS such as tentativeness, theory laden or cultural embeddedness of NOS. Teachers' teaching strategies were found parallel to their orientation towards science all of the teachers in this study preferred direct instruction and questioning. In addition, 54 % of them used experimenting and 22 % of teachers used demonstration. Few of the participants used contemporary teaching strategies such as inquiry (8 %), cooperative learning (8 %), analogy (8 %), project based learning (8 %). As their assessment techniques, teachers either didn't assess their students (38 %) or used traditional assessment techniques such as giving homework to students (62 %), making quizzes (15 %). On the other hand only few of the teachers used alternative assessment techniques correspondingly concept mapping (8 %), performance based assessment (8 %). Contextual knowledge is another aspect of this study. Pre-service teachers reported that their mentor teachers usually were not aware of the school environment, students need in and out of school as contextual knowledge. Only 42 % of the teachers were informed about the contextual factors such as school and students' parents. Final aspect of our study was based on how teachers manage their classrooms. Result of this study showed that 85 % of the teachers used strict rules for classroom management as disciplinary teachers. Moreover, 27 % of the teachers used their gestures to manage their classes. On the other hand only 30 % of the teachers were friendly towards their students to manage their classes.

CONCLUSIONS

This study aimed to portray the in-class implementations of science teachers. By examining the components of PCK it was aimed to present the current situation in terms of teaching science. In conclusion, this study showed that teachers were insufficient for their PCK in general depending on their orientation towards science, knowledge of curriculum, knowledge of assessment and knowledge of instructional strategies. In addition, these teachers were not successful to transform their NOS views into their teaching. Teachers' contextual knowledge and classroom management skills were also found inadequate depending on the views of pre-service teachers.

RECOMMENDATIONS

According to the finding of the study participating science teachers have little PCK. Therefore, programs that can develop their PCK may be beneficial. Additionally, workshops and end-of-semester seminars may be designed to foster their PCK. In terms of their classroom management strategies, teachers generally prefer to use traditional techniques. Seminars related to motivation may be useful to make teachers alter their discipline approach to motivating to learn science.

STUDENTS' TALK DURING COLLABORATIVE GROUP DISCUSSION

ABSTRACT: This study aimed to explore the types of talk occurring in small group discussions about digestive system. Twenty two seven-graders worked on digestive system in small groups. In order to study these particular group's interactions and how they constructed meaning as they discussed digestion, field notes, transcripts of small-group discussions and group interviews were analyzed qualitatively. The results revealed that three types of talk (exploratory, cumulative and disputational) were observed in each group in varying amounts. The comparative analysis among groups revealed that students' engaged in exploratory talk showed explicit and more sound reasoning than students' engaged in disputational or cumulative talk. The potential factors which may lead to reasoning were also explored.

INTRODUCTION

"Language is, historically and individually, the foundation of being human. And talk—direct exchange between humans who can attribute intentionality and understanding to each other—is the foundational act of language" (Resnick, Michaels, & O'Connor, 2010, p.163). Resnick et al. further stated that "without talk, minds can neither grow nor become disciplined. Without disciplined talk, scientific, mathematical, and humanistic knowledge remains static and unused" (p.163). From ancient times to present, human beings tried to understand the world, communicate with others, shared ideas, emotions, and wishes through language and talk. Dialogue and talk are inevitable in our daily lives as in classroom environments. Structured and disciplined talk can enable learners to improve their reasoning.

Mercer (1996) emphasized that talk between learners is crucial in the construction of knowledge with underlining the idea that not all kinds of talk serve for this aim. Mercer (1996) described the features of talk that contributes to solution of problems and increasing understanding among the students. Mercer stated that it is the talk in which group members present their ideas clearly and explicitly so that they can be understood and evaluated well by all group members. And it is the talk in which group members reason together, share negotiation, evaluates claims and evidences and reach a consensus on the problem. Mercer also identified three conditions required for occurrence of this kind of talk. These conditions are:

- members have to talk to accomplish task.
- activity should support working and accomplishing together rather than encouraging individualized accomplishments.
- all group members should be aware of what the purpose of the task and how they will accomplish it.

Mercer's research works for group work and collaborative activities among learners. Teacher-led whole class discussions and group interaction among learners are two main contexts in which talk and language are related to the learning in schools (Mercer, Dawes, Wegerif, & Sams, 2004). Mercer et al. (2004) stated that learning in groups provides learners with many opportunities to develop different kinds of reasoning patterns (Mercer et al., 2004). In group activities or collaborative activities, learners can display a variety of ways to describe, explain, make connections, draw conclusions, and find solutions. They can be richer in terms of higher cognitive level interactions providing sustained and active engagement in learning (Galton, Hargreaves, & Pell, 2009) but it should be noted that group interactions may not always develop learning and reasoning if the conditions mentioned above are not satisfied. Learners can be off-task easily, uncooperative, and disruptive (Galton & Williamson, 1992).

Three ways of talking during collaborative group activities were identified as exploratory talk, disputational talk, and cumulative talk (Mercer, 1996). Exploratory talk is defined as

> a joint, co-ordinated form of co-reasoning, in which speakers share relevant knowledge, challenge ideas, evaluate evidence, consider options, and try to reach

> agreement in an equitable manner. By incorporating both constructive conflict and the open sharing of ideas, exploratory talk constitutes the pursuit of rational decision-making through dialogue. It depends not only upon the establishment of trust amongst partners, but also on the kind of intersubjectivity that enables them to achieve a shared understanding of the task in hand (Mercer, 2008, p. 95).

Disputational talk is portrayed by disagreement and individual decision making rather than sharing ideas, discussing alternatives and making decision as a group (Mercer, 1996). Mercer identified cumulative talk as building each others' ideas uncritically resulting in the accumulation of common knowledge without challenging and discussing ideas. Repetitions, explanations, confirmations are typical characteristics of cumulative talk. Exploratory talk is the talk in which "knowledge is made publicly accountable and reasoning is more visible in the talk" when compared to the others (Mercer, 1996, p. 369). Three kinds of talk can be observed in classroom environment but the research implies that exploratory talk is the rarest but the most important one for cognitive interactions.

In light of previous research, this study aimed to explore the types of talk occurring in small group discussions about digestive system. It also explored how talk may lead to more sophisticated reasoning.

THEORETICAL FRAMEWORK

This study was based on sociocultural theory. Mercer, Wegerif, and Dawes (1999) stated three functions of language in intellectual development according to the sociocultural theory. These are language as "cognitive tool" which students use in order to process knowledge; language as "social or cultural tool" which students use to share knowledge with peers; language as "pedagogical tool" which is used to support students' cognition. Language can function as social and cultural tool among students in the collaborative group activities guided by teachers who use language as pedagogical tool. As a result students' understanding and reasoning can develop through the use of language in a social environment.

METHOD

This study included twenty two seven-graders (four groups consisting of 5-6 students) worked on digestive system, specifically on the task "what happens to the food we eat". Students were required to negotiate how different kinds of food (bread, steak, butter) are processed through digestive system. Before activity, they were told some directions. They were required to ask questions and elaborate on others' responses. The questions should be to learn about student's ideas and underlying reasoning. Students were given such directions to make group work productive to improve learning and reasoning. In order to study these particular group's interactions and how they constructed meaning as they discussed digestion, field notes, transcripts of small-group discussions were analyzed qualitatively by two independent researchers. Interviews were conducted to understand group interactions and to explore more about their reasoning as a result of collaborative work. The analysis was based on the framework developed by Mercer (1996) to evaluate talk among students. For each group discussion, episodes of different talks were identified by two independent researchers and consistency between them was ensured.

RESULTS

The analysis of group discussions revealed that the four groups displayed all kinds of talk in varying amounts. However one group was engaged in exploratory talk more during their discussions. The other three groups were mostly involved in disputational and cumulative talk. The relative percentages of talk each group displayed were given in Figure 1.

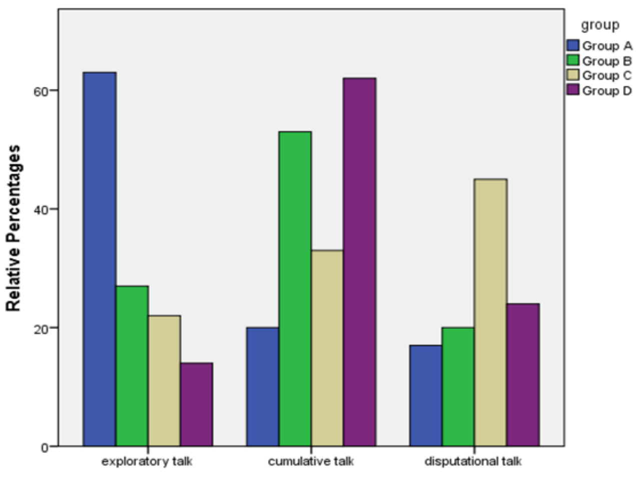

Figure 1. Comparison of Percentages of Talk Observed in each Group.

The Figure 1 reveals that Group A displayed exploratory talk considerably more than other groups (63%). Cumulative talk was mostly observed in Group B and D. More than half of discussions in Group B and D were characterized as cumulative talk. Disputational talk took place in similar percent in Group A, B, and D (around 20%). On the other hand, Group C displayed disputational talk frequently (45%). Group C is the one which was engaged in disputational talk most.

The comparative analysis among groups revealed that students engaged in exploratory talk showed explicit and more sound reasoning than students engaged in disputational or cumulative talk. The group interviews also supported that students engaged in exploratory talk displayed higher level of reasoning than other types of talk. Table 1 presents an example exploratory talk displayed in Group A.

Table 1. **An Example Exploratory Talk Observed in Group A**

Student A. Let's discuss the first one, bread. What do you think about digestion of bread?
Student B. It is digested as all foods.
Student A. But how? We should discuss this.
Student B. Ok. When we chew it, it becomes smaller.
Student C. I agree.
Student A. But being smaller means digestion?
Student C. Yes. But it is not the whole. There are some other processes.
Student B. What kind?
Student C. It goes to small intestine and is still digested there.
Student D. I have a question. Do you think it becomes even smaller in small intestine?
Student C. Umm!... should be so... I am not sure.
Student A. (Referring to student E) what do you think about it?
Student E. I think teeth help bread become smaller and saliva makes it softer but the real digestion starts in small intestine. Do you agree?
Student A. No. Saliva does not only make softer, it also includes some enzymes that start digestion of bread.
Student E. Ok. You mean that digestion starts in the mouth?
Student A. Yes but not all foods. It depends on the kind of food.
Student D. Does this mean different food requires different enzymes?
Student A. Sure, and in different digestive organs.
…

In the example above, five students focused on digestion of food. Student A started the discussion and encouraged others to present their ideas. These students not only presented their ideas but also elaborated on them. They asked questions to each other and clarified the ambiguities in the answers. This discussion helped students reason on concepts related to digestion. Student A mostly acted as a guide and helped others discuss about the topic. It was evident that this student was more knowledgeable about digestion and used his prior knowledge in the discussion.

DISCUSSION

The results revealed that three types of talk were observed in each group with different amount. The qualitative investigation of each group's discussion revealed that the group that exhibited exploratory talk showed in depth reasoning than other groups did. The students in this group asked questions which fostered further interpretation. The collaboration among them also helped the comprehension of the topic by relatively passive students. Talk, as an activity, provided opportunities for students to construct knowledge and develop reasoning with the aid of interaction with others. For group works and other collaborative activities in the classroom, talk has a potential role in contributing to the learning. Mercer (2008) stated that exploratory talk increases reasoning skills through interaction among group members who become more sophisticated users of language as a psychological tool. There are also other studies having similar findings which reveal that peer talking and discourse in the groups result in higher levels of reasoning through discussing and elaborating each others' ideas (Hogan, 2002; Mercer et al., 1999; Resnick et al., 2010). The results showed that students' knowledge about digestive system also influences the interaction and talk among them. The knowledgeable student in this group (Student A) guided the discussion and scaffolded others. This result is consistent with Vygotsky's (1978) claim that discourse and interaction among students can shape their individual mental processes. Dawes (2004) also emphasized that group talk can help learners to exchange ideas, to have access to different perspectives and to make meaning together.

ÖZET: Bu araştırma, biyoloji öğretmen adaylarının memeliler hakkındaki görüşlerini belirlemek amacıyla yapılmıştır. Çalışma grubu, Balıkesir Üniversitesi Necatibey Eğitim Fakültesi Biyoloji Öğretmenliği 2. sınıfta öğrenim gören 23 öğretmen adayından oluşmaktadır. Veriler, 6 açık uçlu sorudan oluşan Memeliler Anketi ile toplanmıştır. Veriler, içerik analizi tekniğine göre analiz edilmiştir. Elde edilen sonuçlara göre, biyoloji öğretmen adaylarının memelileri gruplandırmada bazı sorunlar yaşadıkları gözlenmiştir. Öğrenciler özellikle gagalı memeli kavramında sorun yaşamaktadırlar.

Anahtar Kelimeler: memeliler, gagalı memeli, keseli memeli, plasentalı memeli, biyoloji öğretmen adayı

ABSTRACT: This research aimed to determine the views of prospective biology teachers about mammals. Study group consisted of 23 students who studying at the second grade of biology teaching in Necatibey Faculty of Education in Balıkesir University. Data were collected by Mamals Questionnaire icluding six open-ended questions. Data were analyzed using by content analysis technique. According to the results, it has been observed that prospective biology teachers had some problems in classification of mammals, especially regarding the concept of ornithorhynchus.

Key words: mammals, ornithorhynchus, marsupials, placental mammals, prospective biology teachers

ARGUMENTATION IN PEER-GUIDED VERSUS TEACHER-GUIDED GROUP DISCUSSIONS

Nurcan CANSIZ

Mustafa CANSIZ
Artvin Çoruh University
mustafacansiz@gmail.com

ABSTRACT: This study investigated argumentation patterns resulting in teacher-guided and peer-guided group discussions on four socioscientific-issues (SSI). Two groups, each including five students from grade 7, studied on a different SSI during four weeks. Discussions within both groups were observed, videotaped, and analyzed qualitatively. After four weeks, group interviews were conducted. The results showed that teacher-guided group presented more complex argumentation patterns than peer-guided group. Both groups supported their claims with scientific and non-scientific evidence. But teacher-guided group presented the evidence deeply. The results suggested that teachers should have the related pedagogical skills to put argumentation into practice and to explore the students' skills in constructing arguments in the context of SSI. The implications for science educators and researchers were discussed.

INTRODUCTION

It is important for individuals to be competent in science content knowledge, to have argumentation skills, and to make informed decisions to be responsible citizens which are also among the key elements of scientific literacy. Scientific literacy is defined as a multidimensional construct including "being able to use scientific knowledge and ways of thinking for personal and social purposes" (AAAS, 1990, pp. xvii-xviii). It is important to be a scientifically literate person in this century which is full of scientific and technological developments. Scientifically literate individual is the one who "use appropriate scientific processes and principles in making personal decisions" and "engage intelligently in public discourse and debate about matters of scientific and technological concern" (NRC, 1996, p. 13). To sum up, scientific literacy is related to one's knowledge about science, technology, society and the relationship between them and scientifically literate person is the one who uses her/his scientific literacy in order to make decisions for complex issues which are not only scientific but also social and technological. These issues are called as socioscientific issues (SSI) and defined as intricate and open-ended having no certain answers (Sadler, 2003). They are controversial in nature and likely cause an argument. Being questionable makes SSI debatable therefore opposing ideas emerge against those issues. Dawson and Venville (2010) emphasized that school science should focus on necessary skills, knowledge, and comprehension to deal with socioscientific issues since individuals should be able to evaluate their pros and cons, ask questions, assess the information in terms of different perspectives and finally reach balanced, reasonable, and informative decisions. In light of this, this study investigates the argumentation patterns and quality of argumentation in grade seven students' small group discussions about different SSIs with and without teacher guidance. The specific research question guided this study was: What are the argumentation patterns and the quality of argumentation within teacher-guided and peer guided small group discussions?

THEORETICAL FRAMEWORK

In this study, sociocultural approach of learning was drawn on to comprehend how students grapple with different socioscientific issues. Jimenez-Aleixandre and Erduran (2007) underlined two aspects of argumentation; justification of claims and persuading audience. The former is related to the connection between reasoning process, theoretical ideas and empirical evidence to justify the claim. The latter is what you claim and advocate by evidence aim to persuade the audience for your argument. Jimenez-Aleixandre and Erduran (2007) foreground sociocultural approach as a framework laying stress on socialization for learning and thinking through the use of language. Argumentation is a form of discourse underlying learning in social context through the interaction of learners. Sociocultural approach basically explains the mental processes in human mind with an emphasis on the relation between these processes and the context and human communicative practices instigate these processes (Wertsch, 1991). Wertsch states that this approach works for academic discussions as well as everyday events.

LITERATURE REVIEW

Argumentation is defined as a claim furnished by corroborating justification (Kolstø & Ratcliffe, 2007). Researchers studying argumentation in teaching and learning science stated that argumentation should be integrated into science education and researchers should contribute to the progress of it (i.e. Driver, Newton, & Osborne, 2000). Driver et al. (2000) argued that science is not only observation and experimentation but also includes disagreements which contribute to the construction of scientific knowledge. These disagreements result in the engagement with claims, evidence, counter claims, rebutting claims and changing hypotheses.

The related literature shows that most of the studies in socioscientific issues focused on the argumentation as a means to resolve sociosceintific issues (Jimenez-Aleixandre, Rodriguez, & Duschl, 2000; Kortland, 1996; Patronis, Potari, & Spiliotopoulou, 1999; Zohar & Nemet, 2002). Kortland (1996) studied the argumentation patterns with the middle school students in the content of environment, specifically waste management and recycling. The results of the study guide Kortland to make the conclusion that students have the ability to create a basic argument, on the other hand he reported that the arguments generated are not clear, limited and not applicable. Patronis et al.'s (1999) study revealed opposite findings to the Kortland's study. They suggested that middle school students could develop strong arguments in the context of socioscientific issues. SSI, being controversial in nature with different scientific and social dimension, is an appropriate context to engage students in argumentation. It creates such a classroom environment in which students develop claims, counter claims including evidence to justify them. Therefore classroom practices might be useful to engage students in argumentation in the context of SSI.

METHOD

This study investigated the argumentation patterns resulting in teacher-guided and peer-guided group discussions on four SSIs (hydroelectric power plant, nuclear power plant, genetically modified food, and research conducted on animals). Participants of the study were ten Grade 7 students who worked as groups of five. They studied on a different SSI each week for a total of four weeks. Discussions within both groups were videotaped, transcribed, and analyzed qualitatively. They were also observed by researchers. After four weeks, group interviews were conducted on discussions. The nature and quality of students' argumentation patterns were analyzed through Toulmin Argumentation Pattern (TAP) (Toulmin, 1958) and the analytical framework developed by Erduran, Simon, and Osborne (2004). Table 1 gives the analytical framework used in this study.

Table 1. Analytical Framework to Assess the Quality of Argumentation

Level 1	Level 1 argumentation consists of arguments that are a simple claim versus a counter-claim or a claim versus a claim
Level 2	Level 2 argumentation has arguments consisting of a claim versus a claim with either data, warrants, or backings but do not contain any rebuttals.
Level 3	Level 3 argumentation has arguments with a series of claims or counter-claims with either data, warrants, or backings with the occasional weak rebuttal.
Level 4	Level 4 argumentation shows arguments with a claim with a clearly identifiable rebuttal. Such an argument may have several claims and counter-claims.
Level 5	Level 5 argumentation displays an extended argument with more than one rebuttal.

RESULTS

In particular, we were interested in comparing the nature of arguments generated in the small groups with and without teacher guidance on different SSIs. Transcripts of two group discussions were examined for episodes of argumentation clusters. Erduran et al. (2004) defined clusters as permutations of Toulmin Argumentation Pattern such as "claim-data-warrant" or "claim-data-rebuttal". We aimed at identifying argumentation clusters and assigning levels for both type group discussions.

Teacher-guided group discussions: These discussions were guided by the teacher. The group was informed about four SSIs with short stories including a few directions about what they were required to do. Teacher asked the driving question about each socioscientific issue during discussions and let the students discuss. He did not directly state his personal ideas and thoughts and give any specific information. Instead he asked questions to clarify and elaborate on students' ideas and encouraged them to participate in discussions. The teacher was knowledgeable about argumentation and practiced it in his classes before. Therefore he did not have difficulties in guiding students to present elements of argumentation. The most evident result in teacher-guided group discussions was that students experienced a higher level of argumentation (see Figure 1). They referred to scientific evidence to support themselves in addition to the non-scientific ones. For example they referred to water cycle in supporting their claims about hydroelectric power plant. Students' lived experiences were also found to be influential in presenting their claims and evidence. In one of the discussions, for example, one student told that his relatives were forced to abandon their home due to the construction of hydroelectric power plant by the authority because their home was in that region. This student felt upset because of this and opposed to the construction of it.

Peer-guided group discussions: This group did not receive any guidance from teacher during their discussions. The group was given the same short stories as teacher-guided group about four SSIs and they were given the same directions about what they were required to do. They negotiated on each issue with their peers. The researcher observed their discussions to ensure that they were on task and there is no off-task behavior. The group members shared their ideas. However they could not elaborate on them further. The most evident result in peer-guided group discussions was that students could not experience a higher level of argumentation as in teacher-guided group discussions (see Figure 1). Similar to other group, they referred to both scientific and non-scientific evidence to support themselves. However their scientific evidence was so superficial. For example, one student supported the construction of hydroelectric power plants due to electricity production but neither he nor other group members elaborated on this.

Table 2 presents an example for how the nature and quality of arguments differed in both groups' discussions in the context of hydroelectric power plant. It was evident that teacher-guided group experienced a more sophisticated level of argumentation than peer-guided group.

Table 2. An Example Argumentation Patterns in Teacher-Guided and Peer-Guided Discussions

	Example (Level)	
	Teacher-guided	*Peer-guided*
Hydroelectric power plant	**Student A:** I think hydroelectric power plants should not be constructed because it takes water from nature and water becomes less. **Teacher:** Do you mean the amount of water in nature reduces? **Student A:** Yes. **Student B:** I do not think that water is used up [by hydroelectric power plants] and reduced. **Teacher:** What do you mean? Do you mean that hydroelectric plants do not change the amount of water in nature or they increase it? **Student B:** I think water is not used up [by hydroelectric power plants]. Those plants collect water together and let the water turn turbines through energy transformation and produce electricity. If they used up water, the amount of it in nature would not reduce	**Student F:** Hydroelectric plants are necessary because they produce electricity. **Student G:** I think so because it is also important for economical developments. **Student H:** You may be right in your views but it damages environment and ecosystem and people protest it. **Student F:** Ok it may have some disadvantageous but electricity is vital in our lives and it is more important. Can you do your homework without electricity at home (referring to Student H)? Of course no! ***(Level 2)***

because there is water cycle in nature.
(Level 4)

The chart in figure 1 shows the distribution of level of arguments which were obtained from two groups' discussions during four weeks. This chart shows that teacher-guided group performed better in terms of nature and quality of argumentation than peer-guided group. The students engaged in more sophisticated argumentation patterns when the teacher guided the discussion. Level 5 argumentation was not observed in both groups. Peer-guided group could reach level 3 argumentation at most.

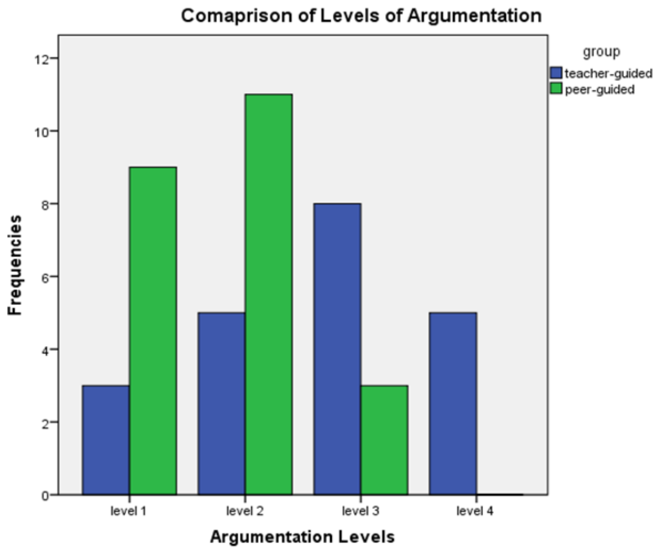

Figure 1. Comparison of Argumentation Levels for Teacher-Guided and Peer-Guided Groups

DISCUSSION

The results showed that teacher-guided group presented more complex argumentation patterns than peer-guided group (see Figure 1). Teacher-guided discussions were more informative and included high quality argumentation. Peer-guided group could not achieve complex argumentation patterns. Both groups supported their claims with scientific and non-scientific evidence. But teacher-guided group presented the evidence deeply. The teacher in this study experienced argumentation before and guided students in presenting different elements of argumentation competently. The questions he asked directed students to a more complex argumentation. In light of this, the results suggested that teachers should have the related pedagogical skills to put argumentation into practice and to explore the students' skills in constructing arguments in the context of SSI. As a result this will contribute to educating students as responsible citizens who are capable of engaging in public discussions about social issues which influences their lives.

This study will contribute to science educators and researchers' general interest in terms of argumentation and its implementation in SSI context. It will also inform them about results for teacher or peer guided group discussions.

ÖZET: Son yıllarda çevre sorunlarının insanlığın geleceğini tehdit eder boyutlara ulaşması, ekoloji biliminin önemini arttırmıştır. Ekosistemde durmaksızın süren bir madde ve enerji akışı görülmektedir. Döngünün doğal yapısının bozulmaması tüm canlılar için büyük önem taşır. Uyğarlığın ilerlemesiyle insanoğlu doğaya birçok yapay madde atmıştır. Bu maddelerin bazılarının zararsız forma dönüştürülebilmesi imkansızdır. Bunun sonucunda besin zincirinin halkalarındaki canlılarda bu maddeler birikerek hasarlara yol açmaktadır. Bu sorunların pek çok nedeni olmakla birlikte en önemli nedenin insanların çevreyi bilinçsizce kullanması gösterilmektedir. Bu açıdan bakıldığında çevrenin korunması ve kirliliğin azaltılması ancak yaşadığı çevreye karşı bilinçli, doğayı ve canlıları seven, koruyan bireyler yetiştirmekle gerçekleşebilir.

Biyoloji derslerinde yaratıcı drama güçlü bir öğretim aracıdır. Çevresel sorunlar yaratıcı drama teknikleri kullanılarak oyunsu süreçlerle canlandırılır.

Bu çalışmanın amacı, ekosistem ekolojisi ünitesindeki besin zincirleri ve besin ağları konularında hazırlanan yaratıcı drama etkinliklerinin uygulanmasına yönelik bir ders işlenişi sunmaktır. Bu şekilde konuların etkili bir şekilde öğrenileceği ve bu konu üzerinde çalışma yapan araştırmacılara faydalı olacağı düşünülmektedir.

Anahtar kelimeler: ekosistem, ekoloji, yaratıcı drama, 10. sınıf öğrencileri

ABSTRACT: As in recent years, environmental problems reach the dangerous levels for the future of human; the importance of ecological science is increased. In ecosystems the flow of unceasingly substance and energy are seen the deterioration process of natural structure carries weight with all lives. With the progress of civilization, humankind throws away lots of artificial items to the nature. It is impossible to change some of these items to harmless forms. At the end of this, lives accumulated these items result in to damage. As together with many reasons, the most important reason is displayed the unconscious usage of human. When viewed from this angle environmental protection and reduction of pollution can be actualized by training environmentally conscious, nature-loving environment, protecting individuals.

Creative drama is a powerful teaching tool in Biological lesson. Environmental problems are illustrated with playful process by using creative drama techniques.

The aim this study is to present a lesson process with implementation of Creative drama activities about food chain and food web subjects prepared in Ecology unit .Thus, it is considered that the subjects will be taught effectively and it will be useful to the researchers studying on this subject.

Key words: ecosystem, ecology, creative drama, 10 grade students

GİRİŞ

Ülkeler eğitim kurumlarını çağdaş, karar alma ve uygulama becerisine sahip, hayatı algılayabilen ve sorgulayabilen, kendine güvenen, iletişim kurma ve ekiple çalışma yönü gelişmiş, kitleleri etkileyebilen bireyler yetiştirebilmek için planlamak ve programlamak zorundadırlar (Gürol, 2003; Karakaya, 2007).

Bu zorunluluk klasik öğretim anlayışından uzaklaşılarak öğreneni merkeze alan ve öğretmeni öğrenme sürecine rehber kılan pek çok yeni öğretim yöntem ve tekniklerinin gelişmesine olanak sağlamıştır . Eğitim öğretimin sürecindeki bu yeni oluşumlardan biri de yaratıcı drama yöntemidir (Karakaya, 2007).

Yaratıcı Drama, bireylerin bir grup çalışması içinde, doğaçlama, rol oynama gibi tekniklerden yararlanarak, bir yaşantıyı, olayı, fikri eğitim ünitesini; kimi zamanda bir soyut kavramı, eski bilişsel örüntülerin yeniden düzenlenmesi yoluyla ve gözlem, deneyim, duygu ve yaşantıların gözden geçirildiği 'oyunsu' süreçlerde anlamlandırılması ve canlandırılmasıdır (San 1996).

Yaratıcı drama, temelde bireylerin birbirleriyle iletişim ve rol alma yeteneklerini barındırır. Bu yetenek, insanın doğasında var olduğuna inanılan sosyal ve duygusal özellikleri yansıtır (Wright, 2006). Öğrenme sürecinde bireyin öğrenmeyi nasıl gerçekleştireceği, ne kadar öğrendiği, ne zaman ve kimden yardım isteyeceği, öğrenme süreçleri vb. ile ilgili kararları yaratıcı drama yöntemi ile kazandırabiliriz. Geleneksel öğretimde bunların çoğuna öğretmen karar vermektedir. Yaratıcı drama yönteminde ise bu sürecin sorumluluğu öğrenendedir ve öğretici sadece yol göstericidir.

Tüm bunlar göz önünde bulundurulduğunda ortaöğretim Biyoloji dersi müfredatındaki ekosistem ekolojisi ünitesinde yer alan besin zincirleri ve besin ağları konusunun yaratıcı drama yöntemleriyle işlenmesinin öğrencilerin biyoloji konularının yaşamın bir parçası olduğunu fark etmelerini, Biyoloji dersine bakış açılarının değişmesini ve Biyoloji dersine ilgi duymalarını ve bununda daha etkili, daha kalıcı bir öğrenmeyi sağlayabileceği düşünülmektedir.

YÖNTEM

Besin zinciri ve enerji piramidi konusu ile ilgili hazırlanan yaratıcı drama etkinliği öğrencilere uygulanacaktır.

Drama Ders Planı

Ders: Biyoloji
Konu: Besin zincirleri ve besin ağları
Katımcılar:10.sınıf öğrencileri (14 kişi)
Süre: 3 saat
Yöntem ve Teknikler: Doğaçlama, Rol oynama, Hikaye tamamlama
Araç gereçler: Cd çalar, Cd, yazı tahtası, tahta kalemi, renkli kartonlar, makas, yapıştıcı, renkli elişi kağıtları, pastel boyalar
Kazanımlar:

- Besin zincirini ve besin zincirini oluşturan faktörleri kavrar.
- Besin zincirini oluşturan üretici, tüketici ve ayrıştırıcı canlıların görevlerini söyler.
- Besin ağı ile besin zinciri arasındaki ilişkiyi fark eder.
- Besin zincirindeki enerji akışını açıklar.
- Biyolojik birikimin nasıl gerçekleştiğini fark eder.

Süreç

Hazırlık –ısınma:

1. **Etkinlik**

Çember olunur müzik eşliğinde serbest yürüme etkinliği yapılır. Öğretmenin verdiği yönergeye göre herkes en yakınındaki kişi ile eşleşir. Öğretmen öğrencilere kısa bir gezintiye çıkacaklarını söyler. Gezinti sırasında eşlerden birinin gözleri kapalı olur ve diğer kişi gözleri kapalı olan arkadaşına çevresinde gördüğü resimlerden yola çıkarak bir hikaye anlatmaya başlar ve onu yürüyüş boyunca yönlendirir ve güvenliğini sağlar. Aynı uygulama diğer eş için de tekrarlanır.
Uygulama bittikten sonra anlatılan hikayeler ana hatlarıyla dinlenir. Hikayelerdeki ortak noktalar çıkarılır.
Öğretmen, öğrencilere insanların, hayvanların ve bitkilerin yaşamlarını sürdürebilmesi için nelere ihtiyaç duyduklarını sorar ve cevaplarını alarak konuya giriş yapar.
Öğretmen besin zincirinin üretici tüketici ve ayrıştırıcılardan oluştuğunu ve bu zincirde üreticiden tüketiciye doğru birey sayısının ve aktarılan enerjinin azaldığını vücut büyüklüğü ve aktarılan toksin madde miktarının arttığını anlatır.

2. Etkinlik

Öğrencilerle çember oluşturulur. Öğrencilerin her birinin boynuna bir varlığın resmi asılır. Öğrencilerden bir tanesinin eline ip yumağı verilir. Öğretmenin verdiği komuta göre öğrenci ipin ucundan tutarak yumağı ilgili kişiye atar. Yumağı tutan kişi yumağı atan kişi ile ilgili nasıl bir ilişki içinde olduğunu söyler. Etkinlik bu şekilde devam eder.

3. Etkinlik
Öğrenciler iki gruba ayrılır. Her gruba bir zarf verilir. Zarfların içinde çeşitli yönergeler vardır. Öğrencilerin yönergeleri sırasıyla takip etmeleri ve oyunu en kısa sürede bitirmeleri söylenir. Etapları en kısa sürede bitiren takım oyunu kazanacaktır.

Yönergeler
- Her grup birer sepet bulsun.
- Sepetinize çevrede bulunan 20 bitkiyi doldurun.
- Etrafta dolanan farelerden (fare resimleri) 5 tane toplayın.
- Şimdi beslenme zamanı sepetinizdeki bitkileri farelere yedirin.(bitki resimleri ile fare resimlerini bantla yapıştırın)
- Fareleri doğal ortamlarına bırakın. (dağınık şekilde)
- Şimdi yılan avına çıkıyoruz. Çevrede dolanan 5 yılan yakalayın.
- Elinizdeki 5 yılan için 10 fare yakalayın .(Her yılan resmine 2'er fare yapıştırın)
- Yılanları ormana bırakın. (dağınık şekilde)
- Şimdi kartallar belirdi etrafta bu kartallardan 3'er tane tutun.
- Kartalların karnı açıkmış. Avlanma zamanı!
- Her kartal 3 yılan avlasın. (Kartal resimleriyle yılan resimlerini yapıştırın)
- Şimdi bitiş noktasına kartallarınızı getirin.
- Kartal resimleriyle yapışık olan hayvan resimlerini çıkarın. (Her bir kartal için ayrı ayrı)
- Tüm resimlerde bulunan siyah benekleri sayın.
- Sayımı doğru şekilde ilk yapan oyunu kazanır.

Öğretmen oyundan sonra öğrencilerin düşüncelerini dinler. Daha sonra bu siyah beneklerin ne olabileceği ile ilgili tahminlerinin olup olmadığını sorar.

Ara değerlendirme
Etkinliğin sonunda söz almak isteyen öğrencilere konuşma fırsatı verilir. Öğretmen doğadaki canlıların birbirleriyle etkileşim halinde olduğunu anlatır. Besin zincirleriyle besin ağı arasındaki ilişkiyi belirtir. Besin zinciri yoluyla canlılardaki biyolojik birikimin etkilerinden bahseder.

Canlandırma

4. Etkinlik
Öğretmen öğrencilerin konu ile ilgili temel kavramları içeren resimlere tekrar göz atmasını ister. Öğrencilerden yeni öğrendikleri bilgilerle resimler arasında ilişkiler kurması ve bu ilişkileri yorumlaması istenir. Doğru yorumlamalara ulaşıncaya kadar öğretmen öğrencileri çeşitleri ipuçlarıyla yönlendirir.
Öğrencilerle çember olunur. Sırasıyla üretici-tüketici-ayrıştırıcı kelimeleri söylenerek öğrenciler üç gruba ayrılır. Her gruba farklı resimler verilir. Verilen fotoğraflara göre grupların konuyla ilgili resim, şiir ve kolaj çalışmaları yapmaları istenir. Hazırlanan çalışmalar öğretmen tarafından kontrol edilir. Gruplar çalışmalarını sergiler.

5. Etkinlik
Öğrencilerle çember olunur. Sırayla önce-sonra denilerek iki grup oluşturulur. Öğrencilere verilen fotoğraflardan yola çıkılarak öğrencilerin fotoğrafların öncesi ve sonrasını canlandırması istenir. Öğrencilere hazırlanmaları için süre verilir ve canlandırmaları izlenir.

Değerlendirme

6. Etkinlik
Öğretmen öğrencilere üzerinde "Bugün öğrendim ki ………………………………………………….." yazan kağıtları dağıtır. Bugünkü çalışmada öğrendiklerinden yola çıkarak boşlukları tamamlamaları ve daha sonra bu kağıtları duvara yapıştırmalarını söyler. Daha sonra tüm kağıtlar okunur. Çalışma ile ilgili öğrencilerin görüşleri alınır.

7. Etkinlik

Öğrenciler sırasıyla Zincir -Ağ diyerek iki gruba ayrılır. Zincir grubunun Besin piramidi oluşturmaları ağ grubunun besin ağı oluşturmaları bunları yaparken de öğrencilere verilen dergilerden gazetelerden de faydalanmaları söylenir. İki çalışmada da yapılan çalışmanın özelliklerin belirtilmesi gerektiği vurgulanır. Çalışmalar bittikten sonra her grup kendi çalışmasını sergiler.

BULGULAR

Araştırma, ortaöğretim 10. sınıf Biyoloji dersi "Ekosistem Ekolojisi " ünitesinde yürütülecektir.
Kontrol grubunu 14, deney grubunu 14 öğrenci oluşturacaktır.
Çalışma iki grupta da dersin öğretmeni olan araştırmacı tarafından yürütülecektir.
Deney ve kontrol gruplarına çalışmanın başında ön testler uygulanacaktır.
Uygulama sonunda da son testler uygulanacaktır.
Çalışmadan önce deney grubuna ders konusu dışındaki etkinliklerle yaratıcı drama hakkında bilgi verilecektir.
Yaratıcı drama etkinlikleri, ekosistem ekolojisi ünitesi kazanımlarını içerecek şekilde araştırmacı tarafından planlanmıştır.

SONUÇ

Öğrencilerin dünya hakkındaki kavramları anlama, yeni bakış açıları geliştirme ve yorumlama becerilerinin geliştirilmesinde fen öğretimi önemli bir etkendir. Fenin günlük hayatla ilişkili kısmı, sınıflarımızda ihmal edilmiş durumdadır.
Fen eğitimindeki yaparak yaşayarak öğrenme ,yaratıcı dramadaki yaparak yaşayarak öğrenme ilkesi ile bir bütünsellik içerisindedir. Çevresel sorunların çözümünde, bireylerin çevreyi tanıyıp korumalarında ve çevrenin insan hayatındaki önemini anlamaları konusunda biyoloji eğitiminin önemi büyüktür (Yüzbaşıoğlu ve Atav, 2004).
Bir öğretim yöntemi olarak yaratıcı dramanın Biyoloji dersinde kullanılmasının kalıcı öğrenmeyi gerçekleştirmede etkili olabileceği düşünülmektedir.
Biyoloji dersinde yaratıcı dramanın yöntem olarak kullanıldığı çalışma sayısı oldukça azdır. Bu nedenle yapılan bu çalışmanın alan yazınına katkı sağlayabileceği, Biyoloji öğretmenlerine yol gösterebileceği ve öğrencilerin Biyoloji dersi ile ilgili tutumlarının olumlu yönde değiştirilebileceği düşünülmektedir.

zekeriya@bilelim.net

ÖZET: Dönüşüm geometrisi öğrenirken ve öğretirken birçok zorluğun yaşandığı bir konudur. Yaşanılan zorlukların temelinde öğrencilerin yeteri kadar görsel ile desteklenmemeleri ve öğrencilerin kendi bilgilerini kendilerinin inşa edememesi yatabilir. Öğrencilerin görsel öğrenmelerine ve dönüşüm geometrisini daha etkili öğrenmelerine yardımcı olmak için Dinamik ve Etkileşimli Matematik Öğretme Programı olan GeoGebra'yı kullanarak hazırladığımız ders modelini eylem araştırması ilkeleriyle araştırdık. Çalışmamızda, verileri video kaydı ile topladık ve daha sonra verileri içerik analiz yöntemi ile analiz ettik. Analiz sonucunda bulduğumuz temalar rehberlikli öğretim, rehberlikli keşfetme (açınsama) , rehberliğin miktarı, dikkat ve etkili öğrenmedir. Başlangıçta rehberlikli öğretimin baskın olduğunu zamanla azalıp yerini rehberlikli keşfetmeye (açınsamaya) bıraktığını ve katılımın zaman içinde arttığını gözlemledik. Rehberliksiz öğretimin kavram yanılgılarına ve eksik bilgilere sebebiyet verme ihtimali olduğu için rehberlikli öğretimin olması gerektiğini destekleyen bulgulara ulaştık. Rehberlikli öğretimin yerini rehberlikli keşfetmeye (açınsamaya) bırakması ile öğrencilerin derse katılımlarının daha da arttığını ve en önemlisi onlara keşfetme imkânı bulmalarına yardımcı olduğunu gösteren ipuçları elde ettik. Bunlara ek olarak açınsamaya fırsat verildiği için etkili öğrenmenin gerçekleştiğini gözlemledik.

Anahtar sözcükler: rehberlikli eğitim, rerhberlikli keşfetme, etkili öğrenme, rehberlik miktarı ve derse katılım

ABSTRACT: Learning and teaching of transformation geometry is an issue that has many challenges One reason of the case could be that in the class they have limited access to visual learning. Other reason could be that students lack constructing their own knowledge even if they have opportunities to interact with visual materials. In order to help students improve visual thinking and better learn transformational geometry we prepared lesson model using a Dynamic and Interactive Mathematics Learning software GeoGebra. We used action research method. Data was collected by videotaping and analyzed qualitatively. After analyzing, we found guided instruction, guided exploration, effective learning, amount of guidance and involvement. At the beginning we found that guided instruction was dominant in time it decreased and guided instruction increased. By this, we got that students' involvement increased and most importantly we obtain that students can get opportunity to explore and effective learning.

Key words: guided instruction, guided exploration, effective learning, amount of guidance and involvement

GİRİŞ

Kişisel deneyimlerimiz göstermektedir ki, dönüşüm geometrisinin geleneksel sınıf ortamlarında öğrenilmesinde ve öğretilmesinde birçok sorunlar yaşanmaktadır. Öğretmenlerin yaşadıkları zorluklar çizimlerinin hatalı olması, çok fazla çizim yapılamaması ve öğrenme zamanının yeterli olmamasıdır. Yani, öğrenciler görsel olarak yeterince desteklenmemektedirler ve dolayısıyla öğrenciler kendi bilgilerini inşa etme imkânı bulamamaktadırlar. Yapılan araştırmalar Dinamik Etkileşimli Öğrenme Ortamları (DIMLE) (Karadağ, Martinovic, & Freiman, 2011; Martinovic, & Karadağ, 2012) sunan yazılımların öğretmenlere bilgiyi keşfettirecek ve görselliği sağlayabilecek etkinlikler tasarlama imkânı verdiğini belirtmiştir. Bu programlar geometriyi statik bir yapı olan kâğıt - kalemden kurtarır ve dinamik hale getirerek öğrencilerin varsayımda bulunmalarına öğrencilerin varsayımda bulunmalarına, teorem ve ilişkileri keşfetmelerine ve bunları test etmelerine imkân sağlar (Güven, 2002)

DIMLE matematik öğrenimini geliştirmek için tasarlanmış Cabri, Geometer's SketchPad, Fathom, GeoGebra, Geocadabra gibi yazılımları içerir. Bu yazılımların özellikleri matematiksel nesnelerin oluşturulacağı ortamlar ve bu nesneler ile özgürce etkileşim kurabilme imkânı sağlamalarıdır. Nesnelerin özelliklerini değiştirilerek özellikler arasındaki ilişkilerin açınsanmalarına fırsat sunarlar. Daha da önemlisi bu programlar birçok matematiksel ifadeyi görselleştirir. PME-NA 2011 de DIMLE' nin öne çıkan özelliklerinin dinamik ve etkileşimli olduğu ifade edilmiştir. Dolayısıyla bu özellikler matematiği daha iyi öğrenme ve anlama imkânı verir. (Hoyles & Noss, 2009). Bunların yanında DIMLE' nin sunduğu öğrenme türleri ise görsel, açınsayarak ve dinamik öğrenmedir. (Karadağ, Aktumen, 2013)

YÖNTEM

2.1. Araştırmanın Modeli

Eylem araştırması (Yıldırım & Şimşek, 2013, s.84) uygulamada ortaya çıkan sorunların anlaşılmasına ve çözülmesine yönelik uygulayıcıların uygulama süreçlerini çalışmasını içerdiğinden bu çalışmada nitel araştırmanın bir deseni olan eylem araştırması kullanılmıştır.

2.2. Araştırmanın Örneklemi

Araştırmanın örneklemini Bayburt iline bağlı bir taşımalı bir köy okulundaki yedinci sınıf öğrencilerinden seçilen beş öğrenci oluşturmaktadır.

2.3. Veri Toplama Araçları ve İşlem

Dinamik ve Etkileşimli Öğrenme Ortamı olan GeoGebra kullanılarak çalışma yaprakları hazırlanmış, bu çalışma yapraklarını kullanacakları ders modeli hazırlanmış ve her öğrenciye bireysel olarak kullanabilecekleri bilgisayarlar verilmiştir. Ders video kamera ile kayıt altına alınmıştır.

2.4. Verilerin Analizi

Bu çalışmada amacımız topladığımız verileri açıklayabilecek kavramlara ve ilişkilere ulaşmak olduğundan analiz yöntemi olarak içerik analizi kullandık.

BULGULAR

GeoGebra ile hazırlanmış çalışma yaprakları ile oluşturulan ders video kaydına çekilip, bu video kaydı Word belgesine aktarılmış ve aşağıdaki temalar elde edilmiştir. Temalar ve temaların elde edildiği bilgiler aşağıda sırası ile verilmiştir.
Çalışmanın yapıldığı okulun köy okuludur. Dolayısı ile öğrenciler köy çocuklarıdır. Bunlara ek olarak öğretmenleri birçok öğrencilerin sosyoekonomik durumlarının düşük olduğunu bu sebeple birçoğunun bilgisayarı olmadığını ifade etmiş. Öğretmenleri çoğunun bilgisayar kullanmaya karşı korkularının olduğunu hatta öğrencileri seçerken bazılarının bilgisayar kullanmayı bilmediklerini ifade ederek bu çalışmaya katılmamış veya katılmamak istediklerini belirti. Bunlara ek olarak bu öğrenciler ilk defa bir derste bilgisayarı kendileri kullanarak bir şeyler öğrenmeye çalıştılar. Bu nedenlerden dolayı öğretmen öğrencilerin korkularını kırmak ve derse adapte olmaları için dersin başında rehberlikli öğretim kullanmıştır.

Öğretmen: I noktasını(simetri doğrusu) yakınlaştırıp uzaklaştırdığım da ne gibi bir değişiklik meydana geliyor?
Kemal: Birbirlerine yakınlıkları
Öğretmen: Yakınlaştırdığımda ne oldu?
Kemal: Şekiller birbirine yakınlaştı
Öğretmen: Uzaklaştırdığımda
Kemal: Uzaklaştı
Öğretmen: İkisi de aynı oranda uzaklaştı
…
Öğretmen: Şekil üzerinde başka noktalara da bakalım. Örneğin; A noktası. A noktasının doğruya olan uzaklığı kaç birim?
Öğrenciler: İki birim
Öğretmen: A noktasının simetrisi neresi gizem?
Gizem: A1 noktası
Öğretmen: A1 in doğruya olan uzaklığı kaç birim?
Gizem: İki
Öğretmen: Buradan nasıl bir sonuç çıkarabiliriz? Uzaklıklar?
Öğrenciler: Değişmiyor

Öğretmen: Şeklin gerçeğinin doğruya olan uzaklığı ile simetrisinin doğruya olan uzaklıkları
Sibel: Değişmiyor.

Öğretmen öğrencilerin bilgisayarı kullanmaya alıştıklarını fark ediyor ve öğrencilerin açınsamalarına fırsat vermek için rehberlikli eğitimin miktarını azaltıyor. Öğrenciler yetiştikleri kültür itibarı ile kendi kendilerine açınsamaya alışık olmadıkları için öğretmenleri rehberlikli keşfetme yöntemini seçiyor.

Öğretmen: B harfinin yatay simetrisi var. Peki, Samet dikey simetrisi var mı?
Samet: ?
Öğretmen: Dikey doğrunu hareket ettirdiğinde B harfini simetrik olarak iki eş parçaya bölüyor mu?
Samet: Bölmüyor. O zaman B harfinin dikey simetrisi yoktur demi hocam?
Öğretmen: Evet
…
Öğretmen: S harfinin simetri doğrularını bulalım Abdülmecit
Abdülmecit: S harfinin simetri doğrusu yoktur.
Samet: Vardır.
Öğretmen: Göster bize simetri doğrusunu Samet
Samet: (dikey doğruyu S harfinin ortasına yerleştirir)
Öğretmen: Simetri doğrusu mu?
Samet: Evet
Öğretmen: Üst taraftaki uç noktasının karşıda görüntüsü var mı?
Samet: Yok, alt taraftaki uç noktasının da diğer tarafta görüntüsü yok. Yatay simetrisi de yoktur.

Öğretmen: Kemal S harfinin simetri doğrusu var mı?
Kemal: (dikey doğruyu S harfinin ortasına getirerek) var öğretmenim
Öğretmen: simetri doğrusunu ayna gibi düşünürsek kemal S harfinin üst uç kısmının görüntüsü karşı tarafta nerde olmalı?
Kemal: (simetriği olan yeri gösterir)
Öğretmen: Peki görüntü orda mı?
Kemal: Hayır öğretmenim
Öğretmen: S harfinin alt uç kısmının görüntüsü nerde olacak?
Kemal: (simetriği olan yeri gösterir) ama burada değil yansıması
Öğretmen: Dikey simetrisi var mı?
Kemal: Hayır
Öğretmen: Kemal S harfinin yatay simetrisi var mıdır? Bakar mısın?
Kemal: (yatay doğruyu S harfinin ortasına getirir) öğretmenin yatay simetrisi var
Öğretmen: Kemal doğruyu ayna olarak düşün ve S harfinin uç noktalarına bak simetrikler mi?
Kemal: Evet simetrikler
Öğretmen: Üstteki uç noktanın simetrisini gösterebilir misin?
Kemal: (alttaki uç noktayı gösterir)
Öğretmen: Kemal sen aynaya baktığında kafanı ayaklarının olduğu yerde mi görüyorsun yoksa kafanın karşısında mı?
Kemal: Karşısında.
Öğretmen: (S harfinin uç noktalarını harflendirir) C noktasının görüntüsü nerde olur?
Kemal: (noktanın simetriği olan yeri gösterir) ama burada değil. S harfinin yatay simetrisi yoktur öğretmenim.

Öğretmen: E ve M harflerinin doğruları hareket ettirerek simetri doğrularını bulun.
Sibel: E harfinin yatay simetrisi var
Gizem: M harfinin dikey simetrisi var

Yukarıdaki diyalogları incelediğimizde rehberlikli eğitimin yerini rehberlikli açınsamaya (keşfetmeye) bırakması ile beraber öğrencilerin derse olan katılımlarının da arttırdığı görülmüştür. Bunlara ek olarak yukarıdaki diyaloglar rehberlik miktarının öğrencilerin ihtiyacına göre değişeceğini de göstermektedir.

Dersin sonunda öğretmen ufak bir değerlendirme yapmak için simetri ile ilgili hazırlamış olduğu etkinlik kâğıdını dağıtmış ve öğrencilerden bireysel olarak soruları cevaplamalarını istemiştir.
Öğretmen: İkinci soruyu kim okuyup cevaplıyor?
Sibel: Aşağıda verilen simetrilerden hangisi doğrudur? A şıkkı öğretmenim
Öğretmen: Başka bir fikri olan var mı?
Gizem: A

Samet: A
Abdülmecit: A
Kemal: C
Öğretmen: Hep beraber bakalım her iki şıkka da. A şıkkı doğru. C şıkkı da doğru. Soruda bir yanlışlık mı var?
Kemal: hayır öğretmenim A şıkkında ayva kelimesinin yansımasında a ve v harfleri doğru yansıtılmış olmalarına rağmen y harfi doğru yansıtılmamıştır.

Yukarıda Kemal' in simetriyi anlamakta zorlandığı ve öğretmenin ona fazlaca rehberlik yaptığı görülmüştür
Dersin sonunda yapılan etkinlikte ise diğer arkadaşlarının ve hocasının göremediğini Kemal fark etmiş ve açıklamıştır. Öğretmeni ile olan görüşmemizde dört hafta sonra yapılan simetri etkinliğinde de bu beş öğrencinin doğru sayılarının fazla olduğu Kemal' in ise soru kaçırmadığını ifade etmiştir. Bu ifadeler de bize etkili öğrenmenin gerçekleştiğini ifade etmiştir.

SONUÇ

Öğrencilerin bilgisayar kullanmaya olan tutumlarından ve derste ilk defa bilgisayar kullanmalarından dolayı öğretmen rehberlikli eğitim kullanmıştır. Dersin başlarında rehberlikli eğitim kullanılması öğrencilerin korkularını azaltmış ve öğrencilerin derse olan motivelerini arttırdığı gözlemlenmiştir. Fakat derse katılımı arttırmadığından, ilerleyen aşamalarda da kullanılması dersi öğrenci merkezli yapmayacağından, derse olan ilgiyi azaltabileceğinden ve açınsama imkânı vermediğinden rehberlikli eğitimin yerini rehberlikli keşfetmeye bırakmış olması olumlu sonuçlara sebep olmuştur. Derse katılımı artmış ve (Gravemeijer, 1998) var olan bilgiyi keşfetme imkânı elde etmişlerdir. Kirschner' in (2006) belirttiği gibi rehberliksiz keşfetme kavram yanılgılarına ve eksik bilgilere sebep olabileceğinden ve yetişmiş olukları kültürün açınsamaya açık olmamasından dolayı ders boyunca rehberlikli keşfetme devam edilmiş fakat bireysel farklılıklardan dolayı her öğrenciye aynı miktarda rehberlik yapılmamıştır. Bu bilgi bize öğretmenin yapacağı rehberlik miktarını ayarlaması için öğrencilerini çok iyi tanıması gerektiğini söylemektedir. Aynı zaman da açınsama ile öğrendikleri için etkili öğrenmeyi gerçekleştirilmiştir. Bunlara ek olarak bu öğrenciler daha sonraki derslerini de bu şekilde işlemek istediklerini öğretmenlerine söylemişler, bu da onların bilgisayar kullanmaya olan korkularının kırıldığını göstermiştir.
Yapmış olduğumuz çalışma yapacağımız çalışmanın pilotu olduğundan sadece simetri konusu ele alınarak yapılmıştır.

ÖNERİLER

Öğrencilerin bilgisayar kullanmaya karşı olumsuz bir tutumları var ise dersin başlarında rehberlikli eğitim kullanılmalı fakat bu süre uzun tutulmamalıdır. Öğrencilerin yetişmiş olduğu kültüre ve öğrencinin bireysel özelliklerine göre rehberlikli ve rehberliksiz keşfetmeden uygun olan seçilmelidir. Öğrencilerin açınsamalarına yardımcı olmak ve etkili öğrenmeyi gerçekleştirmek için DIMLE yazılımları derslerde ve yapılan etkinliklerde kullanılmalıdır.

ÇEVRE EĞİTİMİ PROJESİNİN[1] ÖĞRENCİLERİN BİLİŞSEL YAPILARI ÜZERİNE ETKİSİ

Doç. Dr. Sacit KÖSE
Pamukkale Üniversitesi, Eğitim Fakültesi, Biyoloji Eğitimi ABD
sacitk@pau.edu.tr

ÖZET: İçinde bulunduğumuz yüzyılın en büyük sorunların biri de hiç şüphesiz çevre ve çevre kirliliğidir. Bu sorun ülkemizde de her geçen gün istenmedik boyutlara ulaşmaktadır. İnsanoğlunun yaşam biçimi, doğal kaynakları sınırsız ve dikkatsiz bir şekilde kullanması, atıkların bilinçsizce çevreye atılması ve eğitimsizlik bu sorunun temel nedenleri olarak karşımıza çıkmaktadır. Bu sorunun farkına varıp çözümler üretelebilme ancak iyi bir çevre eğitimi ile mümkün olacaktır. Bu çalışma; TÜBİTAK 4004 - Doğa Eğitimi ve Bilim Okulları proje grubunda yer alan 113B141 nolu "Çevre Dedektifi Horoz İş Başında -2" isimli projenin, 5. sınıf öğrencilerinin içinde yaşadıkları çevre ve çevre sorunlarına yönelik bilişsel yapıları üzerine etkisini belirlemek amacıyla yapılmıştır. Çalışmada deneysel desenlerden "Tek grup ön test-son test modeli" kullanılmıştır. Çalışma grubunda, Denizli il merkezindeki bir okulda 5. sınıfa geçen 25 öğrenci, velileri ve iki sınıf öğretmeni yer almıştır. Projede öğrencilerin yaparak-yaşayarak ve eğlenerek öğrenmelerini sağlamak amacıyla, seviyelerine uygun olarak hazırlanmış çevre ve çevre sorunlarına yönelik 45 etkinlik farklı öğretim yöntemleri (senaryo, oyun, gezi-gözlem, deney) kullanılarak gerçekleştirilmiştir. Çalışmada öğrencilerin çevre ve çevre sorunları ile ilgili bilişsel yapılarını ve bundaki değişimi belirlemek amacıyla kelime ilişkilendirme testi proje başında ve sonunda ön test ve son test olarak uygulanmıştır. Bu testi oluşturmak amacıyla konulara uygun 11 tane anahtar kavram (çevre kirliliği, erozyon, toprak kirliliği, atık pil, geri dönüşüm, su kirliliği, hava kirliliği, çöp, sera etkisi, asit yağmuru, enerji) seçilmiştir. Bu kavramlar konunun üzerine inşa edildiği ve konu için en önemli olduğu düşünülen kavramlardır. Elde edilen bulgular, proje uygulandıktan sonra tüm anahtar kavramlarla ilişkilendirilen cevap kelimelerin sayısında büyük oranda artış olduğunu göstermiştir. Ayrıca ön testte görülen kavram yanılgılarının belirli oranda son testte giderildiği belirlenmiştir. Çalışma sonunda, uygulanan çevre eğitimi projesinin öğrencilerin anlamlı öğrenmelerine katkıda bulunduğu ve bilişsel yapılarını geliştirdiği sonucuna varılabilir. Bu sonuç yürütülen projenin etkililiğini ortaya koymaktadır.

Anahtar sözcükler: çevre sorunları, çevre eğitimi, proje, bilişsel yapı, 5. sınıf öğrencileri

sedefcelik@artvin.edu.tr

Features expected from individuals by today's world, which keeps step with scientific developments, changes day by day. It becomes more important to adapt and use acquired information in daily life and individuals who are equipped with interpretation, analysis, problem solving abilities are needed more. This situation is reflected to education programs, and it is seen that at the end of learning process, students are expected to have mental process skills. It is possible to gather these significant points under the title of 'literacy'. It is known that the meaning of the concept of literacy has been broadened and today literacy means having the above mentioned abilities besides acquiring reading-writing skills. When it is thought that learning occurs in different disciplines, branching of the concept of literacy specifically in some disciplines becomes inevitable. Computer literacy, mathematics literacy, television literacy, science literacy and visual literacy are some of these branches. This research focuses on visual mathematics literacy, which is the intersection of mathematics and visual literacy and the goal of this research is to analyze visual mathematics literacy levels of classroom teacher candidates.

The research is designed as a survey model. Participants of this research are 2nd grade students in Education Faculty, Classroom Teaching Department of a university in Eastern Black Sea Region. They are determined as candidate teachers who take the lessons of Basic Mathematics-, Basic Mathematics-2.

Data are obtained through ten open ended questions which are prepared according to the Mathematics I or II classes topics' learning outcomes that are proper for determining mathematics visual literacy; expert opinions on these questions are taken. After the pilot study, aiming at determining if questions are clear and understandable, 1 question is removed from the study. Reliability of the study is attempted to be ensured by analyzing separately by two researchers with the help of evaluation form prepared by researchers. According to the obtained data, it can be said that, preservice elementary teachers can not completely and accurately express visual mathematic expressions verbally as they can not use the mathematical terminology successfully.

Key Words*:* Visual Mathematics Literacy, Mathematical Literacy, Mathematical Expression, Classroom Teacher Candidates

ÖZET: Bu araştırmanın amacı ilköğretim matematik öğretmen adaylarının lisans düzeyinde aldıkları lineer cebir dersine yönelik teknoloji destekli çoklu temsil temelli bir öğretim uygulaması hazırlamaktır. Çalışma, Dokuz Eylül Üniversitesi, Buca Eğitim Fakültesi, İlköğretim Matematik Öğretmenliği Bölümü'nde öğrenim görmekte olan 45 öğretmen adayı ile gerçekleştirilmiştir. Bu öğretim uygulamasında, çoklu temsil temelli öğretime uygun olarak bilgisayar ortamında hazırlanan videolar ve derse ilişkin konu anlatımı kaynakları uzaktan eğitimde kullanılmak üzere öğrencilere internet üzerinden erişime açılmıştır. Öğrencilerin sistemdeki kaynakları incelemeleri için belirtilen süre sona erdikten sonra, kararlaştırılan zaman diliminde internet ortamında uzaktan eğitim ile öğrencilerle birlikte dersin işlenişi gerçekleştirilmiştir. Bu öğretim uygulaması sonucunda, teknoloji destekli çoklu temsil temelli öğretimle lineer cebir dersinin uzaktan eğitim ile başarılı bir şekilde uygulanabileceği görülmüştür. Ancak uzaktan eğitim sırasında tüm öğrencilerin derse katılımını sağlama sürecinde bazı güçlüklerin yaşanabileceği tespit edilmiştir.

Anahtar sözcükler: uzaktan eğitim, çoklu temsil temelli öğretim, teknoloji destekli eğitim, lineer cebir öğretimi, ilköğretim matematik öğretmen adayı

ABSTRACT: The purpose of this study was to prepare and implement an application of the technology–assisted multiple representation-based instruction for linear algebra that primary mathematics pre-service teachers take at undergraduate education. The study was performed with 45 pre-service teachers receiving education at Dokuz Eylul University, Faculty of Education, Department of Primary Mathematics Education. In this education mode, videos prepared in accordance with multiple representation-based instruction in computer environment and resources related to the lessons uploaded to internet to be used in distance education. After the expiration of the time given students to examine the resources in the distance education environment, the linear algebra course was carried out with pre-service students via distance education environment at the appointed time. As a result of this education mode, it was seen that linear algebra course can be successfully carried out via the distance education. On the other hand, it was determined that teachers can have some difficulties about the students' participation of the distance education course.

Key words: distance education, multiple representation-based instruction, technology-assisted education, linear algebra teaching, primary mathematics pre-service teachers.

GİRİŞ

Temsil kavramı matematik eğitimindeki etkisi ve önemi üzerinde durulan bir terimdir. Temsil, herhangi bir matematik probleminin, çeşitli zihinsel faaliyetler sonucunda ilk olarak zihinde sonrasında, eylemsel olarak farklı bir yolla ifade edilmesidir. Temsiller temel olarak iç ve dış temsil olmak üzere ikiye ayrılır. İç temsil, bilişsel süreç sonunda zihinde oluşturulan sembollerdir. Dış temsil ise oluşturulan iç temsilin davranışa dönüştürülmesiyle elde edilen sembollerdir. Bireylerin oluşturdukları iç temsiller doğrudan değerlendirilemez, ancak oluşturulan dış temsiller yardımıyla değerlendirilebilirler. Bu nedenle yapılan araştırmalarda dış temsiller ele alınmaktadır. Matematik eğitiminde kullanılan dış temsille karşılaştırıldığında, birden çok dış temsilin aynı durumda birlikte kullanılması (çoklu dış temsiller (ÇDT)) öğrenme düzeyini arttırabilir ve eğitimi daha da zenginleştirmektedir.

Matematik eğitiminde ÇDT kullanılması öğrenme kalitesini arttırır. Matematiksel kavramları anlamlandırma, birbiriyle ilişkilendirme ve etkili bir şekilde kullanabilme, ÇDT kullanabilme ve aralarındaki geçişleri yapabilmeyle yakından ilişkilidir (Bossé, Adu-Gyamfi ve Cheetham, 2011). ÇDT ile zenginleştirilmiş matematik öğretimi uygulamalarında öğrencilerin başarıları artar (Akkuş Çıkla, 2004). Öğrenmede çoklu temsile yer verilmesi öğrencilerin matematiğe olan ilgisini arttırır (Durkaya, 2011). Öğretmenler ders zamanından tasarruf sağlar, daha çok çeşitteki temsillere yer verirler, kalan zamanda öğrenciler temsiller arasındaki bağları kurma ve analizleri yapma ile ilgilenebilirler, ayrıca teknoloji destekli temsillerle biçimlendirici değerlendirme yapabilirler (Fraser, 2010).

Öğretmenler çoklu temsilleri içeren çeşitli tekniklerle ders işlenişini gerçekleştirmeli, öğrencilerin temsillerle pratik yapmalarına olanak sağlamalı, öğrencilerin çoklu temsilleri düşünme, açıklama ve değerlendirme için bir araç olarak görmelerini sağlamalıdır (Pape ve Tchoshanov, 2011). Öğretmenler, öğrencilerin matematiksel kavramları daha iyi öğrenmesi ve matematiksel süreçlerde bilinçli ve akıcı hareket edebilmesi için, çoklu temsiller arasında bağlantılar kurulabilecek fırsatlara sahip olan öğrenme ortamları tasarlamalıdır (Wood ve diğ., 2007).

Öğrencilerin matematik başarılarını artırmanın anahtarlarından biri ÇDT' dir. Öğrencilerin ÇDT kullanım becerilerine sahip olması için, onlara matematik eğitimini verecek olan öğretmenlerin ÇDT konusunda tam donanımlı olması ve ÇDT'yi matematik eğitiminde uygun şekilde kullanma becerilerine sahip olması gerekir. Ancak yapılan araştırmalar sonucunda öğretmen adaylarının ÇDT ve kullanımı konusunda sınırlı bilgi ve becerilere sahip oldukları görülmektedir. Bunun yanı sıra öğretmen adaylarının ÇDT ile ilgili becerilerini arttırmaya yönelik yapılan çalışmaların az olduğu tespit edilmiştir. Bu nedenle bu çalışmanın amacı, öğretmen adaylarının ÇDT bilgilerini ve ÇDT kullanım becerilerini arttırmayı sağlayacak örnek bir öğretim uygulaması hazırlamaktır.

TeÇoLi: Teknoloji Destekli Çoklu Temsil Temelli Lineer Cebir Öğretimi Uygulaması

TeÇoLi İlköğretim Matematik Öğretmenliği Bölümü'nde ikinci sınıfta alınan Lineer Cebir dersi konularından ortagonallik ve ortanormallik, Gram-Schmidt yöntemi konuları temel alınarak hazırlanmıştır. Uygulama konuya ilişkin hazırlanan sunum, cebirsel, sözlü ve grafik temsiller (bilgisayar cebir sistemiyle hazırlanan 2 ve 3 boyutlu grafikler) ile zenginleştirilmiştir. Grafik temsillerin hazırlanmasında Mathematica ve GeoGebra yazılımları kullanılmıştır. Bilgisayar ortamında hazırlanan materyaller, yine bilgisayar ortamında araştırmacı tarafından sağlanan sesli konu anlatımı desteğiyle sunum ve grafik temsiller kullanılarak video formatında kaydedilmiştir. Hazırlanan tüm ders videoları, yazılımlarda hazırlanan grafik temsiller, konu anlatım sunumları, Dokuz Eylül Üniversitesi Uzaktan Eğitim Uygulama ve Araştırma Merkezi (DEUZEM) tarafından sağlanan DE-OYS uzaktan eğitim ortamına yüklenmiştir. DE-OYS aracılığıyla ilgili ders konularının cebirsel temsilleri içeren sunumlar ve grafik temsilleri içeren yazılımlarda hazırlanan uygulamalar ve sözlü temsili içeren videolar internet üzerinde öğrencilerin erişimine açılmıştır. Sistemde bulunan matematik yazılımlarıyla hazırlanmış grafik temsilleri yardımıyla öğrencilere temsilleri farklı temsillere dönüştürme şansı verilmiştir. TeÇoLi' deki grafik temsilleri üzerinde değişiklik yaparak elde edilecek farklı temsillerin konuyu öğrenme seviyesini olumlu yönde etkileyeceği düşünülmüştür.

Öğrencilere ilgili konunun haftasında, konuya ilişkin dosyaların erişimi sağlanmıştır. Belirlenen gün ve saatte ise sistemdeki kaynakları önceden taramış olan öğrenciler ve araştırmacı uzaktan eğitim platformunda bir araya gelerek anlaşılmayan noktaları, dersin sistemindeki kişiler tarafından görülen bir sohbet ortamında tartışmışlardır. Ayrıca öğretmen adayları ve araştırmacı sınıf ortamında bir araya gelerek işlenen konuları tekrar gözden geçirmişlerdir.

TeÇoLi de Kullanılan Cebirsel Temsil

Araştırmada ele alınan ortagonallik-ortanormallik ve Gram-Schmidt ortanormalleştirme yöntemlerinin doğası gereği, çalışmada cebirsel temsile yer verilmiştir. Cebirsel temsile, gerek hazırlanan sunumda gerekse de kullanılan yazılımlarda yer verilmiştir. Şekil 1 de gösterildiği üzere cebirsel temsiller vektör kümelerinin ortagonallik-ortanormallik testinde ve Gram-Schmidt ortanormalleştirme yöntemlerinin vektör kümelerine uygulamalarında kullanılmıştır.

Örnek 1:

$\mathbb{R}^2$ de $S = \{u_1 = (1,3), u_2 = (2,-1)\}$ tabanı yardımıyla $\mathbb{R}^2$ nin herhangi bir ortanormal tabanını bulunuz.

Çözüm: (2. Temsil)

$K = \{v_1, v_2\}$ ortagonal tabanı olsun.

$v_1 = (1,3)$ olsun.

$v_2 = u_2 - \frac{<u_2,v_1>}{<v_1,v_1>} v_1 = (2,-1) - \frac{<(2,1),(1,3)>}{<(1,3),(1,3)>}(1,3) = (2,-1) - \frac{-1}{10}(1,3) = \left(\frac{21}{10}, \frac{-7}{10}\right) = \frac{7}{10}(3,-1)$

$< u, v >= 0$ ve $< u, r.v >= 0$ olduğundan

$< v_1, v_2 >=< (1,3), \frac{7}{10}(3,-1) >= 0 =< (1,3), (3,-1) >$ dır ve $v_2 = (3,-1)$ alınabilir.

$K = \{v_1 = (1,3), v_2 = (3,-1)\}$ ortagonal tabandır. Buradan;

$L = \left\{\frac{1}{\|v_1\|}v_1 = l_1, \frac{1}{\|v_2\|}v_2 = l_2\right\} = \left\{\frac{1}{\sqrt{10}}(1,3), \frac{1}{\sqrt{10}}(3,-1)\right\}$ ortanormal taban elde edilir.

Şekil 1. R^2 de Herhangi Bir Tabana Uygulanan Gram-Schmidt Yönteminin Cebirsel Temsili

$K = \{v_1, v_2, v_3\}$ ortagonal taban olsun.

$v_1 = u_1 = (1,3,1)$ olsun.

$v_2 = u_2 - \frac{<u_2,v_1>}{<v_1,v_1>} v_1 = (2,2,0) - \frac{<(2,2,0),(1,3,1)>}{<(1,3,1),(1,3,1)>}(1,3,1) = (2,2,0) - \frac{8}{11}(1,3,1) = \left(\frac{14}{11}, \frac{-2}{11}, -\frac{8}{11}\right) = \frac{2}{11}(7,-1,-4)$

$v_2 = (7,-1,-4)$ olarak alabiliriz.

$$v_3 = u_3 - \frac{<u_3,v_1>}{<v_1,v_1>}v_1 - \frac{<u_3,v_2>}{<v_2,v_2>}v_2 = (-1,0,2) - \frac{<(-1,0,2),(1,3,1)>}{<(1,3,1),(1,3,1)>}(1,3,1) - \frac{<(-1,0,2),(7,-1,-4)>}{<(7,-1,-4),(7,-1,-4)>}(7,-1,-4)$$

$$= (-1,0,2) - \frac{1}{11}(1,3,1) - \frac{-15}{66}(7,-1,-4) = \left(-1 - \frac{1}{11} + \frac{35}{22}, 0 - \frac{3}{11} - \frac{5}{22}, 2 - \frac{1}{11} - \frac{20}{22}\right) = \left(\frac{11}{22}, -\frac{11}{22}, \frac{22}{22}\right)$$

$= \frac{11}{22}(1,-1,2)$

$v_3 = (1,-1,2)$ olarak alınabilir.

$K = \{v_1 = (1,3,1), v_2 = (7,-1,-4), v_3 = (1,-1,2)\}$ bulunur.

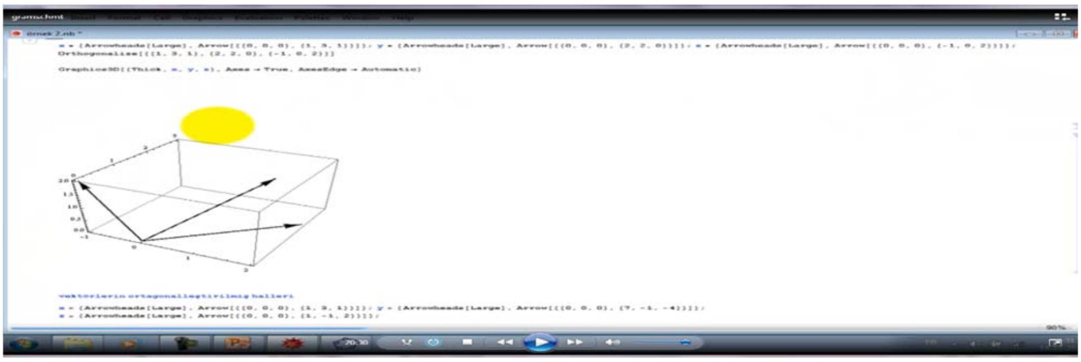
$L = \{\frac{1}{\sqrt{11}}(1,3,1), \frac{1}{\sqrt{66}}(7,-1,-4), \frac{1}{\sqrt{6}}(1,-1,2)\}$ dir.

Şekil 2. R^3 de Herhangi Bir Tabana Uygulanan Gram-Schmidt Yönteminin Cebirsel Temsili

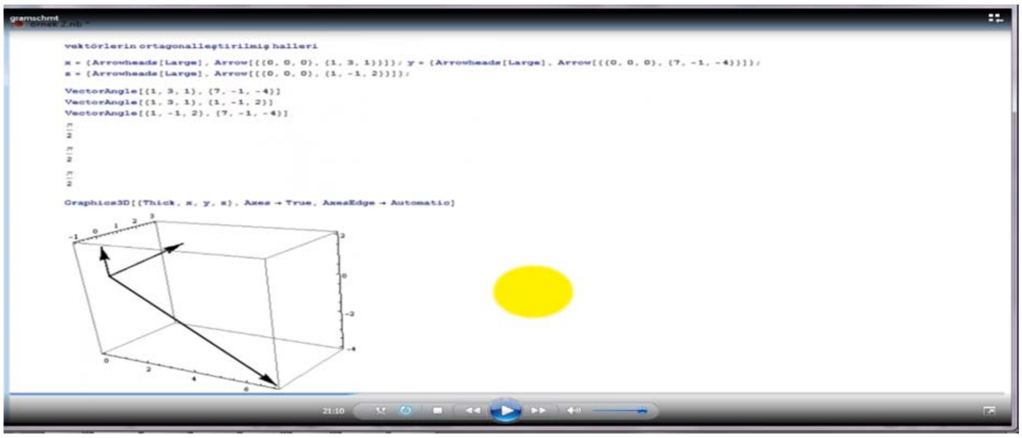
Geleneksel öğretim yöntemlerinde cebirsel temsil kullanılmaktadır. Sadece bu temsilin Lineer Cebir öğretiminde kullanılması, öğrencilere soyut gelen bu dersin anlaşılmasını zorlaştırmaktadır. Öğrenmeyi kolaylaştırmak için farklı çeşitlerde temsillerle öğretim etkinlikleri desteklenmelidir. Bu sebeple grafik temsillerine de çalışmada yer verilmiştir. Ancak temsillerin sunumundaki sıralamaya dikkat edilmelidir. Bu çalışmada cebirsel temsillerin grafiksel temsillerden önce sunulması uygun görülmüştür.

TeÇoLi de Kullanılan Grafiksel Temsil

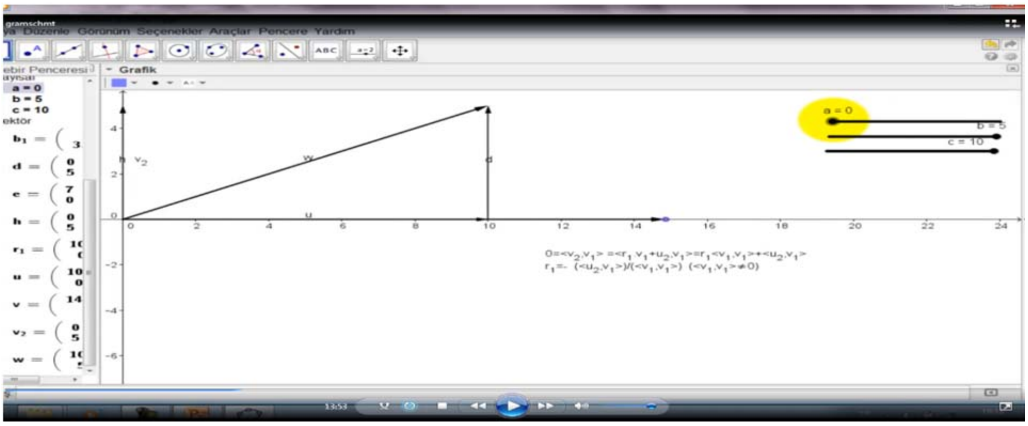
Öğrencilere sunulan cebirsel temsillerin grafiksel temsil modları Mathematica ve GeoGebra yazılımlarında 2 ve 3 boyutlu grafikler halinde hazırlanmıştır. Yazılımların sunduğu imkanlar doğrultusunda, temsillerin hareket ettirilebilir olması, vektörler arasındaki açının hesaplanarak gerçekten de ortagonallik testinin sağlandığının teyit edilebilmesi ve vektör normlarının hesaplanarak ortanormallik testinin yapılabilmesi bu temsillerin öğrenmeyi arttırıcı özelliklerini desteklemektedir.



Şekil 3. R^3 ün Herhangi Bir Tabanını Temsil Eden 3 Boyutlu Grafik Temsili



Şekil 4. R[3] de Herhangi Bir Tabana Uygulanan Gram-Schmidt Yöntemiyle Elde Edilen Ortagonal Tabanı Temsil Eden 3 Boyutlu Grafik Temsili



Şekil 5. 2 Boyutlu Grafik Temsili ve Cebirsel Temsil

SONUÇ

Genel olarak farklı yaş gruplarındaki öğrencilerin çoklu temsillerle ilgili becerilere yeterli düzeyde sahip olamama sorunlarını ortadan kaldırmak için öğretmenlerin, dolayısıyla öğretmen adaylarının bu konudaki eksiklikleri giderilmelidir. Bu ihtiyaca yönelik olarak çalışmada, ilköğretim matematik öğretmen adaylarının seviyesine uygun olarak, lisans öğreniminde ikinci sınıfta aldıkları Lineer Cebir dersinin bazı konularına yönelik TeÇoLi hazırlanmıştır. TeÇoLi'de cebirsel, sözel ve grafiksel temsillere birlikte yer verilmiştir. Soyut kavramlar içeren Lineer Cebir dersinin zihinde somutlaştırılmasını kolaylaştırmak için uygulamanın hemen hemen her materyalinde teknolojik destek alınmıştır. Teknoloji, Lineer Cebir'in uzun işlemlerini kısaltma göreviyle değil, asıl olarak öğrenmeyi destekleyecek işlevler üstlenerek uygulamanın önemli bir parçası haline getirilmiştir. Uygulamada yer alan cebirsel ve grafiksel temsillerin öğrencilere aktarılmasında, öncelikle cebirsel temsillerin sunumu sonrasında ise grafiksel temsillerin sunumu şeklinde bir sıra izlenmiştir. Bunun sebebi, önce grafiksel temsillerin sunulması durumunda kavram karmaşasına yol açabileceği düşünülmüştür. Yapılan uzaktan eğitim dersleriyle zaman ve mekândan tasarruf sağlanarak, öğrencilere daha fazla çoklu temsillerle çalışma imkânı sunulmuştur. Gerçekleştirilen Lineer Cebir öğretiminde öğrencilerin derse katılım performanslarının yüksek olduğu gözlemlenmiştir ve bunun sebebinin kullanılan çoklu temsiller ve teknoloji desteğinin öğrencilerin derse karşı motivasyon düzeylerini arttırdığı düşünülmektedir. TeÇoLi' nin üç haftalık uygulanması sonrasında, öğrencilerin sahip olduğu bu kadar soyut kavramlar içeren Lineer Cebir dersinin uzaktan eğitimle işlenmemesi gerektiği düşüncesi, yerini dersin uzaktan eğitimle daha anlaşılır bir şekilde işlenebileceği düşüncesine bırakmıştır. Öğrencilerin derse olan ilgisinin olumlu olarak arttığı gözlemlenmiştir. Ayrıca öğrenciler uygulama sonunda, dersle ilgili fikirlerini sunarken, kullanılan çoklu temsillerin dersi daha iyi anlamalarına yardımcı olduğunu ve çoklu temsilleri öğretmen olduktan sonra öğrencilerin başarılarını arttırmak için kullanacaklarını belirtmişlerdir.

TeÇoLi sürecinde uzaktan eğitim sistemine yüklenen ders videolarının önceden öğrenciler tarafından izlenmesi ve anlaşılmayan yerlerin not edilerek derste araştırmacıya sorulması istenmiştir. Ancak öğrencilerin ders videosunu izlerken anlamadıkları noktaları anında bir uzmana sorma şanslarının olmaması nedeniyle öğrenciler bir takım sorunlar yaşamışlardır. Ayrıca uzaktan eğitim platformunda kilit noktanın internete erişim kalitesidir, fakat bazı öğrencilerin internete erişimde yaşadığı sorunlar bu çalışmanın olumsuz yönlerinden biridir. Son olarak uzaktan eğitimde öğrencilerin internet üzerinden derse katılımını takip etme konusunda bir takım sorunlar yaşanmıştır. Bu sorun uygulama sırasında tüm öğrencilere konu ile ilgili sorular sorup öğrencilerin dikkatlerinin dağılmamasını sağlanmaya çalışarak giderilmeye çalışılmıştır.

ÖNERİLER

TeÇoLi'de öğrencilerin Lineer Cebir dersine katılım performanslarını arttırması ve derse olan bakış açılarını olumlu etkilemesi sebebiyle araştırmacılara ve Lineer Cebir dersini veren öğretim elemanlarına örnek bir çalışma olabilir. TeÇoLi'de kullanılan çoklu temsiller çeşitlendirilerek daha etkili öğretim çalışmaları yapılabilir. Çalışmada kullanılan teknoloji destekli çoklu temsil temelli öğretim yöntemi, matematiğin bu yönteme uygun olan diğer alanlarında kullanılmasına yönelik çalışmalar yapılabilir. Uzaktan eğitim sürecinde öğrencilerin bilgisayardaki dikkatlerinin dağılmasını önleyici kriterleri bulmaya yönelik araştırmalar yapılabilir. Günümüz eğitim sisteminde yapılan internet tabanlı eğitim uygulamalarının bir gereği olarak internete erişim kalitesinin arttırılması gerekmektedir.

Teşekkür: Bu çalışmamızın uzaktan eğitim sistemi desteğini sağlayan Prof. Dr. Vahap TECİM ve Uzm. Emre KARAGÖZ başta olmak üzere Dokuz Eylül Üniversitesi Uzaktan Eğitim Uygulama ve Araştırma Merkezi'ne (DEUZEM) teşekkürlerimizi sunarız.

ÖZET: Bu araştırmanın amacı, teknoloji destekli çoklu temsil temelli lineer cebir öğretiminin, ilköğretim matematik öğretmen adaylarının lineer cebir başarılarına etkisini incelemektir. Çalışma, Dokuz Eylül Üniversitesi, Buca Eğitim Fakültesi, İlköğretim Matematik Öğretmenliği Bölümü'nde öğrenim görmekte olan 73 öğretmen adayı ile gerçekleştirilmiştir. Araştırmada Son-test Kontrol Gruplu Seçkisiz Desen kullanılmıştır. Araştırma sonucunda, teknoloji destekli çoklu temsil temelli lineer cebir öğretimini alan öğretmen adaylarının lineer cebir başarı testi puanlarının, geleneksel öğretimle lineer cebir dersini alan öğretmen adaylarının lineer cebir başarı testi puanlarından anlamlı derecede daha yüksek olduğu görülmüştür.

Anahtar sözcükler: teknoloji destekli eğitim, çoklu temsil temelli öğretim, lineer cebir öğretimi, lineer cebir başarısı, ilköğretim matematik öğretmen adayı.

ABSTRACT: The purpose of this study was to investigate the effects of technology-assisted multiple representation-based linear algebra instruction on linear algebra success of primary mathematics pre-service teachers. The study was performed with 73 pre-service teachers receiving education at Dokuz Eylul University, Faculty of Education, Department of Elementary Mathematics Education. Post-test control group experimental design was used in the research. According to research results, linear algebra achievement test scores of the pre-service teachers taking the technology-assisted multiple representation-based linear algebra instruction were significantly higher than those of pre-service teachers taking the conventional linear algebra instruction.

Key words: technology-assisted education, multiple representation-based instruction, linear algebra teaching, linear algebra success, primary mathematics pre-service teachers.

GİRİŞ

Matematik kavramlarını derinlemesine öğrenebilmek için çoklu temsiller matematiğin anahtarıdır. Çoklu temsillerin kullanıldığı öğrenme ortamlarının sağlanmasıyla öğrenciler, alternatif temsilleri deneyerek hangilerinin kendi öğrenme stillerine daha yakın olduğuna karar verebilirler (Mallet, 2007). Çoklu matematiksel temsillerin kullanımı öğrencilerin matematiksel kavram anlayışlarını destekler ve teknolojik müdahale, somut işlemden soyut düşünmeye geçişi arttıran ve sürekli öğrenme için temel sağlayan temsillerin çoklu kullanımına olanak sağlar (Ozel, Capraro ve Yetkiner, 2008). Öğrenme ortamlarında çoklu temsillerin kullanılmasıyla öğrencilerin temsilleri kullanabilme becerileri ve derse olan tutumları olumlu yönde gelişir (Wong, Yin, Yang ve Cheng, 2011).

Ortaokul seviyesindeki öğrencilerle çoklu temsil kullanım becerilerini araştırmaya yönelik yapılan çalışmalarda öğrencilerin çoklu temsil kullanım becerilerine ve temsiller arası ilişkilendirme ile geçiş becerilerine yeterli düzeyde sahip olmadıkları görülmüştür (Neria ve Amit, 2004; Sert, 2007). Bunun yanı sıra matematik öğretmen adaylarının da temsillerle ilgili beceriler bakımından olmaları gereken seviyeye ulaşamadıkları görülmüştür (Durkaya ve diğ., 2011; Delice ve Sevimli, 2010).

Araştırmanın Amacı

Eğer ortaokul düzeyindeki öğrencilerin iletişim becerilerinin artması için çoklu temsil kullanımı ve aralarında geçiş yapabilme becerilerini kazanmalarını istiyorsak, ilgili konuda pedagojik alan bilgisine sahip olan öğretmenlere ihtiyacımız vardır. Yani çoklu temsiller konusunda donanımlı öğretmenler yetiştirmek gerekir. Bu nedenle gerçekleştirilecek olan çalışma çoklu temsil kullanım becerilerini öğretmen adaylarına kazandırmak açısından önemlidir. Bu çalışmada, teknolojinin desteğiyle soyut ifadeleri somut hale getirerek ve lineer cebir dersini kalabalık işlemlerden kurtararak, öğrencilerin kavramsal öğrenme düzeylerini arttırmak için lineer cebir öğretimi teknoloji destekli çoklu temsil öğretimiyle (TeÇoLi) gerçekleştirilecektir. Böylece ilköğretim matematik öğretmeni adaylarının lineer cebir dersindeki başarılarını arttırmak hedeflenmektedir. Çalışma sonunda öğrencilerin teknoloji destekli çoklu temsil temelli lineer cebir öğretiminin dersteki anlama düzeylerine ve başarılarına olan olumlu etkisinin farkına vararak, bu uygulamanın önemini anlamaları ve yöntemi çeşitli derslere entegre ederek ileride kendi öğrencilerine de uygulama düşüncesine sahip olmaları amaçlanmaktadır.

Araştırmanın problemi; teknoloji destekli çoklu temsil öğretimiyle gerçekleştirilen Lineer Cebir öğretimi ile geleneksel öğretim yöntemleriyle gerçekleştirilen Lineer Cebir öğretimine göre öğrencilerin başarılarında farklılık olup olmadığını belirlemektir.

TeÇoLi: Teknoloji Destekli Çoklu Temsil Temelli Lineer Cebir Öğretimi Uygulaması

TeÇoLi Lineer Cebir dersine yönelik hazırlanmış, cebirsel, sözlü ve grafik temsilleri ihtiva eden teknoloji destekli hazırlanmış bir öğretim uygulamasıdır. Uygulamanın içeriği Lineer Cebir'in ortagonallik, ortanormallik ve Gram-Schimdt yöntemi konularına yönelik hazırlanmıştır. Soyut kavramlar içeren Lineer Cebir dersinin öğrenilmesini kolaylaştırmak ve başarıyı arttırmak için konu anlatımı çoklu temsillerle desteklenmiş ve soyut kavramların somut hale daha kolay transfer edilebilmesi için matematik yazılımlarından Mathematica ve GeoGebra'da hazırlanmış 2 ve 3 boyutlu grafik temsillerine yer verilmiştir. Geleneksel öğretimde de kullanılan cebirsel temsiller bilgisayar ortamında sunum içerisinde yer alırken, grafik temsillerde de desteklenmiştir ve öğrencilerin temsiller arasında ilişki kurabilmesine uygun olarak sıraya konulmuştur. Hazırlanan materyaller kullanılarak bilgisayar ortamında, araştırmacının konu anlatım ses kaydını da içeren konu anlatım videoları hazırlanmıştır. Bu videolarda cebirsel, sözel ve grafik temsiller yer almaktadır. Konu anlatım sunumları, yazılımlarda hazırlanan temsiller ve videolar Dokuz Eylül Üniversitesi Uzaktan Eğitim Uygulama ve Araştırma Merkezi (DEUZEM) tarafından sağlanan DE-OYS uzaktan eğitim ortamına yüklenmiştir. Öğrenciler ilgili konunun sırası geldiğinde, hafta içerisinde internet üzerinden kaynakları tarayıp, belirlenen zamanda uzaktan eğitim dersine katılmışlardır. Sistemdeki sohbet odası platformunda, dersle ilgili taranan kaynaklardan anlaşılmayan noktalar tartışılmıştır. Ayrıca sınıf ortamında konunun önemli bölümleri tekrar edilerek üç haftalık öğretim uygulaması tamamlanmıştır.

YÖNTEM

Araştırmada deneysel araştırma modellerinden Son Test Kontrol Gruplu Seçkisiz Model kullanılmıştır.

Tablo 1. Son Test Kontrol Gruplu Seçkisiz Model

G_1	M_R	X_1	O_1
G_2	M_R	X_2	O_1

G_1: Teknoloji destekli çoklu temsil temelli öğretime dayalı Lineer Cebir öğretiminin uygulandığı grup
G_2: Geleneksel öğretime dayalı Lineer Cebir öğretiminin uygulandığı grup
X_1: Teknoloji destekli çoklu temsil temelli öğretime dayalı Lineer Cebir öğretimi
X_2: Geleneksel öğretime dayalı Lineer Cebir öğretimi
O_1: Son Test (Lineer Cebir Başarı Testi)

Deney grubunda etkisi araştırılacak değişken teknoloji destekli çoklu temsil temelli lineer cebir öğretimi, kontrol grubunda ise geleneksel öğretimle lineer cebir öğretimidir. Araştırmanın bağımlı değişkeni lineer cebir dersindeki başarıdır. Araştırmada Lineer Cebir dersindeki başarıyı belirlemede kullanılmak üzere Lineer Cebir Başarı Testi geliştirilmiştir. Deney grubu ve kontrol grubu arasında Lineer Cebir dersi başarılarına göre anlamlı bir farklılık olup olmadığı, uygulama öncesinde Lineer Cebir dersinin ara sınavından aldıkları puanlar kullanılarak belirlenmiştir..

Katılımcılar

Araştırmanın deneysel kısmında, Dokuz Eylül Üniversitesi Buca Eğitim Fakültesi İlköğretim Matematik Öğretmenliği bölümünde Lineer Cebir dersini alan ikinci sınıfta öğrenim gören 73 öğretmen adayı çalışma grubunu oluşturmaktadır. Deney ve kontrol grupları oluşturulurken Lineer Cebir dersini alan iki sınıf rastgele deney ve kontrol grubu olarak seçilmiştir. İlgili lineer cebir konularına göre hazırlanan TEÇOLİ deney grubuna uygulanmıştır. Kontrol grubuna da geleneksel yöntemle lineer cebir öğretimi yapılmıştır.

Araştırmada kullanılması planlanan Lineer Cebir Başarı Testi'nin pilot uygulamaları deneysel çalışmanın yapılacağı gruptan farklı olması gerektiğinden dolayı Dokuz Eylül Üniversitesi Buca Eğitim Fakültesi İlköğretim Matematik Öğretmenliği bölümünde 3. sınıfta öğrenim görmekte olan lineer cebir dersini almış 170 öğretmen adayları üzerinde gerçekleştirilmiştir.

Veri Toplama Araçları

Lineer Cebir Başarı Testi

Alan yazın taraması sonucunda, "bilgi, kavrama, uygulama, analiz, sentez değerlendirme" basamaklarına uygun şekilde hazırlanan 32 tane taslak madde ilgili alanda uzman öğretim elemanının görüşleri doğrultusunda şekillendirilerek Dokuz Eylül Üniversitesi Buca Eğitim Fakültesi İlköğretim Matematik Öğretmenliği bölümünde 3. sınıfta öğrenim görmekte olan lineer cebir dersini almış öğretmen adayları uygulanmıştır. Finesse programı yardımıyla yapılan analizler sonucunda testin güvenirlik katsayısı 0,835 olarak bulunmuştur.

Tablo 2. Test Sorularının Ayırt Edicilik Indeksleri

Maddenin ayırt etme indeksi (*d*)	**Madde numarası**	**Değerlendirme**
0,40 ve daha büyük	5,8,13,14,15,16,18,19,20, 22,23,25,28,30,31,32	Oldukça iyi madde
0,30-0,39	4,6,9,10,12,17,21,27,29	Iyi madde
0,20-0,29	1,2,11,26	Düzeltilmesi- geliştirilmesi gereken madde
0,19 ve daha küçük	3,7,24	Zayıf madde

Maddelerin güçlükleri ve madde ayırt edicilik indeksleri incelenmiş ve 1,2,3,7,11,24,26. maddelerinin ölçekten çıkarılması uygun görülmüştür. Maddeler çıkarıldıktan sonra Finesse programında analizler tekrar yapılmış ve 25 maddelik ölçeğin güvenirlik katsayısı 0,849 olarak bulunmuştur.

Tablo 3. Test Sorularının Madde Güçlükleri

Madde güçlüğü (*p*)	**Madde numarası**	**Değerlendirme**
0,80 ve 1 arasındakiler	6,12,16,17,18	Çok kolay madde
0,50 ve 0,80 arasındakiler	4,5,8,9,10,13,14,15,19,20, 21,22,23,25,27,28,30,32	Kolay madde
0,30 ve0,49 arasındakiler	29,31	Orta güçlükte madde
0,29 ve daha düşükler	-	Zor madde

BULGULAR

Teknoloji destekli çoklu temsil öğretimiyle gerçekleştirilen Lineer Cebir öğretimi ile geleneksel öğretim yöntemleriyle gerçekleştirilen Lineer Cebir öğretimine göre öğrencilerin başarılarında farklılık olup olmadığını belirlemek için öncelikle belirlenen deney ve kontrol gruplarının aralarında homojen olup olmadığı tespit etmek üzere, hazırlanan Lineer Cebir Başarı Testi öğrencilerin önceden görmediği konulardan oluştuğu için, Lineer Cebir dersi ara sınavından aldıkları notlar analiz edilmiştir. Ara sınav notları arasında anlamlı bir farklılık olup olmadığını belirlemek üzere puanların normal dağılım gösterip göstermediği incelenmiştir. Normallik testinde eğer grup büyüklüğü 50'den küçük ise Shapiro-Wilks, 50'den büyük olması durumunda Kolmogorov-Smirnov testi kullanılmalıdır (Büyüköztürk, 2011). Deney ve kontrol gruplarındaki öğrenci sayıları 50 den az olduğu için incelenen Shapiro-Wilks testinin sonuçları Tablo 4' deki gibidir. Tablo 4 deki sonuçlara göre deney ve kontrol gruplarının p değerleri .05 in üzerinde olduğu için grupların ara sınav puanları normal dağılım göstermektedir. Buna göre deney ve kontrol gruplarının ara sınav puanlarına göre aralarında anlamlı bir farkın olup olmadığı parametrik testlerden ilişkisiz örneklemler t-testi kullanılmıştır ve sonuçlarına Tablo 4'te yer verilmiştir. Deney ve kontrol gruplarının ara sınav puanları arasında anlamlı bir fark olmadığı Tablo 4'te görülmektedir.

Tablo 4. Ara Sınav Puanlarının Normallik Analizi

				Shapiro-Wilks			**sd**	**t**	**p**
	N	$\bar{x}$	**SS**	**Statistic**	**df**	**Sig.(p)**			
Deney Grubu	35	16.37	10.11	.955	35	.158	71	.048	.962
Kontrol Grubu	38	16.47	7.89	.986	38	.895			

Aralarında homojen oldukları tespit edilen deney ve kontrol gruplarının deneysel işlemler sonrasında LCBT sonuçları karşılaştırılmıştır. Gruplara son test olarak uygulanan LCBT ölçümlerine göre normallik testi sonuçları Tablo 5'te yer almaktadır. Verilere göre deney ve kontrol grupları LCBT ölçümlerine göre normal dağılım göstermemektedir (p<.05).

Tablo 5. LCBT Ölçümlerinin Normallik Analizi

				Shapiro-Wilks		
	N	$\bar{x}$	**SS**	**Statistic**	**df**	**Sig.(p)**
Deney Grubu	35	23.48	1.42	.882	35	.001
Kontrol Grubu	38	22.00	3.15	.784	38	.000

Bu nedenle grupları karşılaştırmak için parametrik olmayan testlerden Mann Whitney U-testi kullanılmıştır. Elde edilen veriler ise Tablo 6 daki gibidir.

Tablo 6. LCBT Ölçümlerinin Normallik Analizi

	N	**Sıra Ortalaması**	**Sıra Toplamı**	**U**	**p**
Deney	35	42.76	1496.50	463.500	.024
Kontrol	38	31.70	1204.50		

Sonuçlara göre üç hafta süren teknoloji destekli çoklu temsil temelli lineer cebir öğretimini alan deney grubu öğrencilerin LCBT ölçümleri, geleneksel öğretimle lineer cebir dersini alan öğrencilerin ölçümlerine göre anlamlı derecede farklılık göstermektedir (U=463.500, p<.05). Sıra ortalamaları incelendiğinde deney grubu öğrencilerinin LCBT sıra ortalaması (42.76) kontrol grubununkinden (31.70) daha yüksektir. Buna göre teknoloji destekli çoklu temsil temelli lineer cebir öğretimi öğrencilerin lineer cebir başarısını arttırıcı özelliktedir.

SONUÇ

Deneysel uygulama sonrasında yapılan analizler sonucunda teknoloji destekli çoklu temsil temelli lineer cebir öğretimini alan deney grubu öğrencilerinin lineer cebir başarılarının geleneksel öğretimle lineer cebir öğretimini alan kontrol grubu öğrencilerine göre anlamlı derecede daha yüksek olduğu görülmüştür. Mevcut teknolojinin olanakları yardımıyla hazırlanan TeÇoLi uygulamasının öğrencilerin lineer cebirdeki başarılarını arttırıcı özelliklere sahip olduğu söylenebilir. Bu sonucun elde edilmesinde, TeÇoLi'nin temsiller arası geçişlere imkân verecek nitelikte olması, uygulamada kullanılan çoklu temsillerin uygun seçimi ve doğru sırayla öğrencilere sunulması, temsillerin teknolojik olanaklarla birlikte daha ileri seviyelere taşınarak öğrencilerin derse olan ilgilerini arttırması gibi faktörlerin rol oynadığı söylenebilir. Ayrıca konu anlatımının araştırmacı tarafından seslendirilerek bilgisayar ortamında video formatında kayıt edilerek öğrencilere internet üzerinden kullanıma açılması, öğrencilerin konu anlatım videolarını istedikleri zaman istedikleri bölümleri izleme imkânı sunmuştur. TeÇoLi sürecinde araştırmacı tarafından hazırlanan ders kaynaklarının internet üzerinden erişime açılmasıyla öğrenciler bunları istekleri zaman ve yerde inceleyerek uzaktan eğitimle gerçekleştirilen derse hazırlıklı olarak gelerek, önceden kayıt ettikleri anlaşılmayan noktaları sorma imkânı bulmuşlardır. Böylece zaman ve mekândan tasarruf sağlanmıştır. Bu sonuçlar Fraser (2010), Özel, Capraro ve Yetkiner (2008), Akkuş Çıkla (2004), Konyalıoğlu ve diğ. (2011) gibi araştırmacıların yaptıkları çalışmalarla paraleldir.

TeÇoLi'nin uzaktan eğitim kısmında, öğrencilerin videoyu izlerken takıldıkları noktalarda anında uzman desteği alamaması, videolarda anlaşılmayan noktalardan bazılarını not etmeyi unutmaları, bazen internete erişim sorunlarının yaşanması, uzaktan eğitimle gerçekleştirilen derste kullanılan sohbet odasında sorulan dersle ilgili noktaların herkes tarafından anlaşılamama gibi sorunlar yaşanmıştır.

ÖNERİLER

TeÇoLi öğrencilerin lineer cebir başarısını arttırıcı özelliklere sahip olduğu sonucu elde edilmiştir. Bu yöntem lineer cebir dersi veren öğretim elemanlarına ve araştırmacılara örnek bir uygulama olabilir. Araştırmada uzaktan eğitim sürecinde yaşanan sorunları engelleyici yönde çalışmalar yapılabilir.

TeÇoLi'de kullanılan çoklu temsillerin çeşitlendirilip öğretime doğru bir şekilde entegrasyonunun sağlanmasıyla lineer cebir başarısını daha ileri düzeyde arttırıcı seviyeye taşınabilir. Bu konu ileri araştırmaların amacı olabilir. Bu araştırmada kullanılan teknoloji destekli çoklu temsil temelli öğretimin diğer matematik alan derslerinde kullanımına ilişkin çalışmalar gerçekleştirilebilir.

Teşekkür: Bu çalışmamızın uzaktan eğitim sistemi desteğini sağlayan Prof. Dr. Vahap TECİM ve Uzm. Emre KARAGÖZ başta olmak üzere Dokuz Eylül Üniversitesi Uzaktan Eğitim Uygulama ve Araştırma Merkezi'ne (DEUZEM) teşekkürlerimizi sunarız.

NOT: Bu çalışma, 2013.KB.EĞT.007 nolu proje kapsamında Dokuz Eylül Üniversitesi Bilimsel Araştırma Projeleri Koordinasyon Birimi tarafından desteklenen, ikinci yazar danışmanlığında, birinci yazar tarafından hazırlanan "Teknoloji Destekli Çoklu Temsil Temelli Öğretimin Öğrencilerin Lineer Cebir Öğrenimine ve Matematiğe Yönelik Tutumlarına Etkisi" isimli yüksek lisans çalışmasının bir bölümünü oluşturmaktadır.

ÖZET: Bu araştırma ile ortaokul 4. sınıf öğrencilerinin, bilgiyi oluşturma süreçlerinin ve önceden yapılandırılmış matematiksel bilgiyi tekrar organize edebilme düzeylerinin incelenmesi amaçlanmıştır. Araştırmanın örneklemini, başarı durumları yüksek, orta ve düşük olan 3 ortaokul 4. sınıf öğrencisi oluşturmaktadır. Araştırma nitel araştırma yöntemlerinden durum çalışması özelliğindedir. Araştırmaya veri sağlayan araçlar ise, öğrencileri düşündürmeye teşvik eden matematik problemlerinin yer aldığı çalışma kağıtları, görüşme kayıtları ve gözlem notlarıdır. Veriler içerik analizi ile incelenmiştir. Elde edilen veriler, matematik başarısı ne olursa olsun öğrencilerin tanıyabildikleri verileri kullanabildiğini ve yeni bilgileri, eski bilgileri kullanabildikleri ölçüde oluşturabildiğini göstermektedir. Aslında basit görüldüğü için pek üzerinde durulmayan, ön bilgilerin hatırlanması yani 'tanıma eylemi', matematiksel soyutlamanın temel basamağıdır ve matematiksel soyutlama için bu eylemin eksiksiz bir şekilde tamamlanması gerekmektedir. Araştırmanın bulguları bu ifadeyi destekler niteliktedir. Ayrıca, araştırmadan elde edilen verilere göre, dışarıdan verilen desteğin, öğrencilerin soyutlama sürecine olumlu anlamda katkı sağladığı sonucuna ulaşılmıştır.

Anahtar sözcükler: Matematiksel Düşünme, Soyutlama Süreci, RBC Modeli

ABSTRACT: The purpose of the study was to investigate of mathematical knowledge construct processes and reorganizing level previous mathematical knowledge of 4th grade middle school students. This study was of three middle school students who had different mathematical success. The study was qualitative research and case study was the research method. We used study papers, interview records and observation notes as data collection tools. The study papers was of three mathematical problems which encouraging to think. The analyzing of the datas was used content analyze method. It was observed that students used the knowledge to the extent that recognizing and constructed to the extent that building. 'Recognizing' action was seen simple and so, this action didn't care about. In fact, the action was basic step of mathematical abstraction and it needed to completely apply for mathematical abstraction. Finding of study was support to referred to above. Also, according to datas obtained from study , it was seen that given the support from outside contribute positively to students' abstraction processes.

Key words: Mathematical Thinking, Abstraction Process, RBC Model

GİRİŞ

Düşünmeyi geliştirdiği bilinen en önemli araçlardan biri matematiktir. İnsanı diğer canlılardan ayıran en temel özellik şüphesiz insanın düşünebilme yetisine sahip olmasıdır. Bu nedenledir ki matematik eğitimi temel eğitimin ilk basamağını oluşturmaktadır. Dolayısıyla temel eğitim için matematik eğitimi keyfi bir gereksinim olmaktan çok daha öteye gitmektedir. Matematiksel düşünme, tahmin edebilme, tümevarım, tümdengelim, betimleme, genelleme, soyutlama, örnekleme, ispatlama gibi karmaşık süreçlerin birleşimi olarak tanımlanmaktadır (LiuPo-Hung, 2003; akt. Alkan &Bukova Güzel, 2005). Matematiksel düşünme süreçlerinden biri de soyutlamadır. Soyutlama çok yönlü karmaşık bir kavramdır. Literatürde bu kavram ile ilgili farklı açılardan yapılan tanımlamalara rastlamak mümkündür. Soyutlama kavramı üzerine hem fikir olunan bir tanım bulunmasa da, soyutlama ile ilgili fikir birliğine varılan tek nokta bu kavramın bireye kendini değişik açılardan inceleme olanağı sunmasıdır. Soyutlama, önceden yapılan matematiğin yeni matematiksel yapı içerisinde dikey olarak tekrar organize edilmesinin etkinliği olarak tanımlanmaktadır (Hershkowitz, Schwarz & Dreyfus, 2001).

Soyutlama bir süreçtir ve bu sürece farklı bakış açıları ile yaklaşan araştırmacılar vardır: bilişsel soyutlama ve sosyo-kültürel soyutlama (Yeşildere & Türnüklü, 2008). Bilişsel açıdan bakıldığında soyutlama, deneyimsel, sözde-deneyimsel ve yansıtıcı olmak üzere üç boyutta ele alınmaktadır. Sosyo-kültürel açıdan bakıldığında ise soyutlama, gözlenebilmeye imkan tanıyan boyutlardan oluşmaktadır. Recognising-Building with-Contructing (RBC) modeli etkinlik teoremine dayalı bir sosyo-kültürel soyutlama modelidir. Herskowitz vd. (2001) tarafından ilk olarak ortaya atılan bu modelin amacı, soyutlama süreci hakkında bilgi edinmektir. Modelde yer alan üç bileşen, gözle görülebilir deliller sunacağından soyutlama sürecine ışık tutacaktır. RBC modeli, bağlamsal parametrelere karşı oldukça duyarlıdır ve sosyal etkileşim ve derin düşünceli anlamlar vasıtasıyla soyutlama süreci boyunca gelişimi öne sürer. Matematik eğitiminde bir model ya da teori; tahmini destekleyebilir, güçlü açıklamaya sahip olabilir, bireyin karmaşık ve karşılıklı ilişkili fenomeni hakkındaki düşüncesini organize etmeye yardımcı olabilir, veri analizi olarak hizmet edebilir ve yüzeysel tanımların ötesine giden öğrenme hakkındaki fikirlerin iletişimi için bir dil sağlayabilir (Dubinsky & McDonald, 2001). İlgili literatür ile yapılan çalışmalar söz konusu modelin soyutlama sürecine pozitif yönde etki ettiğini göstermektedir (Biederman, 1987; Hershkowitz vd., 2001; Dreyfus & Tsamir, 2004; Özmantar & Monaghan, 2007; Yeşildere & Türnüklü, 2008; Altun & Yılmaz, 2008).

Yeşildere & Türnüklü (2008) çalışmalarında farklı matematiksel güce sahip öğrencilerin bilgi oluşturma süreçlerini RBC modeli çerçevesinde incelemişlerdir. Elde edilen veriler, matematiksel güç farklılığının bilgi oluşturma süreçlerinde takip edilen yolları farklılaştırdığı yönündedir. Diğer yandan Özmantar & Roper (2004) çalışmalarında öğrencilerin soyutlama süreçlerinde tutorun rolünü araştırmışlardır. Araştırma verileri RBC modeli ile değerlendirmeye alınmıştır. Sonuç olarak, tutor desteğinin soyutlamaya önemli ölçüde katkı sağladığı belirtilmiştir.

Bu araştırma ile ortaokul 4. sınıf öğrencilerinin, bilgiyi oluşturma süreçlerinin incelenmesi ve önceden yapılandırılmış matematiksel bilgiyi tekrar organize edebilme düzeylerinin incelenmesi amaçlanmıştır. Araştırmanın amacına hizmet etmesi için, ortaokul 4. sınıf seviyesindeki 'Birinci dereceden iki bilinmeyenli doğrusal eşitsizlikler' konusu araştırma konusu olarak seçilmiştir. Araştırmanın amacı doğrultusunda cevap aranacak araştırma soruları şu şekildedir:

1. Öğrenciler matematiksel bilgiyi oluştururken hangi yolları izliyorlar?
2. Öğrencilerin önceki bilgilerini tekrar organize edip kullanma düzeyleri nelerdir?

YÖNTEM

Araştırma Deseni

Bu araştırma bir durum çalışmasıdır, dolayısıyla nitel bir araştırmadır. Nitel araştırma, araştırılacak konunun doğal ortamında anlaşılmasına ve yorumlanıp sonuç çıkarılmasına imkân veren bir araştırma yöntemidir (Denzin & Lincoln, 2000, s. 215). Durum çalışması nitel araştırma desenlerinden biridir. Durum çalışması, bir ya da birkaç olguyu kendi yaşam çerçevesinde açıklamaya çalışan bir araştırma desenidir (Yin, 1984, s. 23, akt. Yıldırım & Şimşek, 2011, s. 280). Durum çalışmaları süreç odaklıdır ve 'Neden?' ve 'Nasıl?' soruları ile ilgilenir. Bu açıdan bakıldığında durum çalışmasının, öğrencilerin matematiksel bilgilerini nasıl oluşturduklarının incelenmesi amacına hizmet edecek bir araştırma deseni olduğu düşünülmüştür.

Çalışma Grubu

Bu araştırmanın çalışma grubunu, 2013-2014 öğretim yılında Erzurum il merkezinde bulunan bir devlet okuluna halen devam etmekte olan ortaokul 4. sınıf öğrencileri oluşturmaktadır. Bu öğrenciler arasından matematiksel başarısı düşük, orta ve yüksek olan 3 öğrenci, amaçlı örnekleme yöntemlerinden aykırı durum örnekleme yöntemi kullanarak seçilmiştir. Öğrencilerin seçiminde gönüllülük esas olup, herhangi bir ön test ya da ölçek kullanılmamıştır. Öğrencilerin belirlenmesi hususunda yardımcı olması adına, öğrencilerin öğretmenleri ile görüşülmüş, öğrencilerin okul başarı puanları ve deneme sınav sonuçları incelenmiştir. Ayrıca, öğrencilerle yapılacak uygulama öncesinde, hem okul idaresinden hem de öğrencilerden gerekli izinler alınmıştır. Öğrencilere, uygulanan çalışma kağıtlarının inceleneceği, sonrasında görüşme yapılacağı ve bu görüşmelerin kayıt altına alınacağı önceden bildirilmiştir. Yapılan bu çalışmanın başarı notu ile herhangi bir ilgisi olmadığı da açıklanarak, öğrencide oluşacak kaygıların önüne geçilmesi hedeflenmiştir.

Veri Toplama Araçları

Çalışma Kağıtları

Araştırmaya veri sağlayan çalışma kağıtları, 'Birinci dereceden iki bilinmeyenli doğrusal eşitsizlikler' konusu ile ilgili matematiksel problemlerden oluşmaktadır. Söz konusu konu ile ilgili 3 problem, Milli Eğitim Bakanlığı Öğretmen Kılavuz Kitabı (2011) referans alınarak, araştırmacı tarafından oluşturulmuştur. Problemlerin oluşturulmasında, öğrencilere önceki bilgilerini olabildiğince kullanma olanağı sunmasına ve öğrencilerin soyutlama yapabilmelerine olanak tanıyan özellikte olmasına dikkat edilmiştir. Ayrıca problemlerin oluşturulması esnasında uzman görüşüne başvurulmuş ve problemlerin dil bakımından incelenmesi sağlanmıştır. Hazırlanan problemler bir üst sınıfta öğrenim gören 8 öğrenciye uygulanmıştır. Bu pilot çalışmadan sonra gerekli düzenlemeler yapılarak ve tekrar uzman görüşüne başvurularak problem cümlelerine son hali verilmiştir. Böylelikle bu araştırmaya veri sağlayacak araçların geçerlilik ve güvenirlik çalışmaları tamamlanmıştır.

Veri Toplama Süreci

Bu araştırmada nitel veri toplama yöntemlerinden gözlem ve görüşme bir arada kullanılmıştır. Bu iki yöntemin bir arada kullanılması ile oluşabilecek hataların en aza indirilmesi amaçlanmıştır. Araştırmaya veri sağlayan çalışma kağıtları üç matematik probleminden oluşmaktadır. Her bir problem ayrı ayrı kağıtlara yazılmış ve bu problemler öğrencilere belli bir sıra ile uygulanmıştır. Problemlerin uygulanma sırası RBC modeline uygun olarak yapılmıştır. Araştırmacı uygulama sırasında gözlemci olarak ortamda bulunmuş, bunun haricinde hiçbir müdahalede bulunmamış, elde ettikleri gözlemlerini not etmiştir. Tüm uygulama bittikten sonra öğrencilerle bire bir görüşülmüştür. Görüşme için ayrı bir form kullanılmamış, sadece öğrencilerin çalışma kağıtlarından yararlanılmıştır. Fakat görüşme esnasında öğrencilerin karaladıkları kağıtlara dokunulmamış, bunun için tekrar ayrı bir kağıt kullanılmıştır. Görüşmelerde öğrencilerin anlaşılmayan ifadeleri üzerinde durulmuştur. Öğrencilere herhangi bir yanlı yönlendirme yapılmamış, sadece gerekli görüldüğü zaman ipuçları verilmiştir. Öğrencilerin görüşmeden önceki ve sonraki cevapları karşılaştırılmak üzere değerlendirmeye alınmıştır. Yapılan görüşmeler araştırmacı tarafından kayıt altına alınmıştır. Hem öğrencilere uygulanan çalışma kağıtları hem de sonrasında yapılan görüşmelerin kayıtları gözlem notları ile birlikte araştırmaya veri sağlayan dokümanlar olarak kullanılmıştır.

Veri Analizi

Araştırma verileri nitel özellik taşıdığından, veriler nitel veri analizi türlerinden içerik analizi ile incelenmiştir. İçerik analizi, verileri tanımlamaya ve verilerin içinde gizli olabilecek gerçekleri ortaya çıkarmaya çalışan bir nitel veri analiz yöntemidir (Yıldırım & Şimşek, 2011, s. 227). Öğrencilerin problemlere verdiği cevaplar analiz edilmiş ve öğrencilerin ifadeleri arasındaki örüntüler incelenmiştir. Gerekli kodlamalar yapılarak incelenen bu örüntüler, genel olarak RBC modeli çatısı altında değerlendirmeye alınmıştır. Dolayısıyla, tanıma, kullanma ve oluşturma kategorileri altında, öğrenci cevapları analiz edilmiş ve fark edilen önemli durumlar yorumlanmıştır.

BULGULAR

Ortaokul 4. sınıf öğrencileri ile yürütülen bu çalışmada her bir öğrenciye kod isim verilmiştir. Matematiksel başarısı yüksek olan öğrenci Nermin'in (N), orta olan Serpil'in (S), düşük olan Eda'nın (E) cevapları incelenmiş ve ifadelerin dikkat çeken noktaları, önceden belirlenmiş kategoriler (tanıma, kullanma, oluşturma) altında, aşağıdaki tabloda sunulmuştur. Araştırmada yer alan üç soru her ne kadar aynı amaca hizmet etse de özele inildiğinde, ilk soru öğrencinin daha çok tanıma, ikinci soru kullanma ve son soru tüm bunlarla birlikte oluşturma eylemini harekete geçirici özelliktedir. Bu kanılara varmak için, sadece öğrencilerin vermiş olduğu cevapları incelemek yeterli değildir. Görüşmelerde yapılan yansız yönlendirmelerle bu eylemlerin ortaya çıkarılması hedeflenmiştir. Bu kısımda soruların verilmesi aşağıdaki tabloyu incelemede kolaylık sağlayacaktır.

1. Ayça'nın yaşının 3 katının 4 eksiği 32'den büyüktür. Buna göre Ayça **en az** kaç yaşındadır?
2. İki sayıdan birinin 2 katının 3 fazlası, diğerinin 3 katının 3 eksiğinden küçüktür. Bu sayıların koordinat düzleminde bulunacağı bölgeyi gösteriniz.
3. $x - y \geq -3$ ve $6x + 3y \leq 18$ eşitsizlikleri ile x ekseni arasında kalan bölgenin alanını bulunuz.

Tablo 8: Öğrenci Cevaplarının RBC Modeli Örnekleri

Tanıma	Kullanma	Oluşturma

A: Öncelikle soruyu sesli bir şekilde okuyalım. E: (Okur) Ayça'nın yaşına x diyelim. (denklemi oluşturur ve eşit olarak düşünür) A: Peki eşit mi sence? E: Hayır, büyük, yanlış yazdım. (yazdığını değiştirmiyor) A: O zaman ne yapmalıyız? E: Aslında, eşit gibi düşünüp işlem yapsam, sonrada soruya tekrar dönerim. Ayça'nın yaşı 12'den büyük olmalı, o zaman 11' dir. A: Peki üsteki eşitsizliği sağlıyor mu? E: Hayır, sanırım ters yaptım. 13 olmalı, en az 13.	S, soruyu sesli okuduktan sonra hemen çözmeye geçer. S: Öncelikle ilk sayıya x, ikincisine y derim. A: Evet. (Denklemi alt alta yazar ve toplar.) Neden topladın? S: Çünkü x ve y'yi koordinat düzleminde bulmak için. A:Peki böyle x ve y'yi nasıl bulursun. S: +3 ile -3 birbirini götürür. 2x ve 3y kalır. O halde x,2; y'de 3'tür. (Koordinat düzlemi çizer ve I. bölgede olduğunu gösterir. A: Bu şekilde olduğuna emin misin? S: Aslında değilim, saçma oldu sanki. A: O zaman soruyu tekrar gözden geçir. S: (Tekrar okur). Aynı sanki. A: Taraf tarafa toplamanı gerektirecek şey ne? S: Iı. Evet ya yok. Küçük yazacam araya, pardon. A: Devam edelim. (Eşitsizliği yazar, x ve y'nin değerini bulur. S: Sanırım sadece bölgeyi yanlış gösterdim, II. bölgeymiş. A: Peki bulduğun x ve y değerleri hakkında ne söyleyebilirsin. S: Zaten orası kafamı karıştırdı, x < -3, -3 değilki. A: o halde iyi düşün, sadece bir nokta mı belirtir? S: .... (sessizlik) Grafik mi çizmeliyim yoksa. A: Deneyebilirsin. S: (Grafiği çizer) Evet, evet, böyle olmalı. Hatırladım gibi, yukarıyı da tarayacaz. Taralı bölgede olacak.	N: (Soruyu seslice okur) Öncelikle grafik çizmeliyim. A:Bizden istenen ne? N:Alan. Muhtemelen bir çokgen. A:Grafikleri neden ayrı koordinatlarda çiziyorsun? N: Kafam karışır, sonradan birleştirsem. Şekil daha iyi çıkar gibi. A: Evet. Ben dinliyorum seni. N: şimdi kesişim noktalarını bulalım. Evet y=4 noktasında kesişiyor sanırım. A: Evet. (Aynı düzleme alıyor grafikleri) N: Zaten üç sınırı varsa şekil üçgendir. A: Evet. (Şekli tarayıp, üçgenin yüksekliğinin y olduğunu söylüyor) N: Alanı hesaplıyor ve buluyor. A: Peki başka türlü bulunabilir miydi bu alan. N: Bilmiyorum. A: (y eksenini işaret ederek) Yükseklikle bağlantı kurulabilir mi? N: Benzerlik gibi mi? A: Olabilir mi? N: (Düşünüyor) Evet, benzerlikten çözebiliriz(çözüyor) A: Peki x ekseni değil de y ekseni deseydi? N: Bakayım, şekil değişiyor. Hatta o zaman yükseklikte x oluyor. Az önce y idi. A: Sence bu söylediklerin arasında bir bağ var mıdır? N: (Şekil üzerinde düşünerek tekrarlıyor). Aslında var gibi ama emin değilim. A: Emin olmadığın şey ne? N: Üçgenin tabanlarını diyecektim. A: Evet söyle, dinliyorum. N: Üçgenin tabanı x ekseninde mesela. O zaman yükseklik y noktası oluyor. Tam tersi de mümkün.

(A): Araştırmacı

SONUÇ

Matematik eğitiminde bir model ya da teori; tahmini destekleyebilir, güçlü açıklamaya sahip olabilir, bireyin karmaşık ve karşılıklı ilişkili fenomeni hakkındaki düşüncesini organize etmeye yardımcı olabilir, veri analizi olarak hizmet edebilir ve yüzeysel tanımların ötesine giden öğrenme hakkındaki fikirlerin iletişimi için bir dil sağlayabilir (Dubinsky & McDonald, 2001). Bu çalışmada soyutlamaya dayalı bir model olan RBC modeli kullanılmıştır. Bu model tanıma, kullanma ve oluşturma eylemlerinden oluşmaktadır.

Araştırmanın bulguları gösteriyor ki, bu üç eylem birbirinden bağımsız değildir. Başarı düzeyi ne olursa olsun, bir öğrenci hatırlamadığı bilgileri kullanamamakta ve böylelikle yeni bilgiler oluşturmakta zorluk çekmektedir.

Bu döngünün sürekliliği, başarısızlığı getirmekte ve aşılması zor güçlüklere neden olabilmektedir. Aslında basit görüldüğü için pek üzerinde durulmayan, ön bilgilerin hatırlanması yani 'tanıma eylemi' matematiksel soyutlamanın temel basamağıdır ve matematiksel soyutlama için bu eylemin eksiksiz bir şekilde tamamlanması gerekmektedir. Bu eylem basit bir hareket değildir, öğrencilerin yeni bilgi ile karşılaştığında eski bilgilerini nasıl kullanması gerektiğine yön veren bir eylemdir.

Tanıma eylemini (görüşmeden önce) gerçekleştiremeyen E, kendisine verilen ipuçlarını bile kullanamamaktadır ve karşılaştığı yeni durumlarda pasif kalmıştır. Diğer yandan S, tanıma eylemini gerçekleştirdiğinden, önceki bilgilerini yeni durumlara uyarlayabilmektedir. Fakat S'nin oluşturma eylemini kendi başına gerçekleştiremediği görülmüştür. O halde bilgileri hatırlayıp kullanmanın, oluşturma eylemi için gerek olduğunu ama yeterli olmadığını söyleyebiliriz. Ayrıca veriler, başarı düzeyleri farklı öğrencilerin önceki bilgilerini organize edip kullanma düzeylerinin de birbirinden farklı olduğunu göstermektedir.

Yapılan görüşmeler sonucunda elde edilen veriler ile öğrencilerin sorulara müdahalesiz cevapları karşılaştırılmıştır. Yapılan küçük uyarıların oluşturduğu fark görmezden gelinmeyecek kadar önemlidir. İlk başta kullanma oluşturma eylemini gerçekleştiremeyen N, yapılan küçük uyarılar ve ipuçları ile bu düzeyde davranış sergileyebilmiş ve soyutlama yapabilmiştir. Literatürde soyutlama yeteneğinin geliştirilmesinde alınan yardımın önemliliği üzerine yapılan araştırmalar yeterli sayıda olmasa da mevcuttur (Dreyfus & Tsamir, 2004; Ozmantar & Roper, 2004; Yeşildere & Türnüklü, 2008).

Öğrencilerin kavrayarak anlamalarını sağlamak, olası güçlükleri kendi başlarına aşmalarına yardım etmek ve matematiksel başarının artık zaruri bir ihtiyaç olduğu fikrini benimsetmek için soyutlama süreçlerinin incelenmesine dair daha kapsamlı çalışmalar yapılabilir.

ABSTRACT: The purpose of this study is to investigate students' perceptions of the common and differing effective characteristics of teachers on students' mathematics achievement and to explore whether the effects of these characteristics were significantly associated with certain variables (gender, grade level, mathematics achievement and mother and father education level). Relational survey method was used. Participants of the study was selected randomly and consisted of 320 students from 5th through 8th grades. Data were collected by "Mathematics Teacher Characteristics Scale". The data were analyzed for descriptive statistics, t-test and ANOVA. According to findings, the most effective characteristics were about teachers' subject matter and pedagogical knowledge. Furthermore, students' gender, math achievement and grade level were important variables correlated with the teachers' characteristics. Female students declared more than male students that teachers characteristics affecting students' achievement. 5th grades declared more than 6th, 7th and 8th grades. It was found that, there was no statistically significant main effect for mother and father education levelYou need to insert an English abstract into this section by taking into account exactly the same format.

ÖZET: Bu araştırmada üniversite kademesinde İngilizce hazırlık sınıflarında öğrenim gören öğrencilerin yabancı dil derslerinde bilgi ve iletişim teknolojileri kullanılmasına yönelik tutumlarının belirlenmesi ve Saykılı ve diğ. (2013) tarafından geliştirilen BİT tutum ölçeğinin farklı bir örneklem grubunda uygulanarak faktör yapısının geçerliğinin sınanması hedeflenmiştir. Araştırma nicel, betimsel bir tarama araştırmasıdır. Araştırmanın evrenini Türkiye'nin batısında bir devlet üniversitesinin hazırlık sınıfında 2013-2014 akademik yılında öğrenim görmekte olan 623 öğrenci oluşturmaktadır. Araştırmada amaçlı örnekleme tekniği kullanılarak 353 gönüllü öğrenci örnekleme alınmıştır. Elde edilen veriler üzerinde ilk olarak ölçeğin faktör yapısını sınamak amacıyla doğrulayıcı faktör analizi yapılmıştır. Sonraki aşamada veriler üzerinde gerekli istatistiki işlemler yapılarak öğrencilerin tutumları belirlenmiş ve farklı demografik değişkenlere göre incelenmiştir.

ABSTRACT: This study aims to investigate learner attitudes toward the use of information and communication technologies (ICT) in foreign language classes at tertiary level testing the validity of factor structure of ICT scale developed by Saykili et al. (2013). A distinct sample of 353 volunteering participants studying English as a foreign language at a preparatory school of a western public university in Turkey in the academic year of 2013-2014 took part in the study. The study follows a quantitative descriptive survey research design. Confirmatory factor analysis was carried out on the data to test the validity of factor structure of the scale. Next, learner attitudes were investigated depending on various demographic variables using the required statistical processes.

ÖZET: Bu çalışmada Fen Laboratuar Uygulaması dersinde uygulanan araştırmaya dayalı öğrenme uygulamalarının öğretmen adaylarının yaratıcı düşünme düzeylerine etkisi araştırılmıştır. Araştırmanın örneklemini Pamukkale Üniversitesi Eğitim Fakültesi ilköğretim fen bilgisi öğretmenliğinde okuyan 36 öğretmen adayı oluşturmuştur. Bu araştırmada veriler Torrance Yaratıcı Düşünme Testi (TYDT) ile toplanmıştır. Araştırmaya dayalı laboratuar uygulamaları ile öğretmen adaylarının yaratıcı düşünme düzeylerindeki gelişim TYDT'de yer alan akıcılık, esneklik ve özgünlük düzeylerinde incelenmiştir. Veriler, SPSS 13 paket programı ile amaca uygun olarak aritmetik ortalama, standart sapma ve T testi değerlerine göre analiz edilmiştir. Verilerin analizi sonucunda öğretmen adaylarına uygulanan araştırmaya dayalı laboratuar uygulamalarının yaratıcı düşünmelerini geliştirmede etkili olduğu görülmüştür. Ayrıca bu çalışmanın sonuçlarına göre öğretmen adaylarının araştırmaya dayalı laboratuar uygulamaları ile yaratıcı düşünme boyutlarından olan özgünlük boyutunda en çok gelişme gösterdikleri ortaya konmuştur.

Anahtar sözcükler: Araştırmaya dayalı öğrenme, fen eğitimi, laboratuar uygulamaları, yaratıcı düşünme.

ABSTRACT: The purpose of this research is to analyse the effects of Inguiry Based Laboratory Instructions on the development of creative thinking skills of pre-service teachers. In this study, one sample pre-test and post-test design which is non-experimental research model of quantitative analysis methods. The sample of the research is composed of thirthy-six pre-service teachers in Science Education Program of The Faculty of Education at Pamukkale University. In this study, "Torrance Creative Thinking Test" is used in order to find out the development of their creative thinking levels In the analysis of the data, frequency , arithmetic mean standart deviation and t-test are used. At the end of the study it is found out that Inquiry Based Laboratory Instructions are effective in developing the all creative thinking aspects of the pre-service teachers such as fluency, flexibility and originality.
Key Words: Inquiry based learning, science education, laboratory instructions, creative thinking,

GİRİŞ

Olağan bir problemin farkında olan, bunun için ihtiyaç duyduğu bilgiye ulaşabilen, farklı çözümler üretebilen ve bunları hayata geçirebilen başka bir değişle yaratıcı düşünebilen bireyler yetiştirmek fen eğitiminin en önemli amaçlarındandır. Araştırmaya dayalı öğrenme ortamında öğrenciler yaparak yaşayarak kendi bilgilerini yapılandırırlar. Yaratıcılığın temeli de bireyin kendi bilgisini oluşturmasıdır. Bu anlamda eğitim uygulamaları, öğrencilerin yeteneklerini geliştirecek, onların öğrenmelerini kolaylaştıracak şekilde olmalıdır. Yaratıcılığın gelişmesinde rol alan öğretmenlerin de bu öğretim anlayışında yetişmesi önemlidir. Araştırmaya dayalı laboratuar uygulamaları ile öğretmen adayları çok sayıda fikir üretebilme, çok yönlü düşünüp, düşüncelerini geliştirebilme ve sorunlara farklı açılardan bakarak yeni açılımlar getirebilme becerilerini geliştirirler.

Araştırmaya dayalı laboratuar uygulamaları; problem çözme, analiz etme, genelleme, eleştirel düşünme, sentezleme, değerlendirme, karar verme ve yaratıcılık gibi bilişsel süreçleri geliştirir (Foulds ve Rowe, 1996). Araştırmaya dayalı laboratuar uygulamalarıyla öğretmen adayları kendilerinin uyguladıkları deney ve etkinliklerle problem durumunu araştırırlar. Problem durumunun çözümüne yönelik planladıkları işlem basamaklarını takip eden öğretmen adayları kalıcı öğrenmeleri sağlayabilirler. Ayrıca bu uygulamalar onların araştırmayı, bilimsel düşünme becerileri kazanmayı ve bu düşüncelerini sınıfta akranları ile test etmeyi öğrenmek için önemli fırsatlar sunmaktadır (Hofstein ve Lunetta, 2004; Kipnis ve Hofstein, 2007). Araştırmaya dayalı laboratuar uygulamaları ile öğrenciler bilgi yığınının altında ezilmeden bilgiye ulaşmayı öğrenebilir, bilimsel çalışma disiplinini ve anlayışını geliştirebilirler (Aktamış ve Ergin 2007).

Laboratuar uygulamaları, öğretmenin problem durumunu söyleyip söylememesine, kullanılacak malzemeleri belirleyip belirlememesine, izlenecek yolu ve deneyin sonucunu açıklayıp açıklamamasına göre dört açıklık düzeyine sahiptir (Hegarty- Hazel, 1986; Tamir, 1989; Buck, Bretz, and Towns 2008). Yani araştırmaya dayalı laboratuar uygulamaları, yüksek derecede yapılandırılmış ve öğretmen merkezliden açık uçlu araştırmaya dayalı etkinliklere doğru değişim göstermektedir (Hofstein ve Mamlok-Naaman, 2007). Laboratuar uygulamalarında düzey "0" da problem, deneyin yöntem ve amacı, deneyin sonucu öğretmen tarafından veya çalışma yaprağı ile öğrencilere sunulur. Düzey "1"de problem ve deneyin yöntem ve amacı öğretmen tarafından belirlenir ve öğrencilerin uygulaması için açıklanır ancak deneyin sonucunun öğrenciler tarafından bulunması beklenir. Fakat burada deneyin sonucu zaten bellidir ancak öğrencinin bu sonuca ulaşması sağlanır.

Düzey "2"de ise problem öğretmen tarafından belirlenir ancak deneyin yöntemi, amacı ve sonucu öğrenciler tarafından belirlenir. Burada öğrenciler ortaya atılan probleme yönelik kendi deney düzeneklerini veya araştırmalarını oluşturur ve verilerini kendileri değerlendirerek daha önce bilmedikleri bir sonuca ulaşarak kavramsal açıklamada bulunurlar. Düzey "2" araştırma için kullanılacak malzemelerin öğrenciler tarafından belirlenip belirlenmemesine göre ikiye ayrılmaktadır. Düzey "2a" da araştırmaya yönelik problem durumu ve kullanılacak malzemeler öğrencilere sunulur ve öğrenciler kullanacakları yöntemi ve araştırmanının sonucunu kendileri belirler. Düzey "2b" ise yönlendirilmiş araştırmalardan açık araştırmalara geçiş düzeyi gibi düşünülebilir. Burada sadece problem durumu öğretmen tarafından belirlenir diğer süreçlerin hepsine öğrenci karar verir. Öğrencilerin kavramları anlama düzeylerini geliştirmek için, araştırmaya dayalı laboratuarlar oluşturulmalıdır. Bu bağlamda öğretmenler araştırmaya dayalı bir laboratuar ortamında öğrencilerin bilgilerini sentezlemelerine yardım etmeli, mantıksal tartışmalar oluşturmalı ve öğrencileri ile iyi bir iletişim içinde öğrenme ve öğretme ortamı sağlamalıdırlar.

Son olarak açıklık düzeyi en yüksek olan ve öğrencilerin bilişsel ve zihinsel gelişimini en çok etkileyen düzey "3" de araştırmanın problemini, yöntemini, amacını ve sonucunu öğrenci bizzat kendi belirler. Burada öğrenci aktif bir şekilde sürece katılır. Son yıllarda bu seviyeler değişik adlarla da adlandırılmaktadır. Seviye 0 ve seviye 1 yapılandırılmış araştırma (structured-inquiry), seviye 2 yönlendirilmiş araştırma (guided-inquiry), seviye 3 ise hiçbir yapı olmadığı için yapılandırılmamış (açık uçlu) araştırma (open-inquiry) olarak adlandırılmaktadır (Martin, Sexton ve Gerlovich, 1998; Basey, Mendelow ve Ramos, 2000; Bell, Smetana ve Binns Buck, 2005; Bretz, and Towns 2008; Herron, 2009; Gormally, Brickman, Hallar ve Armstrong, 2011).

Blomm"a göre yaratıcılığın gelişmesinde okulöncesi eğitim ve ilkokul yıllarıdır önemli bir yer tutmaktadır. Bu bağlamda öğretmenlerin öğrencilerinin yaratıcılıklarını geliştirebilmeleri için, her şeyden önce kendilerinin yaratıcı bir kişiliğe sahip, çocuklar için uygun bir model olmaları gerekmektedir. Araştırmaya dayalı öğrenmenin uygulamalarında anahtar rol üstlenen öğretmenlerin bilen insan rolünden çıkıp öğrencilerin ne düşündüğünü önemseyen ve öğrencilerinin öğrenmelerini geliştiren teşvik edici yanıtlar verebilen özelliklere sahip olmaları beklenir (Van Zee, Hammer, Bell, Roy ve Peter, 2005).Bu sebepten dolayı bu çalışmada da Fen Laboratuar Uygulaması dersinde uygulanan araştırmaya dayalı öğrenme uygulamalarının öğretmen adaylarının yaratıcı düşünme düzeylerine etkisi araştırılmıştır.

YÖNTEM

Araştırmanın Modeli

Bu araştırmada Fen Laboratuar Uygulaması-II dersinde uygulanan araştırmaya dayalı öğrenme etkinliklerinin öğretmen adaylarının yaratıcı düşünme düzeylerine olan etkisinin araştırılması amacıyla yarı deneysel araştırma modeli olan tek gruplu öntest-sontest deseni kullanılmıştır.

Örneklem

Pamukkale Üniversitesi İlköğretim Bölümü Fen Bilgisi Eğitimi Anabilim Dalı'nda 2009-2010 eğitim-öğretim yılının birinci döneminde Fen Laboratuarı-I dersini almış ve ikinci döneminde Fen Laboratuarı Uygulamaları-II dersine devam eden otuz altı öğretmen adayı oluşturmuştur. Örneklemi oluşturan öğretmen adaylarının 22'ü (%61.1) kadın, 14'ü (%38.9) ise erkektir.

Veri Toplama Aracı

Torrance yaratıcı düşünme testi (TYDT) Torrance tarafından ilk olarak 1966'da yayınlanmış ve 35 ayrı kültürde yaklaşık 615 araştırmada ve 100'den fazla lisansüstü tezde bireylerin yaratıcılık performanslarını tanımlamak, ölçmek ve değerlendirmek için kullanılmıştır (Akt. Sungur, 1997). Sungur' un (1988) belirttiğine göre Torrance (1966), test-tekrar test yöntemi ile yaptığı güvenirlik çalışmasında, iki hafta ara ile yaptığı uygulamalar sonucunda 0,50 ile 0,93 arasında değişen sonuçlar elde etmiştir. Testin Türkçeye çevirisini yapan Aslan (1999) anaokulu, ilköğretim, lise ve yetişkinler için testin A ve B formlarının dil geçerliği, güvenirlik ve geçerlik çalışmalarını yapmıştır. Bu çalışmalarda üç uzman tarafından form Türkçe'ye çevrilmiş ve çevrilen bu formlar karşılaştırılarak gerekli düzeltmeler yapılarak forma son hali verilmiştir. Torrance Yaratıcı Düşünce Testi Sözel A kısmı için 0.64 - 0.86 arasında değişen ve p< .01 düzeyinde anlamlı korelasyon değerleri bulunmuştur. Ayrıca testin İngilizce ve Türkçe form ortalamaları arası farklılık t-testi ile analiz edilmiştir. Testin güvenirlik çalışması kapsamında test tekrar test yöntemi ile iç tutarlılığa bakılmış ve yetişkin formu için 0.68 ile 0.81 arasında değişen Cronbach alfa korelasyon katsayıları elde edilmiştir (Aslan, 2001; Aslan ve Puccio, 2006). Bu korelasyon katsayıları TYDT' nin güvenilir olduğunu göstermektedir. TYDT puanları üç farklı alt başlıkta incelenmektedir. "Sözel Akıcılık (Verbal Fluency)" bireyin sözcüklerle bir konu hakkında çok sayıda düşünce üretmesini, "Sözel Esneklik (Verbal Flexibility)" bireyin bir yaklaşımdan diğerine geçebilme esnekliğini ve "Sözel Özgünlük (Verbal Originality)" bilinenin, basitin ve anonim olanın ötesindeki düşünceyi ifade etmektedir. Bu araştırmada TYDT' nin "Sözel A" kısmı ön test ve son test olarak kullanılmıştır. TYDT Sözel A formunda 7 ayrı etkinlik bulunmaktadır. Bunlar; soru sorma, nedenlerini tahmin etme, sonuçlarını tahmin etme, ürün geliştirme, alışılmamış kullanımlar ve alışılmamış sorulardır.

Verilerin Analizi

Veri toplama araçlarından elde edilen veriler SPSS 13.0 paket programında yer alan farklı analiz yöntemleri kullanılarak değerlendirilmiştir. Araştırmadan elde edilen verilerin değerlendirilmesinde kullanılacak olan parametrik veya parametrik olmayan testler arasında seçim yapılabilmesi için öncelikle veri setlerinin normal dağılım gösterip göstermediğinin belirlenmesi için 'tek grup Kolmogorov- Smirnov Testi' uygulanmıştır (Baştürk, 2010). Verilerin çözümlenmesinde Torrance Yaratıcı Düşünce Testi'ne ait ön test ve son test puanları arasında anlamlı fark olup olmadığını ortaya koymak için "İlişkili Örneklemler İçin t- Testi" (Paired Samples t-Test) kullanılmıştır.

BULGULAR

Bu araştırmada kullanılacak olan analiz yöntemine karar verilmesi için öncelikle öğretmen adaylarına öntest ve sontest olarak uygulanan Torrance Yaratıcı Düşünme Testi (TYDT) ile elde edilen verilerin normal dağılım gösterip göstermediğinin belirlenmesi gerekmektedir. Bu amaçla ön testlerden ve son testlerden elde edilen verilere "Tek Grup Kolmogorov-Smirnov Testi" uygulanmıştır. Bu testten elde edilen sonuçlar Tablo-1.'de sunulmuştur.

Tablo 1: Tek Grup Kolmogorov-Smirnov Testi Sonuçları

TYDT	Ön Test				Son Testler			
	N	X	S.S	p	N	X	S.S	p
	36	22.37	.94	6.09	36	40.38	16.56	.07

Tablo 1 incelendiğinde ölçüm aracına ait tüm ön test ve son test sonuçlarının normal dağılım gösterdiği (p>0,05) belirlenmiştir. Bu nedenle araştırmaya ait verilerin analizlerinde parametrik testler uygulanmıştır.

Tablo 2: Öğretmen adaylarının Ön Teste İlişkin Toplam Akıcılık, Esneklik ve Orijinallik Puanlarına Göre Hesaplanmış Ortalama, Standart Sapma, Minimum ve Maksimum Değerleri

	N	X	S.S	En Düşük Puan	En Yüksek Puan
Akıcılık	36	33.66	8.50	15.00	59.00
Esneklik		20.55	6.07	9.00	30.00
Özgünlük		12.88	6.93	2.00	29.00

Öğretmen adaylarının ön teste ait akıcılık, esneklik ve orijinallik düzeylerindeki puanlarının aritmetik ortalama değerleri Tablo 2' de sunulmuştur. Bu değerlerin, en yüksek puandan başlayarak akıcılık (X_{ort}= 33.66), esneklik (X_{ort}= 2.55) ve özgünlük (X_{ort}= 12.66) olarak sıralandığı görülmektedir. Öğretmen adaylarının ön testten aldıkları puanlara bakıldığında endüşük puanı özgünlük düzeyinde (2 puan), en yüksek puanı da akıcılık düzeyinde (59 Puan) aldıkları görülmektedir.

Tablo 3: Öğretmen adaylarının Ön Teste İlişkin Toplam Akıcılık, Esneklik ve Orijinallik Puanlarına Göre Hesaplanmış Ortalama, Standart Sapma, Minimum ve Maksimum Değerleri

	N	X	S.S	En Düşük Puan	En Yüksek Puan
Akıcılık	36	48.25	18.82	22.00	117.00
Esneklik		29.05	9.78	11.00	60.00
Özgünlük		43.86	23.04	10.00	121.00

Öğretmen adaylarının son teste ait akıcılık, esneklik ve orijinallik düzeylerindeki puanlarının aritmetik ortalama değerleri Tablo 2' de sunulmuştur. Bu değerler incelendiğinde en yüksek puandan başlayarak akıcılık (X_{ort}= 48.25), esneklik (X_{ort}= 29.05) ve özgünlük (X_{ort}= 43.86) olarak sıralandığı görülmektedir.

Ayrıca öğretmen adaylarının son testten en düşük puanı özgünlük düzeyinde (10 puan), en yüksek puanı da yine özgünlük düzeyinde (121 puan) aldıkları görülmektedir. Bu sonuca göre, öğretmen adaylarının bilinenin dışına çıkan fikirler üretmekte daha başarılı oldukları söylenebilir. Araştırmaya katılan öğretmen adaylarının TYDT'ne yönelik almış oldukları öntest ve sontest puanları ilişkili örneklemler için t testi ile karşılaştırılmış ve sonuçlar Tablo 4'de sunulmuştur.

Tablo 4. Araştırmaya Katılan Öğretmen Adaylarının TYDT Puanlarının Ortalamaları, Standart Sapmaları ve t-testi Sonuçları

Yaratıcılık Alt Boyutları		N	X	S.S	S.H	t	p
Akıcılık	Ön test	36	33.66	15.89	2.64	-5.50	.001*
	SonTest		48.25				
Esneklik	Ön test		20.55	8.04	1.40	-6.06	.001*
	SonTest		29.05				
Özgünlük	Ön test		12.88	22.22	3.70	-8.36	.001*
	SonTest		43.86				

*(p< .05)

Tablo 4 incelendiğinde testin akıcılık boyutunda ($t=-5.50$, $p<0.05$), esneklik boyutunda ($t=-6.06$, $p<0.05$) ve özgünlük boyutunda ($t=-8.36$, $p<0.05$) ön ve son test puanları arasında, son test lehine istatistiksel olarak anlamlı bir farklılığın olduğu bulunmuştur. Bu sonuca göre; öğretmen adaylarına uygulanan araştırmaya dayalı laboratuar uygulamalarının yaratıcı düşünmelerini geliştirmede etkili olduğu görülmüştür.

SONUÇ ve YORUM

Bu çalışmada araştırmaya dayalı laboratuar uygulamalarının öğretmen adaylarının yaratıcı düşünme düzeylerine olan etkisi incelenmiştir. Öğretmen adaylarının TYDT'ne ön testine ait akıcılık, esneklik ve orijinallik düzeylerindeki puanlarının aritmetik ortalama değerleri incelendiğinde en yüksek puandan başlayarak akıcılık, esneklik ve özgünlük olarak sıralandığı görülmektedir. Öğretmen adayları bu testten en düşük puanı özgünlük düzeyinde, en yüksek puanı da akıcılık düzeyinde aldıkları belirlenmiştir. Bu sonuca göre öğretmen adaylarının fikir üretmede diğer iki düzeye oranla daha başarılı oldukları tespit edilmiştir. Diğer taraftan araştırmaya dayalı laboratuar uygulamaları sonrasında öğretmen adaylarının TYDT son testinin akıcılık, esneklik ve orijinallik düzeylerine ait puanların aritmetik ortalama değerleri incelendiğinde ise en yüksek puanın akıcılık boyutunda olduğu ve bunu özgünlük ve esnekliğin takip ettiği ortaya konmuştur. Bu sonuca göre, öğretmen adaylarının bilinenin dışına çıkan orijinal fikirler üretmekte daha başarılı oldukları söylenebilir.

Öğretmen adaylarının TYDT'nin akıcılık düzeyinde ön test ve son test sonuçları karşılaştırıldığında son test lehine bir gelişmenin olduğu belirlenmiştir. Bu sonuçtan yola çıkarak öğretmen adaylarının yaratıcı düşünme akıcılık düzeyinin gelişiminde araştırmaya dayalı laboratuar uygulamalarının etkili olduğu söylemek mümkündür. Yani öğretmen adayları araştırmaya dayalı laboratuar uygulamaları ile belli bir süre içinde çok sayıda kabul edilebilecek düşünce, çözüm veya alternatifler üretme becerilerini geliştirmişlerdir. Tartışan, soru soran, yaratıcı düşünmeyi öğrenen öğretmen adayları gelecekte de öğrencilerine olaylara farklı bakış açılarıyla bakabilmeyi kazandırabileceklerdir. Bu anlamda bu çalışmada araştırılan araştırmaya dayalı laboratuar uygulamalarının, öğretmen adaylarının bir olaya yönelik birçok problem durumunu ortaya koyabilmelerinde ve problemlerin çözümüne yönelik birçok düşünce sunabilmelerinde etkili olduğu tespit edilmiştir. Bu çalışma sonuçlarına benzer sonuçlar Tezci'nin (2002) ve Aboukinane' nin (2007) yapmış olduğu çalışmalarda da görülmektedir. Fen öğretiminde öğrencilerin yaparak yaşayarak bilgileri kavramaları önemli olduğundan daha derin anlamlar kazanabilmek için olaylardaki farklı durmaları görebilmeli ve her zaman sorunun birden fazla çözüm yolu olduğunu bilmelidir.

Öğretmen adaylarının TYDT'nin esneklik düzeyinde ön test ve son test sonuçları karşılaştırıldığında son test lehine bir gelişmenin olduğu belirlenmiştir. Bu da öğretmen adaylarının yaratıcı düşünme esneklik düzeyinin gelişiminde araştırmaya dayalı laboratuar uygulamalarının etkili olduğunu göstermiştir. Başka bir değişle araştırmaya dayalı laboratuar uygulamaları, öğretmen adaylarının farklı türe ve sınıflara ait düşünce ve çözümler üretme becerilerini geliştirmiştir.

Alışılmışın dışında yeni, özgün, sıra dışı çözümler üretebilmeyi içeren TYDT'nin özgünlük düzeyinde de diğer yaratıcılık düzeylerinde olduğu gibi son test lehine bir gelişme olduğu tespit edilmiştir. Bu çalışmada öğretmen adayları araştırmaya dayalı laboratuar uygulamaları ile alışılmadık, benzersiz yani kendine özgü düşünceler, problemler veya çözümler üretme imkanı bulmuşlardır. Bu süreç onların özgün düşünceler sunabilme becerilerini geliştirmiştir. Öğretmen adaylarının bu beceriyi kazanmaları sadece kendi öğrenmelerinde önemli olmayacaktır aynı zamanda gelecekte öğrencilerine sadece fen konularına yönelik değil yaşantılarının her alanında farklı düşünceleri ortaya koyabilmeleri açısından da önemlidir. Bu sonuç araştırmaya dayalı laboratuar uygulamalarının öğretmen adaylarının yaratıcı düşünme özgünlük düzeyinin gelişiminde etkili olduğunu ortaya koymuştur.

ÖNERİLER

Geleceğin öğretmenleri olan öğretmen adaylarının yaratıcı düşünmelerini geliştirecek öğretim ortamları sağlanarak onların da öğrencilerini bu öğrenme ortamını oluşturabilmelerine imkan verilmelidir.

Bu çalışma sadece Fen Bilgisi Eğitimi Anabilim Dalında öğrenimine devam eden 36 öğretmen adayıyla sınırlandırılmıştır. Gelecekte daha fazla öğretmen adayı ile bu çalışmanın tekrarlanması önerilebilir. Ayrıca aynı çalışma farklı disiplinlerde öğrenim gören öğretmen adayları ile tekrarlanabilir. Bu çalışmada toplanan veriler nicel analiz yöntemleriyle analiz edilmiştir. Gelecek çalışmalarda nicel veriler nitel verilerle desteklenebilir.

ABSTRACT: Technology is an essential tool for learning mathematics in the 21st century, and all schools must ensure that all their students have access to technology. In this study, it was aimed to determine the perceptions of preservice elementary school teachers on the use of technology in mathematics teaching and explore whether these perceptions were significantly associated with certain variables (gender, grade level, and frequency and adequacy ICT use). The sample of the research was composed of 252 prospective elementary school teachers. A "a perception scale for technology use in the teaching of mathematics" which was composed of requirement, advantage and disadvantage sub-dimensions, was used as the data collection tool. The data were analyzed for descriptive statistics, t-test, Mann-Whitney U, ANOVA and Kruskal-Wallis H test. Preliminary analyses indicated that the perceptions of prospective teachers on the use of technology in mathematics teaching were positive in the general perceptions, requirement and advantage sub-dimensions whereas their perceptions on the use of technology in mathematics teaching were negative in the disadvantage sub-dimension.

ABSTRACT: Digital technologies offer increasing opportunities for students in primary or secondary schools to create their own digital media. "Slowmation" (abbreviated from "Slow Motion Animation") is a simplified way of making an animation so that students, themselves, can create it as a new way of learning about some science concepts.
In this study, pre- and post-test quasi-experimental design with control group was used with retention test. During the study, for the experimental group of students, additionally to biology instruction, slowmation has been used as a teaching approach. The implementation lasted 9 weeks. The data gathered by an 18 question-multiple choice test. It was developed by researcher and used as pre-, post- and retention test in order to measure students' biology course achievement. As a result of the research, it was determined that using slowmations as teaching approach for biology instruction increased the students' biology course achievement more significantly for post- and retention implementations.

Key words: Slowmation, Science Teacher, Pre-service Teacher

INTRODUCTION

Using technology that is readily accessible can sometimes be a catalyst for such engagement, especially if the tools help pre-service teachers to represent their knowledge in innovative ways (Kim & Reeves, 2007; Lee, Linn, Varma, & Liu, 2010). With the rapid advancement in personal digital technologies, it is becoming easier for students such as pre-service teachers to design media products such as animations and videos, which may be a way to support their conceptual understanding of science concepts that are typical in the primary school curriculum (Hoban & Nielsen, 2012). In several studies involving animations made by experts to assist students in learning science concepts have produced mixed results. Some studies have shown that watching animations to explain science concepts has improved the knowledge of high school and college students (Marbach-Ad, Rotbain, & Stavy, 2008; Williamson & Abraham, 1995). But in some studies, contrarily, it has been found that there has been little improvement in learning when students watch animations explaining science concepts (Sanger & Greenbowe, 2000; Yang, Andre, Greenbowe, & Tibell, 2003). According to Chan and Black (2005), animations could provide a motivation for engaging with content if learners become the designers and creators rather than consumers of information as in expert generated animations. Although this possibility of motivation for engaging with the content, designing and creating students' own animations have been limited because, this process requires time and sophisticated software and the process is too complex (Hoban & Nielsen, 2012).

Slowmation

Slow Motion Animation (abbreviated to "Slowmation") is a new teaching approach that has been developed over the last decade in science education classes at the University of Wollongong. This approach simplifies the complex process of making animations to enable learners to create their own comprehensive animations about science concepts (Hoban, 2005, 2007, 2009; Hoban & Ferry, 2006). Slowmation technic is similar to clay animation and in this approach, students make research, storyboard, design models, capture digital still images of small manual movements of the models. After these, they use a computer software to play the images in a sequence to simulate movement.
Making a movie using a traditional stop-motion animation technique is feasible, because the creator who manually moves the objects while taking each digital still photograph, thus eliminates the need for complex

mechanisms to provide movement. Having pre-service teachers take digital still photos one by one, instead of a continuous 25–30 frames per second as in video, also allows them to check, manipulate, think about, discuss and reconfigure the models with each movement and photograph (Hoban & Nielsen, 2011).

Pre-service teachers can learn the process at the beginning of a course period and can prepare their models made out of daily routine materials such as plasticine, paper, and existing plastic models. If the materials are ready and available, in the course period, they can continue and take digital photos as the models are moved manually. The creation process integrates features of clay animation, object animation and digital storytelling and involves the pre-service teachers in designing and a sequence of representations (Hoban and Nielsen, 2010); (a) research notes, (b) storyboard, (c) models, (d) digital photographs and (e) narrated animation.

In summary, slowmation greatly simplifies the process of creating a stop-motion animation by enabling pre-service teachers to (i) make or use existing 2-D or 3-D models that may lie flat on a table or the floor; (ii) play the animation slowly at 2 frames per second requiring 10 times fewer photos than required in normal animation and (iii) use widely available technology such as a digital still camera, a tripod and free movie-making computer software (Hoban & Nielsen, 2012). McKnight, Hoban and Nielsen (2011), have explained that a slowmation displays the following features:

• *Purpose* - the goal of a slowmation is for pre-service teachers to make use of 1-2 minute animated mini-movie to tell a story, and through the creation process, learn about the story's meaning. The design of the slowmation can include a range of technological enhancements such as narration, music, other photos, diagrams, models, labels, questions, static images, repetitions and characters.

• *Timing* - slowmations are usually played slowly at 2 frames/second, not the usual animation speed of 20-24 frames/second, and thus need ten times fewer photos than in clay or computer animation, hence the name "Slow Animation" or "Slowmation";

• *Orientation* - models are made in 3D and/or 2D and usually manipulated in the horizontal plane (on the floor or on a table) and photographed by a digital still camera mounted on a tripod looking down or across at the model. This makes the models easier to make, move and photograph;

• *Materials* - because models do not have to stand up, many different materials can be used such as soft play dough, plasticine, 2D pictures, drawings, written text, existing 3D models, felt, cardboard cut-outs and natural materials such as leaves, rocks or fruit; and,

• *Technology* – pre-service teachers use their own digital still cameras (with photo quality set on low resolution so as to avoid overloading the editing software) or cameras in mobile phones and free movie-making software available on their computers (e.g. *iMovie* or *SAM Animation* on a Mac or *Windows Movie Maker* on a PC)

Purpose of the Study

The purpose of this study is to determine whether the approach is effective on students' success in some biology content or not. For this aim, following research question has been examined to conduct this study.

How does the slowmation approach influence pre-service teachers' biology achievement?

METHODS

Research Design

This study used a quasi-experimental (two-group pretest–posttest) design to compare the effects of slowmation as teaching and learning approach in biology achievement of pre-service science teachers.

Participants

This study was conducted in fall semester of 2013 and used quasi-experimental (pre- and post-test control group design) study design to examine the effects of slowmation in learning biology and students biology achievement. No specific exclusion criteria were identified. Experimental and control group participants were identified on the base of volunteerism. After a short information was given about the slowmation application in computer course, students were asked to select one of the two classes.

The pre-service teachers were enrolled in one semester Computer course in the second year of a four year Education Faculty. The students were also enrolled in General Biology course in the same semester. In this study, the forty nine pre-service science teachers were invited to be in the research project for making slowmations as experimental group and 45 of them volunteered. On the other hand, the control group was for 38 pre-service science teachers. The pre-service teachers in experimental group received a workshop to explain how they could create a slowmation. Pre-service science teachers were allocated typical biology topics (e.g., mitosis, meiosis, reproduction) which were selected from general biology course content after the workshop.

They were expected to create a 2–4 minutes narrated slowmation as one assessment task to explain a science concept from their allocated topic.

Instrument and Data Collection

Data of this research gathered by biology achievement test. The test was multiple choice for 18 items. The biology achievement test for 25 items was applied as a pilot study to the students (n=63) who completed the basic biology course at the end of the previous semester (spring semester of 2012) and after the item analysis, 7 items were excluded from the test. This multiple choice biology achievement test was applied as pre- and post-test. The biology achievement test was used again to examine the permanency two months later.

Table 1. The Data Collection and Application Process of the Study

Groups	Pre-Test	Slowmation Creation	Post-Test	Retention Test
Control (n=38)	X	⟶	X	X
Experimental (n=45)	X	X	X	X

Data Analysis

The data gathered from pre-service science teachers were analyzed using the SPSS Software (v.16.0). Descriptive statistics were calculated to summarize the sample characteristics and the subjects' answers. To assess mean differences between pre- and post- and retention test biology achievement scores for each groups, paired sample t-Test was used. To compare the mean difference of experimental and control group, (binary comparisons of pre- and post- and retention-test), independent samples t-test were used. For all analyses, $p < .05$ was considered statistically significant.

RESULTS AND FINDINGS

The means and standart deviations of biology achievement scores of two groups (experimental and control) for pre- and post- and retention-test measurements were given in Table 2.

Table 2. Descriptive statistics of biology achievement for two treatment groups

Group	Pre-Test Mean (SD)	Post-Test Mean (SD)	Retention Test Mean (SD)
Control	6,82 (3,83)	7,47 (3,51)	6,97 (2,75)
Experimental	5,73 (2,85)	9,56 (3,00)	7,76 (2,68)

As can be seen from Table 2, the mean scores of biology achievement test increased from pre to posttest measurement for both group and decreased from post to retention test. According to Table 2, for the control group, only a small amount of the mean score changes occurred among the pre-, post- and retention test measurements.

Paired samples t-Test was carried out on to determine the difference in the pre- and post- and retention-test measurements of biology achievement for each groups (control and experimental). In other words, t-Test was performed to investigate the effect of slowmation approach on the biology achievement of the pre-service science teachers. The results are shown in the following table (See; Table 3 and Table 4).

As seen in the Table 3, there was a significant difference in the scores for pre-test (M=6.82, SD=3.83) and post-test (M=7.47, SD=3.51) conditions; t(37) = -2.749, p =0,009*. There were not significant differences in the scores for post-test (M=7.47, SD=3.51) and ret-test (M=6.97, SD=2.75) conditions; t(37) = 0.705, p=0,485 and for pre-test (M=6.82, SD=3.83) and ret-test (M=6.97, SD=2.75) conditions; t(37) = -0.197, p=0,845.

Table 3. Paired Samples t-Test Results for Control Group

For Control Group	n	X	SD	df	t	p

Pre-test	38	6,82	3,83	37	-2,749	.009
Post-test	38	7,47	3,51			
Post-test	38	7,47	3,51	37	,705	,485
Ret-test	38	6,97	2,75			
Pre-test	38	6,82	3,83	37	-,197	,845
Ret-test	38	6,97	2,75			

When same analysis were done for experimental group, as seen in the Table 4, there were significant differences in the scores for pre-test (M=5.73, SD=2.85) and post-test (M=9.56, SD=3.01) conditions; t(44) = -5.642, p =0,000* and for post-test (M=9.56, SD=3.01) and ret-test (M=7.76, SD=2.68) conditions; t(37) = 0.705, p=0,485 and for pre-test (M=6.82, SD=3.83) and ret-test (M=6.97, SD=2.75) conditions; t(37) = -0.197, p=0,845.

Table 3. Paired Samples t-Test Results for Experimental Group

For Experimental Group	n	X	SD	df	t	p
Pre-test	45	5,73	2,85	44	-5,642	,000
Post-test	45	9,56	3,01			
Post-test	45	9,56	3,01	44	3,203	,003
Ret-test	45	7,76	2,68			
Pre-test	45	5,73	2,85	44	-3,179	,003
Ret-test	45	7,76	2,68			

The mean scores for treatment groups in pre- and past- and retention-test measurement were summarized below (Figure 1).

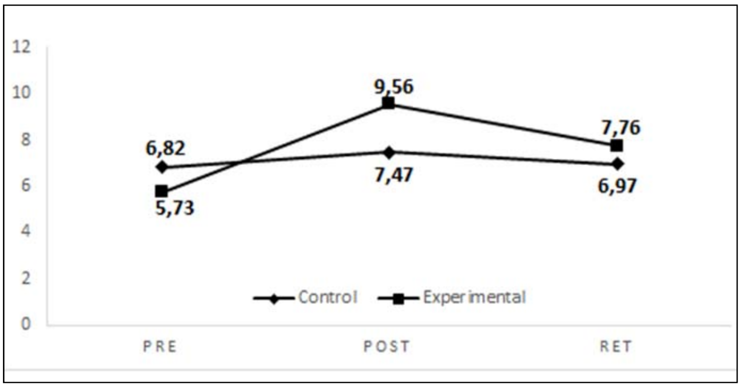

Figure 1. Mean Scores of Control and Experimental Groups in Pre- and Past- and Retention Test

Binary Comparisons of the Mean Scores of Control and Experimental Groups

Table 4 shows how to combine results from several t-tests performed for the same groups. According to Table 4, there are statistically significant differences, at the .05 level of significance, between control and experimental group students in biology achievement scores, but not pre- and retention-test. Results show that experimental group students had higher achievement scores, but no statistical difference exists between control and experimental groups in pre- and retention-test in terms of biology achievement scores.

Table 4. Results of t-test and Descriptive Statistics for pre- and post- and retention-test by groups

	Groups									
	Control			Experimental			95% CI for Mean			
	M	SD	n	M	SD	n	Difference	t	df	p
Pre-Test	6,82	3,826	38	5,73	2,85	45	-0.418, 2.54	1.439*	67,321	0,155
Post-Test	7,47	3,51	38	9,56	3,01	45	-3.50, -0.66	-2,913	81	0,005
Ret-Test	6,97	2,75	38	7,76	2,68	45	-1.97, 0.41	-1,309	81	0,194

* Second row values were used because equal variance not assumed ($p < .05$).

CONCLUSION

With the lack of empirical studies related to effect of slowmation creation process as a teaching and learning approach, this study introduced the results of quasi-experimental research design. According to the results of study, slowmation approach has positive influence on students' biology achievement. Besides, the contribution of slowmation approach to the achievement of students who creates them, when we think about the increasing in whole group mean scores, we should take into account the effect of presentation and discussion after presentation phases. As a result, "we should not teach them, they should learn themselves". Although there were no significant differences between the mean scores of pre- and retention-test and between the mean scores pre- and ret-test measurements, there were between the mean scores of pre- and post-test for control group and between all of the mean scores of experimental group.

RECOMMENDATIONS

Both experimental researches and use of this approach in teacher training and/or in middle and high school should be increased.

ACKNOWLEDGEMENT

As the authors of this report, we gratefully acknowledge the support from the Universtiy of Pamukkale for the participation to this symposium (project code: 2013KRM024).

ÖZET: Bu çalışma, iki yıllık bir çalışma olup, öğrencilerin ikinci ve üçüncü sınıftaki temiz ve kirli çevre ile ilgili görüşlerini belirlemek amacıyla yapılmıştır. Çalışma grubu, 2007-2008 Eğitim-Öğretim Yılı Güz Dönemi'nde Balıkesir'e bağlı bir köy ilköğretim okulunda öğrenim gören 11 ikinci sınıf öğrencisinden oluşmaktadır. Veriler, doküman analizi, resim çalışması ve yapılandırılmamış görüşme teknikleri kullanılarak toplanmıştır. Çalışmanın ilk yılında; çevre ile ilgili kavramlar, konular ve etkinliklerin belirlenmesi amacıyla 2. ve 3. sınıf Hayat Bilgisi ve Türkçe Ders Kitapları ile Öğrenci Çalışma Kitapları incelenmiştir. Daha sonra, ikinci sınıf öğrencilerine temiz çevre ve kirli çevre konulu resimler yaptırılmıştır. Son olarak, öğrencilerle yaptıkları resimler hakkında yapılandırılmamış görüşmeler yapılmıştır. Çalışma, aynı öğrenciler üçüncü sınıfa geçtiklerinde tekrar edilmiştir. Veri analizinde, doküman analizi ve içerik analizi teknikleri kullanılmıştır. Elde edilen bulgulara göre, öğrencilerin temiz çevre ve kirli çevreye ilişkin görüşlerinin yaşa göre değiştiği sonucuna varılmıştır.

Anahtar sözcükler: temiz çevre, kirli çevre, resim çalışması, görüşme, ilköğretim

ABSTRACT: The aim of the study was to investigate the second and third grade students' views about clean and unclean environments. This study was a two-year longitudinal study. Study group included 11 second grade students in a rural primary school in Balıkesir in 2007-2008 academic years. Data were collected by document analysis, drawing pictures and unstructured interview techniques. In the first year of the study, 2 and 3 grade Social Studies and Turkish Textbooks and Students Workbooks were examined in order to determine the concepts, subjects, and activities related to environment. Then, second grade students were asked to draw pictures of clean and unclean environments. Finally, unstructured interviews were conducted with students about their pictures. The study was again conducted with the same group of the students when they were in the third grade. Data were analyzed by using content analysis and descriptive analysis techniques. The study results showed that the students' perceptions related to clean and unclean environments varied by age.

Key words: clean environment, unclean environment, drawing picture, interview, primary education

ERADICATING MATHEMATICS ANXIETY AMONG SECONDARY SCHOOL STUDENTS USING COGNITIVE BEHAVIOURS THERAPY (CBT)

DR.(MRS). Philomina .I. ONWUKA
Mathematics Department College of Education, Agbor, Nigeria
philonwuka@yahoo.com

MRS. Pauline I. TIBI
Psychology Department College of Education, Agbor, Nigeria

ABSTRACT:Achievement in Mathematics to a large extent, is a function of examination anxiety, teachers' instructional strategy, among other variables. The Onus of this paper is to empirically document the effectiveness of CBT in curbing mathematics anxiety in students in Nigeria. A sample of 154 students was composed. The instrument used is Mathematics Anxiety Test Scale (MATS). The reliability coefficient of 0.83 was obtained. The 154 students were pretested and those (68) who scored 24 and above were assigned to experimental group. Two research questions and two hypotheses guided the study. Research questions were addressed using mean and standard deviation while hypotheses were tested with t-test, ANCOVA. The result indicates a therapeutic significant difference in reduction of Mathematics anxiety of students and in terms of gender, no score differential. It was recommended that workshops/Seminars on psychological techniques on examination anxiety be organized for mathematics teachers.

INTRODUCTION

Sometimes Students do not do well in examinations not because they are not intelligent but because some extraneous factors like anxiety interfered with their academic functioning and level of achievement.

According to Frend (1949), Anxiety is "something felt" a specific unpleasant emotional state or condition of human organism. It is also a state of emotional and physical disturbance induced in a person by a real or imagined threat. Anxiety manifests itself differently from other emotions in terms of gestures, posturing performance of interpersonal and also quality of voice. It becomes more dangerous when it is encountered by students during examinations. It causes some students to experience some physiological reactions during examination such as increased heart rate, cold hands, frequent urination, dried mouth, muscle spasm, increase respiration (Zeidner, 1998). These are manifested when taking Mathematics examination. Examination anxiety is dangerous to the growth of an educational system because it brings about poor academic performances of students and this accelerates into decline in educational growth (Ossai, 2004) He also reported a significant correlation between students examination anxiety and their examination malpractice attitude.

Mathematics is one of the compulsory school subjects in Nigeria at both primary and secondary levels. It is very important in arts, social sciences and science subjects. It is widely applied in professional fields such as medicine, pharmacy, engineering, architecture, law, accounting etc. (Onwuka and Kolo, 2010).

However, it is a subject that is dreaded by many students. To many, it is an abstract subject meant for very few. This makes many students to have mathematics phobia and experience anxiety when they hear the name "Mathematics". To Onwuka (2012), Mathematics Phobia is a persistent fear towards the study of mathematics which leads student to avoid mathematics.

With these problems associated with mathematics anxiety, it becomes necessary to seek ways/means that can help ameliorate this ugly phenomenon. In this regard, the relevance of some psychological counseling therapies cannot be overemphasized; and Systematic Desensitization (SD), cognitive behavioural therapy (CBT), psychoanalysis, rational emotive behaviour therapy (REBT), easily come to mind.

Cognitive Behavioural Therapy (CBT) is a psychotherapy based on cognitions, assumptions, beliefs and behaviours, which aims at influencing disturbed emotions that relate to inaccurate appraisal of events (Lin, 2008). CBT has been widely used to treat various kinds of maladaptive disorders including mood and examination anxiety disorders. Since it is based on changing the students' erroneous ways of thinking about themselves, the world and how others perceive them, it can be applied to curb the problem of mathematics anxiety. CBT increases a sense of control and thereafter helps the student adhere to behaviour change strategy as well as improving mood and inducing associated psycho-pathology (Kenger, 2006).

STATEMENT OF PROBLEMS

Mathematics is a school subject that is very important in everyday living. It is applied in sciences, technical and non technical areas. Mathematics examination anxiety is dangerous to the academic growth and development of any nation. It is associated with some negative phenomenon such as physiological reactions (worry, fear) and examination anxiety. Cognitive Behaviour Therapy is one of the psychological therapies that has been successfully applied increase such as health, education and can equally be tried in mathematics in Nigeria. The problem of this study therefore is: What is the effect of cognitive Behaviour therapy on anxious mathematics students?

RESEARCH QUESTIONS

1. To what extent does cognitive behaviour therapy reduce examination anxiety in mathematics?
2. To what extent does cognitive behaviour therapy reduce mathematics anxiety in male and female students ?

RESEARCH HYPOTHESES

The following null hypotheses guided the study and was test at .05 level of significance.
Ho_1 There is no significant difference between the pre-test and post-test scores of mathematics students treated with cognitive Behaviour Therapy.
Ho_2 There is no significant difference in the reduction of mathematics examination anxiety in male and female students using cognitive Behaviour therapy.

PURPOSE OF STUDIES

The main purpose of the study is to investigate the effectiveness of cognitive Behaviour Therapy (CBT) in the treatment of students examination anxiety in mathematics.

METHOD

The researcher adopted a quasi-experiential design. It investigated the possible cause and effect relationship by exposing one treatment group and one control group (not exposed to treatment) . The population comprised all the senior secondary school-two students in Ika south Local Government Area of Delta State in Nigeria. A total 2025 were involved consisting 1038 male and 987 female students.

In composing the sample, first purposive sampling technique was employed to eliminate, the schools that are not co-educational, This is as a result of gender analysis. At the second stage, Six schools were selected to form the sample with a sample size of 68 students, made up of 33 males and 35 females.

The research instrument, was mathematics Anxiety Test scale (MATS) modified from Sarason Test Anxiety Scale which contained 37 items. All the students were tested. The result of the pre-test enabled the researchers to identify those that have anxiety and they were accordingly assigned to experimental and control groups.

To establish the reliability of MATS, Combach Alpha reliability method was used and an index of 0.83 was obtained which showed an evidence of internal and external consisting of the instrument, Those who scored between 24 and 37 are those who showed symptoms of anxiety. They were exposed to seven weeks treatment. At the end of the seven weeks training, they were given the same MATS again in order to ascertain the effectiveness of the training. Mean and standard Deviation (SD) were used in answering the research questions while the null hypotheses were tested using t-test, Analysis of covariance (ANCOVA) at 0.05 level of significance.

Research Questions 1:

To what extent does cognitive behaviour therapy reduce examination anxiety in Mathematics?

Table 1; Reduction of Examination Anxiety in Mathematics

CBT	Pre-Test Scores	Post Test Score
Means (x)	28.59	16.38
S.D.	2.34	6.95
N	68	68

Table 1 above addressed the research question, There was a reduction in the means score of mathematics anxiety of the students treated with cognitive therapy from 28.59+2.34 of the pre- test scores to 16.38 + 6.95 of the post-test.
The mean difference is 12.21.

Research Question 2:
To what extents does cognitive behavior therapy reduce mathematics anxiety in male and female students?

Table 2: Mathematics Examination anxiety in Male and female students.

Gender		Pretest scores	Post test scores	Means difference
Male	N	33	33	
	X	27,88	17.03	10.85
	S.D	2.16	5.80	
Female	N	35	35	
	X	29.26	15.77	13.49
	S.D	2.33	7.93	

The mean value for the male students reduced from 27.88 before treatment to 17.03 after treatment while for the female students, it reduced from 29.26 to 15.77. The mean difference is therefore 10.85 and 13.49 for male and female students respectively.

Hypothesis 1: There is no significant difference between the pretest and post-test scores of mathematics students treated with cognitive behaviour therapy. The result of the test is present in table 3.

Table 3: Paired sampled t-test of post-test and pre-test of scores mathematics student treated with CBT

	Faired differences					T	df	Sig	Remark
	X	S.D	S.E.M	95% confidence					
Pretest & post-test scores	12. 21	7.18	0.87	10.47	13.95	14.01	67	0.00	Significant

Table 3 shows that there was a significant difference between pretest and post-test scores of mathematics students treated with cognitive behaviour therapy, with mean difference of 12.21 with 95% confidence interval ranging from 10.47 to 13.95, t-value is 4.01. The null hypothesis is therefore rejected.

Hypothesis 2: There is no significant difference in the reduction of mathematics examination anxiety in male and female students using cognitive Behaviour therapy. Test result is given in table 4.

Table 4: ANCOVA Of Mathematics Examination Anxiety in male and female students using CBT

Source	Types sum of square	df	Means square	F	Sig	Partial square	Remark
Correct mode	59.39	2	29.70	0.61	0.55	0.02	
Intercept	22.87	1	22.87	0.47	0.50	0.01	
Pretest	32.48	1	32.48	0.66	0.42	0.01	
Gender	44.16	1	44.16	0.90	0.35	0.01	
Error	3180.67	65	48.93				
Total	21490.00	68					
Correct total	3240.06	67					Not significant

From Table 4, F(1,65) = 0.90, P =0.35. The effect size which is very low is 0.01 representing only 1% variance. Comparing the pre-test and post-test scores of male and female mathematics students, it was not significant as show by the P value of 0.42 (f(1, 65) = 0.66). Hence there is no significant difference in the reduction of mathematics examination anxiety in male and female students. Hence the null hypotheses is accepted.

DISCUSSION

The result of the experiment shows that there is a significant difference between the pre-test and post-test scores of mathematics students treated with cognitive behaviour Therapy (CBT). In Otherwords CBT was effective in the treatment of mathematics anxiety among secondary school students. The difference is really reflected in the pre-test and post-test mean scores of 28.59 and 16.38 respectively. The mean scores reduction of 12.21 after treatment indicates an evidence of an effective treatment. It showed that students who were treated with CBT had their anxiety level reduced after treatment. The result is in consonance with the study conducted by (Salami 2007). He examianed the effectiveness of CBT in managing stress among some trainees of college of education in kwara state, Nigeria. The result indicated that the participants had significant reductions in levels of stress, depression and anxiety. The study conducted by Omotosho, Titiloye and Titiloye (2013) is also in line with the above result. Their work centred on reduction of mathophobic level among in-school adolescents in Nigeria using Rational Emotive Behaviour – Therapy (REBT). The result showed significant reductions in mathophobic levels on those treated with REBT.

The findings on gender difference on Mathematics students examination anxiety reveals no significant difference in the reduction of examinations anxiety in male and female students. Hence gender had no influence on students post-test scores.

CONCLUSION/RECOMMENDATIONS

The study investigated the effectiveness of cognitive behaviour. Therapy (CBT) in the treatment of mathematics anxiety among secondary school students in Nigeria. From this study we can conclude that CBT is effective in the treatment of mathematics examination anxiety among secondary school students. Additionally, there is no gender influence in the reduction of examination anxiety.

Based on the conclusion reached we therefore recommend that

(1). Mathematics teachers should be trained on therapeutic techniques of reduction of mathematics examination anxieties. This can be done by orgnising seminars and workshops.

(ii) Text Books on such therapeutic techniques should be in circulation.

(iii). Students should cultivate good reading habit. Through reading situations that can lead to high anxiety level could be averted.

EFFECTS CONSTRUCTIVIST BASED INSTRUCTIONAL STRATECY ON STUDENTS' LEARNING OUTCOME IN MATHEMATICS

DR. MRS. Philomina .I. ONWUKA
MATHEMATICS DEPARTMENT, COLLEGE OF EDUCATION, AGBOR, NIGERIA.
philonwuka@yahoo.com +2348035783701

Keywords: Mathematics, Constructivist, Instructional strategy.

ABSTRACT: This paper examines the impact of constructivist –Based instructional strategy on students' achievement in Mathematics. The study employed a quas:- experimental design carried out in Delta State, Nigeria. The researcher generated one research question and one hypothesis which were answered/tested with mean, standard deviation and t-test respectively. A sample of 215 was composed with 104 assigned to experimental and 111 control group. The instrument for the study was Mathematics Achievement Test (MAT). The reliability coefficient of 0.81 was established using Crombach's Alpha method. The result of the experiment indicates that those in experimental group performed significantly better. It was recommended that Mathematics teachers should be retrained in modern instructional strategies such as constructivist Based Instructional Approach.

INTRODUCTION

Mathematics is one of the subjects that is offered in school systems in Nigeria. It is a cone subject at the primary and secondary educational levels. It is a basic tool for all scientific and technical know- how, and it plays an important role in the economic development of any nation (Ogbonna, 2007). In fact, according to Moseri, Onwuka, Iweka (2010), mathematics is very important in everyday living and it is maximally utilized in science and non- science subjects.

Inspite of the important role mathematics plays in the development of any nation, its performance in the primary and secondary schools in Nigeria is poor. The table below, shows the students' result in the senior secondary school organized by the West African Examination Council (WAEC), from 2000 to 2009

Table 1; Result Of Senior Secondary School Mathematics By WAEC, From 2000 To 2009

Years	% with credit and above	% with pass and below
2000	32.81	67.19
2001	36.55	63.45
2002	34.50	65.50
2003	36.91	63.09
2004	34.52	65.42
2005	35.55	64.45
2006	39.92	60.08
2007	15.56	84.44
2008	23.00	77.00
2009	31.00	69.00

From the table, it is obvious that the performance of Mathematics at the secondary school level is poor. The story is not different from other educational levels. Educationists and researchers have adduced different reasons for this ugly phenomenon(poor performance). Galadinma(1998) and Ojo(1998) in their findings linked the poor performance to poor quality of instructional techniques employed by teachers as the major cause of while Bello(2006) and Adamu(2007) identified the root causes to be: i. overcrowded nature of the classes, ii. Teacher's poor method of teaching.

From the foregoing, there is need therefore to explore means of teaching that can bring a better understanding which can improve performance. Steen(2003)advocates that teachers can stimulate students to learn Mathematics through the process of constructing patterns in addition to devising strategies for solving problems and discovering the application and beauty of Mathematics. The above method is in consonance with constructivist teaching view.

Constructivist perspective holds the view that it is about knowing and learning that emphasizes the active role of learners in constructing their own knowledge(Von Glaserfield,1989). It suggests that learners construct knowledge out of experience ; knowledge is constructed in trying to integrate existing knowledge and new experiences (Moseri,et al).

Brooks and Brooks(1993) enumerated five important principles of constructivist pedagogy which include:

1. Proposing problems of emerging relevance.
2. Constructing learning around primary concepts
3. Seeking and valuing students points of view.
4. Assessing student's learning.
5. Adapting curriculum to address students suppositions.

When these principles are applied in the Mathematics teaching, it could ameliorate the problem of poor achievements in the secondary schools. Against this background there is need to dry the instructional strategy(constructivist)

STATEMENT OF PROBLEM

Mathematics as an important and compulsory subject at the primary and secondary school levels in Nigeria, is maximally utilized in science, technical and almost all sphere of life. Inspite of it's utility, the achievement is very poor at these educational levels. Educationists and researchers have been worried and concerned on how this poor mathematics performance can be remedied.

Constructivist Based-Instructional strategy is a relatively new approach to teaching and has been effective in some countries. It can equally be effective in Nigeria, particularly in Delta State. Hence, what is the impact of constructivist based- instructional approach on student's achievement in mathematics?

PURPOSE OF STUDY

The purpose of this study is to determine if there is difference in the performance of students taught mathematics using constructivist strategy and those taught using conventional learning strategy.

RESEARCH QUESTION

What is the difference in the mean achievement score of students taught mathematics using constructivist-based learning strategy and those taught and those taught using conventional method?

HYPOTHESIS

The hypothesis below was formulated to guide the study and tested at point 05 level of significance.
Ho: There is no significant difference in the mean achievement scores of students taught mathematics using constructivist- based instructional approach and those taught using conventional learning strategy.

METHODOLOGY

The study employed a quasi- experimental design of non-equivalent post-test, control group design. Intact classes were used, to avoid disrupting the normal school programmes for experimental purpose. The study was restricted to senior secondary school one (SSS 1) students and the topic taught was geometry. The area of study was Ika South local government Area of Delta State of Nigeria. Three schools out of the 18 senior secondary schools in Ika South local Government Area were randomly composed for the study and this gave rise to a sample of 215 students.

The experimenl was for a duration of four weeks and the students in the three schools were taught the same topics. In each school, there were two classes; one for experimental and the other, control. The experimental groups were students taught mathematics with constructivist based- instructional strategy, while the control group were those taught with conventional instructional strategy. 104 students were in the experimental groups while 111 were in control groups.

The instrument for the research was Mathematics Achievement Test (MAT) which was administered at the end of the treatment. MAT contains ten essay items. The research question was answered with mean while the hypothesis was tested with statistical tool, t-test, at 0.05 level of significance.

RESULTS

Research Questions:

What is the difference in the mean scores of the students taught mathematics using constructivist-based learning strategy and those taught using conventional method?

The answer to this question is presented in table 2

Table 2: Mean And Standard Deviation (SD) Of Constructivist And Conventional Methods.

Group	Mean	SD	N	Mean difference
Constructivist	31.30	8.19	104	7.88
Conventional	23.42	5.80	111	

From the table 2, the mean score of students taught mathematics with constructivist approach is 31.30 and those taught with conventional method is 23.42. their standard deviations are 8.19 and 5.80 for constructivist approach and conventional method respectively. The difference in their means is 7.88 which appears high.

Hypothesis

There is no significant difference in the mean achievement scores of students taught mathematics using constructivist- based instructional strategy and those taught using conventional method.

The test of the hypothesis is presented in table 3

Table 3:t-Test Showing Students' Achievement In Mathematics Using Conventional Method.

Group	Mean	SD	N	Df	Calculated	Sig.
Constructivist	31.30	8.19	104	213	14.85	0.00
Conventional	23.42	5.80	111			

From the table, the level of significant (0.00) is less than the set .05 hence, there is a significant difference in the students' performance. The implication is to reject the null hypothesis of no- significant difference.

DISCUSSION

The mean score of students taught with constructivist- based learning strategy is 31.30 while the students taught using conventional method had a mean score of 23..42. When this was tested statistically using t-test, the difference in their means was significant. This led to the rejection of the null hypothesis and upholding of the alternative hypothesis. This implies when students are taught with constructivist instructional approach, it can produce a better result compared to the conventional method.

These findings, agree with the findings of previous researches such as (Alio, 1997 and Ogbonna, 2007). In their studies, the experimental group performed better than the non-experimental group. This affirms that appropriate instructional materials yields a better performance.

CONCLUSION/RECOMMENDATION

The study looked into the impact of constructivist learning strategy on secondary school students' performance in Nigeria. The result of the study indicates a significant difference in the two teaching approaches employed in favour of constructivist learning strategy. It can be deduced therefore that constructivist learning strategy is effective in the teaching of mathematics.

Based on the above, the following recommendations are made;

(i) Constructivist- Based learning strategy should be incorporated in the mathematics curriculum for the pre-service teachers' programme.
(ii) Workshops should be organized for the in-service mathematics teachers to enable them learn constructivist approach.
(iii) Authors and publishers of mathematics textbooks should incorporate the approach into their books with worked examples.
(iv) Ministries of Education (Federal, State, Local Government) Education boards, professional bodies such as Mathematical Association of Nigeria (MAN), Science Teachers Association of Nigeria (STAN) should all endeavor to promote this new approach.

ÖZET: Bu çalışmada Fen Laboratuar Uygulaması dersinde uygulanan araştırmaya dayalı öğrenme uygulamalarının öğretmen adaylarının yaratıcı düşünme düzeylerine etkisi araştırılmıştır. Araştırmanın örneklemini Pamukkale Üniversitesi Eğitim Fakültesi ilköğretim fen bilgisi öğretmenliğinde okuyan 36 öğretmen adayı oluşturmuştur. Bu araştırmada veriler Torrance Yaratıcı Düşünme Testi (TYDT) ile toplanmıştır. Araştırmaya dayalı laboratuar uygulamaları ile öğretmen adaylarının yaratıcı düşünme düzeylerindeki gelişim TYDT'de yer alan akıcılık, esneklik ve özgünlük düzeylerinde incelenmiştir. Veriler, SPSS 15 paket programı ile amaca uygun olarak aritmetik ortalama, standart sapma ve T testi değerlerine göre analiz edilmiştir. Verilerin analizi sonucunda öğretmen adaylarına uygulanan araştırmaya dayalı laboratuar uygulamalarının yaratıcı düşünmelerini geliştirmede etkili olduğu görülmüştür. Ayrıca bu çalışmanın sonuçlarına göre öğretmen adaylarının araştırmaya dayalı laboratuar uygulamaları ile yaratıcı düşünme boyutlarından olan özgünlük boyutunda en çok gelişme gösterdikleri ortaya konmuştur.

ÖZET: Chevallard (1998)'ın ortaya attığı Didaktiğin Antropolojik Kuramı içerisinde yer alan prakseolojik yaklaşım bilimsel bilginin yapısını sorgulamaya ve analiz etmeye fırsat tanımaktadır. Bu yaklaşım, gerçekleştirilen bir eylem kapsamında araç-amaç ilişkilerini dikkate alarak ders kitaplarında veya sınıf içerisinde oluşturulan veya oluşturulmak istenen bilimsel bir bilginin betimlenip tartışılmasına olanak sağlamaktadır (Chevallard, 2006). Ders kitaplarının prakseolojik yaklaşım ile analiz edilmesi, uygulamaların, problem türlerinin, problem çözüm stratejilerinin belirlenmesine yardımcı olmakta ve böylelikle diğer çözümlerde (özellikle öğrenci çözümlerinin de) referans çözüm ile kıyaslayarak analiz edilebilmektedir. Ayrıca, öğrenme süreçlerinde formüllere odaklanılması, öğrencileri formülleri ezberletmeye yöneltmektedir (Kurnaz & Sağlam-Arslan, 2010) ve bu tür öğrenme ortamlarının öğrencilerin yüzeysel öğrenmeler gerçekleştirmesine sebep olduğuna inanılmaktadır (Kurnaz & Sağlam-Arslan, 2009). Bu bağlamda, çalışmanın amacı üniversite eğitimi sırasında Fizik alanında ağırlıklı olarak takip edilen ve kaynak kitap olarak kullanılan yedi kitapta yer alan elektrik akımı ve ilgili konulara ait öğretme durumlarını prakseolojik yaklaşımdan yararlanarak analiz etmektir. Kitapların analizi sonucunda, öğrenenlerden yapılması istenen aktivite durumları belirlenmiş ve sınıflandırılmıştır. Genellikle hesaplama ve açıklama aktivitelerinin, belirlenen aktivite durumları arasında ağırlık kazandığı görülmektedir. Öğretme durumlarının öğrencilerin öğrenme durumları üzerindeki etkileri göz önüne alınarak kaynak kitaplardaki aktivitelerin hesaplama ve açıklama aktiviteleri ile sınırlandırılmaması ve daha üst düzey becerileri gerektiren (analiz, sentez, değerlendirme gibi) aktivitelere yer verilmesi önerilmektedir. Bu doğrultuda, prakseolojik analiz yaklaşımı kullanılarak öğrenme-öğretme durumları ve arasındaki ilişkilerin analiz edilmesi ile öğrenme ortamlarının eksikliklerinin giderilmesi ve bu ortamların zenginleştirilmesi de sağlanabilir.

Anahtar Sözcükler: Elektrik akımı, Prakseolojik analiz yaklaşımı, Öğretme durumları

ABSTRACT: In the Anthropological Theory of Didactics, which was introduced by Chevallard (1998), the praxeological analysis approach gives opportunity to analyze and question the nature of scientific knowledge. This approach allows to discuss the scientific knowledge which is created or will be formed in the textbooks or classroom by taking into account the means-end relationships within the scope of an action performed (Chevallard, 2006). Analyzing the textbooks via the praxeological analysis helps to determine the practices, the types of problems and problem solving strategies. In this way, the other solutions (especially students' solutions) can be analyzed by compared with the reference solution. In addition, focusing on the formulas in the learning process has been forced the students memorizing these formulas (Kurnaz & Sağlam-Arslan, 2010) and it is believed that this type of learning environments cause superficial learning for students (Kurnaz & Sağlam-Arslan, 2009). In this context, the purpose of the study is to analyze the teaching conditions of the electric current in the seven textbooks that following and using as the source book the during university education by using the praxeological analysis approach. As a result of the textbooks' analysis, the activity situations are identified and classified. It is seen that the calculation and the description activities are generally used in the all activity types. By taking into consideration the teaching conditions' effects on the students' learning conditions, it is recommended that the activities in the source books wouldn't be limited with only the activities of calculation and description and the activities required using the higher-level skills (analysis, synthesis , evaluation, etc.) should be included. In this respect, overcoming the deficiencies of the learning environments and enrichment of these environments are provided by analyzing the teaching-learning conditions and the relations between them with praxeological analysis approach.

ABSTRACT: It is expected that science education will enable students to question, think analytically and creatively, make effective decisions and be scientifically literate individuals. This will only be possible through the use of teaching methods that allow the active participation of students in the learning process. One of these methods is the problem-based learning in which real life issues are presented as scenarios. Problem-based learning can be supported by the use of other techniques in order to increase students' interest, identify their misconceptions and overcome them. One of the techniques to be used is concept cartoons which can make the scenarios used in problem-based learning more understandable and meaningful. The present study aims to explain the use of concept cartoons integrated into problem-based learning in science education, and to present sample activities. For this purpose, concept cartoon activities prepared in relation to 6th grade science units "Substance and Heat" and "Heat Insulation" are presented. These activities include scenarios and concept cartoons that deal with everyday problems. To sum up, the use of concept cartoons integrated into problem-based learning is explained through sample activities.

EFFECTS OF PROBLEM BASED LEARNING ON PROSPECTIVE SCIENCE TEACHERS' ATTITUDES TOWARDS BIOLOGY LABORATORY

Ali Gunay BALİM

Erkan OZCAN

This study\'s aim was to research effects of problem based learning on prospective teachers\' attitudes towards biology laboratory. Experimental practice was made with science prospective teachers who were studying second grade in Dokuz Eylul University Buca Faculty of Education. This study was conducted with pre test post test quasi experimental research design. Courses of experiment group continued with problem based learning while courses of control group continued with general biology laboratory instruction program.

Attitude Scale Towards Biology Laboratory applied on prospective teachers in experiment and control groups. Analysis of obtained data made with SPSS program. After data analysis, a significant difference found in attitudes towards biology laboratory between experiment

and control group in favor of experiment group. It\'s thought that this study will lead to new researches and will help determining effects of problem based learning on prospective teachers.

Keywords: Problem based learning, attitude towards biology laboratory, prospective science teacher.

ÖZET: Araştırmanın amacı öğrencilerin aile işlevselliği algısı ile matematik başarısı arasında bir ilişki olup olmadığını, varsa bu ilişkinin Güney Kore ve Türkiye için farklılık gösterip göstermediğini incelemektir. Türkiye verilerini İstanbul'daki 13-14 yaş grubu öğrenciler yani 7. ve 8.sınıf öğrencilerinden 319 öğrenci oluşturmaktadır. Güney Kore verilerini ise Seul'deki 13-14 yaş arasındaki öğrenciler yani ortaokulların 1. ve 2.sınıf öğrencilerinden 298 öğrenci oluşturmaktadır. Veri toplama araçları olarak "Matematik Başarı Testi" (Çanakçı, 2008) ve "Aile Değerlendirme Ölçeği" (Bulut, 1990) kullanılmıştır. Çalışmada Aile Değerlendirme Ölçeğinin alt boyutlarından "Genel İşlevler" alt boyutuna ait veriler sunulmuştur. Analizler Türkiye ve Güney Kore verileri için ayrı ayrı yapılmıştır. Hem Türkiye hem Güney Kore verilerinde aile işlevselliğinin alt boyutlarından "Genel İşlevler" ile matematik başarısı arasında pozitif yönde bir korelasyon bulunmuştur. Ayrıca ki-kare testi öğrencilerin ailelerini sağlıklı veya sağlıksız algılamaları ile matematik başarıları arasında anlamlı bir ilişki olduğunu göstermiştir.

Anahtar Sözcükler: matematik başarısı, aile işlevselliği, fonksiyonel aile

ABSTRACT: The purpose of the research is to determine the relationship between the students' family functioning perception and mathematics success and it is inquired whether this relationship differentiate between South Korea and Turkey. The sample of the study consists 319 students from 7th and 8th grades (ages 13-14) of state schools in Istanbul and 298 students from 1st and 2nd grades of secondary schools (ages 13-14) in Seoul. The questionnaire which is developed by Çanakçı, (2008) is used to collect information about mathematic success level of the students. Family Evaluation Scale developed by Bulut, (1990) is used to determine the family functioning, as a data collection instrument. In this paper data from 'General Functions' subscale of Family Evaluation Scale is presented. The data analysis of Turkey and South Korea are has been carried out separately. The results of this study indicated that there is a significant and positive relationship found between mathematic success and the perceptions of students about their family (whether healthy or unhealthy) in terms of family functioning.

Key words: mathematics success, family functioning, functional family

GİRİŞ

Matematik, öğrencilerin büyük bir çoğunluğu için zor bir ders olarak görülmektedir. Bu durum, öğrencilerin matematikten korkmasına ve uzaklaşmasına neden olabilmektedir. Matematiğin öğrencilerin çoğunluğu tarafından korkulan bir ders olarak görülmesinin altında sadece bir faktörün etkin olduğunu söylemek zordur. Çünkü, öğrencilerin matematik başarısını veya başarısızlığını etkileyen bir çok faktör vardır. Ailenin bu konuda oldukça etkili olduğu düşünülmektedir. Burada genellikle ailenin sosyo-ekonomik durumu kastedilmektedir (Dursun ve Dede,2004; Yenilmez ve Duman,2008). Ailenin akademik başarıyı dolayısıyla matematik başarısını etkilediği kabul edilmektedir. Ebeveynlerin çocuklarının okul aktiviteleri ve akademik başarılarına etkisi eğitim araştırmalarında uzun bir tarihe sahiptir (Mandara,2006). İlk çalışmalar aile katılımının özellikle ilköğretim çağındaki öğrencilerin akademik başarıyla pozitif bir ilişkisi olduğunu göstermiştir (Reynolds,1992 Akt. Mandara,2006). Son çalışmalar ise ailenin çocuklarının matematik ve fen notları, zihinsel düşünme becerisi, iş ahlakı ve sosyal gelişimi gibi pek çok konuda önemli etkiye sahip olduğunu göstermiştir (Marcon,1999 Akt. Mandara,2006). Acaba bu etki ailenin sosyo-ekonomik durumundan ibaret midir? Öğrencilerin ailelerinin işlevselliği matematik başarılarını etkilemekte midir? Ailenin matematik başarısına etkisi ele alınırken aile işlevselliğinin ihmal edilmesi, bu konuda herhangi bir çalışmanın bulunmaması böyle bir inceleme yapma gerekliliğini ortaya koymuştur.

Aile işlevselliği, aile üyeleri arasındaki ilişkinin pek çok yönünü içeren (problem çözme, iletişim, roller, duygusal tepki verme, gereken ilgiyi gösterme, davranış kontrolü ve genel işlevler) ve bunlara göre fonksiyonel (sağlıklı) ve fonksiyonel olmayan ailelerin belirlenmesini sağlayan bir kavramdır. Sorunlarını bir araya gelerek çözebilen, birbirine duygusal olarak bağlı ve özgürlüklerini önlemeyecek şekilde ilgili, herkesin kendisinden beklenen rolü etkili bir biçimde yerine getirebildiği, birbirlerinin davranışlarını aşırıya kaçmayacak şekilde kontrol edebilen ve aralarında açık, rahat ve dolaysız bir iletişim bulunan aileler, işlevlerini yerine getirebilen sağlıklı veya fonksiyonel aileler olarak tanımlanmaktadır (Bulut, 1990).

Günümüzde eğitim uluslar arası bir nitelik kazanmıştır. Eğitim sorunlarındaki benzerlikler nedeniyle alınan önlemler kadar, uygulanan yöntemlerde de benzerlikler olması beklenmektedir. Bu yüzden karşılaştırmalı eğitim araştırmaları, eğitimin uluslar arası yönlerini inceleyerek eğitim sistemlerine çözüm bulmada yardımcı olabilir (Cho, 1997). Çalışmada Güney Kore'nin seçilmesinde hem Güney Kore'nin TIMSS'teki başarısı (Yücel ve ark.,2013; TIMSS Raporları) hem de Güney Kore'de Türkiye'nin "kardeş ülke" olarak görülmesi etkili olmuştur.

YÖNTEM

Bu çalışma Türkiye'de İstanbul ile Güney Kore'de Seul illerindeki 13-14 yaş grubundaki öğrencilerin, matematik başarıları ile aile işlevselliği arasındaki ilişkiyi belirlemek amacıyla gerçekleştirilmiş olan karşılaştırma türü ilişkisel tarama modelinde, betimsel bir araştırmadır. Araştırmanın evrenini Türkiye'de İstanbul ilindeki 13-14 yaş grubu öğrenciler ile Güney Kore'de Seul ilindeki 13-14 yaş grubu öğrenciler oluşturmaktadır. Araştırmanın örneklemini ise İstanbul'dan bu yaş grubundan yani 7. ve 8. sınıf öğrencilerinden 319 öğrenci ile Seul'den 298 öğrenci oluşturmaktadır. Araştırmada veri toplama araçları olarak "Matematik Başarı Testi" (Çanakçı,2008) ve "Aile Değerlendirme Ölçeği" (Bulut,1990) kullanılmıştır.

Matematik Başarı Testi

"Matematik Başarı Testi (MBT)", Çanakçı (2008) tarafından uluslar arası çalışmalar esas alınarak hazırlanmış, geçerliliği ve güvenilirliği hesaplanmıştır. 25 maddenin her birinin varyansına bağlı Cronbach Alfa değeri 0,813 ve testin iki eş parçaya ayrılması ile Spearman-Brown ve Guttman iç tutarlılık katsayıları 0,769 ve 0,767 olarak hesaplanmıştır. Matematik Başarı Testi için test-tekrar test yöntemi kullanılarak ilk uygulama yapıldıktan 4 hafta sonra daha önce başarı testini cevaplayan 7. ve 8. Sınıf öğrencilerinden 73'üne başarı testi tekrar uygulanmıştır. Matematik Başarı Testinin zamana göre değişmezliğinin sınanmasına ilişkin olarak yapılan bağımlı grup t-testi sonucunda öğrencilerin test puanlarının ortalamalarının iki uygulama sonucunda 0,05 düzeyinde anlamlı bir farklılık göstermediği söylenebilir. ($t=0,489$, $p>0,05$) Ayrıca hesaplanan Pearson Momentler Çarpımı Korelasyon Katsayısı ($r=0,884$; $p=0,000$) iki uygulama sonucunda elde edilen test puanları arasındaki ilişkinin yüksek derecede olduğunu göstermiştir.

Araştırmada MBT Türkiye ve Güney Kore'de uygulandığı için her iki ülke bulguları için ayrı ayrı incelenmiştir. İç tutarlılık güvenirlik katsayıları hesaplanmış, İstanbul verileri için Cronbach Alfa değeri 0,772 , Seul verileri için Cronbach Alfa değeri 0,900 olarak bulunmuştur. Ölçeğe ilişkin bulgular ölçeğin orijinalinde yapılan çalışmalardan elde edilen bulguları destekler niteliktedir (Çanakçı,2008).

Aile Değerlendirme Ölçeği

"Aile Değerlendirme Ölçeği (ADÖ)" Mc Master Aile İşlevleri Modeli (Bishop ve ark., 1983) temelinde hazırlanmış bir ölçektir. Ölçeğin ülkemize uyarlama çalışması Bulut (1990) tarafından yapılmıştır. Tüm aile üyeleri ve deneğin kendisinden aile işlevlerini 4 seçenek üzerinden değerlendirmesi istenir. 12 yaşın üzerindeki tüm aile üyelerine uygulanabilen ADÖ, 60 soru içermektedir ve 7 alt ölçekten oluşmaktadır. Bunlar; Problem Çözme (PRÇ), İletişim (İLT), Roller (RL) Duygusal Tepki Verme (DTV), Gereken İlgiyi Gösterme (GİG), Davranış Kontrolü (DVK) ve Genel İşlevler (GNF) dır. Ölçekten alınabilen en yüksek puan 4'dür. Yüksek puan "bozuk ailesel işlev"e işaret etmektedir. Aile puanı, tüm aile üyelerinin puan ortalamaları kullanılarak elde edilebilir.

Ölçek, güvenirlik çalışması, iç tutarlılık ve puan değişmezliği açısından incelenmiştir. Alt ölçeklerin Cronbach-alfa katsayıları 0,38 ile 0,86 arasında değişmektedir. Ölçeğin toplam bir puanı olmadığından, her alt ölçek için test tekrar test korelasyonu Pearson Momentler Çarpımı ile hesaplanmıştır. Alt ölçekler için korelasyon kat sayıları en düşük 0,62 ile en yüksek 0,90 arasında verilmiştir.

ADÖ Türkiye ve Güney Kore'de uygulandığı için her iki ülke bulguları için ayrı ayrı incelenmiştir. Ölçeğin İstanbul verileri için iç tutarlılıkta Cronbach Alfa değerleri problem çözme için 0,659 ; iletişim için 0,621 ; roller için 0,591 ; duygusal tepki verebilme için 0,662 ; gereken ilgiyi gösterme için 0,354 ; davranış kontrolü için 0,203 ve genel işlevler için 0,855 olarak belirlenmiştir. Ölçeğin Seul verileri için iç tutarlılıkta Cronbach Alfa değerleri problem çözme için 0,638 ; iletişim için 0,722 ; roller için 0,508 ; duygusal tepki verebilme için 0,723 ; gereken ilgiyi gösterme için 0,251 ; davranış kontrolü için 0,202 ve genel işlevler için 0,796 olarak belirlenmiştir. Ölçeğe ilişkin bulgular ölçeğin orijinalinde yapılan çalışmalardan elde edilen bulguları destekler niteliktedir (Bulut,1990). Ayrıca ölçek Korece ve Türkçe'ye hakim bir gruba bir hafta arayla uygulanarak dil eşdeğerliği testi yapılmıştır.

Ölçeğin sadece 12 maddelik *Genel İşlevler* alt boyutu üzerine yapılan bir araştırmada geçerlilik ve güvenilirlik çalışmaları yapılmış ve bu alt ölçeğin diğer alt ölçeklerle de desteklendiği görülmüştür (Byles ve ark, 1988). Yani sadece *Genel İşlevler* alt ölçeğinin sonuçları dikkate alınarak aile işlevselliği ile matematik başarısı arasındaki ilişkiyi ortaya koymak mümkündür. Buna dayanarak çalışmada ADÖ'nün sadece *Genel İşlevler* alt boyutu ele alınmıştır. ADÖ'nün Genel İşlevler alt boyutu ile MBT'den alınan puan arasında bir ilişki olup olmadığını incelemek için analizler yapılmıştır.

BULGULAR

Analizler Türkiye ve Güney Kore verileri için ayrı ayrı yapılmıştır. Öğrencilerin Matematik Başarı Testinden aldıkları puanlar ile Aile Değerlendirme Ölçeğinin "Genel İşlevler" alt boyutundan aldıkları puanlar arasındaki korelasyon incelenmiştir. İlişkinin daha net bir şekilde görülebilmesi için veriler kategorik olarak ifade edilerek ki-kare testi yapılmıştır.

Verilerin normalliği incelendikten sonra (Kolmogorov-Smirnov, $p<0,001$) öğrencilerin matematik başarılarının bulundukları şehirlere göre farklılık gösterip göstermediğini incelemek için Bağımsız grup T-testi yapılmıştır.

Tablo 1. Öğrencilerin Matematik Başarılarının Yaşadıkları Şehirlere Göre Karşılaştırılması (N=617)

Şehirler	N	Ort	SS	T	P
İstanbul	319	11,27	4,62	-16,257	0,000
Seul	298	18,10	5,77		

Tablo 1'e göre Seul'deki öğrencilerin (Koreli öğrenciler) İstanbul'daki öğrencilerden (Türk öğrenciler) daha başarılı olduğu saptamıştır. Tabloda Seul'deki öğrencilerin MBT'den aldıkları puanların ortalaması 18,10 iken İstanbul'daki öğrencilerin MBT'den aldıkları puanların ortalamasının 11,27 olduğu görülmektedir.

ADÖ verilerinin normal bir dağılıma sahip olduğu görüldükten sonra (Kolmogorov-Smirnov, $p<0,001$) Genel İşlevler alt boyut puanlarının yaşadıkları şehirlere göre farklılık gösterip göstermediğini incelemek için Bağımsız grup T-testi yapılmıştır.

Tablo 2. Öğrencilerin *Genel İşlevler* Alt Boyutundan Aldıkları Puanların Yaşadıkları Şehirlere Göre Karşılaştırılması

Şehirler	Ort	SS	T	P
İstanbul	1,68	0,56	-5,063	0,000
Seul	1,90	0,52		

ADÖ puanlarının 2'den büyük olması bozuk aile işlevini gösterdiği (Bulut,1990) ve hem Türk hem Koreli öğrencilerin ADÖ puanları 2'den küçük olduğu için genel anlamda öğrencilerin aile işlevlerini sağlıklı algıladıkları söylenebilmektedir (Tablo 2). İstanbul'daki öğrencilerin ADÖ'den aldıkları puanların ortalaması 1,68 iken Seul'deki öğrencilerin ADÖ'den aldıkları puanların ortalamasının 1,90 olduğu görülmektedir. Dolayısıyla İstanbul'daki öğrencilerin (Türk öğrenciler) ailelerini, Seul'deki öğrencilerden (Koreli öğrenciler) daha sağlıklı algıladıkları söylenebilmektedir.

İstanbul ve Seul verileri için ayrı ayrı korelasyonlar incelenmiş ve sonuçları aşağıda tablolarla gösterilmiştir.

Tablo 3. Genel İşlevler Alt Boyutu Puanı İle Matematik Başarı Testi Puanı Arasındaki Korelasyon (İstanbul)

	Matematik Başarı Testi	Genel İşlevler
Matematik Başarı Testi	1	
Genel işlevler	-0,172	1

İstanbul'daki öğrencilerin MBT'den aldıkları puanlarla ADÖ'nin *Genel İşlevler* alt boyutundan aldıkları puanlar arasındaki korelasyon yukarıdaki tabloda gösterilmiştir. Buna göre İstanbul'daki öğrencilerin genel olarak aile işlevlerini algılama biçimi ile matematik başarıları arasında pozitif bir ilişkiden söz edilebilmektedir.

Tablo 4. Genel İşlevler Alt Boyutu Puanı İle Matematik Başarı Testi Puanı Arasındaki Korelasyon (Seul)

	Matematik Başarı Testi	Genel İşlevler
Matematik Başarı Testi	1	
Genel İşlevler	-0,186	1

Seul'deki öğrencilerin MBT'den aldıkları puanlarla ADÖ'nin *Genel İşlevler* alt boyutundan aldıkları puanlar arasındaki korelasyon yukarıdaki tabloda gösterilmiştir. Buna göre Seul'deki öğrencilerin genel olarak aile işlevlerini algılama biçimi ile matematik başarıları arasında pozitif bir ilişki olduğu söylenebilmektedir.

Aile Değerlendirme Ölçeğinin alt boyutları ile Matematik Başarı Testi sonuçları arasındaki ilişkiyi daha net bir şekilde görebilmek için onları kategorik olarak ifade etmek gerekmektedir. Çünkü öğrencilerin bulundukları sınıf düzeyi ve yaşadıkları şehirler farklılık göstermektedir. Bu nedenle öğrencilerin eğitim gördükleri okul ve sınıf düzeyleri için ayrı ayrı aritmetik ortalamalar alınıp ortalamanın altındakiler "başarısız", ortalamanın üstündekiler "başarılı" olarak sınıflandırılmıştır. Aile Değerlendirme Ölçeğinin her bir alt boyutu için 2 puan değerinin altındakiler "sağlıksız", 2 puan değerinin üstündekiler "sağlıklı" şeklinde sınıflandırılmıştır. Daha sonra bu iki kategorik değişken arasında anlamlı ilişki olup olmadığını belirlemek için ki-kare testi yapılmıştır.

Tablo 5. Öğrencilerin Genel İşlevler Alt Boyutuna Göre Başarı Durumları (İstanbul)

Genel İşlevler	Matematik Başarı Durumları		**TOPLAM**	χ^2	**P**
	Başarılı	Başarısız			
Sağlıklı	149	90	239	7,400	0,007
Sağlıksız	36	44	80		
TOPLAM	185	134	319		

Sadece İstanbul'da yaşayan öğrenciler seçilerek ki-kare testi yapıldığında genel işlevler alt boyutu bakımından aileyi sağlıklı veya sağlıksız algılama ile matematik başarısı arasında anlamlı bir ilişki olduğu tespit edilmiştir (χ^2 =7,400 , p<0,05). Yani bu boyut açısından ailelerini sağlıklı algılayan öğrencilerin daha başarılı olduğu sonucuna ulaşılmıştır (Tablo 5).

Tablo 6. Öğrencilerin Genel İşlevler Alt Boyutuna Göre Başarı Durumları (Seul)

Genel İşlevler	Matematik Başarı Durumları		**TOPLAM**	χ^2	**P**
	Başarılı	Başarısız			
Sağlıklı	135	47	182	6,313	0,012
Sağlıksız	70	46	116		
TOPLAM	205	93	298		

Tablo 6'ya göre sadece Seul'de yaşayan öğrenciler seçilerek ki-kare testi yapıldığında genel işlevler alt boyutu bakımdan aileyi sağlıklı veya sağlıksız algılama ile matematik başarısı arasında anlamlı bir ilişki olduğu tespit edilmiştir (χ^2 =6,313 , p<0,05). Yani bu boyut açısından ailelerini sağlıklı algılayan öğrencilerin matematikte daha başarılı olduğu sonucuna ulaşılmıştır.

SONUÇ VE ÖNERİLER

Bu çalışma Seul(Güney Kore) ve İstanbul(Türkiye)'dan 13-14 yaş grubundaki öğrencilerin katılımıyla gerçekleşmiştir. Aile işlevselliğinin alt boyutlarından "Genel İşlevler" boyutu ele alınarak öğrencilerin bu boyut açısından ailelerini nasıl algıladıkları ile matematik başarıları arasında herhangi bir ilişki olup olmadığı araştırılmıştır.

Koreli ve Türk öğrencilerin Matematik Başarı Testi'nden aldıkları puanlarda bağımsız grup T-testi yapıldığında Koreli öğrencilerin Türk öğrencilerden daha başarılı olduğu görülmüştür. Bu durum TIMSS sonuçlarıyla da uyumludur (TIMSS 1999, TIMSS 2007, TIMSS 2011). Aile Değerlendirme Ölçeği'nin "Genel İşlevler" alt boyutundan alınan puanlarla bağımsız grup T-testi yapıldığında hem Koreli öğrencilerin hem Türk öğrencilerin bu boyut açısından ailelerini sağlıklı algıladıkları görülmüştür. Bu sonuç; Dil ve Bulantekin'nin (2011) hemşirelik öğrencileri üzerinde yaptıkları, öğrencilerin *gereken ilgiyi gösterme* ve *davranış kontrolü* boyutlarındaki aile işlevlerini sağlıksız algıladıkları, diğer boyutlarda ise ailelerini sağlıklı algıladıkları sonucuna ulaştıkları çalışmayla desteklenmektedir. Ayrıca korelasyon değerleri hem Türkiye için hem Güney Kore için öğrencilerin ailelerini "Genel İşlevler" işlevi açısından sağlıklı algılayıp algılamama durumları ile Matematik Başarı Testi'nden aldıkları puanların ilişkili olduğunu ortaya koymuştur.

Ki-kare testinden elde edilen bulgulara göre hem Türk öğrenciler hem Koreli öğrencilerden ailelerini *Genel İşlevler* alt boyutu bakımından sağlıklı algılayan öğrencilerin daha başarılı olduğu söylenebilir. Yani her iki ülke için de elde edilen bulgular birbirini destekler niteliktedir. Aile işlevselliğinin *Genel İşlevler* alt boyutu tüm boyutların özeti niteliğinde genel sonuçları içeren bir alt ölçektir (Byles ve ark, 1988). Dolayısıyla sadece *Genel İşlevler* alt ölçeğinin sonuçları dikkate alınarak aile işlevselliği ile matematik başarısı arasındaki ilişkiyi ortaya koymak mümkündür. Araştırmadaki söz konusu boyuta ait bulgulara dayanarak aile işlevselliği ile matematik başarısı arasında bir ilişki olduğu söylenebilir.

Bu çalışmada öğrencilerin sadece aile işlevlerini nasıl algıladıklarına bakılmış, ailenin diğer birçok özelliği dikkate alınamamıştır. Dolayısıyla bu durum araştırmadan beklediğimizden çok daha zayıf bir ilişki bulunmasına sebep olmuş olabilir. Aile işlevselliğinin öğrencinin matematik başarısıyla veya en genel haliyle akademik başarıyla olan ilişkisini daha net bir şekilde tespit edebilmek için amaçlı örneklem seçimi yapılabilir. Sosyo-ekonomik düzeyleri veya anne-baba durumları gibi faktörler göz önüne alınarak örneklem belirlenebilir. Böylece daha gerçekçi sonuçlara ulaşmak mümkün olabilir. Bu konuda çalışmak isteyen araştırmacılara örneklemlerini oluştururken bu hususlara dikkat etmeleri önerilir.

ÖZET: Bu araştırmanın amacı, 10. sınıf öğrencilerinin, sanal manipülatiflerle geçirdikleri deneyimlerin, öteleme ve dönme dönüşümlerine ait matematiksel anlamalarında nasıl bir rol oynadığını belirlemektir. Bir durum çalışması olarak tasarlanan araştırmada veri, bu dönüşümlere ait görev temelli görüşmeler ve ilgili derslerde gerçekleştirilen katılımcı gözlemler yoluyla elde edilmiştir. Dersler, dönüşümlere yönelik çoklu temsillerden sözel, grafiksel ve cebirsel temsillere ek olarak sanal ve fiziksel manipülatiflerle zenginleştirilmiştir. Her bir dersin ardından, araştırma sınıfından amaçlı bir şekilde belirlenen dört öğrenci ile bu dönüşümlere yönelik görüşmeler gerçekleştirilmiştir. Anlamalarındaki kalıcılığı belirleyebilmek amacıyla, katılımcılarla 18 hafta sonra tekrar bir araya gelinerek kavramlara yönelik görev temelli yeni görüşmeler gerçekleştirilmiştir. Elde edilen veri, araştırmanın kavramsal çerçevesini belirleyen Pirie-Kieren ve temsil teorisi temel alınarak analiz edilmiştir. Sonuçlar, öğrencilerin öteleme ve dönme dönüşümleriyle ilgili matematiksel anlamalarını şekillendirirken sanal manipülatifleri farklı anlama seviyelerinde, geriye katlama hareketlerinde, ortamdaki müdahaleleri anlamlandırmada kullandıklarını göstermektedir. Ayrıca sanal manipülatifler, öğrencilerin kavramlara ait farklı temsilleri anlamlandırmalarına ve kullanmalarına yardımcı olmaktadır.

Anahtar sözcükler: matematiksel anlama, sanal manipülatifler, öteleme, dönme

ABSTRACT: The purpose of this qualitative case study was to investigate the role of 10th grade students' manipulative experiences in their mathematical understanding about translation and rotation. The data collected by task-based semi-structured interview forms and observation notes of the each transformation lesson. The lessons were enriched with virtual and physical manipulatives in addition to verbal, graphical and algebraic representations of mathematical concepts. Participants, four students who were selected purposively from the classroom, were interviewed about transformations before and after the lessons. In order to investigate the persistency in understanding new interviews were conducted with them 18 weeks after the lessons. The data were analyzed according to Pirie-Kieren and representation theory. The results indicated that students used virtual manipulatives while working within different levels of mathematical understanding, making folding back movements and comprehending the interventions. Virtual manipulatives helped students to understand and apply the different representations in different mathematical understanding levels.

Key words: mathematical understanding, virtual manipulatives, translation, rotation

FEN BİLİMLERİ ÖĞRETMENLERİNİN ALTERNATİF ÖLÇME DEĞERLENDİRME ARAÇLARINI KULLANMA DURUMLARI

Ummuhan ORMANCI

Salıh CEPNİ

Fen bilimleri programı incelendiğinde; öğretmen ve öğrencilerin öğrenme-öğretme sürecince kavram karikatürü, rubrik, yapılandırılmış grid, günlük, tanılayıcı dallanmış ağaç gibi alternatif ölçme değerlendirme araçlarını etkin şekilde kullanmaları beklenmektedir. Alan yazın incelendiğinde; öğretmenlerin alternatif ölçme-değerlendirme araçlarını kullanma durumlarına ilişkin çalışmalar olmasına rağmen, bu çalışmaların genellikle öğretmenlere anket, görüşme vb. yöntemlerle direk iletişim kurularak yapıldığı anlaşılmaktadır. Buna karşın öğretim süreci boyunca öğretmenleri gözlemleyerek yapılan çalışmaların yeterli sayıda olmadığı düşünülmektedir. Bu bağlamda; öğretmenlerinin alternatif ölçme değerlendirme araçlarını kullanma durumlarının sınıf ortamında gerçekleştirilen gözlemlerle belirlenmesinin önemli olacağı düşünülmektedir. Yapılan çalışmada; fen bilimleri öğretmenlerinin alternatif ölçme değerlendirme araçlarını sınıf ortamlarında kullanma durumlarının belirlenmesi amaçlanmıştır. Çalışmada; nitel araştırma yöntemlerinden özel durum çalışması kullanılmıştır. Bu amaçla çalışma, Bursa ilinde yer bir ortaokulda, üç fen bilimleri öğretmeni ve sınıflarıyla gerçekleştirilmiştir. Çalışma sekiz hafta boyunca ve her hafta 4 ders saati gözlem yapılarak sürdürülmüştür. Bu süreçte veri toplama aracı olarak; alternatif ölçme-değerlendirme araçlarına ilişkin kontrol listesi ve gözlem formu kullanılmıştır. Ayrıca süreç sonunda üç fen bilimleri öğretmeniyle görüşmeler gerçekleştirilmiştir. Çalışmadan elde edilen veriler; frekans-yüzde değerleri ve betimsel analiz yöntemi kullanılarak analiz edilecektir. Veriler şu anda analiz aşamasında olmakla birlikte, analiz sonucunda fen bilimleri öğretmenlerinin kullandığı alternatif ölçme-değerlendirme araçları belirlenecek, bunları kullanma sıklıkları hakkında bilgi verilecektir. Gözlem notlarından elde edilen veriler, öğretmenlerin alternatif ölçme değerlendirme araçlarını nasıl kullandığına ilişkin derinlemesine bilgi verecektir. Ayrıca yapılan gözlemler ve öğretmenlerle yapılan görüşmeler sonucunda, öğretmenlerin sınıflarında kullandıkları alternatif ölçme-değerlendirme araçları açısından karşılaştırması planlanmaktadır.

GRAFİK HESAP MAKİNESİ İLE TRİGONOMETRİ ÖĞRETİMİ: BİR EYLEM ARAŞTIRMASI

Ali ŞİMŞEK

Emine ŞİMŞEK

Eylem araştırmalarının amacı eğitim sürecinde ortaya çıkan gerçekleri sistemli bir şekilde anlamak ve sunmaktır. Bu araştırmalarda ölçme, keşfetme, araştırma, tartışma, belgelendirme, değerlendirme, analiz etme, iyileştirme ve gözden geçirme eylemlerinin döngüsel olarak gerçekleştiği görülür. Kendi uygulamalarını gözlemleme, önceden var olan ya da öğretim sürecinde ortaya çıkan bir sorunu anlama ve olası çözümleri üretmeye yönelik planlı, düzenlenmiş ve başkalarıyla paylaşılan bir sorgulama süreci olarak eylem araştırması, eğitim alanında kuram ile uygulama arasındaki boşluğu doldurabilecek bir köprü olarak görülmektedir. Eylem araştırmalarında, araştırmacı öğretmenler nasıl öğreteceklerine ve öğrencilerin nasıl öğreneceklerine dair yollar bulmak böylece öğretimi iyileştirmek için sistemli bir şekilde araştırmalar yürütür, derinlemesine bilgi toplar.

Öğrenciler Ortaöğretim Matematik Dersi Öğretim Programı (2011) "trigonometri" öğrenme alanında yer alan kazanımlara ulaşmada güçlüklerle karşılaşmaktadır. Bu araştırmanın amacı trigonometri konusunda öğrencilerin yaşadıkları güçlükleri gidermede grafik hesap makinesi ile hazırlanmış etkinlikler kullanılarak yapılan öğretimin etkisini belirlemektir. Bu amaçla araştırma "eylem araştırması" yaklaşımı ile yürütülmüştür. Araştırma 2013 – 2014 eğitim öğretim yılı bahar döneminde Ankara İli' nin Kazan İlçesi' nde bir ortaöğretim kurumunun 10. sınıflarından birinde okuyan 20 öğrenci ile yürütülmüştür. Öğrencilerin sahip oldukları kavram yanılgıları, hatalar ve öğrenme zorlukları literatür taraması, öğretmenin deneyimleri ve öğrencilerin açık uçlu sorulara verdikleri yanıtlar aracılığıyla tespit edilmiştir. Bu olumsuzlukların giderilmesi için araştırmacılar hem yabancı literatürde var olan grafik hesap makinesi destekli etkinlikleri uyarlamış, hem de grafik hesap makinesi destekli etkinlikler tasarlamışlardır. Uygulamalar aynı okulda görev yapan matematik öğretmeni araştırmacı tarafından bu etkinlikler kullanılarak gerçekleştirilmiştir. Araştırmada veri toplama araçları olarak araştırmacı günlükleri, çalışma yaprakları, açık uçlu sorular ve klinik görüşmelerden yararlanılmıştır. Verilerin analizi ile elde edilen bulgular, uygulamaların öğrencilerin öğrenme düzeylerine katkı sağladığını göstermiştir. Bu bulgular ışığında okullarda trigonometri konusunda etkili öğrenme-öğretme ortamlarının nasıl yapılandırılabileceği tartışılacaktır.

MATEMATİK DERSİNE YÖNELİK TUTUM GELİŞTİRME İLE İLGİLİ YAPILMIŞ ARAŞTIRMALARA BİR BAKIŞ

A LOOK AT THE RESEARCHES WHICH WERE MADE ABOUT "IMPROVING THE ATTITUDE TOWARDS THE MATHEMATICS LESSON"

Dr. Özlem ÖZER
Milli Eğitim Bakanlığı
ozlemozer2001@gmail.com

ÖZET: Matematik dersine yönelik öğrenme öğretme süreçlerinde tutumun başarı üzerindeki etkisi yadsınamayacak kadar fazladır. Tutum, her bireyin yaşamında sürekli bir etkendir. Bu, herhangi bir durumda, kişinin algılama şeklini etkilemektedir. Yaşam boyu öğrenme ile olumlu tutum arasındaki ilişkilerde bu yaklaşım önem taşımaktadır. Bu yaklaşım ile bireyler yaşamlarındaki olumlu tutum ile çabaladıkları işler üzerinde daha büyük başarılar kazanmaktadırlar. Öğrencilerin matematik dersinde başarılı ya da başarısız olmalarında, matematiği sevmelerinde tutumların rolü büyüktür. Tutumlar başarıyı, başarı da tutumları etkilemektedirler. Matematik korkusu ve kaygısı üzerine yapılmış araştırmalar, öğrencilerin matematikle ilgili yaşantıları arttıkça, matematiğe karşı olumlu tutumlarında azalmalar gözlendiğini ortaya koymuştur. Bu düşünceden hareketle bu çalışmada, son yıllarda matematiğe yönelik tutumlar ile ilgili durumların ele alındığı çalışmalar incelenmiştir. Çalışmada kullanılacak makaleler yabancı literatürden seçilmiştir. 1999-2011 yılları arasındaki yapılmış araştırmalar " mathematics" and " attitude" anahtar sözcükleri temel alınarak taranmıştır. Matematiğe yönelik tutum geliştirme ile ilgili 14 araştırma incelenmiştir. Araştırma, tarama modelinde gerçekleştirilen betimsel bir çalışmadır.

Anahtar sözcükler: matematik eğitimi, tutum, öğrenme.

ABSTRACT: Attitude has an undeniable effective role in successfuly teaching and learning process of mathematics lessons. Attitude has continous effects on one's life and will effect an individual's perception in different occasions. This approach has an important role in the relation of long life learning and positive attitude. With this approach and with the positive attitude individuals gain better success on the jobs they are working on. Attitude has an effective role on students acedemic success in mathematics and even like or dislike mathematics lessons. Attitude triggers success and success triggers attitude. Reasearches made on "The fear and worry of mathematics" showed that the more the students exposed to mathematics the lesser positive attitudes they had. Based on this thought in the recent years researches made on "Attiudes towards mathematics" examined. The articles used in the resarch will be chosen from the foreign sources. "Mathematics and attitude" key words were used in scanning the resources and formed the base of reseaches which were made between the years 1999-2011. A total of 14 researches done with improving the attitude towards the mathematics lesson studying were examined. This research is a descriptive study realized with screening method.

Key words: mathematics education, attitude, learning.

GİRİŞ

Matematik, bilimde olduğu kadar günlük hayatımızda karşılaştığımız sorunların çözümünde de kullandığımız önemli bir araçtır. Bundan dolayı, matematikle ilgili davranışlar ilköğretimden yükseköğretim programına kadar her alanda yer almaktadır.

Duyuşsal alan davranışlarının önemli bir bölümünü oluşturan tutum (Can,1991) bireyin ilgili bulunduğu tüm nesne ve durumlara olan tepkisi üzerinde yönlendirici ya da dinamik bir etkisi olan deneyimlerce biçimlenen zihinsel ve sinirsel bir hazır olma durumu olarak tanımlanmaktadır. Tutum, bireyin çevresindeki bir simgeyi, bir nesneyi ya da bir olayı olumlu ya da olumsuz değerlendirme eğilimi olarak da görülebilmektedir. Bu durumda, bireyler çevrelerindeki nesneleri ve olayları olumlu ya da olumsuz olarak değerlendirmekte ve tercihleri doğrultusunda tepki göstermektedirler (Harrel, 2000). Tutumun etkili olabilmesi için, öğrencilerin seçtikleri faaliyette başarılı olacağı ile ilgili beklentisinin büyüklüğü, tutum ile ilişkili etkinliğin sağlanması ve başarılı bir performans için geri bildirimde bulunmak gibi öğretimsel koşullar gereklidir (Driscoll, 2000). Öğrencilerin birçoğu hata yapma korkusuyla matematik etkinliklerinden uzak durmakta ve başarısız olmaktadır.

Duygusal ifade yönünden bakıldığında, olumlu tutum, matematik ile uğraşmaktan zevk almayı, olumsuz tutum ise, matematik ile ilgili bir sorun ile karşılaşıldığında kaygı duymayı ifade etmektedir. Davranış yönünden bakıldığında, "olumlu" genellikle "başarılı" anlamına gelmektedir. Okul bağlamında, başarılı davranış genellikle yüksek başarı ile özdeşleşmiştir (Isaiah, 2010).

İlköğretimden başlayarak, üniversiteye kadar, öğrencilerin en çok çekindikleri veya korktukları derslerin başında matematik dersi gelmektedir. Bu korkunun oluşmasında, matematik dersinin çok zor olmasından ziyade, öğrencilerde özellikle, ilköğretim yıllarında oluşan olumlu veya olumsuz tutumun etkisi büyük rol oynar. Bu bağlamda, okullarda matematiğe yönelik tutum ile ilgili çalışmaların incelenmesi ve sonuçların değerlendirilmesi önem taşımaktadır. Bu amaçla bu çalışmada, son on üç yılda öğrenme-öğretme sürecinde matematiğe yönelik tutumun, matematik başarısı üzerindeki etkileri ve cinsiyet faktörünün öğrencilerin matematiğe yönelik tutumları üzerindeki etkilerinin ele alındığı çalışmaların incelendiği bir betimsel tarama çalışması yapılmıştır. Bu çalışmanın gelecekte yapılacak olan çalışmalara yol gösterici olabileceği düşünülmektedir.

MATEMATİK DERSİNE YÖNELİK TUTUM GELİŞTİRME İLE İLGİLİ YURT DIŞINDA YAPILMIŞ ARAŞTIRMALAR (1999-2011)

Fraizer (1999) tarafından, yapılan bir araştırmada, Afrikalı kız öğrencilerin matematiğe yönelik tutumları ve başarı arasındaki ilişki incelenmiştir. Veri toplama aracı olarak, Matematik Tutum Ölçeği kullanılmıştır. Araştırmaya 140 tane ortaöğretimdeki kız öğrenci katılmıştır. Sonuçlar incelendiğinde, köy öğrencilerinin kentteki öğrencilere göre matematiğe yönelik olarak anlamlı düzeyde daha olumlu tutum geliştirdikleri saptanmıştır. Ayrıca, düşük ve yüksek başarıya sahip öğrenciler tutumları açısından karşılaştırıldığında, yüksek başarılı kız öğrencilerin düşük başarılı öğrencilere göre daha az endişeli tutuma sahip oldukları, problem çözmeye ve matematiğin yararlılığına yönelik olarak daha olumlu tutum geliştirdikleri tespit edilmiştir.

Martin (2002), "üstün yetenekli öğrencilerin matematiğe yönelik tutumları ile ilgili yaptığı araştırmada, ilköğretim düzeyindeki hızlandırılmış matematik programına katılan 3. 4. 5. ve 6. sınıftaki üstün yetenekli kız ve erkek öğrencilerin matematik dersine yönelik tutumlarını incelemiştir. Araştırmada, 267 tane üstün yetenekli kız ve erkek öğrencinin matematik dersine yönelik tutumlarını ölçmek için Matematik Tutum Ölçeği kullanılmıştır. Araştırma sonuçları incelendiğinde, kızlar ve erkekler arasındaki matematiğe yönelik tutum açısından en büyük farklılığın ve çeşitliliğin 5. sınıf düzeyinde olduğu belirlenmiştir. Veriler, erkek öğrencilerde genel olarak, daha olumlu bir matematik tutumunun olduğunu ortaya koyarken, en olumlu matematik tutumunun 4. sınıfta oluştuğu belirlenmiştir.

Sullivan ve Yu Ku (2002), "kişiselleştirilmiş matematik öğretiminde öğrenci performansı ve tutumlar" adlı araştırmayı, kişiselleştirilmiş öğretimin Tayvanlı öğrencilerin matematik problemlerindeki başarıları ve tutumları üzerindeki etkisini tespit etmek amacıyla yapmışlardır. Araştırmaya, 136 tane 4. sınıf öğrencisi katılmıştır. Araştırmada veri toplama aracı olarak, Matematik Tutum Ölçeği ve Matematik Başarı Testi kullanılmıştır. Elde edilen veriler incelendiğinde, kişiselleştirilmiş ön test ve son test problemlerinde öğrencilerin, kişiselleştirilmemiş problemlerin performansından önemli ölçüde daha iyi performans gösterdiği saptanmıştır. Ayrıca, öğrencilerin kişiselleştirilmiş öğretim programına, kişiselleştirilmemiş öğretim programından önemli ölçüde daha olumlu tutum geliştirdikleri tespit edilmiştir.

Hannula (2002) tarafından, yapılan" duygular, beklenti ve değerler" adlı araştırmada; tutuma yönelik olarak dört farklı değerlendirme süreci tanımlanmıştır. Bu süreçler, mevcut durumun uyandırdığı duygular, uyaranlar ile ilişkili duygular, beklenen sonuçlar ve kişisel değerlere ilişkin durum şeklindedir. Araştırmada, bir ilköğretim okulundaki öğrencilerin matematiğe yönelik olumsuz tutumların tanımlanması ve sonrasında problem çözme durumunda olumsuz duyguların nasıl geliştiği vaka incelemesi ile incelenmiştir. Araştırma verileri incelendiğinde, 3 önemli sonuç elde edildiği görülmüştür. İlk olarak, duyguların, beklentilerin ve değerlerin önerilen çerçevede tutum ve değişiklikleri ayrıntılı olarak açıklamada yararlı olduğu, ikinci olarak, tutumların bazen oldukça kısa bir zaman içinde önemli ölçüde değiştirilebileceği, üçüncü olarak, matematiğe yönelik olumsuz tutumun, benlik kavramının olumlu ve başarılı bir savunma stratejisi olduğu tespit edilmiştir.

Luh, Guo ve Wisenbaker (2004) tarafından, "harp okulu öğrencileri ve üniversite öğrencileri arasındaki matematiğe yönelik tutumun, matematiksel yetenekler açısından farklılığını" istatistiksel olarak araştırmak ve karşılaştırmak amacıyla bir araştırma yapılmıştır. Araştırmaya harp okulu'ndaki 38 erkek öğrenci ve 43 tane üniversite öğrencisi katılmıştır. Araştırmada veri toplama aracı olarak, Matematik Tutum Ölçeği uygulanmıştır.

Sonuçlar incelendiğinde, her iki grupta da olumlu tutum geliştiği, ancak, algılanan matematik yeteneğinin ve matematik tutumunun üniversite öğrencilerinde daha yüksek düzeyde olduğu tespit edilmiştir.

Lianghuo, Seng ve Yan (2005), "Singapurlu öğrencilerin matematiğe yönelik tutumları ve matematik öğrenme" adlı araştırmayı yapmışlardır. Araştırmanın amacı, matematik ve matematik öğrenme ile ilgili öğrencilerin tutumlarını araştırmaktır. Araştırmada veri toplama aracı olarak, Matematik Tutum Ölçeği kullanılmıştır. Araştırmaya 1215 ortaöğretim öğrencisi katılmıştır. Veriler değerlendirildiğinde, öğrenciler matematiği genellikle ilginç bulduklarını (%73) ve matematik çalışmaktan zevk aldıklarını belirtmişlerdir. Ayrıca, öğrencilerin %77'sinin matematiği çok iyi öğrenme ve %61'ninde matematik dersinden iyi notlar almak istedikleri yönündeki inançlarının olduğu tespit edilmiştir. Öğrencilerin %91'i matematiği faydalı, %89'u önemli ve %84'ü matematiği öğrenme için harcanan zamanı değerli bulduklarını belirtmişlerdir.

Schackow (2005) tarafından, "ilköğretim okulu öğretmenlerinin hizmet öncesi matematik yöntemlerine giriş dersine yönelik tutumları ve bu tutumların gelişmesini etkileyen deneyimler" adlı çalışma yapılmıştır. Katılımcıların matematiğe yönelik tutumları ve bu tutumların gelişmesine yol açan deneyimler nitel yöntemler kullanılarak araştırılmıştır. Çalışmaya 33 üniversite öğrencisi katılmıştır. Veri toplama aracı olarak, "Matematik Tutum Ölçeği" verilmiştir. Sonuçlar, bir bütün olarak değerlendirildiğinde, katılımcılar üzerinde tutumun anlamlı düzeyde olumlu bir değişim gösterdiği saptanmıştır. Ayrıca, bireysel görüşmeler, belirtilen manipülatiflerin ve yöntem dersinin düzenli bir şekilde verilmesinin, katılımcıların matematiğe yönelik tutumları üzerinde önemli düzeyde değişiklikler gösterdiğini ortaya koymuştur.

Jenkins (2006), "matematik tutumlarını etkileyen faktörler" adını taşıyan araştırmasında, ilköğretim 6. sınıftaki 19 üstün yetenekli öğrencinin matematiğe yönelik tutumları ile bireysel matematik başarısı ve belirlenen zeka alanları arasındaki ilişkiyi incelemiştir. Araştırmada veriler "Matematik Tutum Ölçeği" ile toplanmıştır. Araştırma süresince, okuldaki üstün yetenekli öğrenciler için olan eğitim programına ilave olarak, aktif bir şekilde matematiksel yorumlar ve yaratıcı problem çözme etkinlikleri düzenlenmiştir. Elde edilen veriler incelendiğinde, öğrencilerin bazıları birden fazla zeka alanında üstün yetenekli iken, diğerlerinin sadece bir zeka alanında yetenekli oldukları ortaya çıkmıştır.

Zan ve Martino (2007), "matematiğe yönelik olumsuz tutum" olgusunu incelemek amacıyla yaptıkları araştırmada, günlükler, sınıf gözlemleri, anket, yapılandırılmış ve yarı yapılandırılmış görüşmelerle, denemeler kullanılmıştır. Araştırmaya 146 öğretmen katılmıştır. Veri toplama aracı olarak, Matematik Tutum Ölçeği kullanılmıştır. Araştırma verileri incelendiğinde, öğretmenlerin matematiğe yönelik tutumları ile inançları arasında anlamlı düzeyde ilişki bulunduğu tespit edilmiştir.

Ashyb (2009) tarafından, "öğrencilerin matematiğe yönelik tutumlarını araştırma" adını taşıyan bir çalışma yapılmıştır. Araştırmada, veri toplama aracı olarak, Matematik Tutum Ölçeği kullanılmıştır. Araştırma sonuçları genel olarak değerlendirildiğinde, öğrencilerin daha zor matematik problemlerini çözmede kendilerini yetersiz ve zayıf olarak algılamakta oldukları saptanmıştır. Genel olarak, yüksek başarı gösterenler arasında kızlar erkeklerden daha fazla oranda düşük güvene sahip olduklarını belirtmişlerdir.

Yara (2009), Nijerya'nın güneybatısındaki seçilmiş ortaokullardaki öğrencilerin matematik dersine yönelik tutum ve akademik başarıları arasındaki ilişkiyi incelemiştir. Araştırmaya, orta ikinci sınıf öğrencilerinden 1542 tane üst düzey öğrenci katılmıştır. Bu öğrencilere Matematik Tutum Ölçeği verilmiştir. Araştırma sonuçları, öğrencilerin matematik dersine yönelik tutumlarının olumlu olduğunu, matematik dersini değerli ve gerekli bulduklarını ve gelecekteki kariyerleri için onlara yardımcı olabileceğini düşündüklerini ortaya koymuştur. Ayrıca, 1458 öğrenci (%83.3) problem çözmeden hoşlandıklarını, kalan 84 öğrenci (%16.7) ise hoşlanmadıklarını belirtmişlerdir. Bu oranlar dikkate alındığında, matematiğe yönelik tutum ile akademik başarı yönünden öğrencilerin önemli bir bölümünün problem çözmeyi sevdiği, çok az bölümünün hoşlanmadığı belirlenmiştir.

Schenkel (2009) tarafından, "matematik dersine yönelik tutumun matematik performansı üzerine etkisi" adlı araştırma yapılmıştır. Nicel ve nitel yöntemin kullanıldığı araştırmaya 79 öğrenci ve 23 öğretmen katılmıştır. Araştırmada, 8.sınıftaki öğrencilerin matematik performansına, öğretmenlerin ve öğrencilerin tutumlarının etkisi incelenmiştir. Araştırmada, veri toplama aracı olarak, Matematik Tutum Ölçeği kullanılmıştır. Veri analizleri sonrasında, matematik dersine yönelik olumlu bir tutuma sahip olma ile öğrencilerin sınıf performansı arasında pozitif ilişki olduğu ortaya çıkmıştır. Araştırmada, öğretmenlerin çabaları ile öğrencilerde olumlu tutumun ve sınıftaki performansın geliştirilmesi arasında pozitif bir ilişki tespit edilmiş olup, öğrenciler, öğretmenlerin matematik dersini eğlenceli hale getirmelerinin, onların katılımını ve yetenek düzeylerini arttırmada yardımcı olduğunu belirtmişlerdir.

Farooq ve Shah (2010) tarafından, yapılan bir başka çalışmada; "öğrencilerin matematiğe yönelik tutumu, güveni, matematiğin kullanışlılığını ve aynı zamanda, öğretmen algısı ve erkeklerin matematikteki etki alanlarını" ölçmek amaçlanmıştır. Çalışmaya, 685 öğrenci katılmıştır. Araştırmada veriler, Matematik Tutum Ölçeği ile toplanmıştır. Araştırma sonuçları incelendiğinde, ortaöğretim düzeyindeki kız ve erkek öğrencilerin matematiğe yönelik güvenleri açısından anlamlı bir fark tespit edilirken, matematik öğretmeni hakkındaki algıları ve matematiğin kullanışlılığı ile ilgili olarak kız ve erkek öğrenciler arasında anlamlı bir fark olmadığı saptanmıştır.

Lawsha ve Hussain (2011), Maldivlerden seçilen bir orta dereceli okuldaki öğrencilerin matematiğe yönelik tutumlarını incelemişlerdir. Çalışmada, bir ortaokuldaki öğrencilerin cinsiyet farklılığının matematiğe yönelik tutum üzerindeki etkisi belirlenmeye çalışılmıştır. Toplamda 200 ortaöğretim öğrencisi çalışmaya katılmıştır. Araştırmada veri toplama aracı olarak, Matematik Tutum Ölçeği kullanılmıştır. Veriler değerlendirildiğinde, öğrencilerin matematik performansı düşük olmasına rağmen, katılımcıların tutumunun oldukça olumlu olduğu tespit edilmiştir. Ayrıca, çalışmada öğrencilerin matematiğe yönelik tutumuna yönelik olarak kız ve erkek öğrenciler arasında anlamlı bir fark olmadığı ortaya çıkmıştır.

SONUÇ VE ÖNERİLER

Çalışma kapsamında yer alan araştırmaların sonuçları incelendiğinde, matematiğe yönelik tutum ile başarı arasındaki ilişkinin ve cinsiyet farklılığının matematiğe yönelik tutum üzerindeki etkilerinin irdelenmiş olduğu görülmektedir. Araştırmalarda yapılan veri analizleri değerlendirildiğinde, matematik dersine yönelik olumlu bir tutuma sahip olma ile öğrencilerin sınıf performansı arasında pozitif ilişki olduğu ulaşılan ortak sonuçtur. Matematiğe yönelik geliştirilen olumlu tutumun matematik ders başarısını yükselttiği yönünde sonuçlar elde edilirken, matematiğe yönelik olarak geliştirilen olumsuz tutumun akademik başarıyı negatif yönde etkilediği ortaya çıkmıştır. Ayrıca, eğitimin her düzeyinde matematik dersinin eğlenceli hale getirilmesinin öğrenci motivasyonunu ve buna paralel olarak öğrenci katılımını ve yetenek düzeyini arttıracağı sonucuna ulaşılmıştır.

Ayrıca, matematik dersinin öğrenciler tarafından yaşadıkları başarısızlık yaşantıları nedeniyle, pek sevilmeyen bir ders olduğu ve bu nedenle bu derse yönelik olarak olumsuz tutum geliştirdikleri gözlenmektedir. Başarıyı tadamayan öğrencilerin öğrenilmiş çaresizliği yaşamakta olduğu ve dolayısıyla bu derse yönelik olarak olumsuz tutum geliştirdikleri söylenebilir. Öğrencilerin başarıyı tatmalarının sağlanması ile bu derse karşı olumlu tutum geliştirmeleri sağlanabilir. Ayrıca, eğitim sistemimizde matematik dersinin, öğrencinin geleceğinde ve okul seçiminde belirleyici bir ders olmasının, öğrencilerin bu derse karşı olumlu tutum geliştirmesinde etkili olduğu söylenebilir. Bu bağlamda, öğrencilere yönelik yapılacak yönlendirme çalışmaları etkili olabilir.

ÖZET: Bu çalışmada araştırmacıların amacı öğretmen adaylarının, ilköğretim öğrencilerinin tamsayı tarifi hakkındaki alternatif anlayışları ve hatalarını ve bunun nedenlerine dair güncel bilgilerini keşfetmektir. Çalışmanın verisi 201 – 2011 akademik yılı sonunda 38 Türk öğretmen adayından toplanmıştır. Bir durum çalışması deseni kullanılmıştır. Veriler, açık uçlu bir soru ile toplanmıştır. Çalışmamızın verileri, öğretmen adaylarının çeşitli alternatif kavramları ve hataları önerdiğini göstermiştir. Bu alternatif kavram ve hataların neden kaynaklandıklarına ilişkin ise öretmen adayları, öğrencilerin sayı kümesi hakkındaki önceki bilgilerinin olumsuz aktarımı, öğrencilerin genel yetersizliği ve öğretim yaklaşımını önermişlerdir. Öğretmen adaylarının bu tür bilgi birikimlerini dikkate alarak ders tasarlayacakları düşünüldüğünde, alternatif kavram ve hataları belirlemelerinin önemli olduğu söylenebilir. Ancak, bu alternatif kavram ve hataların herbirinin birkaç katılımcı tarafından önerildiği düşünüldüğünde, öğretmen adaylarının bu konuda daha donanımlı hale gelmesine ihtiyaç olduğu söylenebilir.

Anahtar sözcükler: Kavram tanımı, öğretmen adayları, öğretmen bilgisi, tamsayılar, kavram yanılgıları

ABSTRACT: In this study, the researchers attempted to explore prospective teachers' current knowledge about elementary students' alternative conceptions and errors while they are describing integers and their reasons of why elementary students have such conceptions and errors. Data were collected from 38 Turkish prospective teachers at the end of 2010 – 2011 academic years. A case study design was used. Data were collected through an open-ended question. The data of our study indicate that prospective teachers suggested varied alternative conceptions and errors and the conceptions and errors are derived from students' negative transfer of former knowledge on number sets, students' general insufficiency, and the teaching approach. Being capable of suggesting them is important that prospective teachers design their lessons considering such background knowledge. However, each of them is suggested by few participants that in this regard prospective teachers need to become better equipped.

Key words: Concept definition, prospective teachers, teacher knowledge, integers, misconceptions

BİLİŞİM TEKNOLOJİLERİ VE YAZILIM DERSİ PROGRAMININ ÖĞRETMEN GÖRÜŞLERİNE GÖRE DEĞERLENDİRİLMESİ (KONYA-EREĞLİ ÖRNEĞİ)

Yakup YILMAZ

Teknolojide yaşanan gelişmeler ile birlikte öğretim-öğrenme teknolojileri bilim dalı olarak karşımıza çıkmaktadır. Mevcut gelişmeler ışığında yeniden yapılandırılan bilişim teknolojileri ve yazılım dersi programı bilgi okuryazarlığı, teknoloji kullanımı ve üretiminde etik değerler, estetik, gizlilik, bilgi güvenliği ve siber suçlar gibi kişisel ve toplumsal açıdan önemli olan konuları içine alacak biçimde yeniden oluşturulmuştur. Buna göre Milli Eğitim Bakanlığı (MEB) Talim Terbiye Kurulu Başkanlığı, yeni bir "Bilişim Teknolojileri ve Yazılım Dersi Öğretim Programı" hazırlamıştır. 2012 yılında yürürlüğe giren bu program ile ilgili olarak Konya ili Ereğli ilçesinde ortaokullarda görev yapan bilişim öğretmenlerinin yeni program hakkındaki görüşleri alınarak değerlendirilmiştir.

In conjunction with improvements in technology, learning and education technology is appeared as a discipline. Information technologies and software lesson program reconstructed under current improvements have been reformed as including personally and socially important subjects like information literacy, ethics in technology usage and production, aesthetics, privacy, information security and cybercrime. Accordingly, Milli Eğitim Bakanlığı (Ministy of Education) Talim Terbiye Kurulu Başkanlığı prepared "Information Technology and Software Lesson Instruction Program". In terms of this program issued in 2012, IT instructors',in secondary schools in Ereğli, Konya, reviews of about new program is assessed.

HOW WELL PREPARED MATHEMATİCALLY ARE OUR ENGİNEERİNG STUDENTS WHO TRANSFER FROM AN ORDİNARY DEGREE İNTO AN HONOURS DEGREE

SUBJECT: TECHNOLOGY EDUCATION

Michael Carr

Marisa Llorens

Susan O ‘Shaughnessy

Brian Bowe

Domhnall Sheridan & Sheryl Sorby.

Dublin Institute of Technology, Bolton St., Dublin 1, Ireland

ABSTRACT: Students who have received a C3 (55%) or higher in Higher level mathematics in the Irish Leaving Certificate (the terminal secondary examination in Ireland) may enter directly onto a 4-year Honours degree in engineering. Students who have not achieved this level of mathematics have the option of entering onto a 3-year Ordinary degree(Level 7). Upon completion of this students may progress to the third year of the Honours degree. Relatively little work has been done on the transition(articulation) from an Ordinary degree to an Honours degree and in particular the mathematical preparedness of these students. In the third and fourth year of many Honours engineering courses within the DIT it is not unusual to have 30-50% of the students coming from an Ordinary degree background. The majority of these students come from within the DIT while others transfer in from other Institutes of Technology in Ireland. Previous work has shown that students from an Ordinary degree background are more than twice as likely to fail mathematics in their third year of the Honours degree when compared with students who have proceeded directly through an Honours degree programme. In this study we analyse students’ performance across all subjects and examine if there is a relationship between mathematical performance in the final year of the Ordinary degree and overall performance across all subjects in the third and fourth year of the Honours degree. In addition, a similar comparison is made with these students mathematics grade on entry to first year and whether this is a determining factor in their success in the in the Ordinary degree and their ability to transfer to the Honours degree.

Keywords: Engineering Mathematics, Honours degree

INTRODUCTION

There are two distinct routes to an Honours degree (Level 8) in engineering in the Dublin Institute of Technology (DIT). Students with a C3 (55%) or higher in Higher level mathematics in the Irish Leaving Certificate (the terminal secondary examination in Ireland) may enter directly onto a 4-year Honours degree. Students who have not achieved this level of mathematics but have a pass in ordinary level mathematics may enter onto a 3-year Ordinary degree(Level 7). Students who successfully complete this award may apply to progress to the third year of the Honours degree. Up until relatively recently an upper merit (60%) was the minimum required to make this transition. In recent years this requirement has been relaxed with many students with lower marks being offered the possibility of transition upon successful completion of an interview.

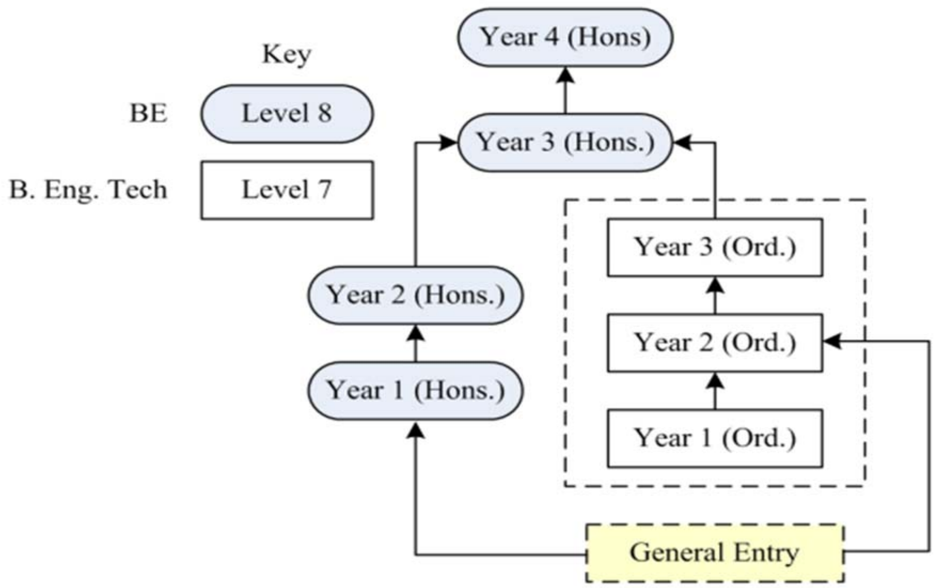

Figure 1: Schematic of the alternative routes to an Honours degree in Engineering in Ireland

Previous work has shown that students from an Ordinary degree background are more than twice as likely to fail mathematics in their third year of the Honours degree when compared with students who have proceeded directly through an Honours degree programme(Carr 2013). In this study we examine the performance of the group of students from the Ordinary degree in mechanical engineering who entered the third year of the honours programme in 2007 and 2008 and who subsequently graduated in 2009 and 2010 respectively.

RESULTS

2009 and 2010	Direct Entry to level 8	Entry via Level 7 course
N	85	33
Average mark (Standard deviation)	53.4(18.8)	62.1(8.1)
Number with grade of more than 60%	37/85	27/33
Graduated on time(Complete pass)	62/88	32/33

Table 1:Comparative Performance Of Students Who Transfer Onto An Honours Degree Programme And Those Who Enter Directly From Secondary School

In table1 above we show a combined analysis for the combined mechanical engineering classes of 2009 and 2010. There were a total of 85 students who graduated who came from an Honours degree background i.e they had entered the course directly from secondary school. In contrast 33 students graduated who had entered the Honours degree programme after having completed the 3 year Ordinary degree. The average mark of the direct entry students was 53.4 % with a standard deviation of 18.8. In contrast the students who had entered via the ordinary degree had an average of 62.1% with a standard deviation of 8.1%. A two sample t-test was applied to this data and the average mark of the Ordinary degree students was found to be significantly different with p=0.000.

In addition we measured the proportion of students who achieved a 2.1 degree or higher. Of the direct entry students 37/84 achieved a 2.1 degree or higher in comparison with the ordinary degree students where 27/33 achieved a 2.1 degree or higher. This difference was found to be significant using two proportion test(p=0.000) and the Fisher exact test(p=0.000).

Of the students who entered from the ordinary degree background 32/33 graduated on time in comparison with 62/88 who had come through the direct entry route. Again this is significantly different using both the two proportion test($p=0.000$) and the Fisher exact test($p=0.002$)

Maths results

The original motivation for this study was the failure rate in the 3rd year Honours mathematics module. We now show the performance of these students in the mathematics module.

Results for the 2009 and 2010 graduating class

Correlation Coefficient(R^2)	3rd Level 8 maths R^2 (p value)	4th Level 8 Maths (p value)	4th Level 8 Overall (p value)
3rd year Level 7 Maths	0.139(0.454)	0.533(0.001)	0.57(0.001)

Table 2: Correlation Between 3rd Level 7 Maths Grade, 3rd Level 8 Maths Grade, 4th Level 8 Maths Grade And 4th Year Level 8 Overall

What we see here is little or no correlation between the 3rd year level 7 maths grade and the third year level 8 maths grade with a correlation coefficient of $R^2= 0.139$ and $p=0.454$. This is rather worrying. But when we look at the relationship between the 3rd year level 7 maths grade and the 4th year level 8 grade we see a strong correlation ($R^2=0.57$), that is highly significant ($p=0.001$). We are also seeing a strong relationship between the 3rd year level 7th maths grade and their overall performance in the 4th year ($R^2 =0.57$, $p=0.001$).

Maths grade as a predictor of success.

Given the strong correlation we see between the maths grade and the overall grade in fourth year should we use the 3rd year Level 7 maths grade to select students for entry onto the honours programme. In this section we compare whether we should use the overall 3rd Level 7 average grade, 3rd year Level 7 maths grade or the 3rd year Level 7 project grade. We see from table 3 below that the 3rd year level maths grade is as good a predictor of overall success in the honours degree as the 3rd year level 7 overall grade.

Correlation Coefficient(R^2)	3rd Level 7 maths R^2 (p value)	3rd Level 7 Overall (p value)	3rd year Level 7 project (p value)
4th year Level 8 overall	0.57(0.001)	0.585(p=0.000)	0.308(p=0.08)

Table 3: Correlation between overall 4th year performance, 3rd year level 7 maths grade, 3rd year level 7 overall grade and 3rd level 7 project mark

CONCLUSION

Several researchers in the U.S. have identified a phenomenon known as “transfer shock” (Cejda, 1994; Lanaan, 2001; and Hills, 1965). Through transfer shock, community college students who transition to a university typically experience a drop in grades for the first semester or two immediately after transfer. Grade point averages will typically recover by the time that students graduate and the dip in grades is typically attributed to the effort it takes to transition from one educational setting to another. We seem to be observing a similar phenomenon in the DIT, whilst there is a temporary dip in the performance of transfer students in the first semester these student quickly recover and there is a very strong correlation between their performance in the ordinary degree and their final performance. The American literature recommends that well-defined articulation agreements between the community college and the university as being critical to transfer student success. At DIT, the faculty teaching the ordinary and honours programs are typically in the same department and, in fact, most faculty teach in both programs. Thus, it appears that conditions are ripe at DIT for successful transition of students between the programs.

In addition we have noticed that these transfer students are outperforming their direct entry comparators , both in overall grade and the percentage who complete the course on time. Further work is required in this area and we hope to follow up this work with focus groups of students who have articulated in the past, along with a focus group of staff who have taught these students on both the ordinary and honours programmes.

Duygu ALTAYLI
Cumhuriyet University
duygu.altayli87@hotmail.com

ABSTRACT: The aim of this study is to explain the preservice primary mathematics teachers' reasons of preferring this department and to define their opinions about mathematics and mathematics teaching lessons. For this reason it has been worked with 40 preservice teachers who are seniors at a state university's Department of Primary Mathematics Education. In this study, in which qualitative research approach has been applied, the data is gathered by a questionnaire form including open-ended questions. Preservice teachers are asked their reasons of choosing this department, their ideas about ideal university lecturers, their opinions a about mathematics and mathematics teaching lessons, their suggestions about teaching process. The data gathered from the answer sheets has been analyzed by content analysis technique. Most of the students have chosen this department because of their love of mathematics. They have stated that they won't use mathematics lessons in their professional life but still mathematics lessons are important for thinking in mathematical way. On the other hand, they have stated that mathematics teaching lessons have got great importance in their professions.

Key words: Preservice primary mathematics teacher, mathematics lessons, mathematics teaching lessons

INTRODUCTION

One of the main items of education system is the teacher who is applier of the process. The training quality on professional view shows the quality of his/her teaching presentation (Seferoğlu, 2004). It can be seen that the preservice teachers take field courses and field teaching courses together with training courses. When investigating the literature on teacher training, it can be seen that the works on this subject are generally about school experiments but very less of them are about their ideas and opinions on university training programmes (Dursun&Kuzu, 2008; Tüfekçi Aslım, 2013; Sezgin Nartgün, 2008; Yıldırım, 2013; Eraslan, 2008; İnal&Büyükyavuz, 2013; Mete, 2013; Sarıtaş, 2007; Baştürk, 2011; Memduhoğlu&Topsakal, 2008, Eraslan, 2009). So, the aim of this work is to explain the preservice primary mathematics teachers' reasons of preferring this department and to define their opinions about mathematics and mathematics teaching lessons

METHODOLOGY

Preservice teachers are asked to evaluate their university education. So, the research which has been held with the qualitative methodology is a survey study. Survey study is an approach that aims describing a state as it is and collecting detailed data (Karasar, 2006).

Participants

This research has been applied to 40 seniors at Department of Primary Mathematics Education of a state university. It is applied to seniors because the students need to take all the lessons, the mathematics lessons and the formation lessons in order to make correct evaluations.

Instruments

The data has been gathered by a questionnaire form consisting open-ended questions. The questions asked to the participants are classified under the title of participants' reasons of choosing the Department of Primary Mathematics Education, the qualities of ideal lecturers, opinions about mathematics lessons and mathematics teaching lessons, suggestions about the process.

Analysis of data

The data have been analyzed using the content analysis technique of qualitative research method. The answers of the preservice teachers have been categorized as preference reasons of their department, their opinions about an ideal lecturer, their opinions about mathematics lessons and mathematics teaching lessons, their suggestions about the process. NVivo 8 programme has been used on analyzing data. The programme gave the opportunity of being close to the data and revising-arranging the categories (Kuş, 2007). The analysis of the data has been held by two researchers on this field at the same time. There has been a consensus on the codes and the categories formed.

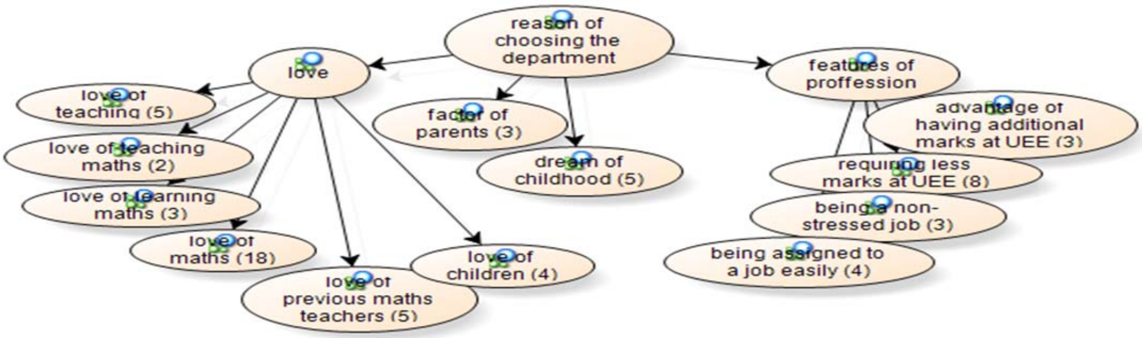
FINDINGS

The answers given to the questions by the preservice teachers have been categorized under 5 titles. Each category will be examined by a model and citations of participants will take place in this part of the research. Frequencies of each category are given together with models in parentheses.

Preservice Teachers' Reasons Of Choosing Department Of Primary Mathematics Education

We can find 4 sub-categories under the category of "reasons of choosing Teaching Mathematics". These 4 sub-categories can be gathered under these subtitles: love [love of teaching (5 participants), love of teaching maths (2), love of learning maths (3), love of maths (18), love of previous maths teacher (5), love of children (4)], factor of parents (3), dream of childhood (5), features of profession [(advantage of having additional marks at universıty entrance exam (3), requiring less mark at university entrance exam (8), being a non-stressed job (3), having a job easily (4)]

Model 1: The reasons of choosing the department of primary mathematics education



Some quotes of preservice teachers:
Preservice Teacher (PT) 31: *Primarily, I love mathematics; I believe teaching mathematics is more exciting than understanding it…*

PT 33: *I wanted to be secondary mathematics teacher but my father wanted me to be primary mathematics teacher. Both include mathematics so it doesn't matter which one.*
PT14: *My main goal was pharmacy but the mark I had at the university entrance exam was equal to primary mathematic teaching…*

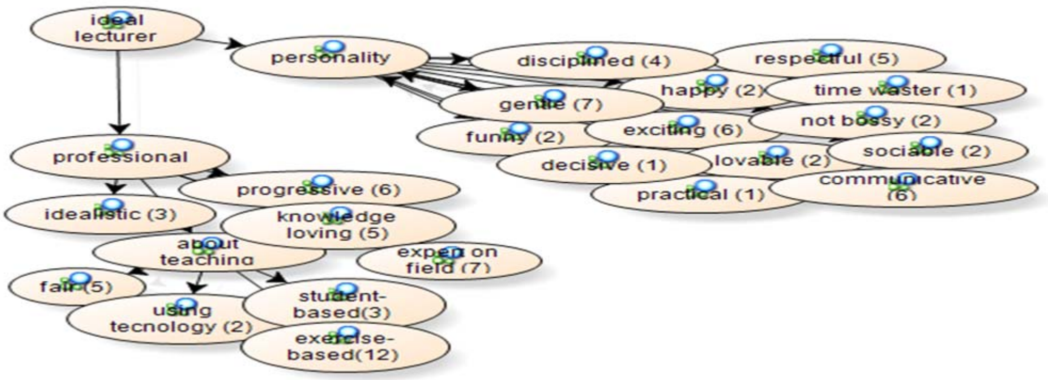
Most of the participants chose the primary mathematics education because they love mathematics. As expressed on PT 31, some chose this department because they both love mathematics and teaching mathematics. When examining the model, reasons that made them choose the primary mathematics education are the love of being teacher, the love of teaching mathematics, the love for their own mathematics teachers and being the their childhood dream.

Also we can say that parents are effective in choosing this department when examining the answers. PT 33's answer supports this conclusion. Some participants state that this job was their dream. As PT14 says, there are students who chose this department depending on their results of the university exam. In addition, there are preservice teachers who chose this department because of having additional point advantages, being an easy job for women and being easy to be assigned.

Opinions About Ideal University Lecturers

When examining the answers, we formed 2 sub-categories for "opinions about ideal university lecturers". they are: personality [(disciplined (4 participants), respectful(5), time waster (1), communicative (6), gentle (7), happy (2), not bossy (2), practical (1), funny (2),exciting (6), lovable (2), sociable (2), decisive (1)] and professional [(progressive (6), idealistic (3), knowledge loving (5), expert on field (7); about teaching: fair (5), using technology(2), student-based (3), exercise-based (12)]

Model 2: Opinions about ideal university lecturers



Some quotes of the preservice teachers:

PT 7: *First of all I want to communicate with a lecturer…We can't keep in touch with lecturers, we can't even ask questions… Yes, they should be disciplined but I must feel that I'm important too.*

PT 24: …*Lecturers should be well equipped and I should use what I have learnt… I think, lecturers should be equipped with mathematical knowledge.*

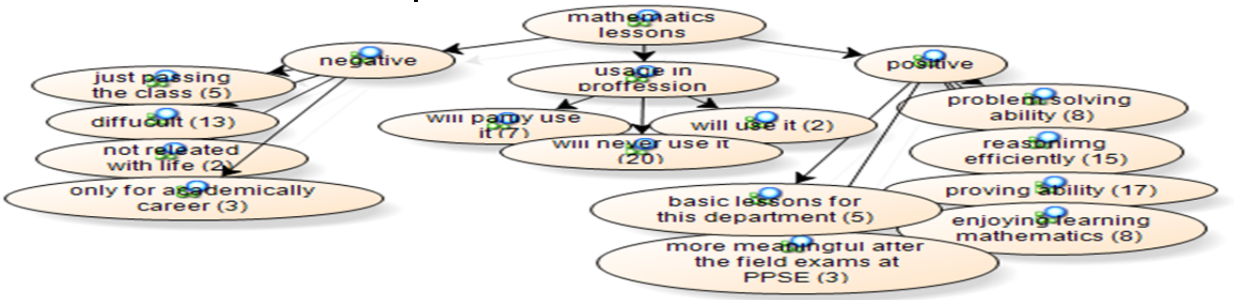
PT 29*: I thought that I will be a mathematician and I will participate the mathematical proofs when I came to this department. So, our lecturers should provide this…*

As we can see, an ideal lecturer should spend time to students, communicate with them and also love them, gentle and also disciplined, respectful, happy, not bossy, practical, funny, exciting, social and decisive. PT7's answer supports this finding. On the other hand, preservice teachers have stated that an ideal lecturer should be an expert on his/her field, progressive, idealistic, learner based, should let students apply what they have learnt, should be technology user and fair. As stated by PT 24 and PT 29, a lecturer should be well equipped with mathematical knowledge and should be progressive on his/her field. As understood from the frequencies of the categories, the participants have given more importance to professional qualities. According to this finding a lecturer is the one who is full of mathematical knowledge and continuously worker on progressing his/her knowledge.

Opinions About The Mathematics Lessons

We have created 3 sub-categories for the category of "Opinions about the mathematics lessons" after analyzing the preservice teachers' answers. These categories are: negative [(just passing the class (5 participants), difficult (13), not related with real life (2), only for academically career (3)]; positive [(problem solving ability (8), proving ability (17), reasoning efficiently (15), enjoying learning mathematics (8), more meaningful after the field exams at "public personnel selection exam" (3), basic lessons for this department (5)] and usage in profession [(will use it (2), will never use it (20), will partly use it (7)].

Model 3: Opinions about the mathematics lessons



Quotes of some preservice teachers:
PT 7: *I still can't understand analysis and differential equations and can't solve them. How can I use them in my professional life? This is faculty of education, not engineering or science…*

PT 15: *I'm thankful to my lecturers but I don't think I will apply these lessons at my professional life. I think those who have academically goals should take these lessons and us who want to teach mathematics at village should not take so much difficult lessons…*

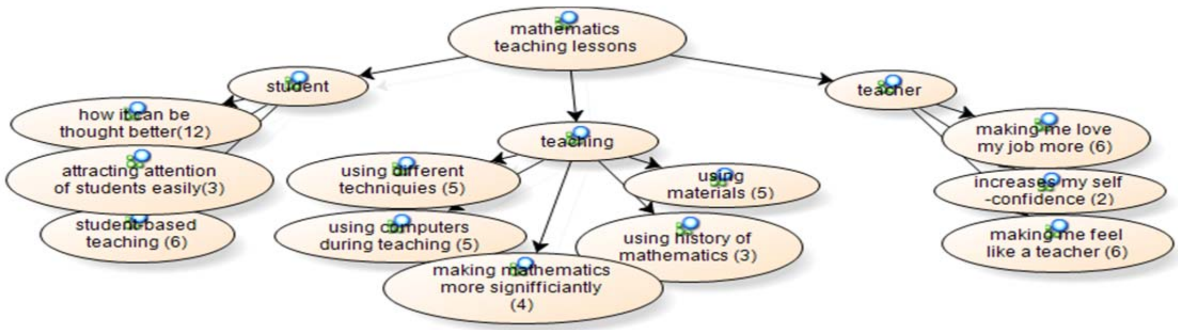
PT 27: *Surely, my mathematical perspective has developed here with these lessons but I don't think I'm going to use this knowledge in my professional life. For example, it's obvious that I'm not going to say "you can memorize more easily if you take it's integral according to Inx" to a student who has problem in memorizing time table.*

As seen on the model, preservice teachers state that the mathematics lessons have made them think more analytically, made them understand the basis of mathematical expressions, and enjoying dealing with mathematics and they state that they give more importance to these field classes after the PPSE Field Exam. PT 27's answer supports this finding. On the other hand, most of the participants state that they take these lessons just to pass to next grade, that the lessons aren't related with daily life and that the contents of the lessons are so difficult that they can't apply them on their professional teaching process. PT 7, PT 15 and PT 32 have expressed this finding at their citations. However, while two participants say that they will use this knowledge in his/her teaching process, 20 of the participants state that they won't use this knowledge in professional teaching process.

Opinions About Mathematics Teaching Lessons

We have created 3 sub-categories for the category of "Opinions about mathematics teaching lessons" after analyzing preservice teachers' answers. These are: student [(how it can be taught better (12 participants), attracting attention of students easily (3), student-based teaching(6)], teaching [(using different techniques (5), using computers during teaching (3), making mathematics more significantly (4), using history of mathematics (3), using materials (5)], teacher [(making me feel like a teacher (6), making me love my job more (6), increases my self-confidence (2)].

Model 4: Opinions about mathematics teaching lessons



Some citations of preservice teachers:

PT 32: *I need to know how to teach the expression of "minus times minus equals to plus"…*

PT 18: *These lessons were about "how to teach"…also, these lessons made me feel like a teacher, I realized that I can teach with pleasure…*

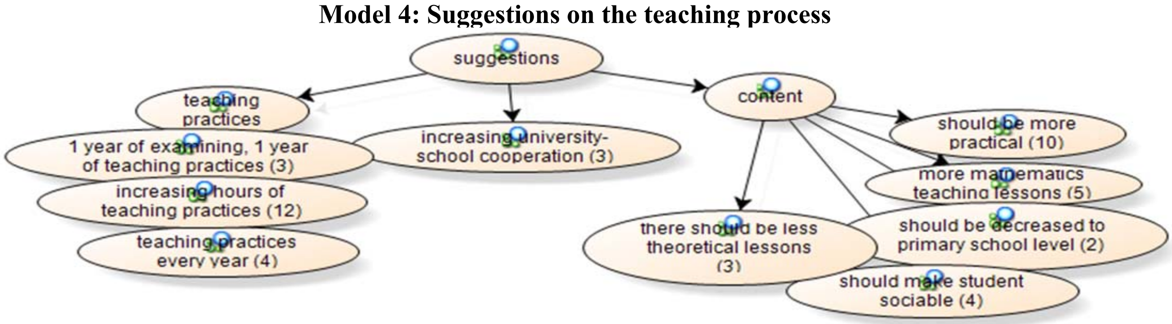
PT 34: *These are the only lessons that I'm fond of and useful for me. Because the content of our professional life went into shape by these lessons. Thanks to these lessons, we have learnt how to teach, how our students can learn better, what mistakes our students can make…*

As we can see on the model, preservice teachers stated that their self-confidence has shown up and that they love their profession more with the help of mathematics teaching lessons. In addition, with the help of these lessons they state that they have learnt to teach the way they learn themselves, to use the appropriate material, to make mathematics more abstractive, to attract their students' focus and to be student-based. We can support these findings with the citations above.

Suggestions On The Teaching Process

There are 3 sub-categories under the category of "suggests on the teaching process". They are: teaching practices[(1 year of examining, 1 year of teaching practices (3 participants), increasing hours of teaching practices (12), teaching practices every year (4)]; increasing university-school cooperation (3); content [(should be more practical (10), should be decreased to primary school level (2), there should be less theoretical lessons (3), should make student sociable (4), more mathematics teaching lessons (5)].

Model 4: Suggestions on the teaching process



Quotes of some of preservice teachers:

PT 32: *Instead of making students tired of theoretical lessons and making them dislike their job, you should teach them what being a teacher means and how to be a better teacher. Because limits, integral or derivatives don't solve the problems of primary school students.*

As we can see on the model, preservice teachers want more mathematics teaching lessons in order to be a better teacher. PT 32's answer supports this outcome.

CONCLUSION

The preservice primary mathematics teachers' opinions about the reasons of choosing this department, about the mathematics lessons, about mathematics teaching lessons, about an ideal university lecturer and the suggestions about the teaching process are determined in this study. As stated before, it can be seen that love of (mathematics, mathematics teaching, eg.) is the most important reason in choosing this department. Most of the students have chosen this department because they love mathematics. The features of working as a mathematics teacher have been a reason of choosing the department too.

The students have focused on the professional side of an ideal lecturer more. On their view, a lecturer is well equipped, hardworking and contributing. They expressed that they will not use knowledge they gained at the mathematics lessons, though these lessons have improved their mathematical background. They told that mathematics teaching lessons have great importance in their professional life and they have gained self-confidence thanks to these lessons. The preservice teachers have suggested that teacher training lessons should be increased and mathematics teaching lessons should take more places instead of mathematics lessons.

SUGGESTION

When paying attention to preservice teachers' thoughts, some precautions can be created to make mathematics lessons to be more meaningful for students. For example, we can try to make students get rid of the idea of "these lessons are not useful" by real-life teaching techniques and telling them how to apply these knowledge in their professional life. We can provide the class environment of using what they have learnt previously and the environment of actively participating during the lessons. Also we can give the opportunity of doing more teaching practices by letting them teach more.

ABSTRACT: Implementing algorithms and making abstractions are two integral parts of computer programming. Algorithm implementation process involves understanding a business problem, designing the most appropriate solution and abstracting this in a programming environment. Thinking within the syntax of a programming language and generating algorithms simultaneously are often found challenging by students. More importantly, majority of students do not necessarily understand the underlying reasons behind the multiple assessment methods used in the evaluation of algorithm implementation. Some students believe that the theoretical measurements for algorithm implementation are not directly related to the practical development of solutions and hence, they do not see the point of theoretical exams particularly in algorithm implementation process. In this paper, we analyze the methodologies used for the evaluation of algorithm implementation. The Data Structures and Data Organization course thought at the Faculty of Engineering in Cyprus International University (CIU) has been selected as a pilot course to perform a rigorous study in order to compare the theoretical and the practical exam results of students. The aim of the study was to understand whether or not there was a significant relationship between the theoretical and practical exam results. The raw data of the study came from 100 students who were randomly selected without considering their previous background or programming knowledge. The correlation between students' programming capabilities and their theoretical knowledge were analyzed in order to state whether or not their performance in theoretical exams are authentic when compared to their practical exams.

Key words: Algorithm implementation, programming assessment, assessment methodologies, data structures, c programming.

INTRODUCTION

Majority of institutions in the Cyprus follow a common academic grading system which offers the options of using quizzes, theoretical exams (e.g. written exams), practical exams (laboratory exams), oral exams and/or project development as major knowledge assessment methods. The variation of the academic grading system provides academicians flexibility in measuring students' knowledge and skills both in theory and in practice. Despite a rich variation in the academic grading system provides many advantages, it also brings considerable problems as the balance among the assessment methods might be diverse. As multiple assessment methods are used to measure students' ability and knowledge, it is arguable whether or not those students who did well in the theoretical exams would also do well in the practical exams. Although this is a generic problem in academy, we have observed that a number of students are suffering particularly in algorithm development courses as they believe the theoretical part of algorithm development is independent from practical solution development. Furthermore, various studies discussed these issues and offered new instructional design and assessment methods in order to measure students' ability and knowledge in computer algorithms accurately. (Ala-Mutka, 2005; Barros *et al.*, 2003; Chamillard & Braun, 2000; Daly & Waldron, 2004).

In this study, we focus on the evaluation of assessment methods for an algorithm implementation course particularly the "Data Structures and Data Organization" course taught in the 5th semester of Computer Engineering, Information Systems Engineering and Management Information Systems departments of Cyprus International University (CIU).

The rest of the paper discusses a) a rigorous study and its objective; b) the methods used in the statistical analyses of the rigorous study; c) distribution of data and d) the statistical results along with their discussion. The paper concludes with future work based on the statistical results obtained.

A RIGOROUS STUDY AND ITS OBJECTIVE

A rigorous study was undertaken to measure the correlation between the assessment methods used in measuring students' knowledge in an algorithm implementation course particularly the Data Structure and Data Organization course thought at CIU. The study had two main purposes. Firstly, it was aimed to investigate whether or not the practical exams and theoretical exams were genuinely evaluating students' knowledge at the same level of accuracy in terms of programming and algorithm implementation. Secondly, it was aimed to analyze the correlations between the algorithm development projects and the theoretical exams. As a result of this, it was intended to investigate whether or not the results of the theoretical exams were correlated with the results of the practical exams.

EXPERIMENTAL BACKGROUND

The study is performed using the IBM software package, SPSS, which is used for statistical analysis particularly in social studies. In order to perform the statistical analysis, a total of 100 students' exam/project results were randomly selected from the Computer Engineering, Information Systems Engineering and Management Information Systems Departments at CIU. As the students studied in different semesters, there had been some absence in their results due to a variety of reasons. Hence, only 84 valid responses were gathered in this study. The performances of the students in the theoretical exams were compared with the practical performances of the same students. The identities of the randomly selected students were kept confidential in order to provide an anonymous study.

Table I. Stack implementation questions contained in midterm exams of the semesters observed.

Semester	Stack Implementation Question
Fall 2011 - 2012	**Q1)** Write **a function** that takes **3 stacks**, **p**, **gr** and **ls**, as arguments and updates the values of the two stacks **gr** and **ls** as follows. The stack **gr** contents are the elements of the stack **p greater than or equal to 50** (>=50), and the stack **ls** contents are the elements of the stack **p less than 50** (<50).
Fall 2012 - 2013	**Q1)** Write a **C/C++ function** that performs **search** operation in the stack. If the search key is found, function should **return 1**, else **return 0**. Stack should **preserve** the contents after the search. **Q2)** Write **a C/C++ function** that takes **2 stacks, p and q**, as arguments and derives the contents of **q** according to **p** such that if the element in p is **greater than or equal to 10**, the corresponding element in q should be **1**, otherwise **0**.
Fall 2013 - 2014	**Q1)** Write a **pseudo code** to separate **even** and **odd** numbers and push them to different stacks. **Q2)** Write **a C/C++ function** that takes **2 stacks, p and q**, as arguments and copies the contents of **stack p** to **q.**

As shown in Table 1, exam results were obtained from three different semesters which are 2011-2012, 2012-2013 and 2013-2014 Fall semesters. For each semester, two analyses have been performed. The first test was performed on stack implementation questions that were matched with a practical lab exam that involved a similar type of question (Table II). Consequently, the second test was performed between the midterm exam and the project which was then graded with an oral exam (Table III). The topics of the implementation questions were the stack implementation which is a well-known topic of data structures. Thus, despite being on different semesters, all midterm questions were based on the same subject. The theoretical and practical exams were all graded by pair reviews in order to keep a fair evaluation.

Table II demonstrates the questions asked to students in their practical exams as the result students obtained from these questions were used in the first test (i.e. comparing midterm exam results with practical exam results).

Table III demonstrates the question asked to students in their project. The results students obtained from this project were compared to stack implementation question results listed in Table 1. As shown from below, the project included implementations related to arrays and structures which then were tested with an oral exam. The questions asked to students in the project were matched with the midterm exam and the result students obtained from these were used in the second test.

Table II. Lab Final Exam questions asked to students at the end of the observed semesters.

Semester	Lab Final Question
Fall 2011 - 2012	**Q)** Write the following function to print the content of stack and test with the given stack implementation. **void printstack (struct stack * ps);**
Fall 2012 - 2013	**Q)** Write the following function to find the size of stack and test with the given stack implementation. **int sizestack (struct stack * ps);**
Fall 2013 - 2014	**Q)** Write the following function tocount even numbers of stack and test with the given stack implementation. **int countevenstack (struct stack * ps);**

Table III. Sample project definition.

Sample Project Definition	
Write a complete C or C++ program to implement a phonebook structure. Structure contains id, name, surname and phone number of a person. Your program should have the following menu. Write necessary functions for the menu: 1- To add a person to phonebook 2- To delete a person from phonebook 3- To list data in the phonebook 4- To search for a record 5- To update phoneNo of a record 6- To sort according to ID 7- To quit	struct phone_book { int ID; char name[20]; char surname[20]; char phoneNo[20]; }phone_list[100];

DISTRIBUTION OF DATA

Figure 1 illustrates the distribution of data gathered from the difference of students' knowledge between the practical exam (i.e. lab final exam) and theoretical exam (i.e. stack implementation question). As it can be observed from the figure, the data came from a non-normally distributed population. The histogram has kurtosis issues as the observations are way over the normal distribution curve. Additionally, the histogram is skewed to the right which proves that the distribution of data is asymmetric. As a result, the histogram shows that the data came from a non-normally distributed population.

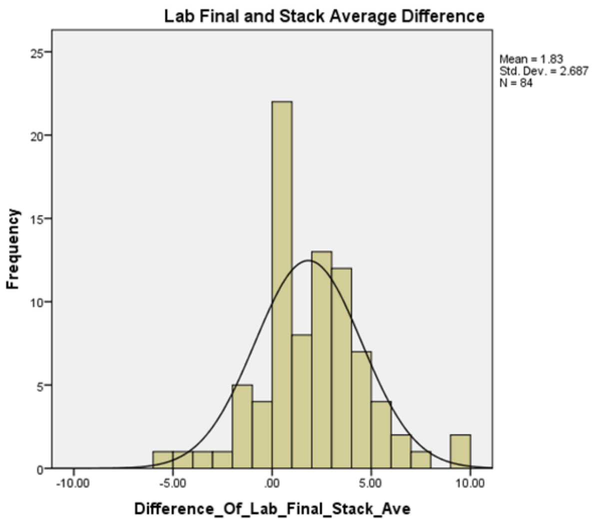

Figure 1. Data histogram showing the distribution.

Despite the fact that a histogram can provide a generic overview regarding the distribution of data, it is not a standalone reliable tool to measure the distribution of data. That is why, a Q-Q plot was generated in order to ensure regarding the distribution of data. As it can be observed from the Figure 2, the observations do not embrace the linear line on the Q-Q plot. The values at both ends are scattered and do not approach to the parallel line. Additionally, very few observations hug the linear line (i.e. the expected normal curve). This shows that the data came from a non-normally distributed population and hence, the result of the Q-Q plot supports the findings of the Histogram.

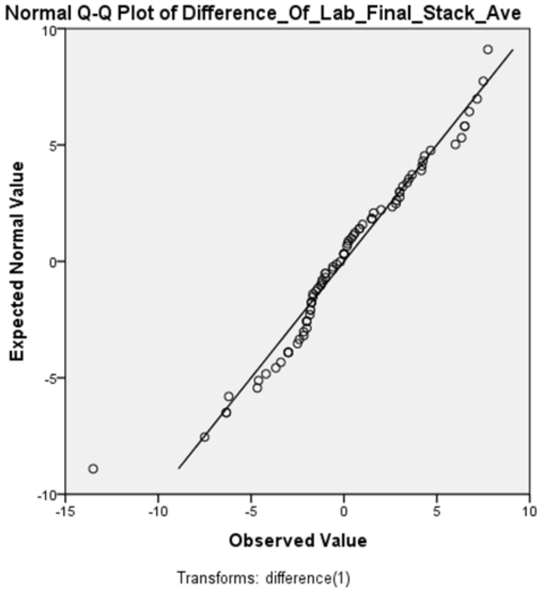

Figure 2. Quantile – Quantile (Q-Q) Plot.

RESULTS AND FINDINGS

As the results show that the data came from a non-normally distributed population, it is required to use the Spearman's rank test in order to investigate the correlations between the student knowledge in test 1 (i.e. stack implementation question and lab final exam) and in test 2 (i.e. the midterm exam and the project implementation).

As shown in Table IV, the Spearman's rank correlation coefficient regarding the first test was found to be significant and moderately strong ($r=0.636$; $p<0.001$). This means that, the students who performed well in the midterm exam for the stack implementation questions also did well in the lab final practical exam. As the correlation is found to be significant, modestly strong and positive, we have strong reasons to believe that the results of the algorithm implementation in the theoretical exams (i.e. midterm exam) are closely related to the results in practical exams (i.e. final exam). In other words, those students who solved stack implementation questions in the midterm exam also solved the same type of questions in the lab final exam.

Table IV. Correlations between stack implementation questions and lab final exams.

			Lab_Final	STACK_Ave
Spearman's rho	Lab_Final	Correlation Coefficient	1.000	**.636****
		Sig. (2-tailed)	.	.000
		N	84	84
	STACK_Ave	Correlation Coefficient	**.636****	1.000
		Sig. (2-tailed)	.000	.
		N	84	84

**. Correlation is significant at the 0.01 level (2-tailed).

Table V shows the Spearman's rank correlation coefficient regarding the second test. As shown from the table, the correlation among the pair was found to be significant and modestly strong ($r=0.535$; $p<0.001$). Although this is not as high as the first tests' coefficient, the correlation between the midterm exam and project is found to be significant, positive and moderately strong. This provides strong reasons to believe that those students who did well in the midterm exam also performed a similar performance in their projects.

Table V. Correlations between midterm exams and projects.

			Midterm	Project
Spearman's rho	Midterm	Correlation Coefficient	1.000	**.535****
		Sig. (2-tailed)	.	.000
		N	84	84
	Project	Correlation Coefficient	**.535****	1.000
		Sig. (2-tailed)	.000	.
		N	84	84

**. Correlation is significant at the 0.01 level (2-tailed).

CONCLUSION

The correlation between students' programming capabilities and their theoretical knowledge were analyzed on a data structure course. The results of the statistical analyses showed that there is a positive, significant and moderately strong correlation among the first test pair (stack implementation questions and lab final exams.) and the second test pair (midterm exam and project). In both cases, the results are similar, and therefore it is possible to conclude that the theoretical and the practical exams are related and assessing the same criteria. In other words, the statistical results provide strong reasons to believe that those students who have a theoretical understanding of algorithm implementation tend to have a good understanding in producing practical solutions through using algorithms. As future work, the finding of this study could be investigated further by conducting the study with a larger sample size. Although the sample size of this study (i.e. 84 valid responses) was enough to generate accurate results, a larger sample size could provide a more realistic and detailed distribution.

DİGİTAL BOŞLUK: KIRSAL ALANLARDA GÖREV YAPAN SINIF ÖĞRETMENLERİNİN BİLGİ İLETİŞİM TEKNOLOJİLERİNİN KULLANIMINA İLİŞKİN GÖRÜŞLERİ

Şengül S. ANAGÜN

Nurhan ATALAY

21. yüzyılda, bilginin kapsamı, bilgiye erişim şekli ve hızı değişmekte, bilgiye erişimde yeni yollar ortaya çıkmakta ve bilgi ve iletişim teknolojileri (BİT) ilerlemektedir. BİT'lerin ilerlemesi doğrultusunda eğitim politikaları da değişmektedir. Dolayısıyla BİTlerin eğitimle bütünleştirilmesi, öğretmenler tarafından öğretme-öğrenme sürecinin her aşamasında etkili bir biçimde kullanılması, eğitim araç-gereçlerinin BİT'lerdeki gelişmelere paralel olarak yenilenmesi önemlidir. Böylece toplumdaki tüm bireylerin, BİT'leri kullanarak istediği bilgiye, bilgi yığınları arasından seçmeleri, daha kolay ve daha hızlı ulaşabilmeleri ve ulaştıkları bilgiyi günlük yaşamlarında kullanabilmeleri sağlanmış olur. Bireylerin BİT becerileri ile donanık olarak yetiştirilmesinde ister şehir ister kırsal alanda görev yapsın öğretmenlerin rolü büyüktür. Özellikle de kırsal alanda görev yapan öğretmenlerin öğrenme-öğretme sürecinde BİT'leri kullanması, öğrencilerinin BİT ile karşılaşmalarını ve kullanma becerilerine sahip olmalarını sağlaması toplumdaki digital boşluğun giderilmesi açısından önemlidir. Bilgi ve iletişim alanındaki olanaklar, kaynaklar ve erişim dağılımındaki eşitsizliği ifade eden digital boşluğun giderilmesinde kırsal alanlarda görev yapan sınıf öğretmenlerin rolü büyüktür. Bu bağlamda kırsal alanda görev yapan sınıf öğretmenlerin bilgi ve iletişim teknolojilerini sınıflarında kullanması ile ilgili deneyimlerinin, görüşlerinin ve yaşadıkları sıkıntılarının belirlenmesi, BİT'lerin öğretme-öğrenme sürecinde daha işlevsel olarak kullanılması ile ilgili olarak paydaşlara bilgi vermesi açısından önemlidir. Dolayısıyla bu çalışmanın amacı da kırsal alanlarda görev yapan sınıf öğretmenlerinin, BİT'leri bir öğretim aracı olarak kullanımı ile ilgili görüşlerini ve karşılaştıkları sorunlarının ortaya çıkarılmasıdır. Araştırmada, fenomenoloji yaklaşımından yararlanılmıştır. Fenomenoloji, katılımcıların deneyimlerini nasıl anlamlandırdıkları ve yorumladıklarını, yine katılımcıların algı ve açıklamalarına dayalı olarak, anlamaya çalışan nitel bir araştırma yaklaşımıdır. Araştırmanın katılımcıları amaçlı örnekleme türlerinden ölçüt örnekleme ile seçilmiştir. Araştırmaya kırsal alanda görev yapan 11 sınıf öğretmeni katılmıştır. Araştırmanın verileri, yarı yapılandırılmış görüşmeler ile toplanmıştır. Araştırmanın bulgularına göre kırsal alanda görev yapan sınıf öğretmenlerinin BİT'leri kullanımlarının, yeterli olmadığı sonucuna ulaşılmıştır.

ÖZET: Bu araştırmanın temel amacı, lise öğrencilerinin "Akıllı Tahta" kavramına ilişkin sahip oldukları algıların, metaforlar aracılığı ile ortaya çıkarılmasıdır. Araştırmada nitel araştırma desenlerinden birisi olan olgubilim deseni kullanılmıştır. Araştırmanın çalışma grubunu bir Anadolu Ticaret lisesinin Bilişim Teknolojileri bölümünün 9, 10, 11 ve 12. sınıflarında öğrenim gören toplam 162 öğrenci oluşturmaktadır. Araştırma verilerin toplanabilmesi için çalışma grubundaki her öğrenciye "Akıllı Tahta ... gibidir; çünkü ... " cümlesi yöneltilmiş ve boşlukların doldurulması istenmiştir. Verilerin analizinde içerik analizi tekniğinden yararlanılarak öğrenciler tarafından oluşturulan metaforların ortak özelliklerine göre gruplandırılması amaçlanmıştır. Toplanan verilerin analizi sonucunda katılımcıların 41 geçerli metafor ürettiği ortaya çıkmıştır. Bu metaforlar özellikleri bakımından 6 kavramsal kategori altında toplanmıştır. Sonuç olarak, öğrencilerin "Akıllı Tahta" hakkında oldukça olumlu kavramlara sahip oldukları ortaya çıkmıştır. Bunun yanında bazı öğrencilerin ise "Akıllı Tahta"yı gereksiz bir araç olarak algıladıkları görülmüştür.

Anahtar sözcükler: FATİH Projesi, Akıllı tahta, Metafor, Akıllı tahta algısı.

ABSTRACT: The main purpose of this study is to reveal the perception that high school students' have on the concept "Smart Board". In this research phenomenology which is one of a qualitative research, is used. The study constitutes totally 162 students in an Anatolian Trade High School of Information Technology classes. In order to collect research data, the question " Smart Board is like ………, because …………..'' is asked to he studens in the groupand want them to fill in the gaps. We aimed to have groups according to common characteristics of metaphors by using the technique of content analysis to analyze the data. As a result of the analysis of the data collected, it has emerged that the participants have produced 41 current metaphors. These metaphors are grouped as six conceptual categories in terms of their features. As a result,we have emerged that studentst have quite positive concepts about smart boards, besides some students' thoughts as an unnecessary tool fort hem.

Key words: FATIH Project, Smart board, Metaphors, Perception of smart board

GİRİŞ

Bilim ve teknolojinin hızla geliştiği günümüzde eğitim sisteminin en önemli görevi, bilgi çağına ayak uydurabilen nitelikli bireyler yetiştirmektir. Bu amacı gerçekleştirmenin bir yolu da, teknolojinin eğitimle bütünleşmesidir (Ayvacı, Nas, Şenel, & Nas, 2007). Teknoloji, yapıcı öğretim uygulamalarını başarıyla sonuçlandırmak için kullanılan bir araçtır. Araç olarak kullanılan teknolojiler daha anlamlı düşünmeyi sağlar (Jonassen, 1994).

Çağımızın teknolojik gelişmeleri sayesinde, eğitim uygulamalarına yeni imkânlar sağlanarak, kullanılan ortam ve yöntemler zenginleştirilmektedir (Koşar & Çiğdem, 2003). Eğitim hizmetlerini daha geniş kitlelere daha kaliteli biçimde götürebilmek için çağdaş eğitim teknolojisinin tüm olanaklarından etkili bir biçimde yararlanmak gerekmektedir. Bu olanaklardan yararlanmak suretiyle öğrenme-öğretme ortamını iyileştirmek, eğitimin kalitesini yükseltmek ve eğitim hizmetlerinin kapsamını genişletmek mümkündür (Yüksel, 2003). Günümüzdeki öğrenme ortamları; geçmiştekinden farklı olarak teknolojinin eğitim ortamına entegre edilmesiyle zenginleştirilme, öğrenmeyi ve anlamayı hem kolaylaştırıcı hem de zevkli hale dönüştüren bir şekle bürünme yolundadır. Yeni teknolojik gelişmeler ışığında öğrenme ortamlarının tasarımında teknolojinin etkili bir şekilde kullanılması gerekmekte; bu nedenle teknoloji, gelecekteki eğitim ortamlarının vazgeçilmez bir parçası olarak görülmektedir (Baki, Kösa, & Berigel, 2007). Teknolojinin eğitimde kullanılması öğrenciyi öğrenme ortamında etkin kılarak öğrenme ve öğretmenin niteliğini arttırırken öğrenci ve öğretmenlerin hedefe ulaşmak için harcadıkları zamanı ve eğitimin maliyetini düşürmektedir (Akkoyunlu, 1998).

Doğan (2000)'a göre genç ve yetişkin öğrenci sayısındaki artışla birlikte eğitim hizmeti bekleyen bireylerin ilgi ve isteklerindeki çeşitlilik, eğitim kurumlarını yeni teknolojileri kullanmaya daha çok yönelmektedir. Bu amaçla Milli Eğitim Bakanlığı başta olmak üzere tüm eğitim kurumları sürekli teknolojiye yatırım yapmaktadır. Gelinen noktada Milli Eğitim Bakanlığı ve Ulaştırma Bakanlığı'nın işbirliği ile yürütülen Fırsatları Artırma ve Teknolojiyi İyileştirme Hareketi (FATİH) Projesi olarak adlandırılan projenin adımlarından biri de bütün dersliklerin geliştirilmiş akıllı tahta seçenekleri ile donatılmasıdır (MEB, 2013). Bu çapta yapılan büyük bir yatırımın öğrenci ve öğretmen üzerinden değerlendirilmesi, bir çıktı olarak akademik alana kazandırılması planlama sürecini etkilemesi açısından önemlidir. Ayrıca öğrencilerin derse yönelik tutum ve motivasyonları üzerindeki etkilerin ortaya konması da ayrı bir önem taşımaktadır. Akıllı tahta kullanıma yönelik öğrencilerden alınacak dönüt ve önerilerin de alana katkı sağlayacağı düşünülmektedir.

Sünkür, Şanlı ve Arabacı (2011) yaptıkları bir çalışmada öğrencilerin akıllı tahta kullanmaktan, akıllı tahtayla öğrenmekten, akıllı tahta üzerinden işlenen derslerden daha çok keyif aldıkları, akıllı tahta kullanıldığında derse daha iyi odaklandıkları, öğrenebildikleri ve akıllı tahta ile öğrenmenin daha kısa zaman aldığını düşündükleri sonucuna ulaşılmışlardır. Bu nedenle uygulayıcılar olarak öğretmenlerin teknik, teknolojik ve pedagojik destek ve eğitim almasının sağlanması, öğrencilerin de akıllı tahta uygulamaları konusunda eğitilmelerinin sağlanması önerilmiştir (Sünkür, Şanlı, & Arabacı, 2011).

Yeni nesil akıllı tahtalarda tahta yüzeyi, elektronik gözlerle taranmakta ve elin tahtaya her dokunuşu hassas bir şekilde algılanmaktadır. Bu sayede âdete bir tablet gibi ya da dokunmatik bir bilgisayar gibi çalışmaktadır. Tahta ekranının interaktif olması, öğrenciye ve öğretmene ekranda yapılanlara müdahale etme şansını vermekte böylece ders esnasında değişikliklere olanak sağlamakta ve bu değişiklikleri kaydedebilme özelliği tanımaktadır. Ses klipleri, animasyonlar ve öğrenme nesneleri gibi çok çeşitli materyallerin kullanılmasına imkân tanımasıyla da ders çok daha anlaşılır hale gelmektedir (Erduran & Tataroğlu, 2009). Akıllı tahtanın bir özelliği de sınıf etkileşimin sağlamak için tasarımlanmış önemli bir eğitimsel bilgi ve iletişim aracı olmasıdır (Gillen, Staarman, Littleton, Mercer, & Twiner, 2007). Farklı derslerde yapılan birçok çalışma, derslerde akıllı tahta kullanımın öğrencilerin akademik başarılarını arttırdığını göstermektedir (Kaya & Aydın, 2011; Ateş, 2010; Delaney, 2007; Tate, 2003; Beeland, 2002).

FATİH Projesi kapsamında okullara kurulan akıllı tahtalar ile ilgili öğrenci algılarının metaforlar aracılığıyla belirlenmeye çalışıldığı bu çalışmada metaforların kullanılmasındaki temel amaç; öğrencilerin akıllı tahta ile ilgili zihinsel imgelerini ortaya çıkarmak ve öğrencilerin akıllı tahtaya bakış açılarını daha iyi anlamaya çalışmaktır. Metafor, bireye iki olay, olgu, konu ya da kavram arasında karşılaştırma yapmayı ve bunlar arasındaki benzerlikleri mecazlı bir anlatımla sunmayı sağlar. Böylece iki şey ile ilgili benzerliklere dikkat çeker ya da birini diğerinin yerine geçirerek açıklama olanağı sunar (Coşkun, 2010). Arslan ve Bayrakçı (2006)'ya göre metafor kullanımı, yaratıcı düşünme ve problem çözme becerilerinin gelişmesi için beyinde yer alan sağ ve sol beyin fonksiyonlarının dengeli olarak kullanılması sağlamaktadır. Metafor, bir bireyin yüksek düzeyde soyut, karmaşık veya kuramsal bir olguyu anlamada ve açıklamada kullanabileceği güçlü bir zihinsel araçtır (Saban, Koçbeker, & Saban, 2006). Metaforlar, bireylerin kendi dünyalarını çözümlemelerine ve oluşturmalarına yönelik güçlü bir zihinsel modelleme mekanizmasıdır ve genellikle gerçek ve yaşantının, kişide nasıl yorumlandığının anlaşılması için kullanılmaktadır (Arslan & Bayrakçı, 2006). Bu araştırmada, FATİH Projesi kapsamında okullarda kullanılmaya başlanan akıllı tahtanın lise öğrencileri için ne anlam ifade ettiği, metafor analizi yöntemi ile belirlenmeye çalışılmıştır.

YÖNTEM

Bu çalışmada nitel araştırma desenlerinden biri olan olgubilim (fenomenoloji/ phenomenology) araştırma deseni kullanılmıştır. Olgubilim deseni farkında olunan, ancak derinlemesine ve ayrıntılı bir anlayışa sahip olunmayan olgulara odaklanmaktadır (Yıldırım & Şimşek, 2006). Olgubilim çalışmalarında genellikle bir olguya ilişkin bireysel algıların ortaya çıkarılması ve yorumlanması amaçlanmaktadır Bu çalışmada da lise öğrencilerinin akıllı tahta ile ilgili belirtmiş oldukları algıları incelenmiştir.

Katılımcılar

Bu araştırmaya bir Anadolu Ticaret Meslek lisesinin Bilişim Teknolojileri bölümünde öğrenim görmekte olan 162 öğrenci katılmıştır. Araştırmaya katılan öğrencilerin cinsiyet ve sınıflarına göre dağılımı Tablo 1'de gösterilmiştir.

Tablo 1. Katılımcıların Cinsiyet ve Sınıflarına Göre Yüzde ve Frekans Dağılımları

Değişken	Seçenek	f	%
Cinsiyet	Kız	74	45.7
	Erkek	88	54.3
Sınıf	9	57	35.2
	10	58	35.8
	11	22	13.6
	12	25	15.4
	Toplam	162	100

Tablo 1'e göre, araştırmaya katılan öğrencilerin 74'ü kız, 88'i ise erkektir. Ayrıca öğrencilerin 57'si 9. Sınıf, 58'i 10. Sınıf, 22'si 11. Sınıf ve 25'i 12. Sınıf öğrencisidir.

Verilerin Toplanması

Araştırmaya katılan lise öğrencilerinin "Akıllı Tahta" kavramına yönelik algılarını belirlemek için, öğrencilerin her birinden "Akıllı Tahta … gibidir çünkü …" cümlesini tamamlamaları istenmiştir. Başlangıçta öğrencilere metaforla ilgili gerekli açıklamalar yapılmıştır. Öğrencilerden özellikle akıllı tahtayı bir şekilde tanımlamak zorunda oldukları birkaç defa vurgulanmış ve yaptıkları tanımların sebepleriyle birlikte açıklama yapmaları gerektiği belirtilmiştir. Bunun için öğrencilere, sayfanın en üstünde ne yapmaları gerektiği ile ilgili bir açıklamanın ve "Akıllı tahta … gibidir; çünkü ..." ifadesinin yazılı olduğu boş bir kağıt verilmiştir. Açıklama kısmında öğrencilerden sadece tek bir metafor üzerinde yoğunlaşarak, düşüncelerini yazmaları istenmiştir. Saban (2009), metaforların bir araştırma aracı olarak kullanıldığı çalışmalarda "gibi" sözcüğünün genellikle "zihinsel imgenin konusu" ile "zihinsel imgenin kaynağı" arasındaki bağı daha açık bir şekilde çağrıştırmak için kullanıldığını, "çünkü" sözcüğünün ise öğrencilerin kendi metaforlarına "gerekçe" (veya "mantıksal dayanak") sunmalarını sağlamaya yardımcı olsun diye yerleştirildiğini belirtmektedir. Metaforları oluşturmak için öğrencilere 20 dakika verilmiştir. Amaç, öğrencilerin metaforlarla ilgili ilk düşüncelerinden faydalanmak olduğu için bu verilen sürenin yeterli olduğu düşünülmüştür. Öğrencilerin "Akıllı Tahta" kavramıyla ilgili yazmış olduğu yazılar bu araştırmanın temel veri kaynağını oluşturmuştur. "Akıllı Tahta…gibidir" ifadesiyle öğrencinin akıllı tahtayı neye benzettiğini belirleyerek kavramı nasıl algıladığı ve "çünkü…" kısmı ile de algısını nasıl ifade ettiği ortaya konulmuştur.

Verilerin Analizi

Verilerin çözümlenmesinde içerik analizi tekniği kullanılmıştır. Yıldırım ve Şimşek (2006), içerik analizinin temel amacının toplanan verileri açıklayabilecek kavramalara ve ilişkilere ulaşmak olduğunu, betimsel analizde özetlenen ve yorumlanan verilerin içerik analiziyle daha derin bir işleme tabi tutulduğunu ve betimsel yaklaşımla fark edilemeyen kavram ve temaların bu analiz sonucu elde edildiğini belirtmiştir. İçerik analizinin temelindeki işlem birbirine benzeyen verileri belirli kavramlar ve temalar çerçevesinde bir araya getirmek ve bunları okuyucunun anlayabileceği bir şekilde organize ederek yorumlamaktır (Yıldırım & Şimşek, 2006).

Analiz ve metaforların araştırmacılar tarafından anlaşılma süreci şu aşamaları içermektedir: İlk olarak öğrencilerin ürettiği metaforlar alfabetik sıraya göre geçici olarak sıralanmıştır. Sıralama esnasında öğrencilerin metaforu açıkça belirtip belirtmediklerine bakılmıştır. Ayrıca boş bırakılan ve herhangi bir metafor içermeyen kağıtlar elenmiştir. Bazı öğrencilerin metafor belirtmek yerine akıllı tahta ile ilgili düşüncelerini paylaştıkları, bazılarının ise metafor belirtseler bile geçerli bir mantıksal dayanak sunmadıkları görülmüştür. Bütün bunlara bağlı olarak 42 kağıt elenerek kalan 120 kağıt değerlendirmeye alınmıştır.

İkinci olarak öğrenciler tarafından üretilen geçerli metaforlar tekrar gözden geçirilerek alfabetik sıraya göre dizilmiş ve daha sonra her bir metaforu temsil edecek örnek metafor ifadeleri seçilmiştir. Bunun amacı metaforların kategorilere ayrılmasına yardımcı olmak ve verilerin yorumlanmasını sağlamaktır. Örnek metaforlar belirlendikten sonra geçerli metaforlar benzerliklerine göre gruplandırılmıştır. Kategoriler, akıllı tahta algısının özellikleri bakımından gruplandırılan metaforlara göre geliştirilmiş ve 120 öğrenci tarafından üretilen metaforlar 6 gruba ayrılmıştır.

Üçüncü olarak araştırmanın geçerliği ve güvenirliği saptanmıştır. Araştırma sonuçlarının geçerliğini garanti etmek için geçerlik ve güvenirlik iki önemli kriterdir. İyi bir araştırmada bilginin ayrıntılı raporu ve araştırmacıların verilen sonuçlara nasıl ulaştığı geçerlik için önemli bir kriterdir (Yıldırım & Şimsek, 2006). Bu araştırmanın geçerliğini saptamak için bilgiyi toplama ve analiz etme süreci ayrıntılı bir şekilde açıklanmıştır. Dahası bu araştırmadan elde edilen bilgiler öğrencilerin yazılı ifadeleriyle desteklenmiştir. Araştırmanın güvenirliğini sağlamak için elde edilen bilgiler, bu çalışmanın araştırmacıları tarafından analiz edilmiştir. Sonra araştırmacılar analizlerini karşılaştırmak için toplanmışlardır. Aynı zamanda araştırmada oluşturulan kategorilerde yer alan metaforların ilgili kategoriyi temsil edip etmediğini görmek için farklı bir uzman tarafından da analiz edilmiştir. Bu bağlamda öğrenciler tarafından üretilen metaforlar ve araştırmacılar tarafından geliştirilen kategoriler liste olarak uzmana verilmiştir. Uzmandan metaforları ilgili kategoriye yazması istenmiş, daha sonra da uzmanın ve araştırmacıların gruplandırmaları karşılaştırılmıştır. Karşılaştırmadan elde edilen fikir birliği ve ayrılıklarının sayısına göre araştırmanın güvenirliğine karar verilmiştir. Güvenirlik, Miles ve Hubarman (1994)'ın formülüne göre hesaplanmıştır. Güvenirlik = Aynı karar sayısı/(Aynı ve farklı kararların toplamı) bu hesaplama sonucunda araştırmanın güvenirliği %92 olarak bulunmuştur. Nitel çalışmalarda uzman ve araştırmacı değerlendirmeleri arasındaki uyumun %90 ve üzeri olduğu durumlarda arzu edilen düzeyde bir güvenilirlik sağlanmış olmaktadır (Akt: Saban, 2009). Bu araştırmanın güvenilirlik çalışması kapsamında görüşüne başvurulan uzman 4 metaforu [cam(3), tiyatro(1), bilgisayar(5), Salıpazarı(1)] araştırmacılarınkinden farklı bir kategoriye yerleştirerek ilişkilendirmiştir. Bu durumda, güvenilirlik = 110 / (110+10) = 0.92 olarak hesaplanmıştır. Bu araştırmanın güvenilirlik çalışmasında %0.92 oranında bir güvenilirlik sağlanmıştır.

Sonuç olarak toplam 41 metafor ve içeriklerine göre 6 kategorinin geliştirilmesinden sonra metaforlar ve tüm bilgi SPSS istatistik programına aktarılmıştır. Bu işlemden sonra 41 metafor ve 6 kategoriyi temsil eden katılımcıların sayısı (f) ve yüzdeleri (%) hesaplanmıştır.

BULGULAR

Bu araştırmaya katılan öğrenciler "Akıllı Tahta" kavramı hakkında 41 geçerli metafor üretmişlerdir. Toplam metafor frekansının büyük çoğunlunu oluşturan "öğretmen" metaforunu üreten 30 öğrenci bulunmaktadır. Ayrıca metaforların 23'ü sadece bir öğrenci tarafından üretilmiştir. Geriye kalan 18 metaforu üreten öğrenci sayısı 2 ile 30 arasında değişmiştir. Öğrenciler tarafından üretilen metaforlar genel olarak 6 gruba ayrılmıştır. Bunlar;

1. Öğretici ve yol gösterici bir araç olarak Akıllı Tahta,
2. Öğrenmeye yardımcı bir araç olarak Akıllı Tahta,
3. Bilgi kaynağı olarak Akıllı Tahta,
4. Mutluluk kaynağı olarak Akıllı Tahta,
5. Eğlence kaynağı olarak Akıllı Tahta,
6. Gereksiz bir araç olarak Akıllı Tahta (Tablo 2).

Tablo 2. "Akıllı Tahta" kavramı ile ilgili öğrenciler tarafından oluşturulan metafor kategorileri

Kategoriler		Metafor (Frekans)	Metafor Sayısı	Toplam Metafor Sayısı	%
1	Öğretici ve yol gösterici bir araç olarak Akıllı Tahta	Öğretmen (30), Anahtar(1), Tekerlek(1), Robot(1)	4	33	27.5
2	Öğrenmeye yardımcı bir araç olarak Akıllı Tahta	Arkadaş(9), Yazı tahtası(4), Cam(3), Tablet(3), Annem(2), Kalem(1), El(1), Uçak(1), Projeksiyon(1), Tiyatro(1)	10	26	21.7

3	Bilgi kaynağı olarak Akıllı Tahta	Kitap(12), Bilgisayar(5), Bilim adamı(2), Kütüphane(2), Ansiklopedi(1), Altın kaynak(1), Babam(1), Akıl küpü(1), İnternet(1), Süpermarket(1), Bilgi kutusu(1)	11	28	23.3
4	Mutluluk kaynağı olarak Akıllı Tahta	Çikolata(4), Şeker(2), Meyve(1),	3	7	5.8
5	Eğlence kaynağı olarak Akıllı Tahta	Sinema(6), Oyun(3), Televizyon(2), Mp3(2), Öğle arası(1), Teneffüs(1), Tivibu(1)	7	16	13.3
6	Gereksiz bir araç olarak Akıllı Tahta	Erkekler(4), Gereksiz(2), Zaman kaybı(1), Arsız bela(1), Hurda(1), Salı pazarı(1),	6	10	8.4
		Toplam	41	120	100

Kategori 1. Öğretici ve yol gösterici bir araç olarak Akıllı Tahta

Bu kategoride 4 metafor toplam 33 öğrenci tarafından üretilmiştir (Tablo 2). Bu kategorideki metaforlar öğretmen(30), anahtar(1), tekerlek(1) ve robot(1)'tur. Bu kategoride üretilen metaforlardan önemli bir çoğunluğunu 30 öğrenci tarafından üretilen "öğretmen" metaforu oluşturmaktadır. Bu metaforları üreten öğrenciler akıllı tahtayı öğretici ve yol gösterici bir araç olarak görmektedir. Onlara göre akıllı tahta dersleri öğreten bir öğretmen gibi onlara dersleri aktaran ve bilgiye ulaşmalarına rehberlik eden yol gösterici bir araçtır. Bu kategoriyle ilgili metaforların bazıları ve geliştirilme nedenleri öğrenciler tarafından şu şekilde belirtilmiştir:

"Akıllı tahta öğretmen gibidir; çünkü akıllı tahtada da konu anlatımı olur ve biz konuları öğretmenden öğrendiğimiz gibi akıllı tahtadan öğreniriz." (Öğrenci 67)
"Akıllı tahta öğretmen gibidir; çünkü akıllı tahtada farklı uygulamalar ve eklentiler bulunur, içindeki bu eklentiler ders anlamamızı kolaylaştırdığı gibi konuyu pekiştirmek ve çeşitli etkinlikler yapmamıza da yardımcı olur. (Öğrenci 114)
"Akıllı tahta öğretmen gibidir; çünkü akıllı tahta öğretmen gibi bize derslere ait çoğu bilgiyi verir." (Öğrenci 25)
"Akıllı tahta öğretmen gibidir; çünkü bütün bilgileri öğrenmemizde kolaylık sağlayan bir aracıdır." (Öğrenci 66)
"Akıllı tahta öğretmen gibidir; çünkü bize bilgi verir, içerisindeki ders modüllerinden bilgi alırız." (Öğrenci 69)
"Akıllı tahta öğretmen gibidir; çünkü öğretmenden öğrendiğimiz her şeyi akıllı tahtadan da öğrenebiliriz." (Öğrenci 83)
"Akıllı tahta öğretmen gibidir; çünkü ne zaman bilgiye ulaşmak istersem bana yardımcı olur." (Öğrenci 88)
"Akıllı tahta öğretmen gibidir; çünkü bize bütün derslerimize nasıl çalışmamız gerektiğini öğretiyor." (Öğrenci 110)
"Akıllı tahta öğretmen gibidir; çünkü öğretmenimizin bizi aydınlattığı gibi bizi aydınlatır ve bize yardımcı olur." (Öğrenci 111)
"Akıllı tahta anahtar gibidir; çünkü anahtarın kapıyı açması gibi akıllı tahtada bilgiye giden kapıyı açar." (Öğrenci 52)"
"Akıllı tahta tekerlek gibidir; çünkü arabalar tekerlek olmadan yürüyemez hareket edemez, okuldaki derslerde akıllı tahtasız ilerlemiyor." (Öğrenci 80)
"Akıllı tahta robot gibidir; çünkü hem öğretir hem kızmaz." (Öğrenci 132)

Kategori 2. Öğrenmeye yardımcı bir araç olarak Akıllı Tahta

Bu kategoride 10 metafor 26 öğrenci tarafından üretilmiştir (Tablo 2). Bu kategorideki metaforlar arkadaş(9), yazı tahtası(4), cam(3), tablet(3), annem(2), kalem(1), el(1), uçak(1), projeksiyon(1) ve tiyatro(1)'dur. Bu metaforları üreten öğrenciler Akıllı Tahta kavramını öğrenmeye yardımcı bir araç olarak görmektedirler. Bu kategoriye ait metaforların bazıları ve geliştirilme sebepleri öğrenciler tarafından şu şekilde belirtilmiştir:

"Akıllı tahta arkadaş gibidir; çünkü derslerimizi yapmamızda yardımcı olur. Nasıl arkadaşımdan bilgi öğrenirsem akıllı tahtadan da bilgi öğrenirim." (Öğrenci 39)
"Akıllı tahta arkadaş gibidir; çünkü onunla ilgilenmek derslerde iyi gelir. Bilmediğin şeyleri sana öğretebilir." (Öğrenci 117)
"Akıllı tahta yazı tahtası gibidir; çünkü dersi kolay işlememize yardımcı olur." (Öğrenci 81)

"Akıllı tahta cam gibidir; çünkü her şeyi gösterir ve bizlere öğretir." (Öğrenci 24)
"Akıllı tahta tablet gibidir; çünkü hem dokunmatik hem bilgisayar gibi hem de tablete çok benziyor. Tablet bilgisayarımda çalıştığım tüm ders modüllerini akıllı tahtada da kullanabiliyorum." (Öğrenci 146).
"Akıllı tahta annem gibidir; çünkü anne gibi her konuda bana yardımcı olur." (Öğrenci 32)
"Akıllı tahta kalem gibidir; çünkü istediğim her şeyi çok kolay yazarım. (Öğrenci 30)"
"Akıllı tahta el gibidir; çünkü her şeyi elimizle dokunarak bulabildiğimiz gibi akıllı tahtaya da dokunarak her şeyi bulabiliriz." (Öğrenci 12)
"Akıllı tahta uçak gibidir; çünkü ulaşmak istediğimiz yere uçakla çok hızlı ve kolay bir şekilde ulaştığımız gibi akıllı tahtayla da bilgilere hızlı ve kolay bir şekilde ulaşabiliriz." (Öğrenci 53)
"Akıllı tahta projeksiyon gibidir; çünkü bize kitaplardaki bilgileri yansıtarak, görüntüleyerek öğrenmemize yardımcı olur." (Öğrenci 36)
"Akıllı tahta tiyatro gibidir; çünkü var olan gerçeği bize görsel olarak sunar." (Öğrenci 124)

Kategori 3. Bilgi kaynağı olarak Akıllı Tahta

Bu kategoride 11 metafor 28 öğrenci tarafından sunulmuştur (Tablo 2). Bu kategorideki metaforlar kitap(12), bilgisayar(5), bilim adamı(2), kütüphane(2), ansiklopedi(1), altın kaynak(1), babam(1), akıl küpü(1), internet(1), süpermarket(1) ve bilgi kutusu(1)'dur. Bu metaforları üreten öğrenciler akıllı tahtayı her zaman faydalanabilecekleri bir bilgi kaynağı olarak görmektedirler. Bu kategoriyle ilgili metaforların bazıları ve geliştirilme nedenleri öğrenciler tarafından şu şekilde belirtilmiştir:

"Akıllı tahta kitap gibidir; çünkü birçok bilgi içerir ve öğrencileri bilgilendirir." (Öğrenci 31)
"Akıllı tahta kitap gibidir; çünkü istediğim her türlü bilgiye akıllı tahtadan kolayca ulaşabiliyorum." (Öğrenci 87)
"Akıllı tahta kitap gibidir; çünkü bilgileri saklar ve ulaşmak istediğimizde bize sunar." (Öğrenci 96)
"Akıllı tahta bilgisayar gibidir çünkü aradığımız her türlü bilgi bilgisayarda olduğu gibi aradığımız her şey akıllı tahtada da vardır." (Öğrenci 78)"
"Akıllı tahta bilim adamı gibidir; çünkü bilim adamlarının çoğu bilgiye sahip olduğu gibi akıllı tahtada da birçok bilgi var." (Öğrenci 51)
"Akıllı tahta kütüphane gibidir; çünkü kütüphanede nasıl binlerce kitap arasından istediğimiz bilgilere ulaşıyorsak akıllı tahta da bilgilere daha kızlı ve çabuk bir şekilde ulaşmamızı sağlıyor." (Öğrenci 113)
"Akıllı tahta ansiklopedi gibidir; çünkü ne zaman bir şeyi araştırmak istersek ansiklopediye bakarız. Akıllı tahtada da bir ansiklopedi gibi ihtiyacımız olan her şeye bakarız." (Öğrenci 140)
"Akıllı tahta altın kaynak gibidir; çünkü tüm yararlı bilgiler ondadır." (Öğrenci 161)
"Akıllı tahta akıl küpü gibidir; çünkü bilgileriyle bizi bilgilendirir." (Öğrenci 9)
"Akıllı tahta internet gibidir; çünkü onun sayesinde bilgileri daha sistemli ve kolay bir şekilde buluruz." (Öğrenci 62)
"Akıllı tahta süpermarket gibidir; çünkü ihtiyacımız olan bütün ders notlarını akıllı tahtadan bulabiliriz." (Öğrenci 86)
"Akıllı tahta bilgi kutusu gibidir; çünkü öğrenciler için ders açısından gerekli olan bütün bilgiler kolay ve rahat bir biçimde bu kutunun açılmasıyla elde edilebilir." (Öğrenci 149)

Kategori 4. Mutluluk kaynağı olarak Akıllı Tahta

Bu kategoride 3 metafor 7 öğrenci tarafından üretilmiştir (Tablo 2). Bu kategorideki metaforlar çikolata(4), şeker(2) ve meyve(1)'dir. Öğrencilere göre derslerde akıllı tahta kullanmak dersi daha iyi anlamalarına ve bundan dolayı da mutluluk duymalarına sebep olmaktadır. Bu kategoriyle ilgili metaforların bazıları ve geliştirilme nedenleri öğrenciler tarafından şu şekilde belirtilmiştir:

"Akıllı tahta çikolata gibidir; çünkü çikolata yerken mutlu olduğum gibi onu kullanırken de mutlu olurum." (Öğrenci 49)
"Akıllı tahta çikolata gibidir; çünkü çikolatanın mutluluk verdiği gibi akıllı tahta da mutluluk verir." (Öğrenci 119)
"Akıllı tahta şeker gibidir; çünkü şeker yediğim zaman kendimi enerjik ve mutlu hissettiğim gibi akıllı tahta kullandığımda da kendimi derslerde enerjik ve mutlu hissederim." (Öğrenci 2)

"Akıllı tahta meyve gibidir; çünkü meyve yerken hem zevk alırım hem de vitamininden faydalanırım. Akıllı tahtayla ders işlerken dersi daha iyi anlıyorum ve dersi daha iyi anladığım için de mutlu oluyorum." (Öğrenci 124)

Kategori 5. Eğlence kaynağı olarak Akıllı Tahta

Bu kategoride 7 metafor 16 öğrenci tarafından sunulmuştur (Tablo 2). Bu kategoride üretilen metaforlar sinema(6), oyun(3), televizyon(2), mp3(2), öğle arası(1), teneffüs(1) ve tivibu(1)'dur. Bu kategorideki metaforları üreten öğrenciler akıllı tahtayı hoşça vakit geçirebilecekleri bir eğlence kaynağı olarak görmektedirler. Bu kategoriyle ilgili metaforların bazıları ve geliştirilme nedenleri öğrenciler tarafından şu şekilde belirtilmiştir:

"Akıllı tahta sinema gibidir; çünkü ekranı çok büyük olduğu için ders olmadığı zaman akıllı tahtada film izlemek çok zevkli oluyor." (Öğrenci 154)
"Akıllı tahta sinema gibidir; çünkü bütün sınıf 3 saat boyunca hiç ses çıkarmadan zevkle film izleyebiliyoruz." (Öğrenci 123)
"Akıllı tahta oyun gibidir; çünkü akıllı tahta sayesinde arkadaşlarımla karşılıklı birçok oyunu oynayıp eğleniyoruz." (Öğrenci 57)
"Akıllı tahta televizyon gibidir; çünkü akıllı tahta ile film izleyebiliyoruz." (Öğrenci 44)
"Akıllı tahta mp3 gibidir çünkü akıllı tahtada arkadaşlarımla hep müzik dinleyip eğleniyoruz." (Öğrenci 95)
"Akıllı tahta öğle arası gibidir; çünkü öğle arasında akıllı tahtada film izleyip, müzik dinlediğimiz için eğleniyoruz." (Öğrenci 136)
"Akıllı tahta teneffüs gibidir; çünkü teneffüslerde akıllı tahtada hep oyun oynuyoruz." (Öğrenci 137)
"Akıllı tahta tivibu gibidir; çünkü akıllı tahtadan bütün filmleri izleyip eğleniyoruz." (Öğrenci 160)

Kategori 6. Gereksiz bir araç olarak Akıllı Tahta

Bu kategoride 6 metafor 10 öğrenci tarafından sunulmuştur (Tablo 2). Bu kategorideki metaforlar erkekler(4), gereksiz(2), zaman kaybı(1), arsız bela(1), hurda(1), Salıpazarı(1)'dır. Bu metaforları üreten öğrenciler akıllı tahtanın derslerde kullanılmasının gereksiz olduğunu düşünmektedirler. Bu kategoriyle ilgili metaforların bazıları ve geliştirilme nedenleri öğrenciler tarafından şu şekilde belirtilmiştir:

"Akıllı tahta erkekler gibidir; çünkü erkekler sürekli dersi kaynatıyorlar. Derste akıllı tahta kullanınca da dersin büyük bir bölümü kaynıyor." (Öğrenci 129)
"Akıllı tahta gereksiz gibidir; çünkü pek bir işe yaramadığı gibi ses ve görüntü kirliliği yaratıyor." (Öğrenci 159)
"Akıllı tahta zaman kaybı gibidir; çünkü tahtaya verilen uğraşa daha fazla ders işleyebiliriz." (Öğrenci 23)
"Akıllı tahta arsız bela gibidir; çünkü gördükçe insanın huzurunu bitirir mutsuzluk verir." (Öğrenci 100)
"Akıllı tahta hurda gibidir; çünkü derste kullanmaya çalıştığımızda sürekli bozulur." (Öğrenci 131)
"Akıllı tahta Salıpazarı gibidir; çünkü bütün gereksizler başına toplanır ve dokunmak için kavga ederler." (Öğrenci 139)

TARTIŞMA VE SONUÇ

Bu çalışmanın amacı, FATİH Projesi kapsamında okullarda kullanılmaya başlanan akıllı tahtanın lise öğrencilerine ne anlam ifade ettiğini metafor analizi yoluyla belirlemektir. Akıllı tahta algısı göz önüne alınarak lise öğrencileri tarafından üretilen 41 farklı metafor 6 gruba ayrılmıştır. Bu kategorilere göre "Akıllı Tahta" öğretici ve yol gösterici bir araç, öğrenmeye yardımcı bir araç, bilgi kaynağı, mutluluk kaynağı, eğlence kaynağı ve gereksiz bir araç olarak algılanmıştır. Bu kategorilerdeki en önemli metaforlar ise sırasıyla, "Öğretmen(30)", "Arkadaş(9)", "Kitap(12)", "Çikolata(4)", "Sinema(6)" ve "Erkekler(4)" dir.

Metafor çalışmalarının birçoğunda bir kavramın bütün olarak açıklanabilmesi için tek bir metaforun yetmeyeceği ifade edilmektedir. Saban, Koçbeker ve Saban (2006: s.504)'nın Yob (2003)'dan aktadığına göre; "Temelde metafor, söz ettiği olgunun kendisi değildir, onun sadece bir sembolüdür. Eğer bu olgunun kendisi olsaydı, metafora gereksinim olmazdı. Bu nedenle metafor söz ettiği olgudan farklıdır ve bu olguya ilişkin çok güçlü bir perspektif sunsa da çoğu zaman ondan daha azdır. Bu durumu telafi etmek içinde birçok metaforun işe koşulması gerekir". Bu çalışmada da buna benzer olarak akıllı tahta öğrenciler tarafından bir çok farklı metafor kullanılarak "Öğretici ve yol gösterici bir araç", "Öğrenmeye yardımcı bir araç", "Bilgi kaynağı", "Mutluluk kaynağı", "Eğlence kaynağı" ve "Gereksiz bir araç" olarak görülmektedir.

Araştırmadan elde edilen bulgulara göre en fazla metafor frekansına sahip kategori "Öğretici ve yol gösterici bir araç olarak Akıllı Tahta" (f = 33) kategorisidir. Buna göre katılımcıların %27.5'ine göre akıllı tahtanın öğretici ve yol gösterici bir yönü vardır. Alanyazın incelendiğinde de akıllı tahtanın öğretme ve öğrenmeyi artıcı özelliği vurgulanmaktadır (Kennewell & Beauchamp, 2007; Smith, Higgins, Wall, & Miller, 2005; Wall, Higgins, & Smith 2005; Tataroğlu & Erduran, 2010). Beauchamp ve Kennewell (2008)'e göre akıllı tahtalar, sınıf içi uygulamalarda öğrenci motivasyonunu arttırmakta ve akıllı tahtaların bilgi ve iletişim teknolojileri kullanımında önemli bir yeri vardır. Kaya ve Aydın (2010) ilköğretim öğrencilerinin Sosyal Bilgiler dersindeki Coğrafya konularının öğretiminde akıllı tahta uygulamalarına ilişkin görüşlerini inceledikleri bir çalışmada ilköğretim öğrencilerinin akıllı tahta uygulamaları ile Sosyal Bilgiler dersini daha iyi anladıklarını belirttiklerini ifade etmişlerdir. Araştırmanın çalışma grubundaki öğrencilere göre akıllı tahta öğretmenin işini kolaylaştıran dersi görsel hale getiren ve daha kolay öğrenmelerini katkı sağlayan bir araçtır.

Araştırma bulgularına göre "Öğretici ve yol gösterici bir araç olarak Akıllı Tahta" kategorisinden sonra en fazla metafor frekansına sahip kategorinin "Bilgi kaynağı olarak Akıllı Tahta" (f = 28) kategorisi olduğu görülmektedir. Ayrıca bu kategori 11 farklı metaforla katılımcılar tarafından en fazla metaforun üretildiği kategoridir. Buna göre katılımcıların %23.3'ü akıllı tahtayı her zaman faydalanabilecekleri bir bilgi kaynağı olarak görmektedirler. Levy (2002), akıllı tahtaların öğretime katkısını "öğrenme kaynakları ve bilginin sunumu", "kavram ve fikirlerin açıklanması" ve "etkileşim ve etkinliklerin kolaylaşması" olmak üzere üç ana başlıkta toplanmıştır. Akıllı tahtalar etkileşim için güçlü bir araçtır ve çok sayıda kaynağın ulaşılabilir olmasını sağlamakla birlikte tartışmayı ve interaktif öğrenmeyi destekler (Becta ICT Research, 2003). Bunlara ek olarak, eğer ihtiyaç duyulursa veya konu ile ilgili olarak ekstra bir kaynak gerekirse, öğretim sürecinde akıllı tahta ile internete bağlanıp bu kaynaklardan da faydalanabilme imkânı elde edilebilmektedir (Starkings & Krause, 2008).

Araştırmadan elde edilen bir diğer dikkat çekici bulgu ise akıllı tahtanın "Gereksiz bir araç olarak" görülmesidir. Katılımcıların akıllı tahtayla ilgili olarak bu kategorideki metaforları incelendiğinde, akıllı tahtanın ders esnasında kullanıma hazırlanmasının "zaman kaybı" na neden olduğu ve kullanım esnasında yaşanan teknik sorunlar nedeniyle "hurda" olarak algılandığı görülmektedir. İlgili alanyazında de buna benzer bulgular bulunmaktadır. Wall, Higgins ve Smith (2005)'e göre akıllı tahta, diğer teknolojik araçlar gibi teknik problemler yaratması ve dersin ortasında açılıp kapanmasının beklenmesi bakımından öğrenciler için problem teşkil etmektedir. Hall ve Higgins (2005), 6. Sınıf ilköğretim öğrencileri ile yürüttüğü bir çalışmada öğrencilerin akıllı tahta ile ilgili olarak, bazı teknik sorunları, öğretmen ve öğrencilerin bilgi ve iletişim teknolojileri kullanımı becerilerinin yetersizliğini ve öğrencilerin teknolojiye erişim imkânlarının kısıtlı olmasını olumsuzluk olarak gördüklerini ifade etmektedir.

Sonuç olarak bu çalışma sonucunda öğrencilerin akıllı tahta ile ilgili olarak ürettikleri metafor ve bu metaforlardan elde edilen kategoriler dikkate alındığında; öğrencilerin 94'ünün (%78.3) Akıllı tahtanın öğretimsel yararlarının farkında oldukları ve akıllı tahta ile ilgili olumlu düşüncelere sahip oldukları, 16'sının (%13.3) akıllı tahtanın öğretimsel boyutundan çok film izleme, müzik dinleme ve oyun oynama gibi diğer özellikleri ile ilgilendikleri, 10'unun (%8.4) ise akıllı tahtanın öğretimsel yararlarının farkında olmadıkları ve olumsuz düşüncelere sahip oldukları ortaya çıkmıştır. Çıkan bu sonuçlara göre sınıf ortamında bu teknolojinin amacına uygun ve etkin bir biçimde kullanılabilmesini sağlamak üzere öğrenci ve öğretmenlerin akıllı tahtaya ve dolayısıyla da teknolojiye yönelik tutumlarının geliştirilmesine ihtiyaç olduğu görülmektedir. Eğitim ortamını zenginleştirmesi ve dersin etkinliğini arttırması açısından çok büyük yararlar sağlayan akıllı tahta gibi teknolojilerin öğretim ortamlarına nasıl entegre edilebileceği konusunda daha fazla araştırmanın yapılması önerilmektedir.

ABSTRACT: Learning computer programming is often perceived to be a difficult task by novice programming students and there have been several studies into the failure rate of students learning to program. This study explores the correlations between introductory programming students' ability to program and their theoretical knowledge in computer programming in order to analyze whether or not their performance in written exams are genuine and accurate. A rigorous statistical analysis was conducted with 400 introductory programming students who were randomly selected without considering whether or not they had a good programming background. The findings of the study used inferential statistics in order to define the correlations between students' practical and theoretical exam results. Additionally, the correlations between students' department and their exam results were investigated in order to define whether or not students' departments have an impact on their success in exams.

Keywords: introductory programming, computer programming, learning to program, assessment of programming courses

INTRODUCTION

Various studies investigated the reasons why students find computer programming difficult and it was found that the attitudes of students play a key role regarding how difficult they find learning to program (Gomes & Mendes, 2007; Hawi, 2010; Coull & Duncan, 2011). Most introductory programming students perceive computer programming as a technical activity rather than a series of cognitive skills (Bennedsen & Caspersen, 2007). Previous studies sought ways to improve introductory programming courses and investigated the skills of those students who were unsuccessful (Butcher & Muth, 1985; Ford & Venema, 2010). It was found that most students fail to understand the underlying reasons behind the theoretical exams in introductory programming courses where the main concern is not to assess the skill of programming but to measure the ability of abstraction, modelling and debugging (Rajaravivarma, 2005; Dalal *et al.*, 2009).

As a result of these investigations, new instructional design methods were suggested (Ismail *et al.*, 2010; Pears, 2010; Hawi 2012), and the impact of various assessment methods were measured including but not limited to computer aided assessment, multiple choice questions, theoretical/written exams, practical exams, and programming assignments. (Ala-Mutka, 2005; Barros *et al.*, 2003; Chamillard & Braun, 2000; Daly & Waldron, 2004; Lopez *et al.*, 2008; Kuechler & Simkin, 2003).

Despite the encouraging work done in this area, to this day it is still arguable whether or not students comprehend the motivation behind the concept of abstraction, modelling and debugging and as a result of this, they do not always see the point of theoretical exams in introductory programming courses. Consequently, there is the common assumption that students who are studying a Computer Science degree tend to do better in computer programming than students who are not studying a Computer Science degree.

This paper is dedicated to measure these assumptions and in order to do this, a rigorous evaluation was undertaken to determine whether or not there is a significant relationship a) between students' theoretical and practical exam results; b) among students' departments and their theoretical and practical exams. It was aimed to measure whether or not there is a significant correlation between students' results in their theoretical exams with the results they obtained in their practical exams. Both of these aspects are analyzed separately and in combination, to ensure the accuracy of the results and the benefits that can be derived from this.

EXPERIMENTAL DESIGN

A rigorous study was undertaken to compare theoretical exam results of students with their practical exam results in order to measure whether or not these results are correlated. These results were gathered from the Faculty of Engineering students who were in their first year. Due to the engineering formation and school policy, all engineering students are obligated to take the introductory to programming course at the Cyprus International University (CIU). There are nine different departments under the Faculty of Engineering at CIU which are Computer Engineering, Information System Engineering, Electric and Electronic Engineering, Industrial Engineering, Energy Engineering, Civil Engineering, Environmental Engineering, Management Information Systems and finally Computer Programming. Regardless of their departments, students received computer algorithms for the first couple of weeks during their introductory programming course where they were thought to draw flowcharts and wrote pseudo codes in order to develop their ability to think computationally. Having covered fundamentals of computer algorithms, students were introduced the C programming language and asked to attend two sets of theoretical and practical exams along the course. The first theoretical exam results are matched with the first practical exam results and the second theoretical exam results with the second practical exam results. The first set of exams were related to the structured computer programming concepts in C covering the most basic computer programming constructs: variables, sequence, decision making and loops. Consequently, the second sets of exams were linked to the modular computer programming specifically focusing on pre-defined and user-defined functions as well as arrays.

A total of 400 comparable valid results from theoretical and practical exams were gathered and entered into IBM software package used for statistical analysis (SPSS). The results of the exams were gathered randomly without considering whether or not students had prior knowledge or background in programming. The identities of students were kept confidential and only the departments of the students were used in the statistical analysis as nominal data. The theoretical and practical exam results were used as raw data to investigate the validity of the following research questions and their hypotheses:

#	Research Question	Null Hypothesis (H_o1)	Alternative Hypothesis (H_a1)
1	Is there a significant relationship between student's theoretical and practical exam results?	There is no significant relationship between students' theoretical and practical exam results.	Students' theoretical exam results are significantly related with their practical exam results.
2	Is there a significant relationship between students' theoretical exam results and their departments?	There is no significant relationship between students' theoretical exam results and their department.	There is a significant relationship between students' theoretical exam results and their department.
3	Is there a significant relationship between students' practical exam results and their departments?	There is no significant relationship between students' practical exam results and their department.	There is a significant relationship between students' practical exam results and their department.

In order to examine the results accurately in the context of the above research questions, it was crucial to identify the correct method for an inferential statistical analysis. As the experimental structure is based on investigating the relationship of theoretical and practical exam results in a sample group, a statistical hypothesis was needed to evaluate the correlations on the subject. Therefore, a procedure for carrying out either a Pearson's product-moment correlation coefficient or a Spearman's rank-order correlation was performed (henceforth referred to as Pearson's r and Spearman's correlation). A Pearson's r was to be selected should the data captured fit a normal distribution and similarly, Spearman's correlation was to be available if the data captured did not fit a normal distribution.

When working with regional data (i.e. exam results) that comes from a normally distributed population, a Pearson's r is used to identify the strength and direction of correlations between the variables. Similar to this, a Spearman's correlation is selected when data comes from a non-normal distribution. Both methods can be used to measure how strong a correlation is between two variables. However, in Spearman's correlation it is simply not possible to calculate the percentage of variance as a coefficient of determination whereas this can be calculated in Pearson’s r. Therefore, having entered the raw data into SPSS, the procedure for checking the normal distribution was undertaken in order to decide which statistical method to use for the analysis of data.

STATISTICAL ANALYSIS

Three different methods were used in order to identify the distribution of data: *Histogram*, *Quantile – Quantile Plots* and a *Skewness and Kurtosis normality check*.

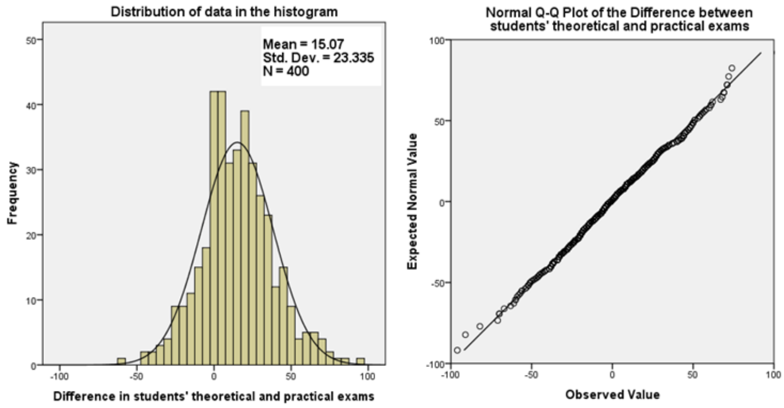

Figure 1. Normal Distribution Of Data In The Histogram And In The Normal Quantile – Quantile (Q-Q) Plot.

As shown in Figure 1, a histogram and a Quantile – Quantile (Q-Q) plot was used as the predominantly methods for observing how close the distribution of data is to a normal distribution. The histogram shows that there are skewness issues in the distribution of data as it is skewed to the right which causes an asymmetry in the distribution. Additionally, the histogram has kurtosis issues as the peak kurtosis point is over than what would be expected in a normal curve. Hence, there are clusters in the distribution of data which suggests that the data came from a non-normally distribution. On the other hand, the Q-Q plot shows that the differences in the exam results hug the linear line and no multiple clusters are visible which proves that the data obtained does not concentrate on specific points. In other words, the Q-Q plot provides strong reasons to believe that the data came from a normally distributed population.

Despite the strong evidence obtained from Q-Q plots, it was necessary to define the degree of Skewness and Kurtosis issues in terms of statistics, as the histogram did not support the results in Q-Q plots.

Table 1. Skewness And Kurtosis Normality Check On The Difference Between Practical And Theoretical Exams.

	N	Mean		Stdandard Deviation	Skewness		Kurtosis	
		Statistics	Std. Error		Statistics	Std. Error	Statistics	Std. Error
Difference between Pract. and Th. midterm	400	15.07	1.167	23.335	**.186**	.122	**.563**	.243
Difference between Pract. and Th. final	400	20.80	1.167	23.347	**.118**	.122	**.298**	.243
Valid N (listwise)	400							

As shown in Table 1, the Skewness and Kurtosis values are very close to 0. Moreover, the standard error calculation for Skewness (0.122*3=0.366>0.186) and Kurtosis (0.243*3=0.729>0.563) satisfy that the data came from a normally distributed population.

The above statistical procedures (i.e. histogram, Q-Q plots and Skewness and Kurtosis normality check) were discussed for the first research question only. Because the data set obtained for each research question has gone through the same normality tests, only the procedure for the first question is described here as the rest of the research questions were analyzed in the same way.

A Pearson’s r was computed to assess the relationships among the exams (i.e. midterm and final) and their relationship to departments. As shown in Table 2, the correlations between the theoretical and practical exams are in positive direction, moderately strong and significant. There is a positive, modestly strong and significant association in between theoretical and practical midterm exam (r=0.621, n=400, p=0.01) and in between theoretical and practical final exam (r=0.651, n=400, p=0.01). This means that the Pearson's coefficient provides strong evidence that the associations are moderately strong (r^2=0.42, 42%) between theoretical and practical exams.

Table 2. Pearson Product-Moment Correlation Coefficient showing relationships between Practical and Theoretical Exams.

**. Correlation is significant at the 0.01 level (2-tailed).		Theoritical Exam Midterm	Practical Exam Midterm
Theoritical Exam Midterm	Pearson Correlation	1	**.621****
	Sig. (2-tailed)		.000
	N	400	400
Praticial Exam Midterm	Pearson Correlation	**.621****	1
	Sig. (2-tailed)	.000	
	N	400	400

		Theoritical Exam Final	Practical Exam Final
Theoritical Exam Final	Pearson Correlation	1	**.651****
	Sig. (2-tailed)		.000
	N	400	400
Praticial Exam Final	Pearson Correlation	**.651****	1
	Sig. (2-tailed)	.000	
	N	400	400

Based on the analysis of data, two different conclusions can be drawn from the Pearson's r. Firstly, those students who did well in their midterm exams also did reasonably well (or even better) in their final exams as the difference between the coefficient number is very small (difference in r = 0.03, p=0.01). Secondly, there is no significant or strong difference between students' theoretical and practical exam results. There is a modestly strong correlation between the theoretical and practical exams in both cases which provides strong reasons to believe that those students who did well in their theoretical exams also did well in their practical exams. Hence, there is strong and significant evidence to support the alternative hypothesis for the first research question. In other words, the results provide strong reasons to believe that students' theoretical exam results are significantly related with their practical exam results.

One-way Multivariate analysis of variance (MANOVA) is used to determine whether there are any differences between the independent groups (i.e. students' department) on more than one continuous dependent variable (i.e. theoretical and practical exams, both midterm and final). At this point, it is crucial to note that the one-way MANOVA is an omnibus test and thus do not recognize which specific groups were significantly different from each other. In other words, it can only show that at least two groups were significantly different from each other. Because of this reason, a post-hoc test (i.e. Tukey's range test) was used but the results of this are not demonstrated here due to the lack of space. Additionally, MANOVA has a series of prior assumptions (e.g. no multivariate outliers, adequate sample size) and the validity of these were in order to ensure that the data obtained would not violate the results.

The MANOVA test included a single independent variable (i.e. students' department) and four dependent variables (students' theoretical midterm exams results, students' practical midterm exams results, student's theoretical final exam results and finally students' practical final exam results). The outcomes regarding the multivariate tests are given below:

Table 3. The Multivariate Tests[a] table showing the second Effect, labelled "Department", and the Wilks' Lambda row

Effect		Value	F	Hypothesis df	Error df	Sig.
Intercept	Pillai's Trace	.166	38.901[b]	2.000	390.000	.000
	Wilks' Lambda	.834	38.901[b]	2.000	390.000	.000
	Hotelling's Trace	.199	38.901[b]	2.000	390.000	.000
	Roy's Largest Root	.199	38.901[b]	2.000	390.000	.000
Department	Pillai's Trace	.034	.842	16.000	782.000	.638
	Wilks' Lambda	**.966**	**.840[b]**	**16.000**	**780.000**	**.640**
	Hotelling's Trace	.034	.838	16.000	778.000	.642
	Roy's Largest Root	.019	.919[c]	8.000	391.000	.500

a. Design: Intercept + Department b. Exact statistic c. The statistic is an upper bound on F that yields a lower bound on the significance level.

As shown in Table 3, there was no statistically significant difference in student's performance with regard to their departments, $F(16, 780) = 0.84$, $p > .0005$; Wilk's $\Lambda = 0.966$. To determine whether the one-way MANOVA was statistically significant it was required to check the "Sig." value on the multivariate tests table, which in this case is 0.640. As the significant value is more than 0.005, it is possible to conclude that the alternative hypotheses for the second and third research questions can be rejected. In other words, there is no strong or significant evidence to support that students' performance in their theoretical and practical exams was related to which department they came from. Hence, the results of the one-way MANOVA provides strong reasons to believe that students' practical and theoretical exam results were not associated on which department they studied in.

CONCLUSION

As discussed earlier in the paper, majority of students tend to believe that practical exams have a higher impact of assessment than theoretical exams. Additionally, there is a common assumption that students who are studding a computer science degree perform better in computer programming than other engineering students. This study investigated how closely practical exams and theoretical exams were related to each other as well as whether or not the department of students has an impact on their performances. The statistical results gathered from this study provided strong reasons to believe that there is a significant relationship between student's theoretical and practical exam results. The results also show strong reasons to believe that there is no significant relationship between the students' department and their practical and/or theoretical exam results.

The information gathered during this study is only based on the overall results gathered from students' practical and theoretical exams. This study can further be expanded by analyzing the relationship of practical and theoretical exam results in terms of different programming constructs (such as loops, decision making, and functions). Therefore, it could be possible to detect which assessment methods work better on measuring which programming constructs.

duygu.altayli87@hotmail.com

Gülçin OFLAZ
Cumhuriyet University
erengulcin3@hotmail.com

ABSTRACT: The opinions of preservice primary mathematics teachers about the qualities that a good teacher need to have and how they can use these qualities in teaching programmes have been searched at this work. The research has been held with 6 students who attend the 4th grade at Primary Mathematics Teaching Department on the educational curriculum of 2012-2013. Case study method, which is a design of qualitative research design, has been used in this research. The data have been gathered by using the semi-structured interviewing technique and semi-structured interview forms. The interview with the preservice teachers has taken place before the Teaching Practice Lesson, and then their teaching samples have been observed. The correlation between what they have cited during the interview and the observation results have been examined. The in data analysis process and descriptive expressions have been used when analysing the data. It has been identified that a good teacher should have these qualities: communicative skills, material usage, improving himself/herself, time management, eradicating contential mistakes, attracting the students' interest in conclusion of the research. According to the findings from the observation, it has been seen that the preservice teachers have problems at time management.

Key words: Teacher, good teacher, preservice teacher

INTRODUCTION

It's been thought that the teachers, as an element of the education system, are the most important factor in order to develop a nation to be a nation of knowledge. Teachers are those who form the future of a nation. We must mention that the relation between today's teachers and tomorrow's people are very tight (Gündüz & Odabaşı,2002). So, it is very important that preservice teachers must be efficient in Professional way.

According to Gökçe (2000), a good teacher must be a good manager who manages the teaching process, a good observer and a qualified guide. So, teaching has become a profession that needs more quality and efficiency. Onural (2005) has asked the preservice teachers to express their ideas about an ideal teacher in his research. In conclusion, the most important qualities have been expressed as: efficiency in field , pedagogical formation and having fine communicative skills. Similar results can be seen at Aypay's (2011) research. He has identified that a good teacher should have communicative skills, have knowledge about his/her field and personel motivation.

In these research the qualities of a good teacher have been investigated in teachers' and preservice teachers' view. But it can be seen that very less researches have been held about how much of these thoughts on an ideal teacher have been used by the preservice teachers. That's why semi-structured observation has been held and analysed about their teaching facilities at Teaching Practice Lesson. after having a semi-structured interview with the preservice teacher. The correlation between what they said and what they did was investigated.

METHODS

Research Design

Case study method, which is a method of qualitative research method, has been used in this research. Case study provides the opportunity of examining one or more state deeply. The state is used for a person, a group or a program (Yıldırım & Şimşek, 2011).

Research Group

This research was held together with randomly chosen 6 students at last grade of a university's Primary Mathematics Teaching Department in Central Anatolia Region in the educational curriculum of 2012-2013.

Instruments

Semi-structured interviewing form and semi-structured observation form of qualitative data gathering technique has been used. At the first part of the research, the question of "What are the qualities of a good teacher?" have been asked to the randomly chosen students. Students' answers to the question is given at Table

Table 1: Students' Thoughts About The Qualities That A Good Teacher Should Have

CATEGORY	CODE	STUDENTS
A Good Teacher	Communication	S1, S2
	Using Material	S1,S3,S4
	Time Management	S2,S4,S5,S6
	Improving himself/herself	S2,S4,S5,S6
	Eradicating contential mistakes	S2,S3
	Attracting student's interest	S1, S2,S5

After this, semi-structured interviewing have been held with students to gain detailed knowledge from students. At the second part of the research, a researcher has observed the students' sample teaching practice at the Teaching Practice Lesson at their practicing school by using a semi-structured interviewing form. Video Recording Camera has been used while the observation.

2.4. Data Analysing

The data gained by interviewing and observation have been analysed using in data analysis process. Interview has been recorded by an audial device and then it has been transcripted and analysed by using the analysing process. The main questions have been determined as different categories. And codes have been created according to the answers. To provide validity, a colleague's confirmation has been asked. Students' descriptive citations has been given together with the categories and codes in order to develop the trustworthiness and reliability.

RESULTS AND FINDINGS

The semi-structured interview results about "the qualities that a good teacher must have", which is done with the Primary Mathematics Teachers, has been presented at this part of the research. Also, we have matched what the preservice teachers have said and their tutoring during their process.

Table 2. The Communicative Skills That Should A Good Teacher Should Have.

CATEGORY	CODE	STUDENTS
Communication	Empathy	S1, S6
	Usage of language	S2,S5,S6
	Being frank and easily understood	S2,S3,S6
	Respecting the student	S1,S2, S3,S4,S5

When examining Table 2, The preservice teachers have stressed that a good teacher should have fine communicative skills. They have stated that a good teacher shouldn't be rude and harsh to students, they should be emphatical and they should be use a well understanding and frank way of expressing knowledge.

S2: Teachers should always be tolerant and kind to students. They should regard the students as a person even though they are children and deal with their problems. Teachers should teach according to the students' learning level and should be encouraging to be active while learning. They should correct their the students's mistakes *by being motivating instead of being offensive.*

When we observed the S2, we have seen that he has been close to students and been love to them. He tought the subject by increasing to students' levels. He avoided being offensive to students when they made a mistake.

Table 3. Preservice Teachers' Opinions About Using Materials At Mathematics

CATEGORY	CODE	STUDENTS
Material usage	Being concrete	S1,S2,S4,S5,S6
	Being attractive	S1,S2,S4,S5
	Being detailed	S1,S2
	Visualising	S2,S4

S1: Material is absolutely essential for some subjects. For example, 3D objects. Our preservice teacher uses material because it's impossible to understand it. Children have just started to think concretely. It's being complexive to teach 3D objects as they have newly started thinking concretely. So, i think its logical to show 3D objects on visual materials.

According to the observation result, it's been seen that S1 has used worksheets instead of 3D materials when teaching trigonometry.

Table 4. Preservice Students' Efficiency Thoughts About Time Management

CATEGORY	CODE	STUDENTS
Time management	Being unexperienced	S1, S4,S5
	Lack of self-esteem	S3
	Finding him/ herself efficient	S2,S6

At table 4, when we asked whether they can manage time while teaching, S1, S2 and S4 has mentioned that they believe in themselves but they're unexperienced and they can cope up with it in time. S5 have told us that he hasn't got confidence, and S3 and S6 has expressed that they could manage time, they haven't got any problems in managing time.

S5: It depends on situation and the subjects. Sometimes I predict that they can understand the subject easily but they don't understand some parts and time passes, on the other hand there times that students understand in shorter time that I predict. I'm unexperienced but I think I can manage time in future with more experience.

According to the observation results, S5 couldn't manage time and couldn't end the course in time even though he was planned and ready.

Table 5. Preservice Teachers' Thought About Keeping Up With Scientific Developments.

CATEGORY	CODE	STUDENTS
Developing	Mathematical issues	S1, S2,S3,S4,S5
	Articles	S2,S5
	Internet	S2,S3,S4,S5

What Preservice teachers think about keeping up with developing scientific progress after graduating from university takes place at Table 5. All of the preservice teachers stated that they will keep on following the innovations and will continuously be interested in issues, internet and scientific articles.

S3: I'm following the mathematic sites via internet, I'm following the "Mathematics World" issues, I am closely interested in technology. For instance, my dream is to teach by using the smart *board. I think these are important because children are following technology more than we do. We should keep up with technology and actual life by reading books too. Articles… Articles very useful to find out things.*

S4: Recently, we have an issue called "Mathematics World", I enjoy reading it. It's not only totally about maths, there's analsys 2 and analysis 3 in it. I love remembering them. Being a mathematician feels great. There are also mathematic groups on internet and I follow them. I'm fond of being a mathematician.

Table 6. The Preservice Teachers's Perceptions About Removing Conceptional Complexities Of The Students.

CATEGORY	CODE	STUDENTS
Removing Conceptional Complexities	Alternative samples	S1, S2, S3,S4,S5,S6
	Telling the mistakes	S1
	Forming confusions on schemes	S2
	Revising	S4,S6

Table 6 shows the techniques that the preservice teachers will use to correct the conceptional mistakes that they've detected. All of the preservice teachers think that they'll ask an alternative question to the previous question in order to remove the confusion. S1 stated that he will tell the mistake and show the correct one,S2 told that he will form confusions on the schemes so that students can realize their own mistake, S4 and S6 answered that they will revise and re-teach the subject.

S4: Alternative samples. I'll give homework with various questions in it if there one or two students. But if its whole the class I'll re-teach the subject until the confusion takes no place.

It has been observed during teaching that S4 has given a sample example to correct a student's confusion. He then gave another example to reinforce.

Table 7. The Responses Of Preservice Teachers To Students Who Don't Listen Them

CATEGORY	CODE	STUDENTS
Attracting Students' Attention	Using gestures	S1, S4
	Showing/Telling sadness	S1,S5
	Oral warning	S2,S4,S6
	Wandering in the class	S3
	Ignoring	S4, S5

Preservice teachers' penalties towards the students who don't listen the teacher has mentioned at Table 7. The preservice teacher are using the techniques of non-verbal warnings (such as gestures or staring), verbal warning, knocking the board, ignoring, showing that he/she is getting upset.

S6: I generally stay close to the board when teaching. If they say something walk around the class so they don't whisper. If they talk when I'm writing something on the board, I go check whether they have written or not. They stop talking when I get close.

It has been observed that S6 went to talking students' seat and made stop talking. But when he went back to the board, they started talking again.

CONCLUSION

Preservice Teachers have stated that a good teacher should have the qualities of communicating, material using, mistake correcting and attenting attracting.

Preservice Teachers expressed that communicating is important for a good teacher. They stated that students should never be shouted at, teachers should utter words to motivate students, and they stated that using an understanding way of teaching provides effective learning. This state shows similarity with Onural (2005) and Aypay's (2011) researches.

Preservice Teachers mentioned that they will ignore unwanted attitudes of the students, they will use repression, use body language and oral warnings in order to make them listen. They added that they will not be harsh on students, they don't want to make them upset. It can be said that they were kind and tolerant to students and they avoided being harsh on them. This shows that new generation teachers don't like violence and they want to solve problems by talking to students.

Preservice Teachers told that they aim to guide them to realise their own mistakes. At the observation findings, it has been seen that Preservice Teachers used alternative examples or they revised the confused subjects to remove confusion. This shows that structural approach is more popular among Preservice Teachers.

Preservice Teachers stated that using material is precisely essential. They have stressed that visualising and concretizing will be better and easier by using materials since mathematics is more difficult when comparing with other lessons and since mathematics is a concrete lesson. It is also thought that material using is effective in attracting students and making them enjoy maths. But when observing Preservice Teachers' teaching at the Practice Lesson, it has been seen that none of them used 3D materials, and they used worksheets instead.

Preservice Teachers stated that they will follow the developments in science and they will improve themselves after they graduate. This shows the positive sides of the newly used Training Mathematics Teacher System in Turkey (Umay,2001).

ÖZET: Araştırmanın amacı, farklı öğrenme stillerine sahip fen bilgisi öğretmen adaylarının, projele performans puanları ve akademik başarıları arasındaki farklılığın belirlenmesidir. Araştırma ilişkisel tarama modelinde betimsel bir çalışmadır. Araştırmanın çalışma grubunu Genel Fizik I Laboratuar dersini alan 80 fen bilgisi öğretmen adayı oluşturmaktadır. Verilerin toplanmasında, Grasha-Riechmann öğrenme stili envanteri, oluşturulan projeleri değerlendirmek için Bahar (2009)'un geliştirdiği proje değerlendirme derecelendirme ölçeği (rubrik) kullanılmıştır. Akademik başarı olarak öğretmen adayların genel akademik başarı ortalamaları alınmıştır. Verilerin analizinde %, f ve tek yönlü varyans analizi (ANOVA) kullanılmıştır. Araştırma sonuçlarına göre; farklı öğrenme stillerine sahip fen bilgisi öğretmen adaylarının proje performans puanları arasında anlamlı bir fark görülürken, akademik başarıları arasında anlamlı bir farklılık söz konusu değildir

Anahtar sözcükler: Fen bilgisi öğretmen adayları, Grasha ve Riechman öğrenme stili, akademik başarı, proje performansı

ABSTRACT: The aim of the research is to investigate the effect of difference learning styles to academic achievement and project performance on science teacher candidates. This cross-sectional study was carried out with 80 Science teacher candidates attending general physics I course. Data of the study was collected through "Grasha-Riechmann Learning Styles inventory" and "Project Evaluation Rating Scale" for projects. Academic achievement has been average overall academic performance of teacher candidates. Descriptive statistics, %, f and one-way ANOVA were used for data analysis. According to research results; while teacher candidates' learning styles is made significant changes on performance points, there is no significant changes on academic achievement.

Key words: Science teacher candidates, Grasha and Riechman learning styles, academic achievement, project performance

GİRİŞ

Bilgi çağının ve bilgi toplumlarının öne çıktığı günümüzde artık eğitimin temel amacı, bilgiyi öğrenenlere aktarmak değil, onlara bilye ulaşma yolarını öğretmektir. Öğrenen bireylere bilgiye ulaşma yollarını öğretmek ancak onlara üst düzey düşünme becerilerini, 21. yy. öğrenen özelliklerini kazandırabilmekle sağlanabilir. . Böylece, bilgi çağında yaşayan bireylerin, Özer'in (2001) de belirttiği gibi, bilgiye erişme yollarını bilmeleri, ulaştıkları bilgiyi kullanabilmeleri ve yeni bilgiler üretebilmeleri önem kazanmaktadır. Bireylerin bu niteliklere sahip olmalarının en etkili yolu, onların nasıl öğreneceklerini öğrenmeleri, daha kalıplaşmış bir deyişle "öğrenmeyi öğrenme" leri ile olanaklıdır. Bu özelliklerin kazandırıldığı derslerin başında fen bilimleri dersi gelmektedir. Fen bilimleri dersinde öğrenenler, çevrelerinde olan biten olayları inceleme, evreni bilimsel anlamda ele alma fırsatı yakalarlar. Bireylerin bilimsel süreç becerilerinin önemli bir parçası olan gözlemi doğal ortamda edindikten sonra fen derslerinde uygulamaya dönük olarak irdeleme fırsatı bulurlar. . Fen bilimleri dersinde bilgiye ulaşma ve bilgiyi keşfetme yolarından birisi de proje çalışmaları, proje tabanlı öğrenme yöntemdir.

Proje tabanlı öğrenme, bir konunun derinlemesine araştırılmasını amaçlar. Bu araştırmalarda öğrenen aktiftir, öğrenme etkinlikleri bazen bir grupla bazen de bireysel olarak yürütülür. Proje tabanlı öğrenme projeler yoluyla öğrenmeyi organize eden bir model olarak da açıklanabilir (Thomas, 2000). Korkmaz (2002)'a göre proje tabanlı öğrenmenin temeli büyük ölçüde John Dewey'in yeniden yapılanma, Kilpatrick'in Proje metodu, Bruner'in Buluş Yoluyla Öğrenme Yaklaşımı ve Thelen'in Grup Araştırması Modeline dayanmaktadır. John Dewey'den başka ilerlemeci eğitimin bir başka temsilcisi olan William Kilpatrick proje tabanlı öğrenmenin ilk uygulayıcısı olarak bilinir (Balkı, 2003). Proje tabanlı öğrenme yöntemi aynı zamanda yapılandırmacılık yaklaşımın uygulamasında ön görülen yöntemlerden birisidir.

Yapılandırmacı yaklaşımda öğretmene göre öğrenci, aktiftir. Yapılandırmacılık bireylerin çevreleri ile etkileşimlerinin bir sonucu olarak meydana gelen bilgi inşasına dayanır ve her bir oluşum diğerlerinden farklı özellikler taşır. Proje Tabanlı Öğrenme gibi Yapılandırmacı öğrenme tasarımları geleneksel öğretim yöntemlerine alternatif olarak düşünülmektedir (Aşan ve Haliloğlu, 2005). Bu bağlamda bilgiyi nasıl öğrendiğimiz hakkında iki önemli farklılık vardır. Bunlardan birincisi, bilgiyi nasıl algıladığımızdır; ikincisi, algıladığımız bilgiyi nasıl işlediğimizdir. Her birimiz gerçekleri farklı olarak algılarız, farklı yöntemlerle zihnimize yerleştiririz. Bazılarımız hissederek, bazılarımız izleyerek, bazılarımız düşünerek, bazılarımız yaparak gerçeklere ulaşırız (Morris ve McCarthy, 1990; McCarthy, 2000). Bu bağlamda uygulamalı ya da performansa dayalı olan proje çalışmaları, fen öğreniminde ve öğreniminde önemli bir yere sahiptir. Birçok araştırmada uygulamalı ya da performansa dayalı çalışmalardan öğrencilerin zevk aldığı, bu tür etkinliklere karşı olumlu bir tutum geliştirdikleri söylenmektedir (Johnstone ve Al-Shuaili, 2001; Kapenda, Kandjeo-Marenga ve Kasanda, 2002).

Her öğretim yaklaşımında olduğu gibi projelerdeki öğrenci performanslarının da bireysel farklılıklar gibi psikolojik faktörlerden etkilendiği belirlenmiştir. Proje hazırlarken motivasyon stilleri ve bilişsel stiller anlamında projelerin kimi öğrenciler için önemli ve motive edici iken diğer öğrenciler olumsuz etkisinin olduğu yada etkisinin olmadığı görülmüştür (Al-Naeme, 1991; Johnstone ve Al-Naeme, 1995). Bireyin kendi öğrenme özelliklerini tanıması, öğrenmede yararlanılan stratejileri bilmesi, seçmesi ve kullanabilmesi olarak tanımlanan öğrenmeyi öğrenme kavramı, bireyin kendi öğrenme özelliklerini tanımasını öncelikli kılmaktadır ki böylelikle karşımıza "öğrenme stili" kavramı çıkmaktadır (Özer, 2001). Öğrenme stillerini işe koşarak gerçekleştirilecek bir öğretim, bir öğrencinin nasıl öğrendiği ve nasıl öğrenmekten hoşlandığı gibi bilgilerin kullanılmasını, böylece öğrencilerin kendi öğrenme özellikleri doğrultusunda daha kolay ve kalıcı öğrenmelerin gerçekleşmesini sağlayacaktır.

Son otuz yıl içerisinde fen eğitiminde olduğu kadar diğer birçok alanda bireysel farklılıklara odaklanan çok sayıda araştırma yapılmıştır. Her bireyin dünyayı anlamak için kullandığı öznel bir bilgi kapasitesine, düşüncelere ve deneyimlere sahip olduğu ve tüm bu özelliklerin öğrenme sürecinde etkili olabileceği düşünülürse öğrenmede bireysel farklılıkların varlığını kabul etmek kaçınılmazdır. Alan yazında bazen birbirinin de yerine kullanılan fakat esasında anlam itibari ile farklılıklar arz eden bireysel farklılıklara ilişkin bilişsel stil, bilişsel strateji, öğrenme stili ve öğrenme stratejisi gibi bazı kavramlar kullanılmaktadır (Bahar, 2009).

Öğrenme stili ile ilgili alanyazında farklı tanımlara rastlanabilir. Keefe (1991) öğrenme stilini hem bir öğrenci karakteristiği hem de öğretme stratejisi olarak tanımlar. Öğrenme stili, öğrenci karakteristiği olarak bir öğrencinin nasıl öğrendiğini ve nasıl öğrenmekten hoşlandı-ğını belirtir. Öğretim stratejisi olarak da biliş, şartlar ve öğrenme içeriği hakkında bilgi verir. Dunn ve Dunn (1993) öğrenme stilini her bireyde farklılık gösteren, bireyin yeni ve zor bir bilgi üzerine odaklanması ile başlayan bilgiyi alma ve belleğe yerleştirme süreciyle devam eden bir yol olarak ifade etmiştir. Kolb (1984) ise öğrenme stilini, bilgiyi algılama ve işlemede kişisel olarak tercih edilen yöntem olarak ifade etmiştir. Grasha ve Riechmann tarafından tanımlanan öğrenme stilleri, bireyin öğrenme tercihlerine yönelmesi bakımından, görünüşte Dunn tarafından keşfedilen yapıya oldukça benzemektedir. Grasha ve Riechmann, akademik çerçevede öğrenmeyi destekleyen, tercih edilen davranış ve tutum kalıpları üzerine sosyal ve etkili bir bakış açısı sunmuşlardır (Riding ve Rayner, 1998).

Grasha ve Riechmann tarafından açıklanan kişilerin öğrenme tercihleri üzerine odaklanmış öğrenme stili modeli, görünüşte Dunn tarafından tasarlanmış yapıya benzerlik göstermektedir. Grasha ve Riechmann, akademik bağlamda tercih edilen davranış ve tutum örnekleri üzerine sosyal ve etkileyici bir bakış açısı sunmuşlardır (Riding ve Rayner, 1998). Grasha ve Riechmann öğrenme stilleri modeli, üst sınıflardaki lise öğrencileri ve üniversite düzeyindeki öğrenciler için daha uygun bulunmuş ve bu düzeydeki öğrenciler için kullanılmıştır. Öğrenme stillerinin değişmez nitelikte olduklarını kabul etmekle birlikte Grasha ve Riechmann, her bir öğrenci için stillerin sınıftan sınıfa değişebileceğini vurgulamaktadır. Çünkü, model sosyal etkileşime dayanmaktadır ve her bir ders için öğrencilerin göstereceği tutum ve davranışlar farklılık gösterebilmektedir. Bu nedenle, öğrenme stillerini ölçmede geliştirdikleri skala, belirli bir dersi ölçmek için ve genel bir değerlendirme yapmak için iki farklı biçimde tasarlanmıştır.

Grasha ve Riechmann tarafından geliştirilmiş bu model, diğer öğrenme stilleri modellerinden farklılık göstermektedir. Öğrencilerin kişisel ve bilişsel özelliklerinin genel değerlendirmesinden çok, onların sınıf etkinliklerine karşı tutumlarının temel alındığı bir modeldir. Bu yönüyle Grasha, modelin çok daha gerçekçi ve geçerli olduğunu savunmaktadır. Çünkü, modelin öğrenme stillerini sınıflandırması, öğretme yöntem ve tekniklerinin belirlenmesinde tüm öğretim personeline ve kurumlarına yardımcı olması amacıyla tasarlanmıştır (Montgomery ve Groat, 2004).

Grasha ve Riechmann, öğrencilerin öğrenme ortamlarında tercih ettikleri stil kalıplarını, üç boyutta tanımlamışlardır (Jonassen ve Grobowski, 1999):

- Öğrencinin öğrenmeye karşı tavrı
- Öğretmenlerin/yaşıtların görüşü
- Ders prosedürlerine karşı verilen tepkiler

Bu üç boyutun karşılığında ise, modeli tanımlayan üç tane iki kutuplu boyut keşfetmişlerdir. Bunlar: *Katılımcı / kaçınan, İşbirlikçi / yarışmacı, Bağımsız / Bağımlı*'dır.

Tablo 1. Öğrencilerin Sınıf Ortamındaki Öğrenme Tercihlerine Karşılık Olabilecek Her Bir Stilin Karakteristik Özelliklerini

Katılımcı	**Kaçınan**
*ders içeriğini öğrenmeye heveslidir	*ders içeriğini öğrenme heveslisi değildir
*derse devam etmekten hoşlanır	*derse devam etmekten hoşlanmaz
*sınıf içi öğrenmede sorumluluk alır	*sorumluluk almaz
*söylenildiğinde katılımda bulunur	*katılımda bulunmaz
**istenileni* yapar	*kendi istediğini yapar
İşbirlikçi	**Yarışmacı**
*paylaşımcıdır	*yarışmacıdır
*işbirlikçidir	*başkalarından daha iyi yapma motivasyonuna sahiptir
*başkalarıyla çalışmaktan hoşlanır	*yarışmaktan hoşlanır
*sınıf öğrenme ve başkalarıyla etkileşimde bulunma yeridir	*sınıf kazanmak zorunda olduğu bir kazan ya da kaybet yeridir
Bağımsız	**Bağımlı**
*kendisi düşünür	*öğretmen bir bilgi ve yapı kaynağıdır
*kendi başına çalışır	*ne yapmasını söyleyecek otoriteye gereksinme duyar
*gerekeni öğrenecektir	*yalnızca isteneni öğrenecektir
*başkalarını dinleyecektir	*düşük derecede entelektüel merakı vardır
*kendine güvenir	*kendine güveni azdır

Araştırmada, Fen Bilgisi öğretmen adayları tarafından oluşturulan proje çalışmalarının başarısının, gruplardaki öğrencilerin öğrenme stillerine göre farklılaşıp farklılaşmadığı incelenmiştir. Öğretmen adaylarının yapılandırılan projelerde gösterdikleri performansı etkileyebilecek Grasha'nın öne sürdüğü öğrenme stilleri (rekabetçi, iş birlikli, pasif, katılımcı, bağımlı ve bağımsız) ve genel akademik başarıları arasındaki ilişki araştırılmıştır Alan yazında öğretmen adaylarının öğrenme stillerinin, yapılandırılan projelere etkisini ortaya koyan araştırmalara rastlanmamıştır. Bu bağlamda araştırma, alan yazına katkı sağlaması açısından önemlidir. Araştırmada aşağıdaki sorulara yanıt aranmaktadır:

1. Farklı öğrenme stillerine sahip olan öğrencilerin proje performans puanları arasında anlamlı bir farklılık var mıdır?
2. Farklı öğrenme stillerine sahip öğrencilerin akademik başarıları arasında anlamlı bir farklılık var mıdır?

YÖNTEM

Araştırma Modeli

Araştırma ilişkisel tarama modelinde betimsel bir çalışmadır. İlişkisel tarama modelleri, iki ya da çok sayıda değişken arasında birlikte değişim varlığını ve/veya derecesini belirlemeyi amaçlayan araştırma modelleridir (Karasar, 1998). Araştırmada kullanılan değişkenler, genel akademik ortalama, öğrencilerin puanlama yöntemi ile belirlenen öğrenme stilleri ve proje performans puanlarıdır Araştırmada korelasyon türü ilişki arandığından, değişkenlerin birlikte değişip değişmedikleri, birlikte bir değişim varsa bunun da ne şekilde olduğu tespit edilmeye çalışılmıştır. İki değişken arasında bir ilişkinin olup olmadığı anlamlılık sınamaları ile belirlenir. Çözümleme sonucunda bulunan değer, şans dışında sistemli bir etkileme ya da etkilenme ile oluşmuş görünüyorsa ilişki var demektir. Değişkenler birlikte artan ve azalan değerler alıyorsa ilişki artı (+) yani yönde, değişkenlerden biri artarken diğeri azalıyorsa ilişki eksi (-) yani negatif yöndedir (Karasar, 1998).

Çalışma Grubu

Araştırmanın çalışma grubunu bir üniversitenin Genel Fizik I Laboratuar dersini alan 80 fen bilgisi öğretmen adayı oluşturmaktadır.

Veri Toplama Araçları

Araştırmada Fen bilgisi öğretmen adaylarının öğrenme stillerini belirlemek amacıyla Grasha ve Riechman (Grasha, 1996) tarafından geliştirilen Grasha-Riechman öğren-me stilleri ölçeği kullanılmıştır. Ölçek Uzuntiryaki, Bilgin ve Geban (2003) tarafından Türkçeye çevrilerek adapte edilmiş ve 330 lise öğrencisine uygulanarak güvenirlik kat sayısı 0.794 olarak bulunmuştur. Ölçek, rekabetçi, iş birlikli, pasif, katılımcı, bağımlı ve bağımsız alt boyutları olan ve her boyutta on olmak üzere beşli likert tipi altmış cümleden oluşmaktadır. Grasha (1996) öğrenme stili envanterindeki sonuçlara göre öğrencilerin "bağımlı/pasif/katılımcı/rekabetçi"; "katılımcı/bağımlı/iş birlikli/"; "iş birlikli/katılımcı/bağımsız" ve "bağımsız/iş birlikli/katılımcı" öğrenme stilleri olmak üzere dört kategoride gruplandırabileceğini belirtmiştir. Ancak bu araştırmada Grasha'nın belirttiği bu sınıflama kullanılmamıştır. Öğrencilerin farklı öğrenme stillerinin bir karışımına sahip olabileceği fakat bir stilin diğerlerine göre daha baskın olabileceği düşünülürse bu çalışmada da öğrenme stili envanterinden elde edilen puanlar ışığında baskın görünen öğrenme stili kullanılmıştır.

Öğrencilerin oluşturdukları projeleri değerlendirmek için Bahar (2009) tarafından Mini projeleri değerlendirmek geliştirdiği dereceli puanlama anahtarı kullanılmıştır. Dereceli puanlama anahtarı temel alınarak oluşturulan projeler 100 puan üzerinden değerlendirilmiştir. Genel akademik puanları, öğrencilerin aldıkları tüm derslere ilişkin genel not ortalamalarıdır.

BULGULAR

Araştırma sorularına yönelik ortaya çıkan bulgulara bakıldığında; araştırmanın birinci alt problemi için farklı öğrenme stillerine sahip olan öğrencilerin proje performans puanları arasında farka yönelik Varyansların Homojenliği (Levene) ve ANOVA testlerine ait sonuçlar Tablo 2 ve Tablo 3'te sunulmuştur.

Tablo 2. Farklı Öğrenme Stillerine Sahip Olan Öğrencilerin Proje Performans Puanları Arasında Farka Yönelik Levene Testi Sonuçları

Levene	Sd1	Sd2	p.
1,65	4	75	,17

Tablo 3. Farklı Öğrenme Stillerine Sahip Olan Öğrencilerin Proje Performans Puanları Arasında Farka Yönelik ANOVA Testi Sonuçları

Öğrenme Stili	*n*	*X*	*SS*	F	p	Fark Stiller
Bağımsız	7	77,85	9,06	5,68	0,00*	Yarışmacı - İşbirlikçi Bağımlı-İşbirlikçi Katılımcı - İşbirlikçi
Yarışmacı	14	74,64	8,42			
Bağımlı	28	75,17	7,26			
İşbirlikçi	11	86,81	4,62			
Katılımcı	20	77,75	7,15			
Total	80	77,56	8,15			

Farklı öğrenme stillerine sahip fen bilgisi öğretmen adaylarının proje performans puanları arasında anlamlı bir fark bulunmuştur [$F(4,75)=5,68$, $p<0,01$]. Proje performans puanları arasında fark görülen gruplara bakıldığında; bu farkların yarışmacı-işbirlikçi, bağımlı- işbirlikçi ve katılımcı- işbirlikçi öğrenme stillerine sahip öğretmen adayları arasında olduğu görülmektedir. Farklılığın yönünün ise işbirlikçi öğrenme stiline sahip öğrenciler lehine olduğu görülmüştür.

Araştırma sorularına yönelik ortaya çıkan bulgulara bakıldığında; araştırmanın ikinci alt problemi için farklı öğrenme stillerine sahip olan öğrencilerin akademik başarı puanları arasında farka yönelik Varyansların Homojenliği (Levene) ve ANOVA testlerine ait sonuçlar Tablo 3 ve Tablo 4'te sunulmuştur.

Tablo 3. Farklı öğrenme stillerine sahip olan öğrencilerin akademik başarı puanları arasında farka yönelik Levene testi sonuçları

Levene	Sd1	Sd2	p
0,86	4	75	,49

Tablo 4. Farklı Öğrenme Stillerine Sahip Olan Öğrencilerin Akademik Başarı Puanları Arasında Farka Yönelik ANOVA Testi Sonuçları

Öğrenme Stili	*n*	*X*	*SS*	F	p
Bağımsız	7	2,21	0,55		
Yarışmacı	14	2,13	0,44		
Bağımlı	28	2,23	0,34	0,84	0,50
İşbirlikçi	11	2,29	0,28		
Katılımcı	20	2,36	0,37		
Total	80	2,25	0,38		

Farklı öğrenme stillerine sahip fen bilgisi öğretmen adaylarının akademik başarı puanları arasında anlamlı bir fark görülmemiştir [$F(4,75)=0,84$, $p>0,05$]. Bu bağlamda öğrenme stili adayların akademik başarıları ortalamalarını doğrudan etkilememiştir.

TARTIŞMA ve SONUÇ

Araştırma sonuçlarına göre; farklı öğrenme stillerine sahip fen bilgisi öğretmen adaylarının proje performans puanları arasında anlamlı bir fark olduğu görülmüştür. Fark görülen gruplara bakıldığında; bu farkların yarışmacı-işbirlikçi, bağımlı- işbirlikçi ve katılımcı- işbirlikçi öğrenme stillerine sahip öğretmen adayları arasında olduğu görülmektedir. Farklılığın yönünün ise işbirlikçi öğrenme stiline sahip öğrenciler lehine olduğu görülmüştür. Bu bağlamda işbirlikçi öğrenme stiline sahip öğrenciler gruplar şeklinde yürütülen proje çalışmalarında daha başarılıdır denebilir. Doymuş, Şimşek ve Bayrakçeken (2004)'e göre; işbirlikçi öğrenme stiline sahip öğrenciler " araştırma yapma", "zamanı iyi kullanma", "rapor hazırlama" ve " organize etme ve planlama" gibi konularda diğer öğrencilere göre öne çıkmaktadırlar. Bu noktadan hareketle bu işbirliğine yatkın öğrenciler hem başarı, hem de öğrenmeye ve konuya karşı tutumlarına olumlu yönde katkı sağlayabilmektedir. Bu aynı zamanda performansa da yansımaktadır.

Araştırmanın ikinci alt probleminde ele alınan farklı öğrenme stillerine sahip fen bilgisi öğretmen adaylarının akademik başarı puanları arasında farka bakıldığında, bu farkın anlamlı bir fark olmadığı görülmüştür. Bu bağlamda öğrenme stillerinin öğretmen adaylarının genel akademik başarılarını etkilemediği görülmektedir. Her iki alt problemleri birlikte ele aldığımızda, öğrenme stillerinin performans ve süreç odaklı çalışmalarda bireyin başarısını etkilediği görülmektedir. Bu başarının işbirlikçi öğrenme stili lehine olması da; başkalarıyla çalışmaktan hoşlanan ve etkileşim içinde olan bireylerin daha iyi performans gösterdiklerini göstermektedir. Akademik başarının ölçülmesinde lisans eğitiminde sıkça kullanılan ölçme yöntemleri bu bağlamda irdelenmelidir.

Öğrenme stillerinin öğretme-öğrenme sürecinde işe koşulmasında; öğrenenlerin öğrenme stilleri hakkında yeterince bilgi sahibi olunması çok önemlidir. Bu bilgilendirme de belki de en önemli şey bireysel farklılık noktasında ele alınan tüm özeliklerle ile ilgili uygulamalarda ortaya çıkan sonuçların "değişmez, sınırları kesinlikle belli, bu öğrenci şu stile sahip bu nedenle kesinlikle şu şekilde öğrenir" tarzındaki genellemeleri terk etmektir. Bunun yerine tüm bu bireysel farklılıkları "şu yönde eğilimi var, bu alanda kendini daha da geliştirebilir ama şu alanda da desteğe ihtiyacı var" tarzındaki destekleyici ve cesaretlendirici yönlendirmelerle yapmak olmalıdır.

Araştırma sonucunun gösterdiği doğrultuda, öğrenme stili özellikle grupla çalışma sürecinde ve performans düzeyinde etkilidir. Akademik başarı ortalaması bağlamında ise ölçme araçları değişkeninden dolayı bu etki gözlenememiştir.

ÖNERİLER

Bu araştırmanın daha geniş bir örneklem grubunda tekrarlanarak açık uçlu görüşmelerle desteklenmesi, öğretmenlerin sınıf içerisinde izledikleri öğretim stillerinin gözlenebilmesi, öğretme ve öğrenme stilleri arasındaki ilişkinin biraz daha iyi anlaşılabilmesi açısından da yararlı olacaktır. Öğrenme stili bireylerin öğrenmeye olan yaklaşımlarını ve öğrenirken izledikleri yolu göstermesi açısından önemlidir. Öğrencilerin öğrenme stilleri konusunda bilgi sahibi olunması, önceden belirlenmiş öğrenme hedeflerine ulaşırken izlenecek yola ışık tutacaktır.

THE EXPLORATION OF QUICK POLLS QUESTIONS' LEVELS WITH THE BLOOM'S TAXONOMY: A CASE STUDY

Sevket Ceyhun CETIN
Texas Tech University

Memet T. BULUT
Grand Valley State University

Questioning has been identified as a crucial aspect of teachers' work (Boaler & Brodie, 2004). In traditional classrooms, the common form of questions is open-ended questions that are asked by teachers and answered by students. With the development of technology, the increasing integration of handheld devices into mathematics classrooms has provided mathematics teachers an opportunity to pose different types of questions more than open-ended ones. *Texas Instrument (TI) Navigator System* with *TI N-spire Computer Algebra System (CAS)* is one of the handheld devices that began to be widely used across the US nation. The *Quick Poll (QP)* feature of the system provides teachers an opportunity to ask questions (as called QP questions) and collect students' responses instantly. Numerous studies have been conducted to show how the system increases students' engagement and participation by allowing all students to answer asked questions. However, there is a gap in the literature in terms of assessing the difficulties of QP questions. The qualitative intrinsic case study (Stake, 2005) was intended to close the gap in the literature and answer the following overarching research question; What are the relationships among the levels of QP questions, lesson objectives, and lessons' "I can statement?" To fulfill the aim, three middle school mathematics teachers' videotaped lessons were observed, the QP questions were recorded, and the questions and "I can statement" of the three lessons were classified based upon the Bloom's Taxonomy. The findings of the present study showed that whereas the "I can statement" of the lessons were set at high levels, such as, analysis, synthesis levels, the levels of QP questions were at low level, such as, application, comprehension. Previous studies about teacher questioning concluded the same result that teachers ask low levels and more factual questions (Myhill & Dunkin, 2002; Sahin & Kulm, 2008). Very few number of QP questions in total were at high levels and the number of students who answered the questions correct was less than the number of students who answered the low questions correct. According to the findings of the study, in-service middle school mathematics teachers need professional development on how to formulate their regular questions and QP questions. Additionally, coordinators and administrators of pre-service mathematics teacher preparation programs may need to evaluate their undergraduate and graduate activities in terms of questioning to make the changes for their programs as needed.

ABSTRACT: Research indicates that the use of the computer can become an ally in the cognitive development of students, allowing them new ways of thinking and acting. However, this potential has not yet been fully integrated into everyday Brazilian school practice. Considering this context, we aimed to investigate how continuing teacher education courses, involving the use of computational resources in the processes of teaching and learning of Mathematics and Physics can impact the pedagogical practice of teachers. We have developed and are executing two projects with interconnected actions, allowing the oriented work with several teachers and international collaborators. The main objective is the inclusion of computational resources in the processes of teaching and learning. The main expected results is that the actions developed will stimulate and encourage more teachers to use technology in their classrooms, allowing students to experience new experiences in Mathematics and Physics**.**

Key words: computational resources continuing education, teaching

INTRODUCTION

The impact and advance of digital technologies are increasingly affecting all aspects of lives of the people. This leads to transformations on the social, economic and technological areas resulting in the need of new forms of teaching and learning in the field of education. In order to meet new demands, educational institutions have sought to integrate technological resources in the practice of teachers. However, only the presence of technological resources in teaching practice is not a guarantee to a higher quality in education, because the simple use of these resources can serve as camouflage for a teaching based on mere reception and reproduction of information. The incorporation of these resources in the school context requires study regarding the use of these tools as mediation between the individual and the knowledge. According to Sangari (2007):

… it is up to the educator to contribute to the education of this generation mediated by information and communication technologies, increasing the dynamism and interactivity in educational processes, creating methodologies that enable the development of epistemological curiosity of our students, in order to promote skills that prepare them for a world of constant and rapid change. (p.20, our translation)

It is noted that students are increasingly involved with technology, have curiosity and are in daily contact with them. In this sense, it calls for the teacher to use these resources in their pedagogical practice. For Bortolotti (2008), “the presence of technology in the classroom, especially with regard to the use of computers, requires new attitudes across the teaching and learning process of the educational institutions and teachers” (p. 9, our translation). Regarding the interaction of teachers with technological resources, Richt (2010) indicates that:

> The introduction of changes in the educational scenario reinforces the need for coordination between teacher education programs and initiatives that propose the use of technology in the processes of teaching and learning. To this end, professionals of education need to interact with these resources, exploring them in a critical and investigative way, reflecting about the use of these in the classroom, and thus to develop a review about the mutability of knowledge concerning technologies and pedagogical changes raised by this dynamics. (p. 73, our translation)

For the use of technology in the processes of teaching and learning, Demo (2009) points that teachers need to be more careful, because it is not possible to do a renovated school with traditional teachers. He says that nothing new will happen with students if teachers do not know how to learn with technology, so it is crucial to prepare them for this task. The author comments that the teacher, to continue learning, can transform your classroom into a laboratory or in a context that challenges him to develop new ways of teaching and learning. In this sense, the author warns:

> Most probably the final diploma will end, entering in its place something temporary. The increasingly frantic race by professionals aiming update academic qualifications proves that their diplomas dried.
> It may be possible to keep the door always open for the reconstruction of the diploma, within the idea that it is essential to become a lifetime member of the university community of learning. (DEMO, 2009, p. 73, our translation)

In this context, professionals working in the area of education, even if they have already attended initial education, they will need continuing teacher education. It should be emphasized that continuing education are all actions taken by teachers to improve their teaching, such as lectures, workshops, short courses and / or moments of reflection. Regarding the continuing education of teachers, Ferreira (2009) points that this is a field often researched in academia, however there is a large gap between the aim of the training offered to teachers and what are their true needs. Nóvoa (2014) points that for such continuing education to be organized around concrete and specific situations, that promote the desire to find a solution to solve them and stresses the importance of knowledge beyond theory and practice. The author indicates the search for a knowledge that is relevant and not just a practical application of any theory, and suggests designing their continuing education in a professional commitment environment, providing attention to changes in work routines, personal, collective or organizational.

In this context, to insert a new tool in the classroom implies pedagogical changes, changes regarding the vision of teaching, which should be studied and considered by teachers. Thus, some questions may be considered: How to effectively integrate the computer in the processes of teaching and learning? What aspects should be considered when choosing a computer application? What software explore in pedagogical practice? How to prepare teaching activities using technological resources? What activities can be explored using these tools? How to organize the computer lab? These and other questions arise for teachers. These are the questions that permeate the investigations of the authors of this work. The authors are professors of Centro Universitário UNIVATES, located in the south of Brazil. The authors also compose a research group with more members: professors, students of scientific initiations, volunteers, students enrolled in the Post Graduate Program in Exact Sciences and teachers. The aim of the research group is to provide contributions to answer the questions above applied in the area of exact sciences, more precisely in the teaching of Mathematics and Physics. For this purpose, the group has already published works, and the progress culminated in the creation of continuing education courses. Their applications are related by Quartieri, Dullius and Bergmann (2013a), and Quartieri, Dullius and Bergmann (2013b) in two participations of conferences in the area, and insights on the results are related by Dullius, Quartieri, Bergmann and Faccio (2012) in other conference.

Currently, the Brazilian government initiated a series of actions in the education. Some of them contemplate proposals with grants for those that are considered relevant for the actual processes of teaching and learning. Currently our group has four projects granted, and two of them are related directly with the subject of this work. In the following sections their methodology and expected results will be related, as well as the progress of the works.

METHODS

In this section it will be described a resume of the methodologies of two researches: Work I and Work II. Both works have qualitative and quantitative approaches and they were idealized to have participation of teachers of basic education. They will be the subjects of the new continuing teacher education courses and the performers of the new practices on the classroom. The research are based to be centered in students and in teachers, so it is natural to expected regular participation of teachers.

Work I

The principal aim of the first work is to study the possibilities of utilizing computational resources in the processes of teaching and learning of Mathematics and Physics in the Brazilian school. More specifically, there is a government strategy to integrate tablets in basic education, so this research is polarized to study tablets as a tool in the pedagogical practice.

The methodology consists to promote meetings with teachers of basic education that are motivated to think and study the use of computational resources in classroom. The meetings will consist of discussions about the possibilities of the use of tablets and software and to create pedagogical activities for the practical intervention in the classroom. During the process, the authors will be constantly evaluating the proposal, the impact in the pedagogical practice of teachers, as well as the difficulties faced by the teachers. The authors pretend to investigate these subjects via interviews, reports and recordings of the interventions.

Work II

The second work consists in exchange international pedagogic experience by collaborating with research groups from outside Brazil. The main proposal of this work is to become familiarized with different views of education, more specifically in how digital technologies are used to contribute in the processes of teaching and learning of Mathematics and Physics. This research was proposed in conjunct with a Portuguese professors group from Universidade do Algarve. Since in the past there were some opportunities to meet them and their subjects of study were connected with the work of the authors of this paper, this union naturally emerged
The first action consists of a work mission of the Brazilian and Portuguese professors in schools of basic education in Algarve to a process for acquiring data that encompasses the following activities: observations of how classroom are conducted by Portuguese teachers, interview with teachers and distinct members that participates in continuing teacher education courses, interviews with students of the investigated classes, case studies and documental data of the investigation realized by the Portuguese professors. All this steps are to be repeated in Brazil with the Portuguese group. The visit in Portugal is directed to acquire knowledge about the reality of the integration of digital technologies in the classroom in this country, to experiment new pedagogical practices situations and to connect and apply useful ideas in the Brazilian research studies to create contributions in teaching innovations.

EXPECTED RESULTS

It is plausible to assume that the first work will originate rich discussions with the teachers, making possible the creation of several technical productions aimed at how to use tablets in the teaching of specific subjects of Mathematics and Physics. Once they are produced, their union may become a book that will be distributed in schools of the authors neighborhood educational institution and also an e-book to maximize its reach. Besides that, the meetings will provide foundations for the creation of a continuing teacher education courses in digital technologies for teachers of basic education that can be offered to qualify their practice.

The second work have potential to expand and confront the authors view of education. Knowing different realities and performing research with different cultures are a promising way to provide deep changes in the understanding of how people can learn. Since the authors will be in loco with the Portuguese collaborators, in both countries, some possibilities naturally rise: the mutual aggregation of important aspects of the distinct processes of teaching and learning, description and understanding of interconnections between the two educational views, interpretation of a different perspective of observation from distinct cultures and the production of pedagogical materials based in the previous points aimed to innovate and challenge teachers in a positive way to provoke them to search qualification in this area.

CONCLUSION

Both works walk side by side, and their main objectives share important aspects. At the end of the two researches, the authors believe that the studies with the teachers, the international collaboration and the new pedagogical materials will have the potential to qualify the exploration of computational resources in the processes of teaching and learning, as well as to report the advantages and disadvantages and problems regarding the use of these materials. Furthermore the authors expect that the participant teachers of the research feel safe, challenged and motivated to utilize computational resources in their classroom as an auxiliary tool in their pedagogical practice, providing to the students a new experience of learning in Mathematics and Physics, motivating them to an active participation in this process.

ABSTRACT: Problem-based learning enhances academic productivity, and improves long-term memory. Thus it is better than traditional instruction. Meanwhile, the teaching of mathematics education is more important than others. Much software is developed for visual learning mathematics, but there is a great need for problem-based systems. This is more visible, due to the increasing proliferation of e-learning education. On the other hand, first degree equations are a uniquely important topic in high school and collage algebra classes, for the simple reason that mastery of a preponderance of later topics requires a student's ability to solve these equations. Such topics include absolute value equation, equation containing fractions, radicals, and an abundance of applications. Proficiency at solving first degree equations in one variable is literally essential to success in an algebra class. Students often do not clearly understand the concepts of these topics and make mistakes when they write homework's or use these concepts in the other topics. In order to help the students to learn these concepts by solving problems, we have proposed a system that generate problems and evaluate learner's answers. In this paper we propose a methodological approach for automatic solving of mathematical equations, especially in terms of the first degree equations in one variable, with the aim of the practicing of mathematics subjects, by using of Computer Algebra System (CAS) tools. The paper also addresses some specific fields such as the simplification and automatic production of mathematical equations.

Key words: First-degree equation, Problem-based learning, Computer Algebra System, Problem generator, Problem solver

INTRODUCTION

According to the research conducted, it can be argued that the problem-based learning is more effective than traditional learning, and increase students' ability to solve the problems (Farnsworth 1994) On the other hands textbooks cannot be suitable as a source of questions, because they are limited, and not Interactive. Also, textbooks do not usually solve the problem step by step and don't have appropriate visual features for motivation. In these resources, often there aren't facilities for on line helps to students. Therefore, Use of information and computer-based technologies in education, specially physics (e.g.,CAPA) (Kashy et *al*. 1993), mathematics (e.g., Mathway) (Dragon, T et *al*. 2013; Gutierrez-Santos S. et al. Oct.-Dec. 2012) or electronics (e.g., CHARLIE) (Barker, 1997) is widespread. Also can be seen that emerged systems for generating and solving the questions (Wolfram 2011, Bridgeman et *al*. 2000;May 2000; Baldwin, 1996)

Also, due to the importance of mathematical education and necessity to produce numerous questions on different topics in this suject, the importance of using Computer Algebra System (CAS) in this section can be shown. Creation infrastructure for the production of educational software in mathematics, studies on this type of software production methods and production and implementation of software for mathematics education is the future cases that should be considered by such topics scholars.

In this article, we will describe a system that is designed to teach the first degree equations in mathematics. This system has two parts: Tutorial and Test, and with taking deferent levels generate any questions automatically and gives to users. Step-by-step solving of generated problems, and guidance to the user, in order to correctly solve the problem are the other facilities of this system.

We used java programming language in design of our system. Because of this language is independent from operating systems and can be used in all devices and even the Internet. Also we used JavaCC for parsing of mathematical expression. The proposed system can be used as part of the personalized educational system or used in the e-learning systems as a tool for practice and self-examination.

In the next sections we will discuss more about methodology and generate of first-degree equation parse tree using JavaCC. Also we will dedicate to our automatic procedure for generating first-degree equations. Then, we demonstrate the user interface and educational plan for our proposed method.

METHODS

Proposed Method

For implementation of proposed system, the following three sections will be designed

- Production of first-degree equations
- Solving of first-degree equations
- Designing of User Interface and Appropriate Plan

Equations should be randomly generated with considering level of difficulty in its. Also, for obtaining the result of equation and to get a user guide, we need to create parse tree and automatically solving by the computer. Below, each of the sections will be explained in detail.

Equation Generation

Discussed system generates an equation as a binary tree. The terminal nodes of the tree contain *Num* or *Var* operands and non-terminal nodes contains *Plus* or *Times* operator. Algorithm of tree generation is recursive and based on grammars that shown in list1.

S → E = E
E → E + E | Num | Var
E → E * E´ | E´ * E
E → (E)
E´ → E´ + E´ | E´ * E´ | Num
E´ → (E´)
Num → $[0\text{-}9]^*$
Var → ´x´

List1. CFG Grammar for First degree Equation Generation

Using the rules in list1, we can obtain infinite equation. Figure 1 show one example of generated equation in tree structure.

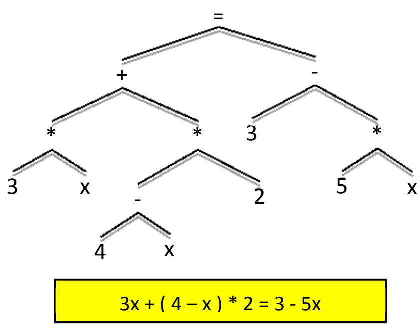

Figure 4 Example of an equation that generated by grammar in list1

According to rules of grammar in list1, the size of generated equations is purely randomly and may be very long. To solve this problem, we can be assigned a certain value as probability for each rules of grammar. The value of some rules will be increase or decrease associated with the level of nodes in tree. Qua the probabilities of terminal nodes will be increased and the probabilities of non-terminal nodes will be decreased. Thus with increasing the size of tree, probabilistic of generating terminal node will be increase too.
Notice that, to generate equations with specefic complexity, we can use parameters for increase/decrease of probabilities amount. Thus in system we can get degree of difficulty from users and generate desired equations.
Generated equation can be stored in a database or displayed to the user. For obtain the string of equation from tree, we must be traversed tree in in-order like fashion. Consider that the equation is evaluated by traversing of

original tree thus we should have already saved a copy of the tree. Also, the intermediate results are stored in the nodes of the tree and used to check the user's answer. The x-coordinate of the operands are also stored in the nodes, and are used to verify the under braces in user's answer.

Equation Solving

In this paper, a CAS-like system is presented for the step-by-step solution of problems. The core calculation mechanism of the system, which is based on symbolic calculation techniques, can be coded by using a Java-like programming language. The input data of the system are textual expressions used for the representations of mathematical problems, which can be parsed via a compiler-compiler tool such as JavaCC.
In this paper we present a method to calculate the first-degree equation symbolically by using the common tools of compiler designs as well as utilizing the CAS methods. Before addressing how it is done, however, first the equations received from the user should ideally be examined in terms of the verified entry (the rules related to a first-degree equation) and the resulting process should be transformed to a tree structure known as parse tree. Therefore, we examine the suggested system in separate phases with the following:

Parse Tree Construction

The general form of an expression is grammatically defined using a context-free grammar (CFG). Since JavaCC generates LL (k) parsers, this grammar must be LL (k) one. The design of a scanner and parser is based on the lexical and phrase structure of mathematical expressions. Thus, a CFG grammar is developed to recognize and parse such equations. In addition to the form of the input data the grammar must also represent the appropriate priority level and associativity of operators. This task is followed by the conversion of the grammar to the LL(k) one. The resulting LL(1) grammar is shown in Table 1.
A scanner splits the input data into a sequence of tokens which are the atomic parse elements of that input data.

Table 1: An LL (1) grammar for first-degree equations.

Rule	Method
S → E "=" E $	parse()
E → ("+" | "-")? T E´	expr()
E´→ ("+" | "-") T E´| λ	
T → Num ("x")? | "x" (Num)?	term()
Num → (D)+ ("." (D)+)?	
D → ["0"-"9"]	

Simplification

The next task is the simplification of the resulting tree, which is one of the most important and underlying operations in symbolic computation systems. This has many difficulties in the implementation because some concepts of simplification are naturally challenging. For example, responding the question "which of the states shown in the following figure is simplified?" justifies this claim.
In this step, reusing the tree obtained from the previous step, all nodes associated with the tree are visited again; this time the simplification operations are performed for every node. For example, if visited node has an operator +, which is connected to two child nodes with numbers, the sum of these two numbers are returned as the simplified form of the node. The Figure 2 represents this example.

```
if OpNode instanceof Pluse then
If RChild and LChild instanceof Num then return Num(RChild.val()+LChild.val())
End if
```

Fig. 2 Pseudo-code for a node with two *Num* child

In the above state, if both child nodes are of the same variable, the addition operation can be done as Figure 3. Note that, in the Figure 3 pseudo-code, the class *Var* is used as a variable, and the coefficient of variable x is placed inside the *Var* objects. For example, *Var*(3) is used to represent the expression 3*x. The simplification stage can encounter some particular expressions. To illustrate this, let us consider more complex expressions represented by a tree such as

Plus(*Var*(5), *Plus*(*Num*(3),*Var*(2)))

The represented expression is 5*x+3+2*x. Since the child nodes are not of the same type, the parent one is not able to simplify, while the expression is equivalent to the simplified one 7*x+3, represented by

Plus(*Var*(7),*Num*(3)). This problem can be resolved by the transformation of the binary tree into multiple one and then applying the simplification. Figure 1 shows the case graphically. In this way, the simplifying function can generate the simplest form of the expression.

```
if OpNode instanceof Plus then
   If RChild and LChild instanceof Num then
 return new Num(RChild.val()+LChild.val())
   If RChild and LChild instanceof Var then
      return new Var(RChild.val()+LChild.val())
End if
```

Fig. 3: Pseudo-code for a node with two *Num* or *Var* Child

Presentation function

At the each stage, the equation tree should comprehensively and suitably be transformed to a mathematical expression to be represented. For this, a function should be designed that takes a tree as an input and then returns a mathematical expression related to that tree as a string. Performed by using the concepts of classes and recursive calling, by meeting every node and depending on the operator type of the node, this function generates and returns appropriate strings. Of course, it should be noticed that for representing mathematical expressions, the appropriate use of parentheses is of specific importance, which should specifically be considered in the design of the function.

First-Degree Equation Calculator

In this step, having the underlying function, a tree related to the first-degree equation solution can conveniently be created. Figure 4 show a flowchart for first-degree equation solving.

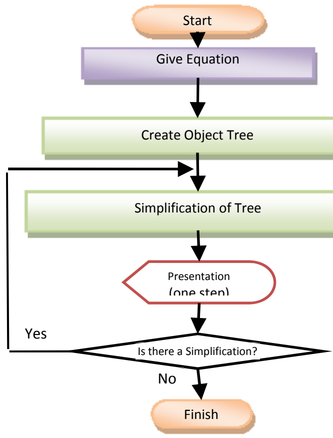

Fig. 4: Flowchart for First-Degree Equation Solving

According to the flowchart above, having received an equation from the user and having generated an initial parse tree, the simplification and presentation function must be called in each round of loop. Thus we can show step-by step solution of equation (one step in each cycle).

User Interface and Educational Plan

The user interface of proposed method can be allows the user to choose from different levels of difficulty and system will be generate equation based on specific level. The default is intermediate level of difficulty. Our system presented an equation that generated based on user's preference of difficulty. The user is expected to solve the equation by specification and writing intermediate results. Entered intermediate answers will be evaluated by system and feedback will be display properly. To obtain appropriate results, the user may enter either the tutorial or test mode to solve the presented equation.

Tutorial Mode

In this mode, the user may operate by repeatedly clicking on the "Next Step" button. On each click, system displays a step of solution followed by the result of one simplification. Therefore, the user can observe the sequence in which equation is solved, and learn this subject.

Test Mode

In this mod, the user in order to solve the problem must enter intermediate results as describe before. The user may have her/his answer checked at any stage of solving the problem. Each stage of answer will be evaluate by system and provide a feedback to user. And if the answer is correct, user can be continuing to her/his task otherwise this stage should be repeated by user.

CONCLUSION

In this work, a CAS-based system was developed for teaching and automatically solving problems related to first-degree equation . By the step-by-step representation of a problem, students can be helped to learn this mathematical subject. Also, the possibility of generating different solutions to a problem and automatically generating a similar new problem to the problem solved can improve students, learning capabilities. So, students will be able to automatically access the infinite number of questions, without spending cost and time, and observe their different solutions step by step. This feature helps them increase their ability to solve a problem, and prepares them for tests. On the other hand, utilizing the system teachers will be able to produce and use diverse questions based on templates designed for each grade, saving time.

sibel.yesildere@deu.edu.tr

ABSTRACT: The present study reports on middle school mathematics teachers' views about teaching generalization of number patterns. Teachers' approaches to teach generalizing and their point of views on using strategies were also examined. Interviews were conducted with sixteen middle school mathematics teachers. Data qualitatively analyzed in terms of Radford's (2008) architecture of algebraic pattern generalization theoretical framework. Analysis of the data indicated that teachers' uses of representations were not effective and teachers' subject matter knowledge on generalization of number patterns is weak. It was found that teachers' commonly used strategy is trial-error. Findings also suggest that although teachers' mostly use strategies and examples in teaching process, they did not use them in order to develop students' understanding, mathematical thinking and reasoning.

Key words: generalizing number patterns, task design, task implementation

INTRODUCTION

Attention to patterns is acknowledged in its importance as an introduction to algebra (Zazkis and Liljedahl, 2002), hence constructing a conceptual understanding in students' minds is crucial. Because teaching the generalization of number patterns requires both to have specialized subject matter knowledge and purposefully constructed teaching approaches, it could be useful to use tasks within a pedagogy including the meaningful use of representations (Yesildere-Imre and Akkoc, 2012). Here one crucial aspect is the 'didactical aim' and 'pedagogical means' of the teaching process. According to Berg (2009) didactical aim is "the choice of a particular area or knowledge target within a subject-matter", and pedagogical means refers to a task "to use in order to address the chosen didactical aim" (p.100). For example, a didactical aim could be "to generalize a number pattern" and it is possible to find many different tasks used as pedagogical means to achieve this didactical aim (Berg, 2009).

Present study focuses on these both aspects of teaching generalizing number patterns process: subject matter knowledge and teaching approaches. Investigation conducted in terms of (a) teachers' subject matter knowledge about number pattern generalization and (b) teachers' pedagogical content knowledge of teaching generalization of number patterns. This will be done by relying on the theoretical framework of Radford (2008) which will be discussed in the next section.

Theoretical Framework: Algebraic Pattern Generalizations

Radford's (2008) theoretical approach to algebraic pattern generalization arose in the course of a longitudinal classroom-based research which is conducted in the 1990s. He suggested that generalizing a pattern algebraically rests on the capability of grasping a commonality noticed on some particulars (say $p_1, p_2, p_3, \ldots, p_k$); extending or generalizing this commonality to all subsequent terms ($p_{k+1}, p_{k+2}, p_{k+3}, \ldots$), and being able to use the commonality to provide a direct expression of any term of the sequence (Radford, 2006). Figure 1 summarizes the architecture of an algebraic generalization of patterns.

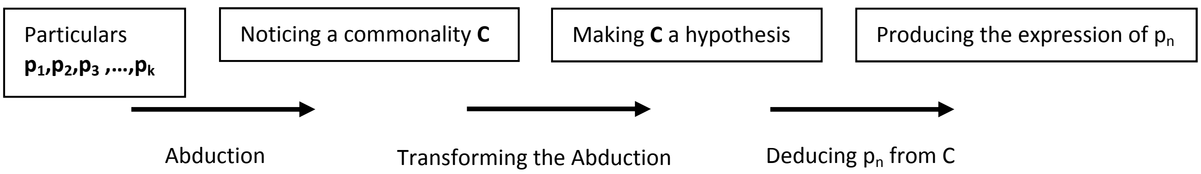

Figure 1. The architecture of algebraic pattern generalizations (Radford, 2008)

The architecture of algebraic pattern generalization framework helps us to distinguish it from other strategies that students often use to deal with patterns; In particular, it is possible to distinguish between algebraic and arithmetic generalizations of patterns (Radford, 2008). Radford underlines two other strategies that are use to generalize number patterns; arithmetic generalization and naive induction. He explains these two strategies as follows: "Arithmetic generalization comes into play when students focus on the increase in consecutive numbers or expressing the relation between the terms of the pattern with numbers. If the abductions did not lead to a rule produced by a generalization, but a rule obtained by induction, i.e. a procedure based on probable (or likely) reasoning and whose conclusion goes beyond what is contained in its premises, this type of induction is called naive induction." In line with this framework, middle school mathematics teachers' approaches in order to teach generalizing number patterns were examined through three strategies; algebraic generalization, arithmetic generalization and naive induction.

METHODS

Qualitative research method was employed for this research. Interviews were the main technique. Primary mathematics teachers participated face to face interviews. Interviews were designed to explore teachers' subject matter knowledge about number pattern generalization and pedagogical content knowledge of teaching generalization of number patterns. Each interview was conducted at participant teacher's school. All interviews were audio-taped and transcribed.

Participants

Sixteen primary mathematics teachers were agreed to be interviewed. The teachers had diverse backgrounds in terms of their experience as teachers. Their professional experiences were shown in Table 1.

Table 1. Classifying the participants according to experience as teachers

Less Than 15 Years	More Than 15 Years
K_5 K_6 K_7 K_8 K_9 K_{10} K_{13} K_{14}	K_1 K_2 K_3 K_4 K_{11} K_{12} K_{15} K_{16}

Data Analyses

Data analyses consisted of coding the interview transcripts. Teachers' views were indentified and categories were proposed. The categories for number pattern generalization included teaching approaches, knowledge of students' misconceptions, the importance given to number patterns, knowledge of teaching and subject matter knowledge. In the next section findings about teachers' views and teaching approaches will be discussed around the consisted categories.

RESULTS AND FINDINGS

Mathematics teachers' views are presented in terms of three categories: (i) teaching approaches (ii) knowledge of teaching (iii) subject matter knowledge. The categories and sub-categories are shown in table 2.

Table 2. The Views About Number Patterns and Teaching Generalization of Number Patterns

Categories and Sub-categories		Participants	f
Teaching Approaches	Teaching with Different Strategies	K_1 K_2 K_3 K_4 K_5 K_6 K_8 K_{10} K_{11} K_{12} K_{13} K_{14} K_{15} K_{16}	14

	Teaching with Multiple Representations	K_1 K_2 K_3 K_4 K_6 K_8 K_9 K_{12} K_{13} K_{14}	10
	Giving the Rule	K_1 K_9	2
Knowledge of Teaching	Effective Use of Multiple Representations	K_{13}	1
	Ineffective Use of Multiple Representations	K_2 K_3 K_4 K_6 K_8 K_9 K_{12} K_{14}	8
Subject Matter Knowledge	Sufficient	K_6 K_{10} K_{13}	3
	Insufficient	K_3 K_5 K_{13} K_{16}	4

Teachers have a variety of views about how instruction should take place and how generalization of a number pattern should be taught. These opinions are examined in detail below.

Teaching Approaches

As seen in table 2, participants' teaching approaches gathered around four sub-categories: (i) teaching with different strategies, (ii) teaching with examples (iii) teaching with multiple representations (iv)giving the rule. Teachers rarely preferred to give the rule in teaching process, rather they mostly preferred to teach with strategies and representations. They also tend to teach with examples in which also naive induction strategy is utilized.

As stated before, middle school mathematics teachers' approaches in order to teach generalizing number patterns were examined through three strategies in line with the theoretical framework; algebraic generalization, arithmetic generalization and naive induction. It was seen that teachers frequently used arithmetic generalization and naive induction rather than algebraic generalization. Only one of the participants (K_{13}) used algebraic generalization as a strategy. Most of the participants (for example K_5) claimed that naive induction could be the only way to generalize a number pattern:

"... students' computation ability must be very fast and practical to generalize a number pattern. He or she must examine the numbers and understand the relationship between numbers immediately by practicing a lot".

Some teachers (for example K_8) claimed that students need to examine the relationship between consecutive numbers in a pattern with trial and error strategy. This approach leads to use arithmetic generalization and naive induction strategies:

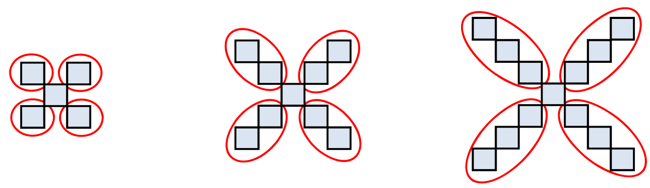
"... students must be encouraged to investigate the relationship between consecutive numbers. I tell my students to add or multiply or subtract or divide numbers to find the number in the pattern."

Most of the teachers stated that it is useful to use multiple representations in teaching process. They usually used table and pictorial representations of the number patterns.

In brief, teachers' one of the approaches for teaching generalization of number patterns were arithmetic and this kind of generalization was not of an algebraic in nature (Radford, 2008). The other approach is naive induction, in which abductions were mere guesses. In other words abductions did not lead to a rule by a generalization, but a rule obtained by induction (Radford, 2008).

Knowledge of Teaching

The use of multiple representations was the main strategy pointed both in primary mathematics curriculum and textbooks. Therefore teachers' knowledge of teaching was determined in terms of the use multiple representations. Teachers were expected to use any representation in the way of supporting students' algebraic thinking. See the pictorial representation shown in figure 2.



(1+1+1+1)+1 (2+2+2+2)+1 (3+3+3+3)+1 ... (n + n + n +n)+1

Figure 2. Finding the Rule of The Pattern of 5, 9, 13, ... with Pictorial Representation

We could find the rule considering the representation and Radford's framework Here a commonality C was inferred from a few particular cases. Then, this commonality was generalized to the rest of the terms of the sequence. Next, the abduction C became an hypothesis and then the rule (n + n + n + n) + 1 was calculated.

It was found that seven of sixteen teachers did not use either table or pictorial representations. It was also seen that teachers who used pictorial representations in their lessons did not aware of the potential of the representations. They usually preferred to use them just for counting and determining the number pattern or visualization. One of the teachers (K_9) said:

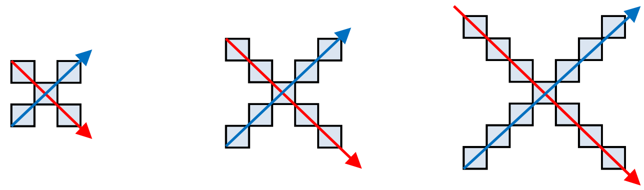
"*...students complete the pattern and have fun. So the lesson becomes more visual and joyful.*"

Only one teacher (K_{13}) effectively used the pictorial representation at all:

"*Students could easily transfer from pictorial representations to algebraic rule. I encourage students to examine pictorial representation and find a common point. According to me it is important to use pictorial representations which helps students to see the relationship between models and transfer this relationship into algebraic rule.*"

Subject Matter Knowledge

Although we did not ask any question regarding generalizing a number pattern directly, we could decide some teachers' (seven of sixteen) subject matter knowledge from their words during interviews. Four of seven teachers were insufficient subject matter knowledge. One of the misconception teachers have is the idea of there is only one way to represent a number pattern algebraically. Apparently we could also find another rule shown in figure 3.



(2.1+1) + (2.1+1) -1   (2.2+1) + (2.2+1) -1   (2.3+1) + (2.3+1) -1   ...   (2.n+1) + (2.n+1) -1

Figure 3. Different Rule of the Pattern of 5, 9, 13, ...

Although both expressions are algebraically equal, emphasizing the variety of rules helps students to develop algebraic thinking. Teachers also stated that the only strategy to find the algebraic rule of a number pattern is 'just keep trying' which leads either arithmetic generalization or naive induction.

CONCLUSION

As was described before, this study reports on middle school mathematics teachers' views about teaching generalization of number patterns. We concluded that teachers rarely preferred to give the rule in teaching process, rather they mostly preferred to teach with strategies, examples and representations. However they did not use pattern-specific strategies and encouraged students to make arithmetic generalization or naive induction. This approach may emanate from their lack of subject matter knowledge because it was also seen that they also use these strategies when it comes to find the rule of a pattern by themselves. Seven of the teachers who participated in the study used pictorial representations in their lessons did not aware of the potential of the representations. They usually preferred to use them just for counting and determining the number pattern or visualization.

RECOMMENDATIONS

In our study we found that teachers appeared to teach with notions, however algebraic pattern generalizations are not characterized by the use of notations (Radford, 2008, p.93). Because of lack of subject matter knowledge, teachers usually employ trial-and-error and finite differences as strategies which were also common misconceptions of students reported in literature (Rossi, Becker & Rivera, 2006). In terms of teaching generalization of number patterns, teachers need to deepen their understanding and appreciations of the use of representations.

ÖZET: Batarya Elektrikli Taşıt (BET) teknolojileri, günümüzde en hızlı gelişen alanlardan birisidir. İnovatif, ekolojik, teknolojik, ekonomik ve sosyal katma değeri yüksek olan BET alanında; yüksek verimli, sürdürülebilir, bilgi ve iletişim teknolojilerini aktif olarak kullanan bir eğitim programı/platformu oluşturulması gerekmektedir. AB destekli VEMEV projesi kapsamında, ilköğretimden doktora seviyesine kadar, örgün, yaygın, e-öğrenme ve mobil-öğrenme araçlarını kullanacak eğitim-öğretim platformu oluşturularak, pilot uygulamaları gerçekleştirilmektedir. BET alanı, makine, elektrik, elektronik, bilgisayar mühendislerinin, fizikçilerin, kimyacıların, endüstrinin ve yatırımcıların birlikte çalışmalarını gerektirir. BET teknolojisindeki hızlı gelişme eğitim-öğretim alanında da paydaşların altyapı, uygulama ve deneyim paylaşımını zorunlu kılmaktadır.

Bu makalede çok disiplinli BET alanında "entegre/bütünleşik" bir eğitim-öğretim programı ortaya çıkarmak için temel bilgilerinin anlaşılmasından, uygulanmasına, daha ileri düzeyde araştırılmasına ve geliştirilmesine yönelik modüler bir program önerilmiştir. Çalışmada, BET alanında farklı aktif öğrenme teknikleri ve öğretim stratejileri incelenmiş, karşılaştırılmış, tartışılmış, bütünleştirilmiş, sürekli iyileştirilmeye, güncellenmeye ve geliştirilmeye açık aktif bir eğitim-öğretim program mimarisi sistematik olarak sunulmuştur.

Anahtar sözcükler: Batarya Elektrikli Taşıt, Mesleki Eğitim ve Öğretim Programı, Otomotiv Endüstrisi

ABSTRACT: Battery Electric Vehicle (BEV) technologies field is one of the fields that is rapidly developing in today's world. In the field of BET having high innovative, ecological, technological, economic and social added value; an education program/platform that actively uses the highly efficient, sustainable information and communication technologies must be developed. Within the scope of EU supported VEMEV project, an education platform that uses the formal, non-formal, e-learning and mobile learning tools are being formed from the primary school to the doctorate level and the pilot implementations are being realized. The field of BET requires the cooperation of machine, electric, electronic, computer engineers, physicians, chemists, industry and the investors. The rapid development in BET technology entails the substructure, implementation and experience sharing of the stakeholders in the education platform.

In this article, a modular program has been recommended from the understanding of the basic information to their implementation, advanced level of research and improvement for the purpose of revealing an education and training program that is "integrated" in the field of BET. In the study, different active learning techniques and educational strategies in the field of BET have been reviewed, compared, discussed, and an active education program architecture open for integration, continuous improvement, update and development has been presented systematically.

Keywords: Battery Electric Vehicle, VET, Automotive Industrie

GİRİŞ

Batarya Elektrikli Taşıtlar

Batarya Elektrikli otomobil benzinli otomobilden çok daha önce üretilmiş ve kullanılmıştır. İlk ticari batarya elektrikli otomobil 1834 yılında Tomas Davenport tarafından geliştirilmiştir (Şekil 1.). 1876 yılında Otto çevriminin bulunması ve Ford Model T'nin ve elektrikli marş motorunun piyasaya çıkması ile içten yanmalı motorlu taşıtlar, elektrikli taşıtların yerini almıştır. Uzun dönem boyunca yoğun çalışma yapılmayan bu teknoloji alanında; yarı iletken teknolojisine dayalı bileşenlerin üretilmesi ve sürekli gelişmesi, yeni enerji depolama teknolojileri, sofistike malzemeler, ileri modelleme ve simülasyon teknikleri, karmaşık kontrol algoritmalarının gerçek zamanlı uygulanması, güç elektroniği ve motor tahriki alanının yeterli olgunluğa ulaşması gibi nedenlerle, 70'li yılların başında daha güçlü bir şekilde yeniden popüler olmuştur. Bu gelişmelerde enerji verimliliği yüksek bir ulaşım aracı geliştirmeye kendini adayan fizik, kimya, matematik, makine, bilgisayar, elektrik ve elektronik uzmanlarının çabaları çok önemlidir. 2010 yılından itibaren Avrupa Birliği ve ABD'deki emisyon standartlarındaki katı kurallar, BMW, Renault, Ford, GM, Toyota gibi global üreticilerin elektrikli taşıt üretimine yeniden başlamalarına neden olmuştur.

Şekil 1. Elektrikli Taşıtlarda İlk Ve Güncel Örnekler.

Batarya Elektrikli Taşıt Mimarisi ve Temel Bileşenleri

Genel olarak elektrikli araçların mimarisi İçten Yanmalı Motorlu (ICE) ve Hibrit (HEV) taşıtlara göre göre oldukça basit ve sadedir. BET temel bileşenleri; Sürüş elektrik motoru, Yüksek voltajlı sürüş bataryası (enerji depolama birimi), Batarya yönetim sistemi, Dahili şarj ünitesi, Kontrol ünitesi, DC/DC ve DC/AC dönüştürücüler, Güç aktarma organları (opsiyonel), Düşük voltajlı yardımcı batarya (genellikle 12V) ve Diğer konvansiyonel taşıt bileşenleri (klima, konfor, multimedya, güvenlik vb.) şeklinde tanımlanabilir.

BATARYA ELEKTRİKLİ TAŞITLAR ALANINDA MESLEKİ EĞİTİM-ÖĞRETİM PROGRAMI

Mevcut eğitim-öğretim programları

Bu çalışmada taşıtın ihtiyaç duyduğu enerjinin tamamının taşıt üzerindeki bir enerji depolama biriminden (bataryadan) karşılandığı "Batarya Elektrikli Taşıt (BET)" eğitim ve öğretim programları incelenmektedir. BET'ler sağlık, ekoloji, ekonomi ve enerji güvenliği açısından oldukça verimli çözümler sunmaktadır. Bu taşıtların gelecekte önemli bir rol oynayacağına şüphe yoktur ve özellikle ekonomik ve endüstriyel sektörlerde büyümeye devam etmesi beklenmektedir. Batarya Elektrikli Taşıtların sahip olduğu öneme rağmen dünya genelinde, elektrikli araçların, şarj altyapısının tasarım, üretim, bakım ve onarımında rol alan tüm alanları tek bir öğretim programında sentezlemeye çalışan, çok az sayıda eğitim ve öğretim programı bulunmaktadır. Günümüzde özellikle ABD'de BET alanında geliştirilmiş ve uygulanan farklı eğitim-öğretim programları bulunmaktadır. Bu programların büyük çoğunluğu lisans ve yüksek lisans programları şeklindedir. 2010 yılına kadar çok sayıda disiplini barındıran elektrikli taşıt alanı, elektrik makineleri, güç elektroniği, enerji, kimya mühendisliği ve mekanik tasarım alanında alınan eğitim ve öğretim programlarının izole edilmiş bir uygulaması olarak değerlendirilmiştir. Bu bakış açısının sonucunda yüksek verimli BET geliştirme potansiyeli ve daha uygun maliyetli çözümler eksik kalmıştır. Bu olumsuz sonuçta eğitim ve öğretim programlarındaki noksanlıktan kaynaklanan deneyim ve uzmanlık yetersizliği büyük rol oynamaktadır. Bu çalışma BET'lere yönelik bütünleşik eğitim-öğretim programları konusundaki güncel çalışmaları ve VEMEV projesi kapsamında geliştirilen yeni önerileri kapsamaktadır.

VEMEV Eğitim-Öğretim Programı

Program hazırlama her eğitim-öğretim kurumun temel unsurlarından birisidir ve oldukça kapsamlı bir çalışmadır. VEMEV projesi kapsamında, BET'lere yönelik bütünleşik bir eğitim-öğretim programı ortaya çıkarmak için farklı aktif öğrenme teknikleri ve öğretim stratejileri incelenmiş, karşılaştırılmış, tartışılmış, bütünleştirilmiş, sürekli iyileştirilmeye ve geliştirilmeye açık bir program mimarisi oluşturulmuştur.

Mesleki eğitim-öğretim programlarının düzenli aralıklarla gözden geçirilmesi, güncellenmesi gereken aktif yapısı; küreselleşme, finansman imkanları, bilgi teknolojisi ve kaynak sınırlamasındaki gelişmelerden zamana bağlı olarak etkilendiği unutulmamalıdır. Yüksek verimli, değişikliklere adapte olabilen ve sürdürülebilir bir program mimarisinin oluşturulması oldukça önemlidir.

Programda sorgulamaya dayanan öğrenmeyi temel alan öğretme modeli ve aktif öğrenme teknikleri önerilmektedir. Sorgulama süreci araştırmak, keşfetmek ve sonuç olarak daha üst seviyede bilgiye ulaşmayla ilgilidir. Program aşağıdaki temel adımlar izlenerek oluşturulmuştur:

- Batarya Elektrikli Taşıtlarla ilgili "genel bilgi ve deneyim" alanlarının tanımlanması,
- Ulusal (MYK), Avrupa Birliği ve Uluslararası mesleki standart ve yeterlilik tanımlamaları dikkate alınarak program seviyelerinin tanımlanması,
- Her bir seviye için meslek tanımının yapılması,
- Seviyelere başlama ve seviyeler arasındaki geçişlerin "modüler" olarak tanımlanması,
- Batarya Elektrikli Taşıtlarla ilgili seviyelere uygun meslek standartlarının oluşturulması,
- BET'lerle ilgili meslek standartları esas alınarak mesleki yeterliliklerin oluşturulması ve
- Ayrıca her bir seviyenin; hedefleri, ön şartları, gereklilikleri, beklenen sonuçları ve genel önerileri verilmektedir.

Genel Alan Bilgisi

Günümüzde, batarya elektrikli bir taşıtın tasarım ve üretimi makine, elektrik, elektronik, bilgisayar mühendislerinin, fizikçilerin, kimyacıların, endüstrinin ve yatırımcıların birlikte çalışmalarını gerektirir. Klasik otomotiv teknolojisindeki mekatronik uygulamaları dikkate aldığımızda, elektrikli taşıtlar için bu tanımlamayı sürüş bataryasının öneminden dolayı kimekatronik (chemimechatronic) bir sistem olarak tanımlanabilir. Batarya elektrikli taşıtlar konusunda hazırlanacak eğitim ve öğretim programlarında, öğrencilerin aşağıdaki alanları (Tablo 1.) içeren, uygulamalarda kullanabilecekleri bilgi ve deneyimlere sahip olmaları hedeflenmelidir:

Tablo 1. BET genel bilgi ve beceri alanları.

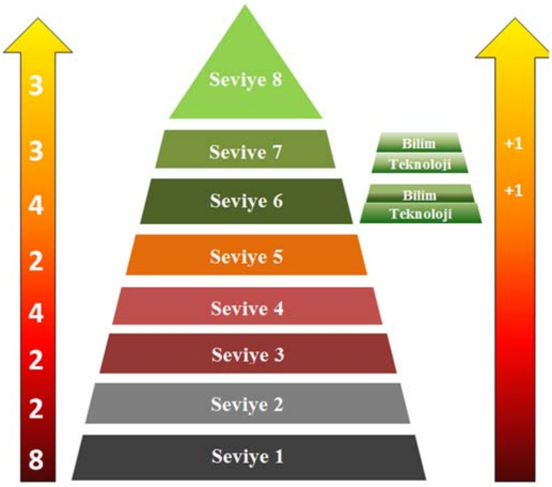
Program Seviyeleri

Kişiler, ilk eğitim-öğretim döneminde okuma yazma, temel hayat bilgi, beceri ve yeterliliklerini kazandıktan sonra bilgi veya beceri ağırlıklı alanlara yönelirler. Bilgi ağırlıklı yönelimler öğretim, beceri ağırlıklı yönelimler eğitim kapsamında değerlendirilebilir. Bu iki alan arasında kesin çizgiler oluşturmak ve tanımlamak mümkün değildir. Fakat tasarlanan ve uygulanan programlar zaman içerisinde eğitim/beceri veya öğretim/bilgi formasyonlarının gelişimini belirler. Verimli bir kariyer gelişimi için ilk eğitim-öğretim tamamlandığında yönelimlerin ana hatları ile belirlenmiş olması gerekir. Burada kişi alan seçimi yaparak pratik beceri ağırlıklı mesleki eğitime veya teorik bilgi ağırlıklı öğretim hayatına devam eder. Bu temel seviyeler (Şekil 2) arasında her zaman geçiş mümkündür. Günümüzdeki ekonomik, teknolojik, sosyal ve kültürel gelişmeler, bu alanda insan hakları açısından önemli olanaklar sunmaktadır. Mesleki kariyer basamaklarında önemli bir alanda seviyeler arasındaki iletişimdir. Pratik beceri ağırlıklı eğitim almış bir teknisyen ile bilgi ağırlıklı öğretim almış bir mühendis arasında mesleki iletişim problemleri yaşanmaktadır. Birçok ülkede bu iletişim problemlerinin çözümüne yönelik olarak meslek yüksek okulları gibi ara eleman seviyeleri oluşturulmuştur.



Şekil 2. Mesleki eğitim-öğretimde seviyeler, önerilen süreler ve alt tanımlamalar.

Öğrencilere ilk dönemlerde daha ileri düzeydeki derslerde kullanacakları temel bilgiler verilmektedir. Bu dönemde verilen derslerin alınması ve yeterliliklerin sağlanması zorunludur. Eğitim programının iyi bir şekilde uygulanması için ilgili alanının izole edilmiş gerekli bilgilerinin, zorunlu ders verilerek denenmesi gerekmektedir. Bu akademisyenin ve eğitimcinin gelişmesi açısından da önemlidir.

Zorunlu dersin ana fikri;

- Mesleğin öğrenilmesi, uygulanması ve geliştirilmesi için gerekli temel bilgi ve becerilerin verilmesi,
- Güncel bilimsel ve teknolojik bilgi ve becerilerin verilmesi,
- Ulusal, bölgesel ve uluslararası mesleki tanınırlığın sağlanması ve

İzleyen dönemlerde zorunlu derslerle birlikte seçmeli derslerde sunulmaktadır. Öğrencilin istediği seçmeli dersi alabilmesi için bu ders için hazırlanmış e-öğrenme içeriklerinden hazırlık aşamasında başarılı olma zorunluluğu önerilmektedir.

Seçmeli dersin ana fikri;

- Öğrencinin BET ile ilgili özel alanlarda, daha detaylı bilgi ve deneyim ihtiyacının karşılanması,
- Özel alanlardaki güncel bilimsel ve teknolojik eğilimlere yönelik, meslek seviyesine uygun yeterliliklerin sağlanmasıdır.

Mesleki eğitim-öğretim programlarının son dönemlerinde genellikle mesleki gelişim için ders ve uygulamalar (laboratuvar, atölye vb.) yer almaktadır. Burada temel hedef öğrencinin katılacağı endüstriyel uygulama programlarındaki anlama, öğrenme, kavrama, uygulama kısacası başarı düzeyini artırmaktır. Mezuniyetten önceki dönem endüstriyel uygulama programları ağırlıklıdır. Bu ortak çalışma deneyimi öğrencilere, uzmanlaşma tercihini daha iyi yapabilmeleri için gerçek yaşam deneyimi kazandıracaktır. Ayrıca öğrencilerden gelen en son teknolojik gelişmeler hakkındaki geri beslemeler, akademik çevrelerde piyasa ihtiyaçlarının daha iyi anlaşılmasını sağlayacaktır.

Yeterlilik Kod Anahtarı

Mesleki seviye, ölçek değeri, yeterlilik kod anahtarı ve BET alanı ile ilgili örnek tanımlamalar Tablo 2'de verilmiştir. Bu tablo alan bilgisi, becerisi ve yeterliliklerle ilgili tanımlamalarda program yapıcılara büyük kolaylıklar sağlamaktadır. Bu tablonun hazırlanmasında Yenilenmiş Bloom Taksonomisi'nden ve Avrupa Mesleki Yeterlilikler Çerçevesi dokümanlarından faydalanılmıştır.

Tablo 2. Yeterlilik Kod Anahtarı

İŞ/GÖREV SEVİYELERİ	ÖLÇEK DEĞERİ	YETERLİLİK KOD ANAHTARI	YETERLİLİK ÖRNEKLERİ
YETKİNLİK	1	**Çalışan işi doğrudan gözetim altında belirli kurallarla tanımlanmış şekilde yapabilir.** İşin basit bölümlerini yapabilir. İşin büyük bir bölümünü nasıl yapılacağının söylenmesi veya gösterilmesi gerekir. (Son derece kısıtlıdır)	**Meslek öncesi yeterlilikler (İlköğretim Dipl.).**
	2	**Çalışan işi gözetim altında sınırlı özerklik ile yapabilir.** İşin büyük bölümünü yapabilir. Sadece zor bölümlerde yardıma ihtiyacı vardır.	**Temel mesleki yeterlilikler (Yaygın eğitim sertifikası).**
	3	**Çalışan görevlerin tamamlanmasıyla ilgili sorumluluk alır ve problemlerin çözümünde kendi davranışlarını ortama uyarlar.** İşin bütün bölümlerini yapabilir. Sadece bitmiş işin kontrolü gerekir.	**Yarı-yetkin ara eleman yeterlilik. (Yaygın eğitim sert.).**
	4	**Çalışan çoğunlukla öngörülebilir, ancak değişime tabi olan bir işi yaparken öz-irade kullanır. İş faaliyetlerinin değerlendirilmesi ve geliştirilmesi için bir miktar sorumluluk alarak diğerlerinin (alt seviyedekilerinin) rutin işlerini denetler.** Bütün işi doğru bir şekilde yapabilir. Başkalarına işi nasıl yapacaklarını söyleyebilir veya gösterebilir.	**Tam yetkinliği olan ara eleman yeterlilikleri (Yaygın eğitim sert., Meslek Lisesi Dipl.).**
	5	**Çalışan öngörülemeyen değişimin bulunduğu iş faaliyetlerini yönetir ve denetler. Kendisinin ve diğerlerinin performansını değerlendirir ve geliştirir.**	**Ön-Lisans. İleri mesleki yeterlilikler.**
	6	**Çalışan karmaşık teknik veya profesyonel faaliyet veya projeleri yönetir. Öngörülemeyen iş faaliyetlerinde karar verme sorumluluğu alır. Bireylerin ve grupların profesyonel gelişimlerini yönetmede sorumluluk alır.**	**Lisans Derecesi. Profesyonel ve yönetici mesleki yeterlilikleri.**
	7	**Çalışan öngörülemeyen, karmaşık ve yeni stratejik yaklaşımlar gerektiren iş faaliyetlerini yönetir ve değiştirir. Çalışma gruplarının profesyonel bilgi ve uygulamalarına katkıda bulunmada ve/veya stratejik performanslarını değerlendirmede sorumluluk alır.**	**Yüksek Lisans Derecesi. Uzman profesyonel yeterlilikler. Üst düzey yönetici yet.**
	8	**Çalışan yüksek düzeyde yetki, yenilik, özerklik, akademik ve profesyonel bütünlük sergiler. Araştırma ve yeni fikir ve süreçlerin gelişiminde sürekli bir sorumluluk (bağlılık) taşır.**	**Doktora Derecesi.**
BİLGİ	a	**Çalışan, temel genel bilgiye sahiptir.** Parçaların ve aletlerin isimlerini bilir ve işin temel bilgilerine sahiptir.	**OLGUSAL** Terminoloji
	b	**Çalışan, bir alanda temel pratik bilgiye sahiptir.** İşi yapmak için gereken prosedürleri adım adım bilir.	**OLGUSAL** Pratik terminoloji
	c	**Çalışan, bir alanda olgulara, ilkelere, süreçlere ve genel kavramlara dair bilgiye sahiptir.** İşin neden ve ne zaman yapılması gerektiğini ve her adıma neden ihtiyaç duyulduğunu bilir.	**KAVRAMSAL** Kavrama
	d	**Çalışan, bir alan içerisinde geniş kapsamlı, pratik ve teorik bilgiye sahiptir.** İşle ilgili sorunları tahmin edebilir, ayrıştırabilir ve çözebilir.	**KAVRAMSAL** Bilgiyi kullanma
	e	**Çalışan, bir alanda kapsamlı, uzmanlaşma gerektiren, pratik ve teorik bilgiye ve bilgi temelinin sınırlarıyla ilgili farkındalığa sahiptir.**	**İŞLEMSEL** Çalışma prensipleri
	f	**Çalışan, bir alandaki teori ve ilkeleri eleştirel bir yaklaşımla anlamayı içeren ileri düzey bilgiye sahiptir.**	**İŞLEMSEL** Analiz, Sentez
	g	**Çalışan, özgün düşünmeye ve/veya araştırma yapmaya temel teşkil eden ve bir kısmı belli bir alanda öne çıkan yüksek derecede uzmanlaşmış bilgiye sahiptir. Bir alanla ilgili bilgiler ve farklı alanlar arasındaki etkileşim hakkında ciddi farkındalığa sahiptir.**	**ÜSTBİLİŞSEL** Yorumlama, değerlendirme
	h	**Çalışan, bir alan ve alanlar arasındaki etkileşim hakkında en üst düzeyde öne çıkan bilgiye sahiptir.**	**ÜSTBİLİŞSEL** Değerlendirme, Geliştirme
BECERİ	A	**Çalışan, basit görevleri yerine getirmek için gereken temel becerilere sahiptir.** Konu hakkında temel bilgileri ve terimleri bilir	**Hatırlama**
	B	**Çalışan, basit kuralları ve aletleri kullanarak görevleri yerine getirmek ve rutin problemleri çözmek için ilgili bilgileri kullanmada gereken temel bilişsel ve pratik becerilere sahiptir.** Temel bilgiler arasındaki ilişkileri kurabilir ve konu hakkında genel prensipleri bilir.	**Anlama**
	C	**Çalışan, temel yöntemleri, araçları, malzeme ve bilgileri seçerek ve uygulayarak problemleri çözmek ve görevleri tamamlamak için gereken bir dizi bilişsel ve pratik becerilere sahiptir.** Bilgileri ve prensipleri analiz ederek konu hakkında sonuca ulaşabilir.	**Uygulama**
	D	**Çalışan, bir alanda belirli problemlere çözüm üretmek için gerekli olan bir dizi bilişsel ve pratik becerilere sahiptir.** Şartları değerlendirip konu hakkında doğru karar verebilir.	**Uygulama Analiz**
	E	**Çalışan, soyut sorunlara yaratıcı çözümler geliştirmek için gereken kapsamlı bir dizi bilişsel ve pratik becerilere sahiptir.**	**Sentez Değerlendirme**
	F	**Çalışan, uzmanlık gerektiren bir alanda karmaşık ve öngörülemeyen sorunları çözmek için gereken ustalığı (hakimiyeti) ve yeniliği ortaya koyan ileri düzey becerilere sahiptir.**	**Sentez Değerlendirme**
	G	**Çalışan, yeni bilgi ve yöntemler geliştirmek ve farklı alanlardaki bilgileri birleştirmek amacıyla yürütülen araştırma ve/veya yenilik faaliyetleri için gereken uzmanlaşmış sorun çözme becerilerine sahiptir.**	**Sentez İnovasyon**
	H	**Çalışan, araştırma ve/veya yenilik yaparken önemli sorunları çözmek ve mevcut bilgi veya profesyonel uygulamayı genişletmek ve yeniden tanımlamak için gereken, sentez ve değerlendirme dahil, en gelişmiş ve uzmanlaşmış beceriye ve tekniğe sahiptir.**	**Yeniden oluşturma**

Modüler Eğitim-Öğretim Modeli

Meslek seçimi, insanoğlu için önemli bir aşamadır. Bu seçimde kişisel, ailevi, coğrafi, bölgesel, konjonktürel ve toplumsal etkiler farklı şekillerde ve seviyelerde rol oynamaktadır. Özellikle az gelişmiş ve gelişmekte olan ülkelerde meslek seçimi bilgi, ilgi ve kapasite ölçümüne dayanmamaktadır. Bu ülkelerde seçim daha çok ailevi baskılar, toplumsal yönelimler, gelir durumu dikkate alınarak yapılmaktadır. Dolayısı ile insanların büyük çoğunluğu belirli bir dönem sonra meslek değiştirme, mesleki alanda eğitim seviyesini artırma gibi talepler oluşmaktadır. Bu son durum dikkate alınarak mesleki seviyeler arasında geçişleri mümkün kılacak modüler bir eğitim-öğretim modeli çok daha kullanışlı olacaktır. BET alanında "entegre/bütünleşik" bir eğitim programı ortaya çıkarmak için temel BET bilgilerinin anlaşılmasından, uygulanmasına, daha ileri düzeydeki uygulamaların geliştirilmesine ve araştırılmasına yönelik modüler bir eğitim programı önerilmiştir. Programın temel özelliği istenilen yetkinlik ya da modül ile bu yetkinliği yerine getirmek için tasarlanan eğitim programı arasında, performans ölçümü ile ilk aşamalardan itibaren doğal bir ilişki kurulmasıdır. Bu ilişki için gerekli metodoloji; modülün tanımlanması, modül düzeni, modülün yapılandırılması, her bir modülün revizyonu, her bir modül için öğretim programının ve içerik yapısının revizyonu ile sağlanır. Her seviyenin sağında çapraz bir modül olduğu görülebilir. Bu modüller seçmeli olacak şekilde sunulur ve bir seviyeden diğerine geçebilmek için tamamlanması gerekir. Bu esneklik bazı öğrencilerin nasıl olduğu bilgisi (know-how) ile başlaması ve ardından neden olduğu bilgisi (know-why) ile ilgilenmeleri önermesine dayanmaktadır.

Eğitim ve Öğretimde Güncel Teknoloji Kullanımı

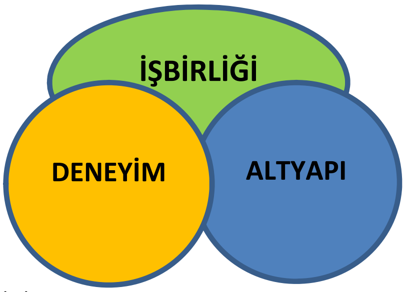
BET alanında hazırlanan programın öğrenciler tarafından benimsenmesi için yeni öneriler, aktiviteler ve güncel teknolojilerin kullanımı önemlidir. Hızla gelişen bir teknoloji alanı olarak BET sektöründeki yeni kariyer fırsatlarını sunmak için yoğun multimedya kullanımı, son teknolojili laboratuvar tesisleri, araştırma laboratuvarları ve çevre sorunlarına vurgu yapan açık hava etkinlikleri değerlendirilmelidir. Bu faaliyetler, alanın geliştirilmesi ve büyütülmesinde temel adımlardır. Günümüzde öğrenci ile eğitmen arasındaki klasik ilişki minimuma düşmüştür ve öğrenme aktivitesi hemen hemen anonim hale gelmiştir. Bu kısıtlamalar akademide ve endüstride araştırma ve geliştirme alanında yeni bir paradigma açmıştır. Okulda artık yalnızca tahta ve tebeşire dayalı bir etkileşim geçerli değildir. Bu senaryoya göre önerilen öğretim programında yeni öğretme tekniklerinin uygulanması tavsiye edilir. Öğrenciler yaparak, üreterek, yazarak, tasarlayarak, yaratarak ve çözerek öğrenirler. Dolayısıyla, bu öğretim programının başarılı bir şekilde uygulanması için öğrencinin yeni bilgileri öğrenme motivasyon ve merakına katkıda bulunacak aktif öğrenme tekniklerinin kullanılması önerilir. Aktif öğrenme tekniklerinin, bu program kapsamında yaygın bir şekilde uygulanması hedeflenmiştir. Bilgi ve Teknoloji (BT) çağının sınıflara ulaştığına şüphe yoktur ve öğrenciler yakın zaman öncesine göre daha aktif ve görsel iletişime alışmış durumdadır. Günümüzde Facebook, Twitter, Bloglar, anlık mesajlaşma programları öğrencilerimizin bilgiyi paylaşmak için kullandığı çok sayıdaki araçtan yalnızca birkaçıdır. Öğrencilerimiz, günlük yaşama yönelik birçok uygulamadan dolayı, bilgisayar veya akıllı telefon kullanımını ve mobil uygulamaları iyi bilmektedir. Öğrenciler, öğreticilerden de bu araçları bilmelerini ve bu teknolojilerin eğitim-öğretim programlarına girmesini beklemektedirler. Dolayısıyla bir programının daha iyi uygulanması için bu yeni araçların program tasarımına dahil edilmesi gerekmektedir. Güncel teknolojilerin yerinde ve yeterli ölçüde kullanımı doğal olarak öğrencinin derse ilgisini artıracaktır. Örnek olarak öğretmen tarafından yönetilen bir ders için öğrencilerin son dakika duyurularını kontrol edebilecekleri bir twitter hesabı açılabilir. Günümüzde tüm eğitim-öğretim kurumlarının en önemli problemlerinden birisi de akademisyen başına düşen öğrenci sayısının artmasıdır. Bunun bir sonucu olarak gelişmiş ülkelerdeki üniversitelerde büyük salon ve anfilerin kullanılması genel bir uygulamadır. Bu anfilerin güncel teknoloji ile donatılması, multimedya donanım ve yazılımlarının sürekli güncellenmesi, klima, aydınlatma sistemlerinin alan ve öğrenci kitlesi ile uyumunun sağlanması, oturma düzenleri, interaktif etkileşim olanakları, giriş ve çıkışların düzenlenmesi verimi artıracak unsurlardır. Aktif öğrenme tekniklerinin dahil edildiği anlatım ve sınıf ortamına ek olarak iyi organize edilmiş bir konu akışı ve kullanışlı bir web sayfasının hazırlanması da gerekir. Öğrencilere tek bir yerde tüm gerekli bilgileri veren bu faaliyetler, öğrencilerin ilgisini arttıracaktır. Ayrıca öğretmenin dersle ilgili yeni materyal temin etme süresinin azaltılmasına yardımcı olacaktır. Öğretmenin etkin çevrimiçi öğrenme siteleri oluşturmak için kullanabilecekleri Blackboard, Avenue, Moodle vb. yazılım uygulamaları bulunmaktadır. Eğitim-öğretim kurumları bu yazılımları öğretmenler için ücretsiz olarak temin etmelidir. Bu yazılımlar; Ders Yönetim Sistemi (CMS), Öğrenme Yönetim Sistemi (LMS) veya Sanal Öğrenme Ortamı (VLE) olarak bilinir. Özet olarak iyi tasarlanmış, gelişime açık bir mimariye sahip eğitim-öğretim web sayfaları:

- Öğrencilerin öğretmen ile daha etkin bir iletişim kurmalarını sağlama,
- Öğrencileri bilgilendirme,
- İlgilerini uyanık tutma ve
- Derste işbirliğini sürdürme gibi fonksiyonları yerine getirebilir.

Web sayfasında dersi veren akademisyen veya öğretmen ilgili bilgileri; özgeçmiş, uzmanlık alanları, aldığı ödüller, yayınlarına yapılan atıflar, aldığı patentler, gerçekleştirdiği teknoloji transferleri, endüstriyel danışmanlıkları, ilgili haberler ve iletişim vb., bilgileri seçmek için bir menü verilir. Bu menü öğrencilere akademisyen veya öğretmen hakkındaki tüm bilgileri vererek, onun konu ile ilgili uzmanlığı konusunda öğrenciye güven telkin eder. Burada öğretmenin daha önce anlattığı ders videolarından örnekler bulunabilir ve bu videolar güncellenebilir. Diğer menü belirli bir ders ile ilgili, ders ana sayfası, ders programı, okumalar, laboratuvarlar, ödevler, sınavlar, araçlar ve indirilebilir ders materyalleri gibi tüm bilgileri verir. Burada, dersin tanımlanması ve ders özelliklerine ek olarak duyuruların da dersin ana sayfasında yayınlanması teklif edilmiştir. Bu bölüme açık ders materyalleri ve kaynakları ile ilgili bilgiler de dâhil edilebilir. Okuma bölümü dersin sözlü anlatım oturumları hakkında bilgi verir. Burada sözlü sunum slaytları, tamamlayıcı notlar, animasyonlar ve sunulan simülasyonlar yayınlanır. Ayrıca akademisyen veya öğretmenin daha önceki derslerde veya güncel çekilmiş ders anlatım videoları eklenebilir. Diğer menüde; dönem, ders asistanı, laboratuvar personeli, program, ön koşul, ders tanımı, ders amaçları, değerlendirme kriterleri, yazılı görevler ve son teslim tarihleri, akademik ahlak ve notlar hakkında bilgiler verilebilir. Laboratuvar bölümünde, laboratuvar uygulama takvimi, deney föyleri ve laboratuvar kuralları ile güvenlik talimatları hakkında bilgi verilir. Laboratuvarda yapılacak testler ve cihazlarla ilgili ayrıntılı bir görsel arşiv hazırlanması önerilir. Bu laboratuvarlara internet üzerinden de erişimin sağlanması ideal bir alternatif oluşturacaktır. Atölye çalışmalarında görsel anlatımlar, videolar veya simülasyonlar yeterli olmamaktadır. Bunun yerine güncel teknolojiye uygun atölye imkanlarının endüstri ile iş birliği içinde hazırlanması gerekir. Atölye çalışmalarının en fazla 7 kişilik gruplarla ve gözetmen eşliğinde yapılması önerilir. Öğrencilerin atölye ve laboratuvar çalışmalarına girmeden önce internet üzerinden oryantasyon sağlaması gerekmektedir. Özellikle güvenlik konusunda gerekli bilgi ve eğitimleri alarak sınavlarda %100 başarı sağladıktan sonra atölye ve laboratuvar çalışmalarına katılım önerilmektedir. Ödev bölümünde; konular ve program ve sunum formatı hakkında bilgiler verilir. Ayrıca burada bazı çözümlü uygulama problemlerinin bulunması da önerilmiştir. Sınav bölümü, mevcut dönemin sınavlarını yani kısa sınav, vize ve final soru-cevap örneklerini içerir.

Eğitim-Öğretim için İşbirliği

Eğitim-öğretim programının tüm aşamalarında, yeterliliklerin esas alınmasına ve endüstri ile eğitim-öğretim kurumları arasındaki kalıcı, sürdürülebilir bağa vurgu yapılmalıdır. Bu ilişki bağı Şekil 3'te verilen iki kilit alanın ve aktörlerin doğru tanımlanması ile gerçekleştirilebilir. Yüksek verimli, katma değeri yüksek bir eğitim-öğretim programı ve uygulaması için eğitim-öğretim kurumları, bu kurumların çıktılarının uygulama ve çalışma alanını oluşturan endüstri, düzenleyici konumda olan kurumlar, yatırımcılar ve öğrenciler arasında sürdürülebilir bir işbirliği sağlanması gerekmektedir. İşbirliği alan ve modellerinin doğru ve uygulanabilir olması, paydaşların mevcut altyapılarının verimli ve kapasite kullanım oranını artıracak bir şekilde tasarlanması gerekmektedir.



Şekil 3. Eğitim-öğretimde işbirliği

Altyapı: Teknolojideki hızlı değişim sektörler arasında farklılıklar göstermektedir. Bu değişim ve gelişim BET alanında çok daha yüksek bir hızla gerçekleşmektedir. Eğitim-öğretim kurumlarının ve kamu kaynaklarının bu hıza uyum sağlamasını beklemek doğru bir yaklaşım değildir. Bu teknolojik ve ekonomik kısıtların, bizi eğitim-öğretim faaliyetlerini en uygun şekilde gerçekleştirmek için yeni yol ve yöntemler aramaya zorladığı açıktır. Günümüzde her bir bölüm için ayrı bir laboratuvar ve atölye kurulması yüksek maliyetlerden dolayı verimli değildir. Bu programda, endüstri, devlet, eğitim-öğretim ve araştırma kurumları kısacası paydaşlar arasında kaynak ve altyapı paylaşımı planlanmıştır. Bu ortak altyapı oluşturma ve kullanım için işbirliği organizasyonu programın başarılı olması için etkin bir yöntem olarak benimsenmiştir.

Deneyim: Akademisyen ve eğitimci deneyimi, bir eğitim-öğretim programının uygulanmasında temel bir gerekliliktir. Bu deneyim ve uzmanlık; yayınların, kitapların, patentlerin, projelerin, vs. sayısı ile yansıtılmalı ve eğitim programının uygulanmasında yer alan tüm ilgili çevre için özetlenmelidir. Bununla birlikte, çalışmaların teoriden pratiğe dönüşmesi ve katma değer üretmesi gerekmektedir.

SONUÇLAR VE DEĞERLENDİRME

Bu makalede, Batarya Elektrikli Taşıt Bilimi ve Teknolojisi alanında gerçekleştirilmesi planlanan, Seviye 1'den Seviye 8'e kadar bütünleşik ve modüler eğitim-öğretim programına genel bir bakış sunulmuştur.

BET alanında hazırlanan bu mesleki eğitim-öğretim platformunda aşağıdaki ana başlıklar ön planda tutulmuştur:

- Uluslararası alanda geçerliliği olan bir mesleki eğitim-öğretim program mimarisi.
- Temel alan ve alt alan başlıklarının güncel trendlere uygun ve güncellenebilir olması.
- BET mesleki eğitim-öğretim alanında etkin, verimli ve sürdürülebilir ulusal ve uluslararası işbirliği.
- Öğretmen, öğrenci, kurum ve endüstri arasında sürekli açık, interaktif etkileşim kanalları.
- İlgili tüm alanlarda ve ortamlarda ilgili tüm tarafların güncel teknoloji kullanımı.
- Uluslararası standartlara uygun güvenilir bir test ve değerlendirme sistemi.

Proje kapsamında yukarıdaki esaslar dikkate alınarak; Çok disiplinli (multi disciplinary) BET alanında, alan bilgisi tanımlamaları uluslararası işbirliği ile yapılmıştır. İsveç'teki başarılı internet destekli uygulamalar transfer edilmiş, yeni uygulamalar geliştirilmiş, alanlarla ilgili basılı ve dijital eğitim-öğretim materyalleri hazırlanmış, uygulamalı eğitimler için örnek atölyeler oluşturulmuş ve pilot eğitimlerle platformun test edilmesine başlanmıştır. Eğitim-öğretim faaliyetlerinde günümüzde gittikçe yaygınlaşan teknoloji odaklı karma yöntem benimsenmiştir.

Çevre ile ilgili davranışların çocukluk gelişiminin erken safhalarında oluşmaya başlamasından dolayı, elektrikli araçlar gibi sürdürülebilir teknolojiler hakkında çocukların bilinçlendirilmesi, eğitilmesi, konunun içine çekilmesi ve aydınlatılması için en uygun ortam ilk ve orta öğretim sınıflarıdır. Bu maksatla Seviye 1'e yönelik olarak ilk ve orta okul öğrencileri ve öğretmenleri için BET okulu çalışmaları da başlatılarak, Sakarya'daki bazı okullarda pilot uygulamalar başlatılmıştır.

Bu çalışma ve yeterlilik tanımlamaları, farklı seviyelerdeki eğitim-öğretim kurumlarına kendi program taslaklarını hazırlamalarında rehber olabilir. Her bölgenin ve kurumun kendi şartları içerisinde programda değişiklikler ve iyileştirmeler yapması beklenen doğal bir süreçtir.

Teşekkür: Bu yayın T.C.Avrupa Birliği Bakanlığı Türk Ulusal Ajansı tarafından desteklenen, "Batarya Elektrikli Taşıtların Bakım/Onarımı Alanında Eğitim/Öğretim İçin Mesleki eğitim Platformu" - VEMEV - 2012-1-TR1-LEO05-35189", Leonardo da Vinci Yenilik Transferi Projesi yaygınlaştırma çalışmaları kapsamında hazırlanmıştır. Tüm proje ekibi adına Türk Ulusal Ajansına teşekkür ederiz.

Acknowledgement: This publication has been prepared within the dissemination efforts of Leonardo da Vinci Innovation Transfer Project (Vocational Education Platform for Maintenance of Electric Vehicles: VEMEV-2012-1-TR1-LEO05-35189) supported by the Turkish National Agency, Ministry of European Union. We would like to express our thanks to the Turkish National Agency on behalf of the entire project team.

ÖZET: Teknolojinin, örgüt dışındaki bilgi kaynaklarından edinilmesi sürecinde başarılı olabilmek için, alıcı örgütün yüksek seviyede 'özümseme kapasitesi(ÖK)'ne sahip olması gerekmektedir. Hızla artmakta olan rekabet ortamında hayatta kalabilmek ve örgüt dışındaki teknolojileri transfer edebilmek için, örgütlerin ÖK'lerini arttıracak değişkenlerin tespit edilmesi ve alınacak sonuçlara göre örgüt politikalarının ve stratejilerinin geliştirilmesi kritik bir gereklilik halini almıştır.

Bu çalışmada öncelikle literatürde geçen, örgütlerde ÖK'ni artıran faaliyetler tespit edilmiştir. Bu faaliyetler arasında yer alan, "firmaların teknoparklarda üniversiteler ile eğitime ilişkin kurdukları işbirlikleri (FÜEİ)" bağımsız değişken olarak seçilerek, Ankara'daki teknoparklara yerleşmiş 157 firmanın FÜEİ ve ÖK'lerinin seviyeleri ve FÜEİ'nin, ÖK'nin yordayıcısı olup olmadığı, yapılan ampirik çalışma ile tespit edilmiştir.

Anahtar Kelimeler: Örgütsel öğrenme, özümseme kapasitesi, teknoparklar, üniversite-sanayi işbirliği

ABSTRACT: To be successful in the process of acquiring technology from outside knowledge resources, the receiver organization must have a high level of absorptive capacity (AC). To be able to survive in a rapidly increasing competitive environment and to transfer outside knowledge to the organization, organizations should find out the variables which increase their AC and also they should determine organizational policies and strategies according to the results.

In this study, first of all the factors that increase AC are identified by reviewing the literature. Educational collaboration between firms and universities in technoparks (ECBFU) which is among these factors is chosen as independent variable and 157 firms in technoparks in Ankara is analyzed by an empirical study to find out the level of ECBFU, AC and to analyze if ECBFU effects AC.

Keywords: Organizational learning, absorptive capacity, technoparks, university-firm collaboration

1. ÖZÜMSEME KAPASİTESİ

Küreselleşen ve rekabetin giderek arttığı ve bilginin önemli bir çarpan olarak ön plana çıkmaya başladığı günümüzde, firmalar rakiplerinden daha hızlı bir şekilde çeşitli yetenekler geliştirmek ve sürekli yeni bir şeyler öğrenmek mecburiyetinde kalmaktadırlar (Teece ve Pisano, 1994). Bilgi, her geçen gün firmalar için daha fazla önem arz eden kaynaklardan biri halini almakta ve yalnızca sürekli olarak yeni bilgi üretebilen firmalar, rekabet avantajı kazanma sürecinde daha iyi bir pozisyon elde edebilmektedir (Nonaka ve Takeuchi, 1995).

Cohen ve Levinthal (1990) örgütlerin öğrenme yeteneklerinin dışarıdaki yeni bilgiyi tanıma, asimile etme ve uygulama konusunda, önemli bir yer tuttuğunu belirtmektedirler. Sun ve Anderson (2010) ise, ÖK'nin yeni bilgiyi edinme ve onu ticari ürünlere dönüştürebilme hedefinde önemli bir yeri olduğuna vurgu yapmışlardır. Bu yaklaşımla, özümseme kapasitesinin örgütsel öğrenme sürecinin tamamlayıcısı olarak bu süreçte önemli bir yer tuttuğu söylenebilir (Autio ve diğerleri, 2000). Bu yaklaşımla, ÖK arttıkça, örgütsel öğrenmenin seviyesinin de artacağının savunulması hatalı bir yaklaşım olmayacaktır (Tsai, 2001). Benzer şekilde, örgütsel öğrenme sürecinde yaratılan yeni bilginin, var olan mevcut bilginin seviyesini artırdığı ve artan bu bilgi seviyesinin, örgütlerin ÖK'ni de artırdığı da gözlemlenmektedir (Kim, 1998).

Firmaların yeni ve dışarıdaki bir bilginin değerinin farkına varabilme, onu asimile etme ve ticari ürünlerde kullanabilme kabiliyeti, yenileşim yeteneklerini (inovasyon) artırma ve rekabet avantajı kazanma süreçlerinde de büyük öneme sahiptir. Bu kabiliyet ise büyük ölçüde, firmaların daha önceden sahip oldukları bilgi birikimlerinin bir fonksiyonudur. Sahip olunan öncül bilgi birikimi firmalara, yeni bir bilginin farkına varma, ondan faydalanma ve onu ticari bir ürüne dönüştürebilme yeteneği kazandırır ki bu yeteneğe daha önce de belirtildiği gibi ÖK, denmektedir (Cohen ve Levinthal, 1990). ÖK'nin, firmaların temel öğrenme yeteneklerinin ana temelini oluşturduğunu söylemek de mümkündür (Lane ve diğerleri, 2006).

ÖK ile ilgili çalışmalar, özellikle gelişmiş ülkelerde yoğun olarak yapılmış ve bu çalışmalar sonucunda araştırmacılar tarafından değişik tanımlar geliştirilmiştir. Zahra ve George (2002) ÖK'ni, firmaların dinamik bir örgütsel yetenek üretebilmek için bilgiyi elde ettiği, asimile ettiği, dönüştürdüğü, faydalandığı rutin ve süreçler bütünü olarak tanımlamışlardır. Murovec ve Prodan (2008) ise, ÖK'ni kısaca, "bir örgütün dışarıdaki bilgileri ticari ürünlere dönüştürebilme yeteneği" şeklinde açıklamışlardır.

ÖK, araştırmacılar tarafından edinme, asimile etme, dönüştürme ve faydalanma olmak üzere dört temel safhaya bölünmekle birlikte (Zahra ve diğerleri, 2002; Flatten ve diğerleri, 2011), Zahra ve George (2002), ÖK'nin potansiyel ve gerçekleştirilen ÖK olmak üzere, iki alt kümeye daha ayrılabileceğini savunmaktadırlar. Onlara göre, potansiyel ÖK, edinme ve asimile etme safhalarını; gerçekleştirilen ÖK ise, dönüştürme ve faydalanma safhalarını kapsamaktadır.

Bilgi tabanlı rekabetin en kritik faktörlerden birisi olarak kabul edilen ÖK'nin (Zahra ve George, 2002) yeni birşeyler geliştirmek, bunu sürekli kılmak, uzun süre hayatta kalabilmek ve sürekli başarılar elde edebilmek için kritik bir gereklilik olduğu artık kabullenilmiş bir gerçektir. Çünkü ÖK, firmanın yenilik yapması için gerekli olan bilgi tabanını kuvvetlendirme ve bütünlemede öncü bir şarttır (Lane ve diğerleri, 2006).

İçerdiği bu önem doğrultusunda, firmaların rekabet ortamında hayatta kalmasının temel etkenlerinden olan ÖK'ni artıran faaliyetlerin tespit edilmesi ve gerekli uygulamaların başlatılmasının mikro düzeyde firmalar, makro düzeyde ise endüstriler ve ülkeler için büyük bir gereklilik haline geldiği söylenebilir. Bu kapsamda, tarafımızdan özümseme kapasitesini artıran faaliyetler, konuyla ilgili yazım alanının incelenmesi sonucu tespit edilmiş ve özet olarak Tablo-1'de sunulmuştur. Tabloda sunulan faaliyetlerin ÖK'ni arttırdığına dair çalışmalar yazarları ile birlikte verilmiş fakat söz konusu çalışmaların sonucunda elde edilen, hangi değişkenler ne kadar etkilemektedir, ayrıntısına girilmemiştir.

Tablo-1: ÖK'nini Artırdığı Tespit Edilen Faaliyetler

ÖK'Nİ ARTIRAN FAALİYETLER	
S.NU.	**FAALİYET KONUSU**
1	Çalışanların öğrenme kabiliyetlerinin artırılması (Yazan, 2007)
2	Çalışanların problem çözme yeteneklerinin artırılması (Yazan, 2007)
3	İşe alınacakların doğru bir şekilde seçilmesi (Othman ve diğerleri, 2011)
4	Çalışanların öğrenmeye ve yeni teknolojileri benimsemeye olan istekliliklerinin arttırılması (Ashekele ve
5	Çalışanların tecrübe ve yeteneklerinin arttırılması (Scribd Home Page[web], 2011)
6	Dışarıdaki bilgileri, çalışanların anlayabileceği bir dile çevirebilen uzmanların istihdamı (Cohen ve
7	Edinilen bilgilerin biriktirilmesi ve muhafazası (Cohen ve Levinthal, 1990)
8	Çalışanların kullandığı ortak bir lisanın oluşturulması (Szulanski, 1996; Cohen ve Levinthal, 1990)
9	Güncel bilimsel ve teknolojik bilgilerin edinilmesi (Yazan, 2007)
10	Örgütsel hafızanın oluşturulması (Zahra ve George, 2002)
11	Yeni bilgi yaratabilme yeteneğinin arttırılması (Matusik ve Heeley, 2005)
12	Dışarıda var olan bilgileri keşfetmek, anlamak ve özümseme süreçlerinin geliştirilmesi (Cohen ve
13	Ar-Ge yeteneğine sahip olmak ve bu yeteneğin geliştirilmesi (Cohen ve Levinthal, 1990)
14	Ar-Ge'ye yatırım yapılması (Yazan, 2007)
15	Bilgi ve teknoloji paylaşım yeteneği oluşturması (Li-Hua, 2004)
16	Örgüt içi veya örgütler arası bilgi, fikir, prensip, model v.b. değiş-tokuş uygulamalarının sayısının artırılması (Szulanski, 1996)
17	Bilgi ve teknoloji yayılım kanallarının oluşturulması (prosedürler, kurallar, veritabanları, eğitim, usta-çırak ilişkisi, takım çalışması, konuşmalar, kişilerarası iletişim ve etkileşim) (Chinho ve diğerleri, 2002)

18	Kimin, neyi bildiğinin bilinmesine dönük uygulamaların oluşturulması (Yazan, 2007)
19	Çalışanların kurslara, kongrelere, çalıştaylara v.b. katılmasının sağlanması (Staples, 2001)
20	Üniversiteler, araştırma merkezleri gibi dış bilgi kaynakları ile iletişim bağlarının kurulması ve kullanılması (Henderson ve Cockburn, 1998)
21	Güçlü örgüt yapısı ve yönetim sistemlerinin oluşturulması (Kedia ve Bhagat, 1988)
22	Pozitif değişim sergileyen açık çalışma kültürleri yaratılması (Levinson ve Ashai, 1995)
23	Eğitim yatırımları yapılması (Yazan, 2007)

Tablo-1'de özetlenen faaliyetler değerlendirildiğinde, bu faaliyetlerin birçoğunun teknoparklarda amaç olarak belirlenen faaliyetler olduğu, kamu erkinin koyduğu yasalar ve sunduğu kaynaklar ile bu tür faaliyetleri gerçekleştirmeye yönelik çalışmalar yaptığı gerçeğinden hareketle, sonraki bölümlerde teknopark faaliyetlerinden olan FÜEİ'nin ÖK üzerindeki etkisi incelenmiştir.

2. FÜEİ VE FİRMALARIN ÖK'LERİNE ETKİSİ

Yurt dışından teknoloji transferi yapmanın giderek daha zor bir hal aldığı günümüz şartlarında ülkeler, kendi teknolojilerini kendilerinin geliştirdikleri ortamlar yaratmak zorunda kalmaktadırlar. Bu tür ortamların başında ise teknoparklar gelmektedir. Teknoparklar, teknoloji ediniminin gerçekleştirildiği, yeni ürünlerin geliştirildiği ve diğer ülkelerle rekabet edebilmek adına ülkenin ve firmaların yeteneklerine katkıda bulunan kuruluşlardır (Kılıç, 2009)

Teknoparkların esas kuruluş amacı, üniversite, sanayi ve devlet işbirliğini sağlayarak, millî politikalara uygun bir şekilde teknoloji geliştirmeyi teşvik etmek, yaratılacak sinerji vasıtasıyla bölgesel ve ekonomik gelişmeyi hızlandırmak şeklinde ortaya konulabilir (Özdemir, 2006). Teknopark içi işbirliklerinden biri olan üniversite firma işbirliği, örgütler arası ilişkilerin pek çok etkileşim formunu içermektedir (Carayol, 2003). Teknoparklar sayesinde, üniversitelerdeki teorik bilgi, sanayideki pratik uygulama ile birleşebilmekte ve bu birliktelik hem üniversitelere hem de sanayiye fayda sağlamaktadır. Bu kapsamda, teknopark içerisinde, üniversite ile firmalar arasında var olan çeşitli işbirliği uygulamaları ve bağlantılarını şu şekilde özetlemek mümkündür (Quintas ve diğerleri, 1996; Erün, 2012):

- Eğitim ve öğretim imkânı,
- Kiracı firmanın, üniversitenin müşterisi olması,
- Mezunlara ve akademisyenlere iş verilmesini de içeren insan hareketleri,
- Ortak kaynakların, teçhizatın ve tesislerin kullanımı ve özel uzmanlıklara erişim olanağı,
- Firma destekli üniversite araştırmaları,
- Resmi veya gayri resmi bilgi akışı,
- Üniversite öğrencilerine staj imkânı sağlanması,
- Üniversite ile firmanın belli alanlarda ortak tez çalışmaları yürütmesi,
- Firma tarafından ihtiyaç alanlarına dönük alanlarda üniversitede yapılan yüksek lisans ve doktora çalışmalarına burs, proje desteği ve mali destek sağlanması,
- Üniversitedeki akademik personelin, firmalara danışmanlık yapması,
- Kiracı firma personelinin, üniversitedeki bilimsel yayınlara erişimi,
- Kiracı firmanın, üniversitenin araştırma altyapısı ve laboratuarlarından faydalanması,
- Kiracı firma tarafından yürütülen araştırma projelerine, proje süresince üniversiteden akademisyen desteği alınması.

Vedovello (2000); Quintas ve diğerleri (1996) ile Erün (2012)'den farklı olarak, teknopark içinde bulunan firmaların bağlantı, etkileşim ve işbirliklerini aktör bazında değil de uygulama bazında değerlendirmiş ve yapmış olduğu çalışmada, gayri resmi bağlar, insan kaynakları bağlantıları ve resmi bağlardan oluşan bir taksonomiyi kullanmıştır. Söz konusu taksonomiye göre;

Gayri resmi bağlar;

- Üniversite akademik personeli ile kişisel iletişim,
- Literatüre/teknik raporlara ulaşım,
- Üniversite araştırmalarına erişim,
- Seminer ve konferanslara katılım,
- Genel eğitimlere katılım.

İnsan kaynakları ile ilgili bağlar;

- Öğrencilerin projelere katılımı,
- Yeni mezunların firmalarda istihdamı,
- Daha tecrübeli bilim adamı ve mühendislerin istihdamı,
- Üniversitede firma personeli için resmi olarak düzenlenmiş eğitimler.

Resmi bağlar;

- Üniversite akademisyenlerinin firmalara danışmanlık hizmeti vermesi,
- Üniversitede test ve analizler yaptırılması,
- Araştırma sözleşmeleri yapılması,
- Müşterek araştırmaların yapılması, olarak tanımlanmaktadır.

FÜEİ içerisinde mevcut olan faaliyetler değerlendirildiğinde, bu faaliyetler ile firmaların ÖK'lerini artıran faaliyetler arasında önemli bir benzeşim olduğu görülmüştür. Sözü edilen benzeşen faaliyetler sentezlenerek Tablo-2'de özetlenmiştir.

Tablo-2: FÜEİ Konuları ile ÖK'ni Arttıran Eylemler Benzeşim Tablosu

S.NU.	FAALİYET KONUSU
1	Firma personeline sağlanan eğitim ve öğretim imkânının artırılması (Quintas ve diğerleri, 1996)
2	Mezunlara ve akademisyenlere iş verilmesini de içeren insan hareketlerinin artırılması (Quintas ve diğerleri, 1996)
3	Firma destekli üniversite araştırmalarının sayısının artırılması (Quintas ve diğerleri, 1996)
4	Resmi veya gayri resmi bilgi akışının artırılması (Quintas ve diğerleri, 1996)
5	Üniversite öğrencilerine staj imkanı sağlanması (Erün, 2012)
6	Üniversite ile firmanın ortak yürüttükleri tez çalışmalarının sayısının artırılması (Erün, 2012)
7	Firma tarafından ihtiyaç alanlarına dönük alanlarda üniversitede yapılan yüksek lisans ve doktora çalışmalarına daha çok destek sağlanması (Erün, 2012)
8	Üniversitedeki akademik personelin, firmalara sunduğu danışmanlık hizmetlerinin artırılması (Erün, 2012)
9	Firma personelinin, üniversitedeki bilimsel yayınlara erişiminin artması (Erün, 2012)
10	Firmanın, üniversitenin araştırma altyapısı ve laboratuarlarından daha çok faydalanması (Erün, 2012)
11	Firma tarafından yürütülen araştırma projelerine, proje süresince üniversiteden daha çok akademisyen desteği alınması (Erün, 2012)

Ortaya çıkan bu sentezlenmiş benzeşim tablosu neticesinde, FÜEİ'nin firmaların ÖK'ni arttırabileceği tezi ile bundan sonraki bölümde oluşturulmuş araştırma soruları ve hipotez 157 firmadan elde edilen verilerle sınanmıştır.

3. ARAŞTIRMA

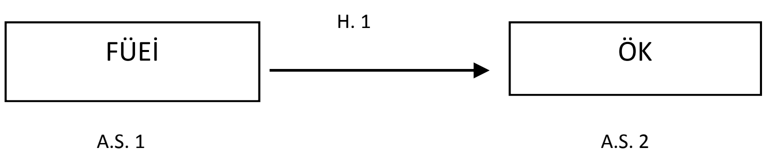
4. *a.Araştırmanın Konusu, Amacı ve Kapsamı*

Bu çalışmada, Ankara'da bulunan beş teknopark (ODTÜ Teknokent, Bilkent Cyberpark, Hacettepe Teknokent, Gazi Teknopark, Ankara Üniversitesi Teknoloji Geliştirme Bölgesi) içerisinde yer alan firmalar aracılığı ile FÜEİ'nin firmaların ÖK'ni ne kadar etkilediği sorusuna cevap aranmıştır. Bu amaçla, FÜEİ ile firmaların ÖK'lerinin seviyeleri ortaya konmuş ve FÜEİ ile firmaların ÖK'leri arasında anlamlı bir ilişki olup olmadığı basit doğrusal regresyon analizi ile sınanmıştır. Araştırma için geliştirilen ölçekler, Ankara'daki Teknoparklarda bulunan toplam 157 firmaya uygulanmıştır.

b.Araştırmanın Modeli ve Hipotez

(1)Araştırmanın Modeli

Araştırmanın amacını ifade eden araştırma modeli, literatür incelemesi sonucunda benzeşim tablosu ile ortaya konulan ve Tablo-2 de sunulan ilişkilerin varlığına dayanarak oluşturulmuştur. Araştırmada geliştirilen model Şekil-1'de sunulmuştur.



Şekil-1: Araştırmada Geliştirilen Model

(2)Araştırma Soruları ve Hipotez

Araştırmanın amacına yönelik olarak aşağıdaki araştırma soruları (A.S.) ve hipoteze yanıt aranmıştır:

A.S.1 : Ankara'daki teknoparklar içerisindeki FÜEİ'nin seviyesi nedir?

A.S.2 : Ankara'daki teknoparklarda bulunan firmaların ÖK'lerinin seviyesi nedir?

H.1 : FÜEİ'nin seviyesinin, teknoparklarda bulunan firmaların ÖK'leri üzerinde pozitif bir etkisi vardır.

c.Yöntem

(1)FÜEİ Ölçeği

FÜEİ'nin seviyesini tespit etmek amacıyla Erün (2012) tarafından geliştirilen ve geçerliliği sınanan "teknopark içi işbirlikleri ölçeği" kullanılmıştır. Ölçekte "FÜEİ" boyutu toplam 4 sorudan oluşmaktadır. Ölçeğin faktör yapısını doğrulamak için uygulanan doğrulayıcı faktör analizi (Büyüköztürk, 2006) sonucunda, ölçeğin faktör yapısı doğrulanmıştır. Veri setinin faktör analizi için uygunluğunu test etmek için Kaiser-Meyer-Olkin (KMO) örneklem yeterliliği ölçütü kullanılmıştır. Yapılan analiz neticesinde KMO değeri 0,907 (çok iyi) olarak tespit edilmiştir.

Bireylerin ölçek maddelerine verdikleri cevaplar arasındaki tutarlılık ve ölçeğin ölçmek istenen özelliği ne derece doğru ölçtüğünü sınamak amacıyla Cronbach Alfa (α) katsayısı ile güvenirlik analizi yapılmıştır (Büyüköztürk, 2006). Yapılan analiz neticesinde, ölçek yüksek derecede güvenilir (α=0,936) bulunmuştur.

(2)ÖK Ölçeği

Teknoparklarda faaliyet gösteren firmaların ÖK'lerinin seviyelerini ölçmek amacıyla, Flatten ve diğerleri (2011)nin firmaların özümseme kapasitelerini ölçmek amacıyla hazırlamış oldukları soru havuzundan toplam 36 soru ve Andrawina ve diğerleri (2008) nin potansiyel ve gerçekleştirilen özümseme kapasitelerini ölçmek için hazırladıkları ölçekten toplam 13 soru alınarak, 49 maddelik bir soru havuzu oluşturulmuştur.

Adı geçen iki ölçeğin Türkçe'ye uyarlanması sürecinde sırasıyla; dil denkliği ve ölçek maddelerinin anlamsal ve kavramsal açıdan denkliklerinin sağlanıp sağlanmadığı kontrol edilmiştir. Yapılan inceleme neticesinde, kapsam geçerliliğini sağlamayan 14 soru ölçekten çıkartılmıştır. Ölçek uyarlama sürecinin son aşamasında ise 115 kişilik bir grupla anketin ön uygulaması yapılmış ve edinim (E), asimilasyon (A), dönüştürme (D) ve faydalanma (F) olmak üzere 4 boyutlu faktör yapısı doğrulanmıştır. Bu 4 faktör ile toplam varyansın %55,5'i açıklanabilmiştir.

Veri setinin faktör analizi için uygunluğunu test etmek için Kaiser-Meyer-Olkin (KMO) örneklem yeterliliği ölçütü kullanılmış ve yapılan analiz neticesinde KMO değeri 0,829 (çok iyi) olarak tespit edilmiştir. Bunun yanında, Cronbach Alfa (α) katsayısı ile güvenirlik analizi yapılmış (Büyüköztürk, 2006) ve ölçek yüksek derecede güvenilir (α=0,830) bulunmuştur.

5. BULGULAR VE YORUMLAR

a.Araştırma Sorusu 1: *Ankara'daki teknoparklar içerisindeki FÜEİ'nin seviyesi nedir?*

FÜEİ'nin seviyesinin tespit edilmesi amacıyla oluşturulan bu araştırma sorusu ile ilgili yapılan analiz sonucunda, FÜEİ'nin normal düzeyde (2,75) olduğu tespit edilmiştir. FÜEİ'nin seviyesi Tablo-3'te gösterilmiştir.

Tablo-3: FÜEİ'nin Seviyesi

DEĞİŞKEN	N	ALINAN ORTALAMA PUAN	STANDART SAPMA	SEVİYE İFADESİ
Üniversite ile Eğitime İlişkin İşbirlikleri	157	2,75	1,04	NORMAL*

* *Beşli likert ölçeğinde; çok düşük, düşük, normal, yüksek, çok yüksek ifadeleri kullanılmıştır.*

Teknoparkların kuruluş amaçlarından birisinin de teknopark içerisinde işbirliği ortamı sağlamak olduğu düşünüldüğünde, teknopark içi işbirliklerinin seviyesinin yüksek veya çok yüksek düzeylerde çıkması beklenmektedir. Çünkü firmalar için ana amaç olan teknoloji edinimi, firma içerisinde geliştirmenin yanında diğer örgütlerden teknoloji transferi yoluyla da sağlanması gereken bir olgudur. FÜEİ'nin seviyesinin 2.75 lik bir düzeyde çıkmasının çeşitli problemlerin varlığına işaret ettiği düşünülmektedir. Bu konuda yapılan başkaca çalışmalar (Kılıç,2009; Erün 2012), bizim bu bulgumuzu destekler niteliktedir.

b.Araştırma Sorusu 2: *Ankara'daki teknoparklarda bulunan firmaların ÖK'lerinin seviyesi nedir?*

Firmaların ÖK'nin seviyesinin tespit edilmesi amacıyla oluşturulan bu araştırma sorusu ile ilgili yapılan analiz neticesinde, teknopark firmalarının ÖK'nin yüksek düzeyde (4,08) olduğu tespit edilmiştir. Yine ÖK'nin her bir boyutunda da araştırmaya katılan firmaların yüksek veya çok yüksek seviyelerde olduğu görülmüştür. Firmaların ÖK seviyeleri toplu olarak Tablo-4'te verilmiştir.

Tablo-4: Toplam Olarak ve Boyut Bazında ÖK Seviyeleri

DEĞİŞKEN	ORTALAMA	SEVİYE
ÖK	4,08	YÜKSEK
BOYUTLAR	**ORTALAMA**	**SEVİYE**
Edinim	3,93	YÜKSEK
Asimilasyon	4,00	YÜKSEK
Dönüştürme	4,17	YÜKSEK
Faydalanma	4,24	ÇOK YÜKSEK

Firmaların ÖK'lerinin yüksek veya çok yüksek düzeylerde çıkması beklenen bir durumdur. Çünkü teknoparklara giriş yapan tüm firmaların, buralara katılış yapabilmeleri için bazı öncül şartları sağlamış olmaları, bilgi çağı firmalarının bazı nitelik ve özelliklerine sahip olmaları gerekmektedir. Bunun yanında, teknopark içerisinde teknoloji transferi faaliyetini gerçekleştirebilmek için de firmaların ortalamanın üzerinde bir ÖK'ne sahip olmaları da bir zorunluluktur. Fakat teknopark aktörleri ile teknoloji bilgisini paylaşmak ve teknoloji transferini gerçekleştirmek için ÖK'nin tek başına yüksek olmasının yeterli bir durum olmayacağı da değerlendirilmektedir. Çünkü ÖK firmanın sahip olduğu bir yetenektir. Teknoloji transferi içinse FÜEİ'nin de yapılması, yani söz konusu yeteneğin faydalı hale dönüştürülmesi gerekliliği mevcuttur.

c.Hipotez: *FÜEİ'nin seviyesinin, teknoparklarda bulunan firmaların ÖK'leri üzerinde pozitif bir etkisi vardır.*

FÜEİ'nin seviyesi ile teknoparklarda bulunan firmaların ÖK'leri arasında anlamlı bir ilişki olup olmadığını test etmek için basit doğrusal regresyon analizi yöntemi kullanılmıştır. Analiz neticesinde elde edilen bulgular Tablo-5'te gösterilmiştir.

Tablo-5: FÜEİ'nin Firmaların ÖK'leri Üzerine Etkisi

Bağımsız Değişken	Standart Beta (β)	t	Sig.	Ortalama	Korelasyon
Sabit	3,66	43,026	0,000	-	-
FÜEİ	0,156	5,39	0,000	2,751	0,397*
R²=0,158		**F**=29,054		**σ**=0,000	
Bağımlı Değişken: ÖK					
* %99 Anlamlılık Düzeyinde					

Oluşturulan regresyon modeli istatistiksel olarak %99 anlamlılık düzeyinde anlamlı çıkmıştır ($\sigma<0,01$). R^2 değeri 0,158 olarak bulunmuştur. Buna göre FÜEİ, firmaların ÖK'lerindeki değişimin %15,8'ini açıklamaktadır.

FÜEİ ile firmaların ÖK'leri arasında %99 anlamlılık düzeyinde pozitif bir korelasyon (0,397) olduğu tespit edilmiştir. Ayrıca regresyon modelinde oluşan β katsayılarının da anlamlı oldukları (βsabit=3,66 σ<0,01; βFÜEİ=0,156 σ<0,01) belirlenmiştir. Elde edilen tüm bu bulgular sonucunda ortaya çıkan regresyon modeli şu şekildedir:

$$\boxed{ÖK=3,66+0,156*FÜEİ}$$

Sonuç olarak çalışma için kurguladığımız H1 hipotezi doğrulanmıştır. Yani FÜEİ ile teknoparklarda bulunan firmaların ÖK'leri arasında anlamlı (%99 anlamlılık düzeyinde) bir ilişki vardır. Oluşturulan basit doğrusal regresyon modelinden de anlaşılacağı üzere, FÜEİ'nin ortalamasındaki bir birimlik artışın, firmaların ÖK'lerini 0,156 birim artıracağı görülmüştür. Dolayısıyla, iki değişkenin aralarında güçlü bir neden-sonuç ilişkisinin bulunduğu değerlendirilmiştir.

Bu güçlü neden-sonuç ilişkisi düşünüldüğünde, FÜEİ'nin seviyesinin artırılmasının, firmaların ÖK'lerine büyük katkılar sağlayabileceği ve böylelikle, örgütsel öğrenme yeteneklerinin de artacağı söylenebilir.

6. SONUÇ VE TARTIŞMA

Literatür araştırması sonucunda, ÖK'nin teknoloji edinim süreçlerini kolaylaştırarak firmalara rekabet avantajı kazandırdığı (Domingez ve diğerleri, 2007), teknoloji transferi için kritik öneme sahip olduğu ve bundan dolayı, firmaların güçlü bir ÖK'ne sahip olmaları gerektiği tespitlerine ulaşılmıştır (Lin ve diğerleri, 2004).

Günümüz rekabet ortamında firmaların tek başlarına hayatta kalabilmeleri kolay olmadığından, firmaların üniversiteler, araştırma kurumları, diğer firmalar, devlet vb. ile işbirliği içerisinde çalışmaları gerekmektedir. Firmalara böyle bir işbirliği ortamını sağlayan kuruluşların başında ise teknoparklar gelmektedir.

Dışarıda varolan bilgileri keşfetmek ve özümsemek (Cohen ve Levinthal, 1990), örgüt içi veya örgütler arası bilgi, fikir vb. değiş-tokuşu yapmak (Szulanski, 1996), üniversiteler gibi dış bilgi kaynakları ile iletişim bağları kurmak (Henderson ve Cockburn, 1998) ve yeni bilgi yaratabilmek (Matusik ve Heeley, 2005) gibi hususların, firmaların teknoloji transferinde öncül gereklilik olan ÖK'lerinin gelişimine katkıda bulunabileceği, araştırmalar ile ortaya konulmuştur. Türkiye'de bu konuda yapılmış olan herhangi bir araştırmaya rastlanmamıştır.

Literatür incelemesi ve yapılan tüm bu değerlendirmeler de dikkate alınarak, FÜEİ'nin, firmaların ÖK'lerine bir katkı sağlayıp sağlamadığı analiz edilmiştir. Bu kapsamda öncelikle, FÜEİ'nin ve ÖK'nin seviyeleri tespit edilmiştir. Yapılan araştırma ve analizler sonucunda; FÜEİ'nin seviyesinin normal ve firmaların ÖK'lerinin yüksek düzeyde olduğu görülmüştür. Teknopark firmalarının ÖK'lerinin yüksek olması beklenen bir durum iken, FÜEİ'nin seviyesinin düşük olması problem olarak değerlendirilmiş, fakat bu araştırmanın asıl araştırma hedefi olmadığı için daha fazla derinlemesine araştırılmamıştır. Bu konuda teknopark yönetim firmalarına ve kamuya düşen bazı görevler olduğu değerlendirilmiştir.

Araştırmanın asıl hedefi olan, FÜEİ'nin teknoparklarda bulunan firmaların ÖK'leri üzerinde güçlü bir etkisi olup olmadığına ilişkin yapılan analizler neticesinde ise bu iki değişken arasında güçlü bir ilişki olduğu tespit edilmiştir. Bu tür işbirliklerinin, firmaların ÖK'leri üzerindeki güçlü düzeydeki etkisi düşünüldüğünde, sadece araştırmanın örneklemini oluşturan firmaların değil, tüm bilgi tabanını geliştirmek isteyen firmaların, ÖK'lerinin seviyelerini artırmak için, FÜEİ'nin seviye ve nitelik yönünden yeterliliğinin artırılması gerektiği düşünülmüştür. Böylelikle, firmaların ÖK'lerinin gelişimine önemli miktarda katkı sağlanabileceği değerlendirilmiştir. Bu değerlendirme, Bigliardi ve diğerleri (2006)nin, üniversite ile firmalar arasında kurulan işbirliği miktarının, firmaların ÖK'lerini artırdığı ve teknoloji transfer performanslarına katkıda bulunduğu bulgusunu destekler niteliktedir.

Üniversiteler ile güçlü iletişim bağları kurmak, FÜEİ'nin seviyesinin artmasına ve dolayısıyla Ramirez ve Dickenson (2010)un da çalışmalarında belirttikleri gibi, firmaların ÖK'lerinin artmasına katkıda bulunmaktadır. Bu bulgu, Bellavista ve Sanz (2009)ın, üniversiteler ile etkileşim içinde olan firmaların, yaratıcı ürün ve hizmetlerinin artacağı değerlendirmesini de desteklemektedir.

Yapılan analizler sonucunda, FÜEİ'nin artmasına katkıda bulunan faktörlerden, üniversite öğrencilerine yarı zamanlı iş ve staj imkânı sağlanması, üniversitede yapılan tez çalışmalarına firma personeli tarafından teknik destek verilmesi gibi hususların da firmaların ÖK'lerine katkıda bulunduğu tespit edilmiştir. Bu tespit, literatürde örgütler arası personel değişiminin ÖK'ni artırdığı ve firmaların teknoloji transferi yapmalarını kolaylaştırdığına yönelik pek çok çalışma sonucunu desteklemektedir (Hernard Mc.Fadyen, 2008; Bellavista ve Sanz, 2009; Westhead ve Batstone, 1998; Miles, 2008).

Bu araştırma hâlihazırda ÖK'lerinin yüksek olması beklenen teknopark firmaları üzerinde yapılmakla birlikte burada ortaya konulan sonuçların, teknopark dışındaki firmalara uygulanması bir gereklilik olarak belirmiştir. Türkiye'deki teknoparklarda faaliyet gösteren firmaların teknoloji transferini gerçekleştirecek yeterliliklere ve kapasiteye sahip olması, Türkiye ekonomisi ve Türkiye'nin içinde yer aldığı küresel rekabet düşünüldüğünde çok önemli katkılar sağlayacaktır. Bu nedenle bilgi ve teknoloji kazanımını yaygınlaştırmak, KOBİ düzeyindeki firmaların ileri teknoloji bilgi düzeylerine ulaşmasını sağlamak hedefleri ile üniversiteler ile eğitime dair işbirliklerinin arttırılmasına dönük politikalar ve planlar geliştirilmeli ve uygulanmalıdır.

THE LIFE AND SCIENCIFIC METHODS OF MEHMED TAHİR FROM BURSA

Fatma KORKMAZ HAZAR
Balıkesir İstanbulluoğlu Anatolian Teacher Training School
fatmakorkmazhazar123@hotmail.com

Abstract: Mehmet Tahir from Bursa was Mustafa Kemal's teacher from Thessaloniki Military Junior High School. At the period he lived, he was called as "the greatest bibliography scholar of the Turks". Mr. Tahir was born in Bursa in 1861. He graduated from the Military Academy in 1883 with the rank of Infantry Lieutenant. He had worked in Skopje, Bitola and Thessaloniki Military Junior High Schools not only as a teacher but also a principal. He took place in Motherland and Liberty Association as one of the founders whose Thessaloniki department was opened by Mustafa Kemal in 1906. After participating in The Committee of Union and Progress between the years 1908 and 1911, he worked as a deputy in the National Assembly. After having retired with the rank of lieutenant colonel, He was brought to Topkapı Palace Library Management as the manager. He died in 1925 in İstanbul. He has got 25 masterpieces and the most famous masterpiece of him, "Osmanlı Müellifleri (Ottoman Authors)", has still been used at the Harward University as one of the sources. He paid attention to the usage of maps in Geography courses. So, he brought French atlases to his classrooms. He was against rote learning in History and Geography courses. He used to teach a country's borders, regime and population first. He made his students draw the map first and he used to talk about old and existing relationships between countries then. He accepted Geograpy as the basis of the History. In his History courses, he requested his students to write some extra questions and give him back. By means of this he made himself become eager to search. He was in favor of the renewal and the purification of the language. In his Literature courses, he used to explain the terminologies first and then used to broaden all. He used to examine the text which was written by his students and ask for corrections according to the spelling rules. Then he himself used to do the corrections by looking at the papers. He was against rote learning (memorization), but he used to ask his students to memorize moral and national poems as well as proverbs. Mehmet Tahir was one of the founders Thessaloniki Department of the Motherland and Liberty Association which is secretly founded by Mustafa Kemal. Mustafa Kemal paid 500 Liras and bought some parts of Mehmet Tahir's books called "Ottoman Authors" and saved from the printing house while Mehmet Tahir was suffering from powerty in his last years, Mehmet Tahir's tombstone was built in 1935 by Atatürk.

Key Words : Mehmed Tahir from Bursa, Mustafa Kemal Atatürk, Ottoman Authors (OM)

His Life

Mr. Mehmet Tahir's father is called Mr. Rıfat and his mother, whose name was Mrs.Rahime, was the daughter of Sir Necip from Bursa. Mehmet Tahir was born in Yerkapı district in Bursa on a Friday night on the 22nd of November, 1861(Akçura,1981&Vahyi,1335).

He started his education at Yerkapı school, which was located opposite to their house. Then he enrolled in the Military Middle School. While he was studying at the Military Middle School, he also had some religion courses from Harraçıoğlu Moslem Theological School and learnt Arabic. After completing the Middle School as the top student, he started studying at the Military High School. He finished that school as the top student once again and joined the Army Military Academy (the Military of Affairs). Then finally, he graduated from the Army Military Academy as an infantry lieutenant(Aksüt,1944&Vahyi1335&Mehmed Fuad,1329)

He started his teaching life as a geography teacher in Bitola. He gave lectures on history and oratory in the Military Middle School and the Military High School(Akün,1992). He worked as a director at the Salonika Military Middle School. By that time, he was promoted to a major commander. However, he was suspended from his duty at the Salonika Military Middle School as a manager due to the reports published about him(Kepecioğu,nr.4519).

Mehmet Tahir was among one the founders of the Ottoman Liberty Association, which was founded in Salonika in 1906. His rank was the highest so that he was at the top among the members(Tunaya,1984&Unat,1960).We also know that he was a member of the Motherland and Liberty Association when Mustafa Kemal founded it in Salonika in 1906(Ülken,1992). Afterwards, Ottoman Liberty Association joined the Young Turks in Europe and renamed itself as the Ottoman Committee of Union and Progress. In that era, Mr. Tahir raised to the rank of sheikh in the Malāmatiyya(Gölpınarlı,1992&Kara1992). He gained a strong political personality. Mehmet Tahir's power is such increased that the third President Celal Bayar registered to the Ottoman Committee of Union just because of the encouragements of him.

Mr. Tahir had always seen himself not only a politician but also a scientist, he became a deputy from Bursa after the declaration of the Second Constitutional Era. Just before the Assembly opened, he had temporarily been elected as the chief(Kutay,1961&Bayur,1952).

He took active roles in Chamber of Deputies that was created in 17th of December, 1908. He was nominated to give lectures to tell people about the goals of constitutionalism. He resigned being a deputy after the first part of Chamber of Deputies that ended at the end of 1911(Kabasakal,1981).

His ministration in Salonika Military Middle School Management was dismissed because of politic reasons. His degree was squadron leader when he was a deputy(Bleda,1979).

Then he served in court martial membership and verification officialism in İzmir. Tahir Bey had a big group of friends wherever he went and he wasn't expelled anywhere far because of these faithful friends of him. When he was a member of court martial for the second time, he was retired of being a lieutenant colonel. He was commissioned to research the libraries of İstanbul just before his retirement. During his duty, he investigated lots of manuscript and he made reports for every single library. After 1,5 years of this duty, he became the manager of Topkapı Palace Library(Akün,1992&Vahyi1335&Türk ve Dünya Ünlüleri Ansiklopedisi1983).

When Tahir Bey was on his duty in Alaşehir, his family came to İstanbul and rented a house. Following days brought his family financial difficulties. Ultimately, Tahir Bey borrowed a big amount of Money from government lending agency. He was unfortunately at the top of the list when the government lending agency announced the names of the debtors. Yet he still didn't change his principle of inviting his guests to his house every week.

His health problems were one of the problems that he had to deal with except for his financial difficulties. "Oymacılık ve Bursalı Oymacı Fahri" was one of his last scripts. While second and third volumes of "Osmanlı Müellifleri" was being pressed, Tahir Bey was sick. He wrote a letter to his friend Mehmet Ali Avni and told about his worries and asked for help. Mehmet Ali Avni provided the Money that he needed and got books from press. Mustafa Kemal bought some of the books for 500 liras in cash against goods(Aksüt,1944&Ergin,1937&.

In his last times, it has been detected that Tahir Bey had underdeveloped intelligence and he died in 28th of October, 1925 in Zeynep Kamil Hospital. The following day, he was buried in Aziz Mahmud Hüdayi islamic monastery. It was rueful that his death wasn't announced by any newspaper except for Cumhuriyet(Akün,1992).

Scientific Methods

His Researcher Characteristics

His father and then Haririzade effected scientific activities of Tahir Bey(Gölpınarlı,1992). He researched sufis that lived in Bitola, poets and scientists and investigated gravestones. He asked for information by letter many times. His first literary work "Türklerin Ulum ve Fünuna Hizmetleri" was published in 1897. He used to consider important to outstanding people(Bursalı Mehmed Tahir 1327).

He published his writings in some journals like Sırat-ı Müstakim, Sebilürreşad and Türk Yurdu. Most of his writings were about bibliography. Around same period, he published the second volume of "Osmanlı Müellifleri"(Bursalı Mehmed Tahir1975) . Tahir Bey is the second most-known bibliography and biography investigator of the last period of the Ottoman Empire after Mehmet Süreyya Bey.

Tahir Bey thought bibliography and biography complete each other. He believed that bibliography is a science that shows cultural level of a society(Bursalı Mehmed Tahir,1325). He travelled to the libraries of Bitola, Kosovo, Salonica, Aydın, İzmir, Manisa, Konya, Bursa and İstanbul. He dedicated his life to remind writers who were forgotten. In the period that he lived, he was honored to be paraised as "the best book introduction scientist of Turks", "the only book introduction expert". He played an important role of opening "İshakiye Library" in Bitola, "Ulucami Library" in Bursa and "Aziz Mahmud Hüdayi İslamic Monastery Library" in Üsküdar(Beyatlı,1973).

The Importance of Sufism in His Scientific Life

Mr. Rıfat, who was a member of naqshbandi tariqa, had a major role in his personal development. Because of the religious conversations that were done during his childhood at his home, he inclined to sufism and got a crush on Muhyiddin İbnü'l-Arabi. When he was a student at the military college, Haririzade who was the writer of Tıbyanü Vesaili'l Hakaik became his mentor. When Haririzade passed away, he obeyed Muhammed Nuru'l-Arabi. When he was at monastery, he arranged religious conversations at Friday nights. During the death of his Sheikh, he had become one of the well-known figures of Melamilik tariqa in this region. He concentrated on scientific activities in time and this situation hindered his religious conversations(Gölpınarlı,1992&Hasan Taib Efendi,1323&Gövsa,tarihsiz).

The Methods That He Used In Teaching

Although Geography was generally taught through memorization at that time, Mr. Tahir made it interesting with the methods that he followed. He gave great importance to the map that comprised a basis for Geography and every kind of Geographic information. He made his students bring a lot of French atlas to the class and provided a basis for the students to make use of them(Vahyi,1335).

Mr. Tahir strongly objected to having students memorize book sentences. In his opinion, teaching Geography and History wasn't composed of making students memorize information and making their memory into an index which includes the names of cities, rivers, mountains and gulfs. He didn't want all of the cities in the book. Furthermore, he found it unnecessary to learn the population of the cities that he wanted. First, he taught the borders of a state, its regime and general population. Especially at that time, it was enough to tell the strength that he had with a nice map. Also, with the help of the map, it was enough to tell under what reasons the strength formed. However, having a student draw the map on the board wasn't enough for him. He told the old and new relationships of the states that he analyzed with other states. He accepted Geography as the basis of History. This Geography and History teacher who dedicated himself to such a conscientious duty didn't confine himself to the new Geography and History. He was in intense research activities in order to know the old History and Geography of Turks and to compare them with the new ones.

When he had extra time in history lessons, he accepted his students' questions in a written form. For the questions that he couldn't answer at that time, he carried out a method in order to make a research about the questions and answer them. This method was suitable in order to give students a sense of curiosity and force himself to non-stop researches(Vahyi,1335&Develioğlu1988).

Mr.Tahir supported innovation and simplification of Turkish. He had some desires:
He wanted his book that is written in Istanbul to be read in Kashgar. Turkish should experience improvement within its own nature. Our literature should be based on logical, scientific and professional principles. Also, our literature should show the lives of Anatolian people. A Turkish person who has some education should find consolation in literature wherever s/he is(Tanpınar,1988).

Within the frame of new methods that he followed in literature lessons, he explained the concept that he taught and developed it with questions. Then, he analyzed the answers of the students one by one. When he noticed spelling and grammar mistakes, he crossed them out with a red pen and gave them back to his students. Therefore, he forced his students to correct their mistakes. Then, Mr. Tahir made the necessary corrections on the 2nd papers that his students gave. In this way, not only the teacher, but also the students made an effort in one method. As mentioned earlier, Mr. Tahir didn't support memorization. However, he made his students memorize poems that are about moral and the country. Especially, he made them memorize the proverbs(Vahyi,1335).

ÖZET: Bu araştırmanın amacı ortaokul öğrencilerinin öğrenme stilleri, matematik kaygıları, ders çalışma süreleri ve matematik başarıları arasındaki ilişkileri incelemektir. Tarama modeli ile gerçekleştirilen araştırmaya 396 ortaokul öğrencisi katılmıştır. Çalışma grubunun %60'ını kız (n=238), %40'ını erkek (n=158) öğrenciler; %42'sini (n=166) 6. sınıf, %32'sini (n=127) 7. sınıf ve %26'sını (n=111) 8. sınıf öğrencileri oluşturmuştur. Öğrencilerin matematik kaygılarını belirlemek için Matematik Kaygı Ölçeği, öğrenme stillerini belirlemek için Öğrenme Stilleri Envanteri ve ders çalışma sürelerini belirlemek için bilgi formu kullanılmıştır. Öğrencilerin matematik başarılarını belirlemek için ise matematik dersi yılsonu not ortalaması dikkate alınmıştır. Çalışmanın amacı doğrultusunda toplanan veriler, Yapısal Eşitlik Modeli ile analiz edilmiştir. Elde edilen sonuçlara göre, matematik kaygısı, ders çalışma süresi ($r=-.17$, $p<.001$) ve öğrenme stilleri ($r=-.42$, $p<.001$) ile negatif yönlü ve anlamlı ilişkilere sahiptir. Diğer yandan, öğrenme stilleri ve ders çalışma süresi arasında ise pozitif yönlü ve anlamlı bir ilişki ($r=.33$, $p<.001$) bulunmaktadır. Ayrıca matematik kaygısının matematik başarısı üzerinde negatif yönlü ve anlamlı ($\beta=-.47$, $p<.001$) bir etkisi vardır. Ders çalışma süresinin ise matematik başarısı üzerinde pozitif yönlü ve anlamlı ($\beta=.13$, $p<.001$) bir etkisi bulunmaktadır. Elde edilen bulgular doğrultusunda bir takım önerilerde bulunulmuştur.

Anahtar sözcükler: Matematik başarısı, ders çalışma süresi, matematik kaygısı, öğrenme stilleri, yapısal eşitlik modellemesi

ABSTRACT: The purpose of the study was to investigate relationship between learning style, math anxiety, math study time and mathematic achievement. The study conducted according to correlational survey model, included 396 middle students. The study group consisted of %60 girls (n=238) and %40 boys (n=158); %42 (n=166) 6 grade, %32 (n=127) 7 grade and %26 (n=111) 8 grade students. In the study Math Anxiety Scale was used in determining the students' math anxiety; Learning Styles Inventory was used in determining the students' learning styles and Information Form was used in determining the students' math study time. Also, students' semester grades were considered in determining the students' math achievement. The data collected in the study were analyzed using the Structural Equation Model. According to the results obtained, math anxiety has significant correlation with math study time ($r=-.17$, $p<.001$) and learning style ($r=-.42$, $p<.001$). On the other hand, there was a positive and significant relationship ($r=.33$, $p<.001$) between math study time and learning style. Also, math anxiety has a negative and significant effect ($\beta=-.47$, $p<.001$) on mathematic achievement. Unlike, math study time has a positive and significant effect ($\beta=.13$, $p<.001$) on mathematic achievement. According to findings, some suggestions were given.

Key words: Mathematic achievement, study time, math anxiety, learning style, structural equation modelling

CENTRAL HOSPITAL APPOINTMENT SYSTEM (CHAS-MHRS) WEB SITE'S USABILITY

ABSTRACT: Central Hospital Appointment System; is an application (http://www.mhrs.gov.tr) that people can take an appointment which they want from state's hospitals, mouth and dental health center and family doctors via central hospital appointment system. This implementation's main purpose is to give more efficient on medical service. The aim of this study is to determine usability levels of this website. The research was carried out of twelve people. Firstly four duties are specified (join, get an appointment, cancel an appointment and changing password) and then users are wanted to do these duties. While they're obeying their duties, (their ability to obey rules, occupancy and difficulties) data were collected with observation and interview. Two of the users could not join the website, other three fulfilled giving duties hardly. This implementation should be brought practical situation for disabled people.

ABSTRACT: The concept of 2-metric spaces and 2-normed spaces were initially introduced by Gahler S., in 1960's. Since 1963, S. Gahler, Y. J. Cho, R. W. Freese, C. R. Diminnier, R. E. Ehret, K. Iséki, A. White and many others have studied on 2-normed spaces, 2-metric spaces, and on n-normed spaces. It is well-know that R is complete, but Q is not complete, Since Q is dense in R is said that R is completion of Q. It is very important that an incomplete space can be completed in similar sense. Complete spaces, in other words Banach spaces, play quite important role in many branches. Park C. has investigate the completion of generalized quasi-normed spaces. In this paper we treated the completion of pseudo-quasi-n-normed spaces. Our result generalized the results of M. Kir and M. Acikgoz, which solved the problem of completion quasi-2-normed space.

Key words: 2-normed spaces, pseudo-quasi-n-normed space, n-normed space, completion

INTRODUCTION

The concept of 2-metric spaces and 2-normed spaces were initially introduced by Gahler S [2], [3] in 1960's. Since 1963, S. Gahler, Y. J. Cho, R. W. Frees, C. R. Diminnier, R. E. Ehret, K. Iséki, A. White and many others have studied on 2-normed spaces, 2-metric spaces, and on n-normed spaces [5], [6]. As well as 2-normed spaces a special interest has been also study of n-normed spaces and their completeness. Complete spaces, in other words Banach spaces, play quite important role in many branches. It is known the fact that R is a complete space, but Q is not. Since Q is everywhere dense in R, we call R completion of Q. It is very important that an incomplete space can be completed in similar sense. Choonkil Park [4] has investigated the completion of the generalized quasi-normed space, which left the problem for construction of completion of a quasi-2-normed space. Mehmet Kir and Mehmet Acikgoz [1] have found the answer for the Park's problem. Starting by this, we have studied compeltion of pseudo-quasi-n-normed spaces.

Definition 1.1. [4] Let $n \in$ N (natural numbers) and E be a vector space of dimension $d \geq n$. (Here we allow d to be infinite). A n-norm on E is a real valued function $\| \bullet, \cdots, \bullet \| : E^n \to [0, +\infty[$, which satisfies the following four conditions:
1) $\| x_1, x_2, \cdots, x_n \| = 0$ if and only if when $x_1, x_2, \cdots, x_n$ are linearly dependent,
2) $\| x_1, x_2, \cdots, x_n \|$ is invariant under permutation,
3) $\| x_1, x_2, \cdots, x_{n-1}, \alpha x_n \| = |\alpha| \, \| x_1, x_2, \cdots, x_{n-1}, x_n \| \ \forall \alpha \in \mathrm{R}, (x_1, x_2, \cdots, x_n) \in E^n$,
4) $\| x_1, x_2, \cdots, x_{n-1}, y + z \| \leq \| x_1, x_2, \cdots, x_{n-1}, y \| + \| x_1, x_2, \cdots, x_{n-1}, z \|$,
$\forall x_1, x_2, \cdots, x_{n-1}, y, z \in E$,
The pair $(E, \| \bullet, \cdots, \bullet \|)$ is then called a n-normed space.
Example 1.1. Let $E = R^n$ we define $\| x_1, x_2, \cdots, x_n \| = |\det(x_{ij})|$,

where $(x_{ij}) = \begin{pmatrix} x_{11} & \cdots & x_{1j} & \cdots & x_{1n} \\ \cdots & \cdots & \cdots & \cdots & \cdots \\ x_{i1} & \cdots & x_{ij} & \cdots & x_{in} \\ \cdots & \cdots & \cdots & \cdots & \cdots \\ x_{n1} & \cdots & x_{jn} & \cdots & x_{nn} \end{pmatrix}$, $x_j = \begin{pmatrix} x_{1j} \\ \cdots \\ x_{ij} \\ \cdots \\ x_{nj} \end{pmatrix}$ for $1 \leq i \leq n$, $1 \leq j \leq n$.

Definition 1.2. Let $n \in$ N (natural numbers) and E be a vector space of dimension $d \geq n$. A quasi-n-norm on E is a real valued function $\| \bullet, \cdots, \bullet \| : E^n \to [0, +\infty[$, which satisfies the following four conditions:
1) $\| x_1, x_2, \cdots, x_n \| = 0$ if and only if when $x_1, x_2, \cdots, x_n$ are linearly dependent,
2) $\| x_1, x_2, \cdots, x_n \|$ is invariant under permutation,
3) $\| x_1, x_2, \cdots, x_{n-1}, \alpha x_n \| = |\alpha| \, \| x_1, x_2, \cdots, x_{n-1}, x_n \| \ \forall \alpha \in \mathrm{R}, (x_1, x_2, \cdots, x_n) \in E^n$,
4) $\exists c \geq 1, \| x_1, x_2, \cdots, x_{n-1}, y + z \| \leq c \, [\| x_1, x_2, \cdots, x_{n-1}, y \| + \| x_1, x_2, \cdots, x_{n-1}, z \|]$,

$\forall\, x_1, x_2, \cdots, x_{n-1}, y, z \in E$,
The pair $(E, \| \bullet, \cdots, \bullet \|)$ is then called a quasi-n-normed space.
Example 1.2. Let E be a linear space of dimension $d \geq n$ and $\| \bullet, \cdots, \bullet \|$ a n-norm on E. The function $\| \bullet, \cdots, \bullet \|_q : E^n \to \mathrm{R}^+$, which

$$\| x_1, x_2, \cdots, x_n \|_q = c \, \| x_1, x_2, \cdots, x_n \|, \text{where } c > 1,$$

is a quasi-n-norm. It is evident.

Definition 1.3. Let $n \in \mathrm{N}$ (natural numbers) and E be a vector space of dimension $d \geq n$. A pseudo-quasi-n-norm on E is a real valued function $\| \bullet, \cdots, \bullet \| : E^n \to [0, +\infty[$, which satisfies the following four conditions:
1) If $x_1, x_2, \cdots, x_n$ are linearly dependent, then $\| x_1, x_2, \cdots, x_n \| = 0$,
2) $\| x_1, x_2, \cdots, x_n \|$ is invariant under permutation,
3) $\| x_1, x_2, \cdots, x_{n-1}, \alpha x_n \| = |\alpha| \, \| x_1, x_2, \cdots, x_{n-1}, x_n \| \ \forall\, \alpha \in \mathrm{R}, (x_1, x_2, \cdots, x_n) \in E^n$,
4) $\| x_1, x_2, \cdots, x_{n-1}, y + z \| \leq c\, [\| x_1, x_2, \cdots, x_{n-1}, y \| + \| x_1, x_2, \cdots, x_{n-1}, z \|]$,
where $c \geq 1$, $\forall\, x_1, x_2, \cdots, x_{n-1}, y, z \in E$,
The pair $(E, \| \bullet, \cdots, \bullet \|)$ is then called a pseudo-quasi-n-normed space.

Definition 1.4. Let $(E, \| \bullet, \cdots, \bullet \|)$ be a vector pseudo-quasi-n-normed space.
a) The sequence $\{x_n\}_{n \in \mathrm{N}}$ is called Cauchy sequence if $\lim\limits_{k,l \to \infty} \| x_1, x_2, \cdots, x_{n-1}, x_k - x_l \| = 0$, for all $x_1, x_2, \cdots, x_{n-1} \in E$,
b) The sequence $\{x_n\}_{n \in \mathrm{N}}$ is called convergence in x if $\lim\limits_{k \to \infty} \| x_1, x_2, \cdots, x_{n-1}, x_k - x \| = 0$, for all $x_1, x_2, \cdots, x_{n-1} \in E$,
c) The pseudo-quasi-n-normed space $(E, \| \bullet, \cdots, \bullet \|)$ is called complete when every Cauchy sequence converges in a point of E.

Definition 1.5. The pseudo-quasi-n-norme function in E, is called uniformly continuous if $\forall\, \varepsilon > 0$, $\exists$ neighborhood of 0 in E, μ_ε, such that for $x_1 - x_1', \ x_2 - x_2', \ldots, \ x_n - x_n' \in \mu_\varepsilon$:

$$| \, \| x_1, x_2, \cdots, x_n \| - \| x_1', x_2', \ldots, x_n' \| \, | < \varepsilon.$$

Definition 1.6. Let $(X, \| \bullet, \cdots, \bullet \|_X)$ and $(Y, \| \bullet, \cdots, \bullet \|_Y)$ be two pseudo-quasi-n-normed space and $T : X \to Y$.
a) The function T is called isometry if for every $(x_1, x_2, \cdots, x_n) \in X^n$ is true

$$\| Tx_1, Tx_2, \cdots, Tx_n \|_Y = \| x_1, x_2, \cdots, x_n \|_X,$$

b) The space X is called isometric with space Y if exists an isometry of X into Y.
In M. Kir and M. Acikgoz [1] have proved completeness of quasi-2-normed spaces. In this paper we will extend this result of M. Kir and M. Acikgoz and we will show completeness of pseudo-quasi-n-normed spaces.

RESULTS AND FINDINGS

Let $(E, \| \bullet, \cdots, \bullet \|)$ be a pseudo-quasi-n-normed space with uniformly continuous pseudo-quasi-n-norme.
Definition 2.1. The Cauchy sequences $(x_k)_{k \in \mathrm{N}}$ and $(y_k)_{k \in \mathrm{N}}$ are called equivalent if

$$\lim_{k \to \infty} \| a_1, a_2, \cdots, a_{n-1}, x_k - y_k \| = 0, \text{ for all } a_1, a_2, \cdots, a_{n-1} \in E.$$

We denote this $(x_k)_{k \in \mathrm{N}} \sim (y_k)_{k \in \mathrm{N}}$.
Theorem 2.1. The relation "~" in set of Cauchy sequences in E is equivalence relation.
Proof.
1) $(x_k) \sim (x_k) \Rightarrow \forall\, a_1, a_2, \cdots, a_{n-1} \in E$ we have that $a_1, a_2, \cdots, a_{n-1}, x_k - x_k$ is linearly dependent, then $\| a_1, a_2, \cdots, a_{n-1}, x_k - x_k \| = 0$.
2) $(x_k) \sim (y_k)$ we have $\lim\limits_{k \to \infty} \| a_1, a_2, \cdots, a_{n-1}, x_k - y_k \| = \lim\limits_{k \to \infty} \| a_1, a_2, \cdots, a_{n-1}, -(y_k - x_k) \| =$

$$= \lim_{k \to \infty} |-1| \, \| a_1, a_2, \cdots, a_{n-1}, y_k - x_k \| = \lim_{k \to \infty} \| a_1, a_2, \cdots, a_{n-1}, y_k - x_k \| = 0, \text{ then } (y_k) \sim (x_k).$$

3) $(x_k) \sim (y_k)$ and $(y_k) \sim (z_k)$ we have

$$\| a_1, a_2, \cdots, a_{n-1}, x_k - z_k \| = \| a_1, a_2, \cdots, a_{n-1}, (x_k - y_k) + (y_k - z_k) \| \leq$$
$$\leq c\, [\| a_1, a_2, \cdots, a_{n-1}, x_k - y_k \| + \| a_1, a_2, \cdots, a_{n-1}, y_k - z_k \|].$$

Passing to the limit as k goes to infinity, we get

$$\lim_{k \to \infty} \| a_1, a_2, \cdots, a_{n-1}, x_k - z_k \| = 0 \Rightarrow (x_k) \sim (z_k).$$

Theorem 2.2. If sequences $(x_k)_{k\in N}$ and $(y_k)_{k\in N}$ are equivalent with $(x'_k)_{k\in N}$ and $(y'_k)_{k\in N}$, respectively, then $(x_k + y_k)_{k\in N}$ and $(x'_k + y'_k)_{k\in N}$, are equivalent too and for every $\alpha \in R$ the sequence $(\alpha x_k)_{k\in N}$ is equivalent with $(\alpha x'_k)_{k\in N}$.

Proof. For all $a_1, a_2, \cdots, a_{n-1} \in E$ we have

$$\|a_1, a_2, \cdots, a_{n-1}, (x_k + y_k) - (x'_k + y'_k)\| = \|a_1, a_2, \cdots, a_{n-1}, (x_k - x'_k) + (y_k - y'_k)\| \le$$

$$\le c[\|a_1, a_2, \cdots, a_{n-1}, x_k - x'_k\| + \|a_1, a_2, \cdots, a_{n-1}, y_k - y'_k\|]$$

Passing to the limit as k goes to infinity in inequality

$$\|a_1, a_2, \cdots, a_{n-1}, (x_k + y_k) - (x'_k + y'_k)\| \le c[\|a_1, a_2, \cdots, a_{n-1}, x_k - x'_k\| + \|a_1, a_2, \cdots, a_{n-1}, y_k - y'_k\|],$$

we get

$$\lim_{k\to\infty} \|a_1, a_2, \cdots, a_{n-1}, (x_k + y_k) - (x'_k + y'_k)\| = 0.$$

Thus $(x_k + y_k)_{k\in N} \sim (x'_k + y'_k)_{k\in N}$. So, the property

$$\|a_1, a_2, \cdots, a_{n-1}, \alpha x_k - \alpha x'_k\| = |\alpha| \, \|a_1, a_2, \cdots, a_{n-1}, x_k - x'_k\|$$

imply, for k goes to infinity, $(\alpha x_k) \sim (\alpha x'_k)$.

Let denote by

- $\hat{x}$, $\hat{y}$, ...the equivalence classes of Cauchy sequences (x_k), (y_k) in E and by $\hat{E}$ the set of the equivalence classes.
- $\hat{x} + \hat{y}$ the set of Cauchy sequences equivalent with $(x_k + y_k)_{k\in N}$, where $(x_k)_{k\in N} \in \hat{x}$, $(y_k)_{k\in N} \in \hat{y}$,
- $\alpha\hat{x}$ the set of Cauchy sequences equivalent with $(\alpha x_k)_{k\in N}$, where $(x_k)_{k\in N} \in \hat{x}$.

Theorem 2.3. If E is equipped with a pseudo-quasi-n-norme uniformly continuous, then for every n Cauchy sequences $(x_k^{(i)})_{k\in N}$, for $i = 1, ..., n$, exist the $\lim_{k\to\infty} \|x_k^{(1)}, x_k^{(2)}, \cdots, x_k^{(n)}\|$.

Proof. Let $(x_k^{(i)})_{k\in N}$, for $i = 1, ..., n$, be Cauchy sequences and $\varepsilon > 0$. From uniformly continuous of pseudo-quasi-n-norme function, exist neighborhood of 0, μ, such that for points $\left(x_k^{(i)}\right)_{i=1}^n$ and $\left(x_l^{(i)}\right)_{i=1}^n$, where $x_k^{(i)} - x_l^{(i)} \in \mu$, for all $i = 1, ..., n$. and $k, l > N(\varepsilon)$, we have

$$\left| \|x_k^{(1)}, x_k^{(2)}, \cdots, x_k^{(n)}\| - \|x_l^{(1)}, x_l^{(2)}, \cdots, x_l^{(n)}\| \right| < \varepsilon.$$

This shows that the sequence $(\|x_k^{(1)}, x_k^{(2)}, \cdots, x_k^{(n)}\|)_{k\in N}$ is Cauchy in R, and consequently, this sequence is convergent.

Theorem 2.4. If vector space E is equipped with a pseudo-quasi-n-norme uniformly continuous, then for sequences $(x_k) \sim (x'_k)$ and $(y_k) \sim (y'_k)$, we have

$$\lim_{k\to\infty} \|a_1, a_2, \cdots, a_{n-2}, x_k, y_k\| = \lim_{k\to\infty} \|a_1, a_2, \cdots, a_{n-2}, x'_k, y'_k\|,$$

for every $a_1, a_2, \cdots, a_{n-2} \in E$.

Proof. The proof of the theorem is based on Theorem 2.3.

The theorem is valid and for i Cauchy sequences, where $i = 1,..., n$.

Corollary 2.5. If sequences $(x_k^{(i)})$,$(y_k^{(i)})$ are equivalent, for $i = 1, \ldots, n$, then

$$\lim_{k\to\infty} \|x_k^{(1)}, x_k^{(2)}, \cdots, x_k^{(i)}\| = \lim_{k\to\infty} \|y_k^{(1)}, y_k^{(2)}, \cdots, y_k^{(i)}\|.$$

Let define in $\hat{E}^n$ the function $\|\bullet, \cdots, \bullet\|_1 : \hat{E}^n \to R^+$ such that

$$\|\hat{x}_1, \hat{x}_2, \ldots, \hat{x}_n\|_1 = \lim_{k\to\infty} \|x_k^{(1)}, x_k^{(2)}, \cdots, x_k^{(n)}\|$$

where $x_k^{(1)} \in \hat{x}_1$, $x_k^{(2)} \in \hat{x}_2$, …, $x_k^{(n)} \in \hat{x}_n$.

From theorems 2.3 and 2.4, this function is well defined and is independent from choice of representatives $x_k^{(1)}$, $x_k^{(2)}, \cdots, x_k^{(n)}$ from their equivalence classes $\hat{x}_1, \hat{x}_2, \ldots, \hat{x}_n$.

Theorem 2.6. The function $\|\bullet, \cdots, \bullet\|_1 : \hat{E}^n \to R^+$ such that

$$\| \hat{x}_1, \hat{x}_2, \ldots, \hat{x}_n \|_1 = \lim_{k\to\infty} \| x_k^{(1)}, x_k^{(2)}, \cdots, x_k^{(n)} \|$$

where $(x_k^{(1)}) \in \hat{x}_1$, $(x_k^{(2)}) \in \hat{x}_2$, …, $(x_k^{(n)}) \in \hat{x}_n$, is a pseudo-quasi-$n$-norm in $\hat{E}$.

Proof. 1) If $\hat{x}_1, \hat{x}_2, \ldots, \hat{x}_n$ are linearly dependent, we have $\hat{x}_n = \alpha_1 \hat{x}_1 + \alpha_2 \hat{x}_2 + \cdots + \alpha_{n-1} \hat{x}_{n-1}$ and

$$\| \hat{x}_1, \hat{x}_2, \ldots, \hat{x}_n \|_1 = \| \hat{x}_1, \hat{x}_2, \ldots, \hat{x}_{n-1}, \alpha_1 \hat{x}_1 + \alpha_2 \hat{x}_2 + \cdots + \alpha_{n-1} \hat{x}_{n-1} \|_1 =$$

$$= \lim_{k\to\infty} \| x_k^{(1)}, x_k^{(2)}, \cdots, x_k^{(n-1)}, \alpha_1 x_k^{(1)} + \alpha_2 x_k^{(2)} + \cdots + \alpha_{n-1} x_k^{(n-1)} \| \leq$$

$$\leq \lim_{k\to\infty} c^{n-1}[\, |\alpha_1| \, \| x_k^{(1)}, \cdots, x_k^{(n-1)}, x_k^{(1)} \| + |\alpha_2| \, \| x_k^{(1)}, x_k^{(2)}, x_k^{(n-1)}, x_k^{(2)} \| + \cdots$$

$$+ |\alpha_{n-1}| \, \| x_k^{(1)}, \cdots, x_k^{(n-1)}, x_k^{(n-1)} \|] = 0.$$

2) $\| \hat{x}_1, \ldots, \hat{x}_n \|_1 = \lim_{k\to\infty} \| x_k^{(1)}, \cdots, x_k^{(n)} \|$. Since $\| x_k^{(1)}, \cdots, x_k^{(n)} \|$ is invariant from permutation of $x_k^{(i)}$, we have $\| \hat{x}_1, \hat{x}_2, \ldots, \hat{x}_n \|_1$ is invariant from permutation of $\hat{x}_i$ also.

3) $\| \hat{x}_1, \hat{x}_2, \ldots, \hat{x}_{n-1}, \alpha \hat{x}_n \|_1 = \lim_{k\to\infty} \| x_k^{(1)}, \cdots, \alpha x_k^{(n)} \| = |\alpha| \lim_{k\to\infty} \| x_k^{(1)}, \cdots, x_k^{(n)} \| =$

$$= |\alpha| \, \| \hat{x}_1, \hat{x}_2, \ldots, \hat{x}_n \|_1$$

4) $\| \hat{x}_1, \hat{x}_2, \ldots, \hat{x}_{n-1}, \hat{y}_k + \hat{z}_k \|_1 = \lim_{k\to\infty} \| x_k^{(1)}, \cdots, x_k^{(n-1)}, y_k^{(n)} + z_k^{(n)} \| \leq$

$$\leq c\,[\lim_{k\to\infty} \| x_k^{(1)}, \cdots, x_k^{(n-1)}, y_k^{(n)} \| + \lim_{k\to\infty} \| x_k^{(1)}, \cdots, x_k^{(n-1)}, z_k^{(n)} \|] =$$

$$= c[\| \hat{x}_1, \hat{x}_2, \ldots, \hat{x}_{n-1}, \hat{y}_k \|_1 + \| \hat{x}_1, \hat{x}_2, \ldots, \hat{x}_{n-1}, \hat{z}_k \|_1].$$

Theorem 2.7. Every vector space E equipped with a pseudo-quasi-n-norm uniformly continuous has its completion.

Proof. As above, we construct the vector pseudo-quasi-n-normed space ($\hat{E}$, $\| \bullet, \cdots, \bullet \|_1$).

Step 1. Let show that E is isomorphe with a subspace of $\hat{E}$, dense in $\hat{E}$. Every constant sequence $x, x, \ldots, x$, $(x_k)_{k\in \mathrm{N}}$, $x_k = x$, is Cauchy sequence in E, therefore it define an equivalence class in E. Let denote by $\tilde{x}$ its equivalence class. It is evident that $\tilde{x} = \tilde{y} \Leftrightarrow x = y$. Let denote by $\hat{E}_0$ the set of these equivalence classes and let define the mapping $f : E \to \hat{E}_0$, such that $f(x) = \tilde{x}$. This function is injective. For every $a_1, a_2, \cdots, a_{n-1} \in E$ we have $\tilde{a}_1, \tilde{a}_2, \ldots, \tilde{a}_{n-1}$ take part in $\hat{E}_0$. So

$$\| \tilde{a}_1, \tilde{a}_2, \ldots, \tilde{a}_{n-1}, \tilde{x} \|_1 = \lim_{k\to\infty} \|a_1, a_2, \cdots, a_{n-1}, x\| = \|a_1, a_2, \cdots, a_{n-1}, x\|.$$

Thus, f is isometric function and then E and $\hat{E}_0$ are isometric.

Now, let show that $\hat{E}_0$ is dense in $\hat{E}$. Let $\hat{x} \in \hat{E}$ and $(x_k)_{k\in \mathrm{N}}$ a Cauchy sequence representation of $\hat{x}$. For every k, x_k correspond $\tilde{x}_k$ in $\tilde{E}_0$, so we have the sequence $(\tilde{x}_k)_{k\in \mathrm{N}}$ in $\tilde{E}_0$. For every $\tilde{a}_1, \tilde{a}_2, \ldots, \tilde{a}_{n-1} \in \tilde{E}_0$, we get

$$\| \tilde{a}_1, \tilde{a}_2, \ldots, \tilde{a}_{n-1}, \tilde{x}_k - \hat{x} \|_1 = \lim_{k\to\infty} \|a_1, a_2, \cdots, a_{n-1}, x_k - x_l\| = 0,$$

for $l > k$, since $(x_l)_{l\in \mathrm{N}}$ is Cauchy sequence. Thus

$$\lim_{k\to\infty} \|a_1, a_2, \cdots, a_{n-1}, x_k - x_l\| = 0, \text{ imply } (\tilde{x}_k) \to \hat{x}, \forall\ \tilde{a}_1, \tilde{a}_2, \ldots, \tilde{a}_{n-1} \in \tilde{E}_0.$$

Step 2. Now we will prove that pseudo-quasi-n-normed space ($\hat{E}$, $\|\cdot, \ldots, \cdot\|_1$) is complete.

For this we must show every Cauchy sequence in $\hat{E}$ converge in $\hat{E}$. Let $(\hat{x}_m)_{m\in \mathrm{N}}$ be a Cauchy sequence in $\hat{E}$. Since $\hat{E}_0$ is dense $\hat{E}$ there is a $(\tilde{y}_m)$ such that for every $\tilde{a}_1, \tilde{a}_2, \ldots, \tilde{a}_{n-1} \in \tilde{E}_0$ we have

$$\| \tilde{a}_1, \tilde{a}_2, \ldots, \tilde{a}_{n-1}, \hat{x}_m - \tilde{y}_m \|_1 < \frac{1}{m}, \forall\ m \in \mathrm{N}.$$

Also

$$\| \tilde{a}_1, \ldots, \tilde{a}_{n-1}, \tilde{y}_m - \tilde{y}_l \|_1 = \| \tilde{a}_1, \ldots, \tilde{a}_{n-1}, \tilde{y}_m - \hat{x}_m + \hat{x}_m - \tilde{y}_l \|_1 \leq$$

$$\leq c[\| \tilde{a}_1, \ldots, \tilde{a}_{n-1}, \tilde{y}_m - \hat{x}_m \|_1 + \| \tilde{a}_1, \ldots, \tilde{a}_{n-1}, \hat{x}_m - \tilde{y}_l \|_1] \leq$$

$$\leq \frac{c}{m} + c\| \tilde{a}_1, \ldots, \tilde{a}_{n-1}, \hat{x}_m - \hat{x}_l + \hat{x}_l - \tilde{y}_l \|_1 \leq$$

$$\leq \frac{c}{m} + c^2[\| \tilde{a}_1, \ldots, \tilde{a}_{n-1}, \hat{x}_m - \hat{x}_l \|_1 + \| \tilde{a}_1, \ldots, \tilde{a}_{n-1}, \hat{x}_l - \tilde{y}_l \|_1] \leq$$

$$\leq \frac{c}{m} + c^2\| \tilde{a}_1, \ldots, \tilde{a}_{n-1}, \hat{x}_m - \hat{x}_l \|_1 + \frac{c^2}{l}.$$

Passing to the limit as $m, l \to \infty$, we get

$$\| \tilde{a}_1, \ldots, \tilde{a}_{n-1}, \tilde{y}_m - \tilde{y}_l \|_1 \to 0.$$

So ($\tilde{y}_m$) is Cauchy sequence in $\tilde{E}_0$. Since $\tilde{E}_0$ is isomorphe with E, imply $(y_m)_{m\in N}$ is Cauchy sequence in E. Let denote by $\hat{y}$ the equivalence class of $(y_m)_{m\in N}$ and $\lim\limits_{m\to\infty} \tilde{y}_m = \hat{y}$. We will show $(\hat{x}_m)_{m\in N}$ converge in $\hat{y}$.

For every $\hat{a}_1, \ldots, \hat{a}_{n-1} \in \hat{E}$ we have

$$\| \hat{a}_1, \ldots, \hat{a}_{n-1}, \hat{x}_m - \hat{y} \|_1 = \| \hat{a}_1, \ldots, \hat{a}_{n-1}, \hat{x}_m - \tilde{y}_m + \tilde{y}_m - \hat{y} \|_1 \leq$$

$$\leq c[\| \hat{a}_1, \ldots, \hat{a}_{n-1}, \hat{x}_m - \tilde{y}_m \|_1 + \| \hat{a}_1, \ldots, \hat{a}_{n-1}, \tilde{y}_m - \hat{y} \|_1] \leq$$

$$\leq \frac{c}{m} + c\| \hat{a}_1, \ldots, \hat{a}_{n-1}, \tilde{y}_m - \hat{y} \|_1$$

Since $\lim\limits_{m\to\infty} \tilde{y}_m = \hat{y}$, passing to the limit as m goes to infinity, in above inequality, we get $(\hat{x}_m) \to \hat{y} \in \hat{E}$. So $\hat{E}$ is complete. The space $\hat{E}$ is completion of E.

CONCLUSION

Every vector space E equipped with a pseudo-quasi-n-norm uniformly continuous has its completion.

ABSTRACT: In this study, we investigated the relationship between problem-solving ability and scores of programming, in computer students. In order to prove this claim, we design a questionnaire consisting of 15 questions. The gathered answers from student were categorized as “right”, “wrong” and “no responded”. Survey of 100 students of computer in qualitative and quantitative is performed. Also we considered scores of programming course for related students as parameter in evaluation research. for enhance the accuracy of these questionnaires we were interviews with 6 students.The result of this investigation, show that there is Significant relationship between problem-solving ability and programming. Based on the results obtained from this study suggestion were presented to enhance problem-solving ability.

Key words: First-degree equation, Problem-based learning, Computer Algebra System, Problem generator, Problem solver

INTRODUCTION

It is well known that many students have difficulties in programming. Programming is a very complex subject that requires effort and a special approach in the way it is solving and taught. To become a good programmer, a student must acquire a series of abilities that go well beyond knowing the syntax of some programming language and problem solving that problem solving is very significant.

Several approaches have been proposed aiming to learning programming in different ways. Although we find reports of positive results as an outcome of some tools [1], none of them has a general use. In fact, we find reports about the difficulties many students experience when programming.

Result of investigate shows that the problem solving is in the initial phase of programming[2], when students have difficult in understand problem or in problem solving concepts, like to create algorithms that solve concrete problems. Special attention is necessary in this initial stage, not only in the development of programming specific abilities, but also in the improvement and knowledge and abilities that should have been acquired in previous years. Problem solving abilities and logic reasoning is relationship with programming[3-4]. The more traditional view of programming is a mapping of this problem understanding and problem solving onto a programming mechanism [5-6]. However, adopting the “programming as problem solving” perception leads to a programming substrate of a different nature that focuses on facilitating the problem solving process. Before even thinking about what to write in a computer program, the programmer must be sure of what the problem is, precisely. What is the input? What is the output? How should they relate? All your study in computer science will involve work with algorithms and chief notations historically have been pseudo code, flowcharts, and module hierarchy charts which direct relationship with problem solving.

Problem Solving Ability

What is a problem? A problem is a state in which you are trying to reach some goal, and must find a mean for getting there. Each problem has its own solution. Solving problems is a complex cognitive skill that characterizes one of the most intelligent human activities[7]. From childhood onward, we actively solve problems presented to us by the world. We acquire information about the world, and organize this information into structure of knowledge about objects, events, people, and ourselves bodies of understanding, mental models, convictions, and beliefs that influence how we relate our experience life, in school, in our jobs, and at play. How do humans develop their abilities to solve problems in these situations? People differ, children from adults, and experts from novices, and these differences are based on cognitive processes and mental organizations that humans have in common, and that characterize their problem solving abilities. In this study, we will be evaluated capable of problem solving any students in relation to those of skill in the programming computer[8]. We believe that students have difficult in problem solving, also in computer programming are trouble. Unfortunately, Computer programming has traditionally been taught and practised as a fundamentally individual activity; however, over the last few years, computer science educators have adopted different collaborative learning practices such as programming in pairs and team projects. Through these collaborative activities, students increase their self-confidence, produce better programs and improve their performance and programming skills. But the best way to enhance the programming ability of students is improve their problem-solving ability[9].

The first thing that people are faced is problem. These are generally divide into two categories: With clear solution and no clear solution. Problems with solutions that are commonly present in the technical books and bulletins, or are the problems that people with knowledge of the issue can be solved. This type of solution is shown in Figure 1. Here's a problem to a standard or similar problem is returned. The standard solution of problem is clear and with the solution the problem will be solved.

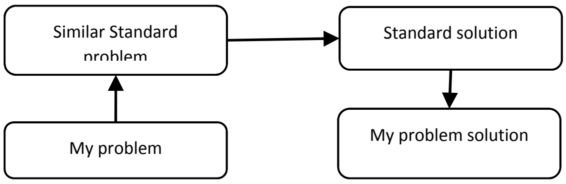

Fig. 1 Clear Solution Type of Problem Solving

Problems which require ideas and innovation are: Other types of problems, problems with uncertain solutions. These types of problems are in need of creativity and innovation. If for problem solving, personal experiences and thoughts of a person who has acquired his expertise to use environment or face defeat, to create new concepts, using alternative technologies, are called "psychological inertia ". To solve these types of problems requires expertise beyond the knowledge of the underlying, individual of creativity and innovation plays a role, too.

METHODS

Research Design

In this study, we investigated the relationship between problem-solving ability and scores of programming, in computer science students. In this research, researchers collected quantitative and qualitative data with questionnaire and interviews of students. The rationale for this approach is that the quantitative data and results provide a table of the research problem; more analysis, specifically through qualitative data collection, is needed to refine, extend, or explain. The quantitative part was conducted in questionnaire design. The treatment variable of the study was Scratch problem solving. The dependent variable of the study was programming skills. The scores of the problem solving and programming skills were gathered through Problem Solving and programming Inventory (PSAPI). In the qualitative part of the research, students were interviews in probelem solving and programming, focus group interview was conducted with students about experimental process problem solving and programming with aexpremental interviews.

Participants

100 high school students, who were attending a computer course in Iran, participated in the study. This computer course is teaching in eight hour per week.

Context and Process

According to the curriculum of the computer programming course in high schools, in many schools, programming environment is being used to teach programming to student.
In this study , we have over students who have a study done 8 hours of lessons per week of programming .
In this study, a list of questions prepared in accordance with Table 1 . As seen in Table 1 the degree of difficulty was designed with three things. Classification problems in an easy group, including basic information to solve

problems that do not require special or specific innovation. These problems are expected to be resolved correctly by the majority groups. The middlegroup problems, problems they need to solve and simulate the classical method of solving problems is similar to the problems that have clear solutions discussed in the previous section of this article[10]. And Hard problems, involves problems that require individual of creativity and innovation is solving.In the design inquiries and questions are also classified into three distinct groups, from the viewpoints of two computer experts and two teachers were using computers, therefore, the questions of linguistically, levels the content it right credibility.

Table 1. List of Programming Problems

Problem
Quadric Equation solving
Factorial of *N*
Prime number of less than *N*
Sum of *N* number
Average of *N* number
Recursive function of factorial number *N*
The greatest common divisor (GCD) of two numbers
Least common multiple (LCM) of two numbers
Find an employee's net salary
Sort of *N* number
Find of Minimum and Maximum number from *N* number

Data Analysis

Gender-based research group, and the status of the problem is properly assessed, measured in accordance with Table 2 were designed based on this table were analyzed. Due to the number of students, by sex, frequency of student responses and errors were evaluated.

Table 2. Evaluation criteria in data analysis

Score	criteria
0	Empty (E)
0	Completely Wrong (CW)
1	Partially Correct (PC)
2	Completely Correct (CC)

Also, in order to assess the relationship between problem-solving ability of students with scores programming, we classify programming Course grades in accordance with Table 3.

Table 3. Benchmark score Programming Course categories

Score Range	criteria
0 - 40	Weak (W)
41 - 60	Medium (M)
61- 80	Good (G)
81 - 100	Excellent (E)

RESULTS AND FINDINGS

Data analysis

The data analysis and results are presented with special reference to the research two hypotheses in the problem solving and programming study. Student-based research group, and the status of the problem is properly sessed, measured in accordance with Table 2 were designed based on this table were analyzed. Simple percentages Chi – Square. In compliance with a pre – study of the instrument was carried out and tested with Cronbach alpha coefficient and a reliability coefficient of 0.92 was obtained, which showed a strong reliability of the research instrument.

H0: problem solving will not have any significant impact on Programming.

In testing the above hypothesis, Chi-square statistics was adopted using question asked to ascertain the impact of problem solving in programming. The results are presented in the table below:

Table 4. Score of students of programming and problem solving

	Programming									
Problem		Weak		Medium		Good		Excellent		
		N	%N	N	%N	N	%N	N	%N	Total
	Weak	65	.65	24	.24	8	.08	3	.03	100
	Medium	26	.26	52	.52	17	.17	5	.05	100
	Good	7	.07	20	.2	53	.53	20	.2	100
	Excellent	2	.02	4	.04	22	.22	72	.72	100

χ^2 =47.8 df=9 Sig=.003

According to table4, χ^2 =47.8, df=9 and $p<.05$ show that participants believe that problem solving has positive effect on programming.

CONCLUSION

In this study, the researchers explored the effect of problem solving in programming skills on high school students'. Moreover, they wondered what high school students think about programming. According to the quantitative results, programming did not cause any significant differences in the problem solving skills of the high school students. This result may show that programming in Scratch platform may not have an impact on their problem solving skills. This result can only be considered within the scope of this research. However, although this study was carried out over a short time period; there was a slight improvement in the students' self-confidence in their problem-solving ability. This slight improvement is also valuable for these conditions. In fact, this sheds light on the possibility that may problem-solving affect programming skills of the students.

Another point to be considered is that the students' self-perception about their problem-solving skills was found to be very low. Students have to be supported with different activities and applications that require high-order thinking in order to help students develop problem solving skills.

When the thoughts of the high students were considered, it can be clearly said that students liked programming and wanted to improve their programming. In the problem solving process, while half of the students had some difficulty, the others did not. Most of them tried to solve their problems in different ways. The favorite aspect of these applications were assigning a command to a character, learning how to write a program, adding a variable to a program, sharing what they did with others and creating their own world. The finally, most of the students found the problem solving of problem in programming if they have ability problem solving.

ÖZET: Çalışmanın amacı biyoloji eğitimi kapsamında uygulanan proje tabanlı öğrenme yaklaşımının ortaöğretim öğrencilerinin üstbilişsel farkındalıklarına etkisini araştırmaktır. Çalışmada nitel araştırma yönteminden yararlanılmıştır. Araştırma 2010-2011 öğretim yılı ikinci döneminde Ankara'da bulunan Özel Nene Hatun Fen Lisesi'nin 2. sınıfında öğrenim gören 15 öğrenci ile gerçekleştirilmiştir. Çalışmada "Bilinçli Birey ve Yaşanabilir Çevre" ve "Ekosistem Hizmetleri ve Sürdürebilirlik" üniteleri 5 hafta (20 ders saati) boyunca proje tabanlı öğrenme yaklaşımı ile işlenmiştir. Sürecin sonunda öğrencilere yarı yapılandırılmış sorular yönlendirilerek veriler elde edilmiştir. Veriler betimsel analiz yöntemi kullanılarak çözümlenmiştir. Öğrencilerle yapılan görüşmeler incelendiğinde proje tabanlı öğrenme yaklaşımı ile öğrencilerin; çalışmalarını planlama, öz-değerlendirme yapma, öğrenmelerini kontrol etme, izleme gibi çeşitli üstbilişsel farkındalıklar edindikleri sonucuna ulaşılmıştır. Öğrencilerin üstblişsel farkındalıklarını geliştirmelerine katkısı olan yaklaşımların tespit edilmesi ve bu yaklaşımlardan biri olan proje tabanlı öğrenmenin eğitim sisteminde daha etkin biçimde kullanılması önerilmiştir.

Anahtar Kelimeler: Proje tabanlı öğrenme, üstbilişsel farkındalık, biyoloji öğretimi

ABSTRACT: The aim of this study is to research the effect of the project-based learning approach, which was implemented in the scope of biology education, on secondary school students' metacognitive awareness. The interview technique, one of the quantitative research methods, were used. The study was carried with the 2nd grade students in a private science high school in the Turkish city of Ankara during second term of the Education Year 2010-2011. In the study, the units of "Conscious Individual and Liveable Environment" and "Ecosystem Services and Sustainability" were taught for 5 weeks with a project based learning approach. As for the qualitative part, the data were examined by using the descriptive analysis method. When the interviews with the students were examined, it has been observed that students in the project-based learning approach have acquired various metacognitive awareness such as planning their studies, performing self-evaluation, check their learning and monitoring.

Key Words: Project-based learning, metacognitive awareness, biology education

GİRİŞ

Proje tabanlı öğrenme değişken, göreli ve hızla artan bilgiyi, son derece sınırlı zaman dilimlerinde, teknoloji tabanlı öğrenme ortamında ve bireyi, problem çözebilen, analitik ve eleştirel düşünebilen, araştırma yapabilen, karar verebilen, sorumluluk alabilen ve iş birliği içinde çalışabilen bir birey haline getirebilecek biçimde kazanmamızı sağlayabilecek güçte bir anlayıştır (Erdem, 2002).

Proje tabanlı öğrenme yönteminin karakteristik özellikleri şöyle sıralanabilir:

- Öğrenenler öğrenme görevlerini belirleyebilirler
- Öğrenenler çözüm sürecini kendileri tasarlarlar
- Öğrenenler çözüm için bilgileri toplamak ve düzenlemekle yükümlüdürler
- Öğrenenler düzenli olarak yaptıklarını arkadaşları ve öğretmenleriyle paylaşırlar
- Sınıf ortamı değişim ve hataları tolere edebilecek şekilde oluşturulmuştur
- Süreç değerlendirme için önemlidir (Başbay, 2005).

Proje tabanlı öğrenmenin sayılan özelliklerine baktığımızda kişinin nasıl öğrendiğini kontrol etmesi, öğrenmeyi planlaması ve öğrenmesini değerlendirmesi gibi üstbilişsel aktiviteleri içerdiği görülmektedir.

Üstbiliş, öğrenmenin kendi kendine oluşmasını sağlayan becerileri kapsar. Bireyde bilişsel farkındalık yani üstbiliş ile ortaya çıkması beklenen beceriler şöyle sıralanabilir:

- Kişinin kendisinin ve öğrenme yollarının farkında olması
- Bilinçli davranma
- Kendini kontrol
- Planlama
- Nasıl öğrendiğini izleme
- Kendini düzenleme
- Kendini değerlendirme (Doğanay, 1997).

Üstbilişsel farkındalık ise amacın ve kişisel kaynakların tanımlanarak bireyin bildiklerinin, motivasyon ve kaygı düzeylerinin, ihtiyaçlarının farkında olarak değerlendirmeyi nasıl yapacağını belirlemesidir (Ertmer ve Newby,1996: Akt. Yavuz, 2009).

Araştırmanın Amacı ve Önemi

Öğrencilerin sahip olmadan başarıya ulaşmalarının güç olduğu üstbilişsel farkındalık gibi özelliklerin nasıl kazandırılabileceği ile ilgili araştırmalar oldukça kısıtlıdır. Çeşitli faktörlerin bu unsurlar üzerinde etkisi incelenmişse de günümüz eğitim sisteminde önemli bir yere sahip olan proje tabanlı öğrenmenin üstbilişsel farkındalığı nasıl etkilediği hususu eksik kalmıştır. Bu araştırmada öğrenmeyi öğrenmek çıkış noktasına sahip olan proje tabanlı öğrenmenin, yine aynı çıkış noktasından yola başlayan üstbilişsel farkındalığa etkisi araştırılmıştır.

Araştırmanın amacı, biyoloji eğitimi kapsamında uygulanan proje tabanlı öğrenme yaklaşımının ortaöğretim öğrencilerinin üstbilişsel farkındalıklarına etkisini araştırmaktır.

Araştırmanın problemi ise 'Ortaöğretim öğrencilerinin proje tabanlı öğrenme yaklaşımının üstbilişsel farkındalıklarına etkisi ile ilgili görüşleri nelerdir?'şeklindedir.

YÖNTEM

Bu çalışmada nitel araştırma yöntemlerinden sıklıkla kullanılan yaklaşımlardan biri olan görüşme tekniği kullanılmıştır. Bu tekniğin kullanıldığı çalışmalardaki öncelikli amaç, çalışılan örneklemden elde edilen sonuçların örneklemin temsil ettiği evrene genellenmesi değildir. Amaç, sonuçların çalışılan kişilere benzer ya da aynı özellik gösteren kişilere genellenmesidir. Bu nedenle görüşme gibi nitel araştırma tekniklerinin kullanıldığı çalışmalarda örneklem seçimine ilişkin çok sıkı kurallar yoktur (Türnüklü, 2000).

Katılımcılar

Çalışma 15 kişi ile yürütülmüştür. Çalışma grubundaki öğrencilerin tamamı kızdır. Yaşları 16-18 arasında değişmektedir. Öğrenciler fen lisesinde bulunmaları ile de paralel olarak yüksek akademik başarıya sahip öğrencilerdir.

Veri Toplama Süreci

Araştırma 2010-2011 eğitim-öğretim yılının ikinci döneminde 9 Mayıs tarihinde başlayıp 10 Haziran tarihinde sona ermiştir. Toplamda 5 hafta süren çalışma Biyoloji dersi kapsamında 'Bilinçli Birey Yaşanabilir Çevre' ve 'Ekosistem Hizmetleri ve Sürdürebilirlik' üniteleri boyunca gerçekleştirilmiştir. Çalışmanın yapıldığı sınıfların haftalık Biyoloji ders saatleri 4'tür yani çalışma toplamda 20 ders saati sürmüştür.

Yarı Yapılandırılmış Görüşme Soruları

Sorular, araştırmacı tarafından hazırlanmıştır ve belirtilen konuların değerlendirilmesine uygunluk bakımından araştırmacıdan bağımsız, 2 farklı uzman tarafından incelenmiştir.

Verilerin Analizi

Görüşmelerden elde edilen veriler betimsel analiz yöntemi kullanılarak çözümlenmiştir. Betimsel analiz yaklaşımı, verilerin araştırma sorularının ortaya koyduğu temalara göre organize edilmesine ve görüşmede kullanılan sorular veya boyutlar dikkate alınarak sunulmasına imkan vermektedir (Yıldırım ve Şimşek, 2011).

BULGULAR

Bu bölümde öğrencilerin sorulara verdiği cevaplar tablolar halinde sunulmuştur.

Soru 1. Proje tabanlı öğrenme yaklaşımı size zihinsel anlamda güçlü ve zayıf yönlerinizi öğretti mi? Örneklerle açıklar mısınız?

Tablo 1. Birinci Soruya Öğrencilerin Verdiği Cevaplar

	f	%
Zihinsel anlamda güçlü ve zayıf yönlerimi öğrendim	11	78,5
Görsel yönümün daha güçlü olduğunu anladım	4	28,5
İşitsel yönümün daha güçlü olduğunu anladım	2	14,2
Sosyal yönümle ilgili bilgi edindim	2	14,2
Aktif olduğumda daha kolay öğrendiğimi anladım	4	28,5

Birinci soruyu 14 öğrenci cevaplamıştır. Açıklayıcı bilgi alt boyutunu ölçmeye yönelik bir sorudur. Bu alt boyut bireylerin öğrenme görevlerinin yapılarına, bilişsel amaçlarına ve kişisel yeteneklerine ilişkin inançlarını içerir. Öğrencilerin % 78,5'i proje tabanlı öğrenme yaklaşımının kendilerine zihinsel anlamda güçlü ve zayıf yönlerini öğrettiğini söylemişlerdir. Bununla birlikte bu çalışma sonucunda öğrencilerin % 28,5'i görsel, % 14,2'si işitsel yanlarının güçlü olduğu çıkarımına varırken, % 14,2'si sosyal yönü hakkında bilgi edindiklerini % 28,5'i ise aktif olduklarında daha kolay öğrendiklerini belirtmişlerdir (Tablo 1).

Soru 2. Proje çalışmaları sayesinde bilgileri hatırlama ve düzenleme becerilerinizin gelişeceğini düşünüyor musunuz?

Tablo 2. İkinci Soruya Öğrencilerin Verdiği Cevaplar

	f	%
Bilgileri hatırlama ve düzenleme becerilerim gelişti	13	86,6
Kendim yaptığım için daha çok akılda kalıcı olur	5	33,3
Konuyu ayrıntılarıyla incelediğimiz için daha akılda kalıcı olur	2	13,3
Görsel olduğu için daha akılda kalıcı olur	3	20
Bilgiler bu şekilde daha sistemli oluyor	2	13,3

İkinci soruyu 15 öğrenci cevaplamıştır. Açıklayıcı bilgi alt boyutunu ölçmeye yönelik bir sorudur. Öğrencilerin % 86,6 sı proje tabanlı öğrenme yaklaşımının bilgileri hatırlama ve düzenleme becerilerini geliştirdiğini söylerken % 33,3 kendileri yaparak öğrendikleri için, % 13,3 ü konular ayrıntılı incelendiği, %20 si görsel olduğu için daha akılda kalıcı olduğunu, %13,3 ü bilgilerin bu şekilde daha düzenli ve sistemli olduğunu belirtmişlerdir (Tablo 2).

Soru 3: Proje çalışmanız sırasında ne tür yöntemler kullandınız?

Tablo 3. Üçüncü Soruya Öğrencilerin Verdiği Cevaplar

	f	%
Çalışırken ne tür yöntemler kullandığımın farkındayım	15	100
İnternet araştırması yaptık	15	100
Deneysel yöntem kullandık	2	13,3

Üçüncü soruyu 15 öğrenci cevaplamıştır. Prosedürel bilgi alt boyutuna yönelik bir sorudur. Bu alt boyut problemi çözmek için stratejilerin nasıl kullanılacağı hakkındaki bilgiyi ve bireyin bilgi ve becerileri kullanma ve düzenleme düzeylerini değerlendirmektedir. Öğrencilerin % 100 proje çalışması sırasında ne tür yöntemler kullandıklarının farkında olduklarını söylemişlerdir. % 100'ü internet araştırması yaptıklarını belirtirlerken %13,3 'ü deneysel yöntem kullandıklarını söylemişlerdir (Tablo 3).

Soru 4: Proje çalışmanızda aktif görev almanız sizi motive etti mi?

Tablo 4. Dördüncü Soruya Öğrencilerin Verdiği Cevaplar

	f	%
Aktif görev almak beni motive etti	10	66,6

Aktif görev almak beni mutlu etti	2	13,3
Aktif olmamayı tercih ederdim	4	26,6

Dördüncü soru 15 öğrenci tarafından cevaplandırılmıştır. Bu soru durumsal bilgi alt boyutunu ölçmeye yönelik bir sorudur. Bu alt boyut bireyin açıklayıcı ve prosedürel bilgiyi ne zaman ve niçin kullanacağını ölçmektedir. Öğrencilerin % 66,6 'sı aktif görev almanın kendilerini motive ettiğini % 13,3 'ü aktif görev almaktan dolayı mutlu olduklarını belirtmişlerdir. Bununla birlikte % 26,6'sı aktif olmamayı tercih ettiklerini söylemişlerdir (Tablo 4).

Soru 5: Proje çalışmanızın başında zamanınızı organize ettiniz mi? Zamanlamanıza uydunuz mu?

Tablo 5. Beşinci Soruya Öğrencilerin Verdiği Cevaplar

	f	%
Zamanımızı organize ettik	13	86,6
Zaman çizelgemize uyduk	11	73,3

Beşinci soruyu 15 kişi cevaplamıştır. Bu soru planlama alt boyutun yöneliktir. Planlama alt boyutu bireyin uygun öğrenme stratejilerini seçmesini ve etkili performans için bilişsel kaynaklarını işe koşmasını içerir. Öğrencilerin %86,6'sı proje çalışmalarına başlamadan önce zamanlarını organize ettiklerini söylerken %73,3'ü ise zamanlama çizelgelerine uyduklarını belirtmişlerdir (Tablo 5).

Soru 6: Proje çalışmanıza başlamadan önce nasıl bir yol izlediniz?

Tablo 6. Altıncı Soruya Öğrencilerin Verdiği Cevaplar

	f	%
Çalışmaya başlamadan önce görev dağılımı yaptık	13	86,6
Çalışmaya başlamadan önce konuları dağıttık	4	26,6
Çalışmaya başlamadan önce farklı yollar düşündük	1	6,6
Çalışmaya başlamadan önce araştırma yaptık	4	26,6

Altıncı soruyu 15 öğrenci cevaplamıştır. Planlama alt boyutuna yöneliktir. Öğrencilerin % 86,6'sı çalışmaya başlamadan önce görev dağılımı yaptıklarını, % 26,6'sı konu dağılımı yaptıklarını, yine % 26,6'sı araştırma yaptıklarını ve % 6,6,'sı da farklı yollar düşündüklerini belirtmişlerdir (Tablo 6).

Soru 7: Proje çalışmalarınız sırasında ara verip ne yaptığınızı, konuyu öğrenip öğrenmediğinizi kontrol ettiniz mi?

Tablo 7. Yedinci Soruya Öğrencilerin Verdiği Cevaplar

	f	%
Çalışmamız sırasında ara verip kendimizi kontrol ettik	13	86,6

Yedinci soruyu 15 kişi cevaplandırmıştır. İzleme alt boyutunu ölçmeye yönelik bir sorudur. İzleme; bireyin performansını analiz etmesini, gelecekteki performansı hakkında kestirimlerde bulunmasını, öğrenme stratejilerinin verimliliğini değerlendirmesini ve performans hatalarını saptamasını yansıtmaktadır. Öğrencilerin % 86,6'sı proje çalışmaları sırasında ara verip çalışmalarını kontrol ettiklerini belirtmişlerdir (Tablo 7).

Soru 8: Sence proje çalışmandan kaç puan alırsın?

Tablo 8. Sekizinci Soruya Öğrencilerin Verdiği Cevaplar

	f	%
Çalışmadan kaç puan alabileceğini tahmin edenler	12	80

Sekizinci soruyu 15 kişi cevaplandırmıştır. Değerlendirme alt boyutunu ölçmeye yönelik bir sorudur. Değerlendirme bireyin öğrenme çıktılarını ve verimliliğini değerlendirmesini belirlemektedir. Öğrencilerin % 80'i proje çalışmalarının sonucunu değerlendirebilmişlerdir (Tablo 8).

Soru 9: Projelerinizi hazırlarken anlayamadığınız bir şey olduğunda grup arkadaşlarınızdan yardım istediniz mi?

Tablo 9. Dokuzuncu Soruya Öğrencilerin Verdiği Cevaplar

	f	%
Anlayamadığım konularda arkadaşlarımdan yardım istedim	8	80
Anlayamadığım konu olmadı	2	20

Dokuzuncu soruyu 10 öğrenci cevaplamıştır. Hata ayıklama alt boyutunu ölçmeye yönelik bir sorudur. Bu alt boyut bireyin performans ve kavramasındaki hataları düzeltmesini içermektedir. Proje çalışmaları sırasında öğrencilerin % 80'i anlayamadıkları konularda arkadaşlarından yardım istediklerini belirtirken % 20'si anlayamadığı bir konunun olmadığını söylemişlerdir (Tablo 9).

SONUÇ

Çalışmadan elde edilen sonuçlar şöyle sıralanabilir;

- Öğrenciler proje tabanlı öğrenme yaklaşımı sayesinde nasıl daha iyi öğrenebildikleri (duyarak, görerek, aktif olduklarında) hakkında da bilgi edindiklerini belirtmiştir.
- Öğrenciler proje tabanlı öğrenmede konu ayrıntılarıyla ele alındığı için ve bu yaklaşım daha görsel olduğu için öğrendiklerinin uzun süre akılda kalacağını belirtmişlerdir. Ayrıca bilgilerin bu yöntemle daha sistemli olduğunu söylemişlerdir.
- Öğrenciler proje tabanlı öğrenme yönteminde aktif oldukları için daha mutlu olduklarını ve bunun da öğrenme motivasyonlarını arttırdığını belirtmiştir.
- Öğrencilerin bu proje tabanlı öğrenme ile çalışırken kullandıkları yöntemlerin farkında oldukları görülmüştür.
- Görüşmelerden elde edilen cevaplardan proje tabanlı öğrenme yaklaşımının öğrencilere *planlama* gibi üstbilişsel farkındalıklar kazandırdığı sonucuna ulaşılmıştır.
- Öğrencilerin çoğu proje tabanı öğrenme sürecinde *izleme* yaparak, performanslarını analiz ederek, gelecekteki performansları hakkında kestirimlerde bulunup, öğrenme stratejilerinin verimliliğini değerlendirmişler ve performans hatalarını saptamışlardır.
- Proje tabanlı öğrenme sürecinin sonunda öğrencilerin *değerlendirme* yaparak öğrenme çıktılarını ve verimliliği hakkında bir fikir sahibi oldukları sonucuna varılmıştır.
- Öğrencilerin büyük bir kısmı proje tabanlı öğrenme sürecinde üstbilişsel bir farkındalık olan *hata ayıklamayı* gerçekleştirerek performans ve kavramalarındaki hatalarını düzeltmeye çalışmışlardır.

Sonuçlar özetlenecek olursa, öğrencilerle yapılan görüşmeler incelendiğinde proje tabanlı öğrenme yaklaşımı ile öğrencilerin çalışmalarını planlama, öz değerlendirme yapma, öğrenmelerini kontrol etme, izleme gibi çeşitli üstbilişsel farkındalıklar edindikleri görülmektedir.

ÖNERİLER

- Öğrencilere bilgiyi öğretmek yerine 'öğrenmeyi öğretmek' toplumun ve bireylerin geleceği açısından çok daha yararlı bir yaklaşım olacaktır. Bu nedenle öğrencilerin üstbilişsel farkındalıklarını arttırma yolları tespit edilip eğitim sisteminin o doğrultuda geliştirilmesi önerilmektedir.
- Proje tabanlı öğrenme yaklaşımı dışındaki öğretim modellerinin de üstbilişsel farkındalığa etkisi araştırılıp bu modeller arasında karşılaştırmalar yapılabilir.
- Bu çalışma farklı disiplinlerde ve ortaöğretim dışındaki öğretim kademelerinde de yapılabilir. Aynı konu farklı araştırma desenleri ve farklı katılımcı sayısı ile tekrar çalışılabilir.

CONTEXTUALIZED LEARNING SETTINGS FOR MEANINGFUL NATURE OF SCIENCE UNDERSTANDING

Kader BİLİCAN

Jale CAKİROGLU

Ceren OZTEKİN

It was claimed that reaching the goal of totally scientific literate people could be achieved by in science courses if students were taught about nature of science (NOS). Even though nature of science understanding has been claimed to be an important learning outcome for science education for a long time, research studies have consistently have indicated both pre- and in-service science teachers' naïve NOS ideas ((Abd-El-Khalick, 2005). Yet, science teachers' naïve understanding of NOS has been crucial factor keeping them emphasizing NOS explicitly and reflectively which also lead students acquiring undesired NOS views (Akerson, Buzelli, & Donnely, 2008). Thus, developing more desired views of NOS for science teachers has been first step to ensure more appropriate NOS emphasize in classes. Considering the success of explicit reflective NOS instruction for improving NOS views, it has often has been undertaken through decontextualized settings to improve pre-service science teachers' NOS views. Although decontextualized explicit reflective NOS instruction provided learners with opportunities to revise their NOS views without struggling science content, they were not alone sufficient to help develop deeper NOS understanding (Clough, 2006). Although there has been some evidence related to impact of contextualized settings on NOS views, it is still unknown how the designing combination of different contextualized settings coupled with explicit-reflective NOS would work for pre-service science teachers' NOS views. Therefore, this study aimed to reduce lack of information related to contribution of contextualized settings to gain deeper NOS understanding for pre-service science teachers. The present study focused on helping pre-service teachers develop their NOS views within a combination of different contextualized settings coupled with explicit reflective NOS instruction. It was concluded that contextualized settings had a huge contribution to promote NOS views. Further results and implications of study will be discussed

Keywords: nature of science understanding, pre-service teacher education

THE INFLUENCE OF INITIAL TEACHER TRAINING IN FUTURE TEACHERS' PERCEPTIONS ABOUT MATHEMATICS TEACHING AND LEARNING

Isabel Cláudia NOGUEIRA
Escolar Superior de Educação de Paula Frassinetti, Porto, Portugal
isa.claudia@esepf.pt

ABSTRACT: Assuming that teachers´ knowledge about mathematics teaching and their beliefs and conceptions about mathematics and about mathematics teaching and learning are related (Ball, 1991; Thompson, 1997), that future teachers´ beliefs act as previous knowledge in their formative experiences (Tardif, 2002) and that those beliefs are dynamic, once its confrontation with others beliefs can modify them (Vila and Callejo, 2006), we are developing a longitudinal study which intends to determine the influence of undergraduate degree on Primary Education in conceptions that students, future teachers, have about mathematics and about mathematics teaching and learning processes.

In this paper, we present preliminary data obtained in academic year 2012/2013 from two different groups of students, future teachers, of the undergraduate degree on Primary Education of Paula Frassinetti School of Education: a students´ group at the beginning of its teacher training studies and a students´ group at the end of this study cycle.

Key words: Teachers Training, Primary Education, Mathematics, Conceptions

INTRODUCTION

Developed by Freema Elbaz, Alba Thompson and Deborah Ball and recognized by, the first studies on conceptions about mathematics and its influence on teaching and learning of this discipline in the various levels of education contributed decisively for a deeper understanding by the mathematics educators community of which factors should be taken into account in its curricular development, allowing to identify the enablers or hindering elements in its teaching and learning. In the early 80s, personal beliefs were identified as filters of all kinds of teachers knowledges: according to Elbaz (1983), a knowledge guiding their practice; Ball (1991) emphasizes the interaction between teachers' knowledge about mathematics and their conceptions about this subject, referring to his influence on their practices, belief also supported by Thompson (1997).

The formative practices experienced by students in their academic pathways and conceptions associated with them are identified as decisive not only in their academic achievements but are of particular relevance in their future professional practice. In this context, Tardif considers future teachers conceptions as previous knowledge regulators, both from their training experiences as from their results, considering that their professional practice is based on judgments interiorized from school traditions and in their lived experience, from which the past enables them to clarify the present and anticipate the future (Tardif, 2002). More recently, Vila and Callejo stated that beliefs develop from experiences and perceptions and enhanced the dynamic character of perceptions, since they can be modified by experience or contrast with other perceptions (Vila & Callejo, 2006).

Aware that beliefs about mathematics are mainly built in the school and that they define the vision and the application given to mathematics and assuming that they have an important role in future teachers training, in school year 2012/2013 we implemented a longitudinal study which main objective is to determine the influence of the undergraduate degree on Primary Education in future teachers conceptions about mathematics and about the teaching and the learning of mathematics.

THE CONTEXT

In a more scientific approach or emphasizing educational knowledge in the specific area of mathematics, the undergraduate degree on Primary Education - necessary condition to obtain qualification for teaching in Preschool Education and in 1st or 2nd cycles of Primary Education - includes mandatory courses in mathematics in its training components. The curricular structure of this undergraduate degree includes six courses (summing 30 ECTS credits) focused on Mathematics and Mathematics Education: Development of Mathematical Logical Reasoning, Numerical Structures, Geometry Topics, Introduction to Statistics, Mathematics Communication and Didactics of Mathematics.

The first of these curricular units, Development of Mathematical Logical Reasoning, provides an initial contact with the specificities of the processes of construction and development of the main logical-mathematical structures. The following four courses (Numerical Structures, Geometry Topics, Mathematics Communication and Introduction to Statistics) are allocated to the training component of the teaching of mathematics, and include the presentation and exploration of concepts, relations, operations and logical-mathematical representations, covering mathematical knowledge needed to the desirable mathematics best practices in Primary Education. The organization and the construction of educational and didactic knowledge in the specific area of mathematics - essential to the design and implementation of educational contexts that promote the development of logical and mathematical reasoning in the areas of early childhood education and in the aim of the 1st and 2nd cycles of primary education - justify the inclusion of the course of Didactics of Mathematics in the last semester of the undergraduate degree on Primary Education curricular structure.

METHODS AND PROCEDURES

The data we present has been obtained in academic year 2012/2013 from two different groups of students, future teachers, of the undergraduate degree on Primary Education of Paula Frassinetti School of Education, in Porto, Portugal: a students´ group at the beginning of its teacher training studies (Group 1) and a students´ group at the end of this study cycle (Group 2). Data collection was carried out in September 2012 in Group 1 (before any formative action related to mathematics, their teaching and their learning) and in Group 2 in June 2013 at the end of those students´ graduations.

Students were requested to fill out a questionnaire survey proposed by Godino (2004). With a Likert type scale, students had to specify their level of agreement or disagreement with 9 statements, according to the following convention: completely disagree; disagree; neither agree nor disagree; agree and completely agree.

All students were informed about the objectives underlying the preparation and implementation of this study and their anonymity was guaranteed.

RESULTS AND FINDINGS

The sample consists of 148 individuals and is almost entirely composed of female students (about 97% of respondents).

Table 1 presents those participants characterization:

Table 1. Sample Description

Variables		N	Gender		Age	X
			Female	Male		
Group	1.	70	68	2	17-30	19.5
Group	2.	78	75	3	20-27	21.9
TOTAL		148	143	5		

The answers provided by the questionnaire survey somehow reflect conceptions and representations revealed by these students about mathematics teaching and learning processes. In fact, data presented in Figure 1 allow not only some considerations regarding the conceptions expressed by these students about mathematics teaching and learning approaches but also provides information that can relate those conceptions with the students´ formative level.

The overwhelming majority of these students believe that the teaching of mathematics should be initiated with the exploration of simple concepts and direct procedures and these should gradually progress to more elaborate conceptualizations and procedures (item that collect over 80% of responses of partial or total agreement). Regarding the implementation of any process of math instruction, the two groups responded in a similar way: only about 5% of students in each group disagrees with the need of progression in the activities level of difficulty and the opposite view is expressed by about two-thirds of students in each group, which partially or totally agree with the necessity of such progress.

More than 90% of respondents of both groups agree partially or completely by considering that one of the duties of the teacher is to provide feedback about the activities carried out by students; it seems to have no significant differences in the responses provided by the two groups in these two items.

Half of the respondents from Group 2 consider that teachers should act quickly in classroom disagreements in order to prevent disruptive behaviors but that figure rises to two-thirds in Group 1 responses. In both groups, none of the respondents are in complete agree with the conception of the teacher as someone who decides what is and is not correct; we should note, however, that about 40% of the students in Group 2 expressed not agree or disagree with teacher's role as judge.

A significant number of these students associate autonomy to individual work - 65% of students in Group 1 and 70% in Group 2 converge in partial or total agreement that performing tasks individually promotes students autonomy -, but the percentage of respondents in Group 2 who established this explicit link is almost half the rate that occurred in Group 1.

About half of the students from both groups responded neither agree nor disagree on the influence of the use of non-standard procedures in learning the standard ones, and disagreement with the existence of this influence is similar in both groups (answer selected by nearly one-third of the students).

Noteworthy is the difference in perceptions expressed by the two groups on the mathematical abilities of young children. In Group 2, almost 80% of the responses indicate that these students disagree that the lack of experience and knowledge makes young children unable mathematically, whereas this figure drops to under 50% in the answers of students in Group 1. The statement that good organization and appropriate sequencing of classes are necessary conditions for children to understand mathematics collects the partial or complete agreement of over 60% of responses in both Group 1 and Group 2.

In Figure 1 we can find a graphic representation of the responses provided:

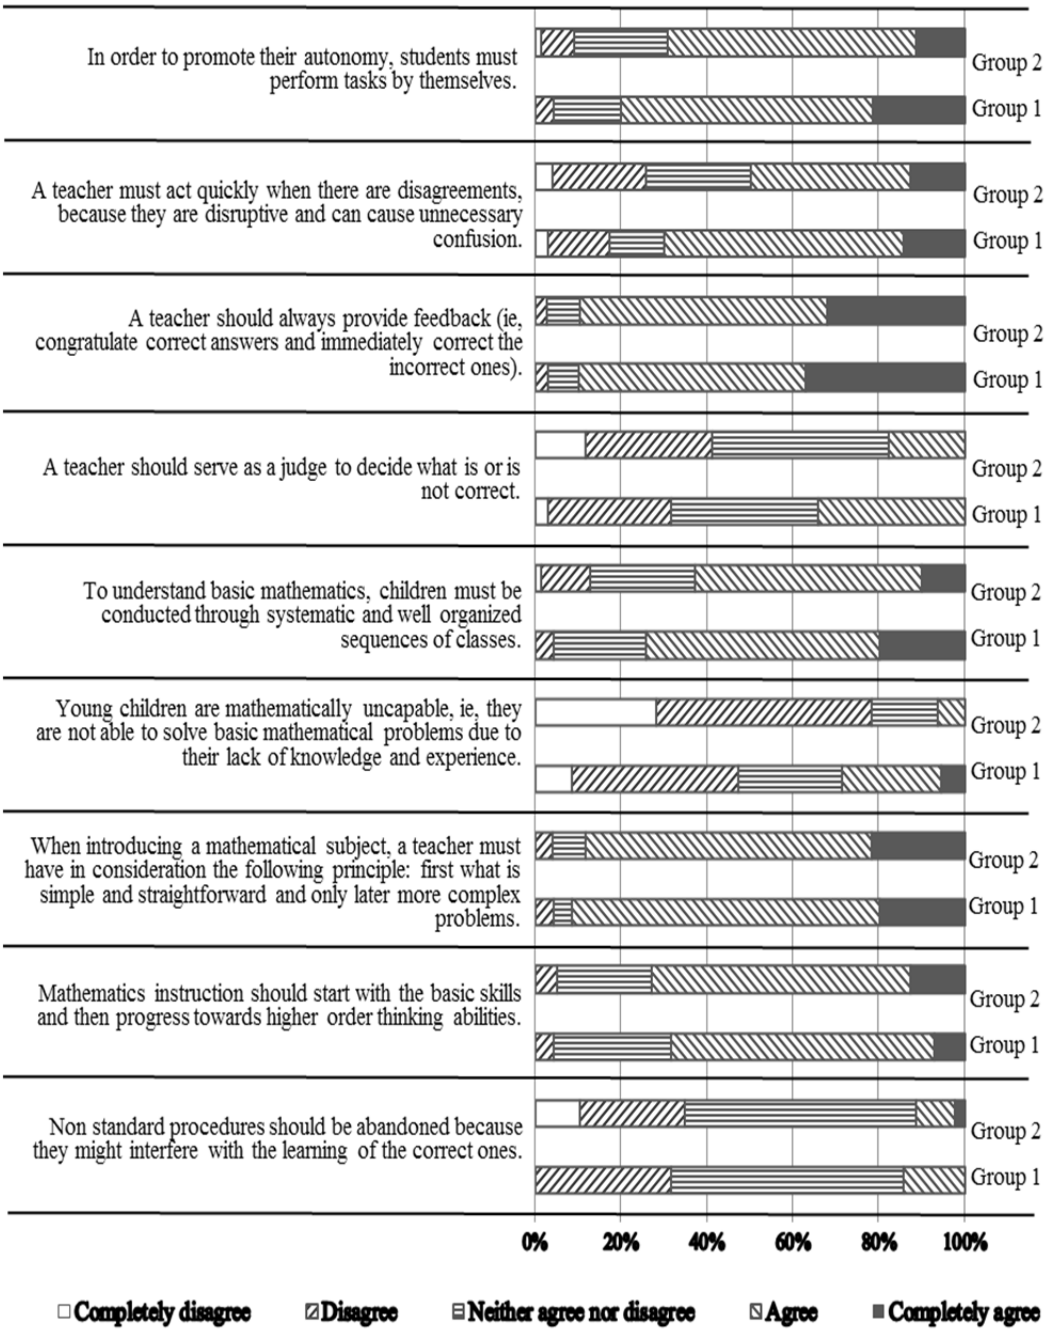

Figure 1. Participants Conceptions about Mathematics Teaching and Learning Processes

CONCLUSIONS

It is known that both students as classes in which they participate are influenced by the vision of the teacher who teaches mathematics. The clash of a teacher with his own vision of mathematics seems to us a key moment in the construction of their professionalism: the participation of these future teachers in this study can already be considered as an important contribution in this construction.

For its part, it is recognized some reciprocity in the process of elaboration of conceptions: first, the training experiences lived by students in learning mathematics play a decisive role in their conceptions of this discipline, about the context of their learning and about their own learning abilities; moreover, the constructed and (re)constructed conceptions - in particular as a result of these formative processes - are also responsible for the mathematical approaches that they will bring for their students when teaching.

The questions proposed to these students allowed the presentation of these preliminary data, making possible to access and describe some of the processes of change of conceptions along their learning paths.

The perceptions expressed by students, future teachers, who participated in this study are largely the product of their own mathematical experiences, prior to its entry in the undergraduate degree on Primary Education, for one group, and also a consequence of its attendance in that course, for the other group. The value of teaching methods that emphasize the implementation of training sequences that depart from simple and direct approaches and progress to more elaborate conceptualizations may indicate that some of the most striking trends and current math education, such as problem solving, performing research tasks and projects in the mathematics classroom (NCTM , 2007; Ponte *et al* , 2007), may not have been experienced by these students or not been experienced by them as effective methods for mathematical learning.

It is also interesting to note that although they refer to individual work as a way of promoting autonomy, these students also understand how essential is the task of the teacher in providing feedback as soon as an incorrect answer is given, which can somehow indicate some lack of autonomy in activities development, pointed as one of the objectives for the discipline of mathematics already in Primary Education (Ponte *et al*, 2007).

From the analysis of these cases emerged a deeper knowledge about the relationship established at two levels: the action between the students and the learning and development of their students, and between the action of teachers and the development of students.

ÖZET: Ölçme konusunda öğrencilerin ilk karşılaştıkları ve anlamada zorlandıkları konu uzunluktur. Uzunluk ölçümü konusunda öğrencilerde sık görülen kavram yanılgılarından birisi öğrencilerin birimleri saymak yerine noktaları veya cetvel üzerindeki çizgileri saymayı tercih etmesidir (Batista, 2006; Boulton-Lewis ve ark., 1996; Zembat, 2009). Öğrencilerin uzunluk ölçümüne ilişkin kavramsal anlamayı gerçekleştirebilmelerine yardım edebilmek için öğretmenlerin bu ve benzeri kavram yanılgılarının farkında olmaları gerekmektedir. Dahası öğrencilerin anlamlı öğrenmesinin önündeki engellerin aşılması için bu engellerin farkında olan öğretmenlerin yetiştirilmesi gerekir. Çünkü hastalığın teşhisi tedavi için çok büyük önem arz etmektedir. Bu bağlamda geleceğin önemli öğretmenlerinden olan sınıf öğretmeni adaylarının öğrenci kavram yanılgılarını tespit edip edemedikleri araştırılmıştır. Veriler sınıf öğretmenliği son sınıfta öğrenim gören 85 öğretmen adayına uygulanan anketlerle toplanmıştır. Verilerin analizi sonucunda, çalışmaya katılan öğretmen adaylarının %59'nun kavram yanılgısını tespit edemedikleri görülmüştür

Anahtar sözcükler: Kavram Yanılgısı, Sınıf Öğretmeni Adayı, Uzunluk Ölçme

ABSTRACT: Length is the first measurement subject that students encounter and face challenges in order to understand. One of the misconceptions observed among the students with respect to length measurement subject is that they prefer counting the points and the lines on the ruler instead of counting the units (Batista, 2006; Boulton-Lewis et al., 1996; Zembat, 2009). Teacher should have awareness regarding these misconceptions and similar ones in order to help students grasp the length measurement conceptually. Because the diagnosis of the disease is of great importance for the treatment of the disease. Within this scope, this study investigated to what extent the pre-service primary teacher, who are the important future teachers, are able to determine the misconceptions of the students. Data were collected through the questionnaires administered to the 85 pre-service primary teachers. At the end of the data analysis, it was found that 59% of pre-service teacher into the study were not able to determine the misconceptions.

Key words: Misconceptions, Pre-Service Primary Teachers, Length Measurement

GİRİŞ

Ölçme, insanların günlük hayatta geçmişten günümüze her alanda ihtiyaç duyduğu önemli kavramlardan birisidir. Ekonomi, ticaret, inşaat, ulaşım gibi birçok meslek sektörlerinde kullanılmaktadır. Günlük hayatta böyle önemli olan ölçme, matematikte de geometri, istatistik, sayılar gibi alanlarla ilişkili bir konudur. Hem günlük hayatta hem de matematiğin farklı alanlarında sıklıkla karşılaşılan ölçme kavramı Milli Eğitim Bakanlığı'nca hazırlanan matematik öğretim programlarında da önemli bir yer teşkil etmektedir.

Ölçme konusunda ilkokulda öğrencilerin ilk karşılaştıkları nitelik ise uzunluktur. (MEB, 2009). Uzunluk öğrencilerin ölçmeyi öğrendikleri ilk nitelik olmasına rağmen uzunluk ölçümünün anlaşılması kolay olmamaktadır (Van De Walle, Karp ve Bay-Williams, 2012). Uzunluk ölçümü İlkokulun ilk yıllarından itibaren öğrencilere öğretilmesine rağmen öğrenciler yukarıda ifade edildiği şekilde kavramsal olarak anlamadan ezbere öğrendikleri yöntemlerle sonuca ulaşmaya çalıştıkları görülmektedir. Bu durumun olumsuz bir sonucu olarak öğrenciler kavram yanılgılarına düşmektedir (Emekli, 2001; Şişman ve Aksu, 2009; Zembat, 2009). Uzunluk ölçümü konusunda öğrencilerde sık görülen kavram yanılgısı, öğrencilerin birimleri saymak yerine noktaları veya cetvel üzerindeki çizgileri saymayı tercih etmesidir (Batista, 2006; Boulton-Lewis ve ark., 1996; Barrett ve ark., 2003; Kamiî, 1995:akt., Zembat, 2009; Van De Walle, Karp ve Bay-Williams, 2012). Bu bahsedilen kavram yanılgısı eğer ilkokul yıllarında sınıf öğretmenleri tarafında fark edilip giderilmezse sonraki sınıflarda öğrenciler çevre uzunluğunu içeren problemleri incelerken uzunluk kavramı ile ilgili zorluklar yaşamaktadır (Van De Walle, Karp ve Bay-Williams, 2012).

Kavram yanılgılarının giderilmesi hususunda birinci adım olarak kavram yanılgılarının farkında olan sınıf öğretmenlerinin yetiştirilmesinin çok önemli olduğu düşünülmektedir. Çünkü hastalığın tedavisinde doktorun hastalığı tespit etmesi çok büyük önem arz etmektedir. Bu bağlamda çalışmanın amacı, öğretmen adaylarının uzunluk ölçümü konusunda yukarıda bahsedilen öğrenci kavram yanılgısını tespit edip edemediklerini incelemektir. Bu amaç doğrultusunda aşağıda belirtilen araştırma sorusuna yanıt aranmıştır.

Sınıf öğretmeni adayları uzunluk ölçümü konusunda yukarıda bahsedilen öğrenci kavram yanılgısını tespit edebiliyorlar mı?

YÖNTEM

Araştırma Modeli

Bu çalışmada genelde nitel araştırma özelde de durum çalışması araştırma modeli olarak belirlenmiştir.

Çalışma Grubu

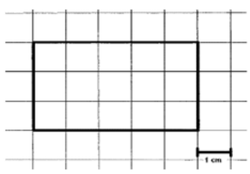
Bu çalışma 2013-2014 öğretim yılında bir devlet üniversitesinin eğitim fakültesi ilköğretim bölümü, sınıf öğretmenliği anabilim dalında son sınıfta (7. dönem) öğrenim gören 85 dördüncü sınıf öğrencisinin katılımıyla gerçekleştirilmiştir. Öğretmen adaylarından 59'u bayan 26'sı erkektir. Bu çalışmada, amaçlı örnekleme yöntemlerinden ölçüt örnekleme yöntemi kullanılmıştır. Sınıf öğretmeliği son sınıfta okuyan öğrencilerin seçilmesindeki temel ölçüt, bu öğrencilerin matematik alanı yönünden öğretmenlik mesleğine hazır olmaları, yani genel matematik ve matematik öğretimi derslerini başarıyla geçmeleridir.

Veri Toplama Süreci ve Aracı

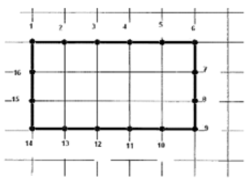
Bu çalışmanın amacı doğrultusunda, sınıf öğretmenliği son sınıfta okuyan 85 öğretmen adayına 2013-2014 öğretim yılının güz yarıyılında sınıf ortamında bir anket uygulanmıştır. Anket uygulanmadan önce öğretmen adaylarına anketin amacı, ankette yer alan örnek olay ve açık uçlu soru açıklanmıştır. Anketin süresi yaklaşık 15 dakika sürmüştür.

Anket formunda matematik derslerinde karşılaşılması mümkün olan bir örnek olay ve bir açık uçlu soru bulunmaktadır. Örnek olay Manizade'nin (2006) pedagojik alan bilgisi ile ilgili yaptığı çalışmadan yararlanılarak hazırlanmıştır. Örnek olayda uzunluk ölçümü konusunda öğrencilerin birimleri saymak yerine noktaları saymayı tercih etmelerine dair olan kavram yanılgısı kurgulanmıştır. Örnek olaydan sonra öğretmen adaylarının, öğrencilerin kavram yanılgılarını ne derece tespit ettiklerini ortaya çıkarmaya yönelik bir açık uçlu soruya yer verilmiştir. Ankette bulanan örnek olay aşağıda verilmiştir.

İlkokul 4. sınıf öğrencisi Zeynep'ten aşağıdaki soruyu çözmesi istenmiştir.
Aşağıdaki dikdörtgensel şeklin çevresini bulunuz.



Zeynep, şeklin çevre uzunluğunu bulurken aşağıdaki şekilde numaralandırılmış yerleri parmaklarıyla gösterip ve sesli olarak saymıştır. Daha sonra çevre uzunluğunun 16 olduğunu ifade etmiştir.



Verilerin Analizi

Bu çalışmada veriler betimsel analize tabi tutulmuştur. Betimsel analiz de veriler daha önceden belirlenen kategorilere göre özetlenir ve yorumlanır. Doğrudan alıntılara yer verilir. Bu tür analizde amaç, elde edilen bulguları düzenlenmiş ve yorumlanmış bir şekilde sunmaktır (Yıldırım ve Şimşek, 2008). Analize öğretmen adayının örnek olayda kurgulanan yanlış yaklaşımın farkında olup olmadığına karar vermekle başlanılmıştır. Eğer öğretmen adayı yanlışlığın farkında ise öğrencinin sahip olduğu kavram yanılgısını doğru bir şekilde ifade edip etmediği incelenmiştir. Analiz süreci sonucunda öğretmen adaylarının cevapları üç kategori altında toplanmıştır. Bu kategoriler; kavram yanılgısının farkında olamayanlar, kavram yanılgısının farkında olup doğru ifade edemeyenler ve kavram yanılgısının farkında olup doğru ifade edenler.

Araştırmanın Geçerlilik ve Güvenirliği

Bu çalışmada elde edilen ham veriler kategorilere göre tekrar düzenlenerek verinin doğasına sadık kalınarak aktarılmaya çalışılmıştır. Doğrudan alıntılara yer verilmiştir. Bu şekilde çalışmanın geçerliliği sağlanmaya çalışılmıştır (Yıldırım ve Şimşek, 2008). Bu çalışmanın güvenirliği sağlamak amacıyla araştırmanın aşamaları, veri toplama ve analiz yöntemleri ayrıntılı bir şekilde açıklanmıştır.

BULGULAR

Sınıf öğretmeni adaylarının anketlere verdikleri cevapların kategorilere göre frekans dağılımı aşağıdaki tablo1'de verilmiştir

Tablo 1. Öğretmen Adaylarının Verdikleri Cevapların Kategorilere Göre Frekans Dağılımı

Kategoriler	f	(%)
Kavram yanılgısının farkında olamayanlar	50	59
Kavram yanılgısının farkında olup doğru ifade edemeyenler	17	20
Kavram yanılgısının farkında olup doğru ifade edenler	18	21
Toplam	**85**	**100**

Yukarıda verilen tablodan da anlaşıldığı üzere öğretmen adaylarının %59'u öğrencinin kavram yanılgısını tespit edememişlerdir. Aşağıda öğretmen adaylarının ankete verdikleri cevaplardan örnekler verilmiştir.

Zeynep ilkokul düzeyinde yani somut işlemler döneminde bulunan bir öğrencidir. Bu dikdörtgeni parmağı ile gösterip sesli olarak sayması dikdörtgeni somutlaştırmaya çalıştığının zihinden düşünemediğinin parmakla dokunarak çözüm yolları ürettiğinin bir ispatıdır. Öğrenci bu problemi somutlaştırarak çözmüştür.(ÖA1-Anket)

Zeynep'in soruya verdiği cevap doğrudur. Dikdörtgenin çevresi bana göre 16 cm dir. Zeynep16 cm'yi bulmak için uyguladığı yöntemde gayet başarılıdır.(ÖA2-Anket)

Sonuç doğru olarak bulunduğu için Zeynep'in cevabı doğrudur. Hazır bulunuşluk düzeyi vs dikkate alınırsa somut işlemler döneminde olduğu için sayarak soruyu cevaplandırmıştır. Bu sorunun asıl çözümünde çevre formülünü (2.(3+5)) kullanamamaktadır. Formülü bilme ve onu kullanabilme yeterliğine ileri yaşlarda (sınıflarda) ulaşacaktır.(ÖA3-Anket)

Zeynep'in cevabı doğrudur. Dikdörtgenin cevabı 16'dır. Zeynep'in gidiş yolu da yaşına göre uygun bir cevaptır. Formül kullanmadan kendi ürettiği yolla bulmuştur çözümü. Zaten formülde köşeler sayılarak ortaya çıkarılmıştır. Zeynep'in bu konudaki ön bilgilerinde bir eksik yoktur.(ÖA4-Anket)

Bence doğru. Çünkü dördüncü sınıfa gelen bir ilkokul öğrencisinin matematiksel becerileri daha tam oturmamıştır. Dikdörtgenin iki kenarının karşılıklı eşit olduğunu düşünebilse bile bunu 2A+2B şeklinde matematiksel işleme döküp yapması zordur o seviyedeki öğrenci için. Parmakla sayması normal yine de iki kenarın karşılıklı eşit olduğunu bildiği için pratik olarak uzun kenar iki defa, kısa kenar iki defa toplanır şeklinde öğretilmişse öğrencinin parmak hesabı yapmadan yapabileceğini düşünüyorum. Zeynep'in parmak hesabı yaparak soruya yanıt bulamaya çalışması yine sınıfın gelişim düzeyiyle ilgili olabilir. (ÖA5-Anket)

İkinci kategoride ise öğretmen adaylarının % 20'si cevabı yer almaktadır. Bu kategorideki öğretmen adayları öğrencideki kavram yanılgısını fark etmelerine rağmen kavram yanılgısını ya yanlış açıklamışlardır ya da hiç açıklamada bulunamamışlardır. Açıklama bulunmayan cevaplarda kavram yanılgısının olduğu ifade edilmesine rağmen öğrencinin algı biçimi açıklanmamıştır. Aşağıda anketlerden elde edilen verilerden örnekler sunulmuştur.

Zeynep soruyu doğru çözmüştür. Kenarları özdeş ve 1 cm olduğu için cevap doğru çıkmıştır. Anacak aradaki uzaklık 1 cm değil de başka bir şey başka bir şey olsa cevabı yanlış olacaktı. Zeynep'in bulduğu çözüm rastlantı sonucu doğru bulunmuştur. Eğer çevreyi her zaman bu şekilde bulmaya çalışırsa kavram yanılgısına düşmüş olur.(ÖA6-Anket)

Şeklin çevre uzunluğu 2(a+b) ise a+b=8 ise 2.8=16 dır. Zeynep doğru çözmüştür. Ama çözüm yolu yanlıştır. Çünkü numaralandırmak her zaman doğru sonucu vermeyebilir ve uzun zaman alır. Ayrıca numaralandırmaya sol üstten başlaması da ilginçtir. Öğrenci formülü uygulamanın daha zor olduğunu ve sayma kuralıyla doğru cevabı bulabileceğini düşündüğü için böyle yanılgıya düşmüştür.(ÖA7-Anket)

Zeynep cevabı tesadüfî olarak bulmuş. Noktaları sayarak her zaman doğru bulamaz. Aralıklar 1 cm olmazsa yanlış çıkar. Dikkat problemi yaşıyor. Olguları neden sonuç ilişki içinde değerlendiremiyor. Mantık yürütemiyor. Ezberci eğitimle yetişmiş bir çocuk. Parmakları sayarken kullanması öğrencinin görsel zekâsının gelişmediğini gösterir. Gözleri ile sayamıyor. (ÖA8-Anket)

Üçüncü kategoride ise öğretmen adaylarının %21'i cevabı yer almaktadır. Bu kategorideki öğretmen adayları öğrencideki kavram yanılgısını tespit edip doğru bir şekilde açıklamışlardır. Aşağıda anketlerden elde edilen bulgulardan örnekler verilmiştir.

Zeynep bu soruya doğru cevap vermiştir. Ama Zeynep burada sadece noktaları saymıştır. Oysa her iki nokta arası 1 birimdir diyememiştir. Bu yüzden Zeynep bu soruda bir kavram yanılgısına düşmüştür. Soruyu doğru yanıtlasa bile çözüm yolu yanlıştır.(ÖA9-Anket)

Zeynep bu yöntemle doğru sonuca ulaşmıştır. Fakat cevabı bulurken kullandığı yöntem yanlıştır. Zeynep yaptığı bu yolla noktaları saymış fakat uzunluk noktalar üzerinden değil iki nokta arasındaki mesafeden bulunabilir. Burada Zeynep'in uzunluk konusunda bilişsel olarak eksiklerinin olduğunu söyleyebilirim. Burada öğrenci somut işlem becerisine sahiptir. Matematikteki soyut formülleri bilmiyor olabilir ya da yukarıda belirttiğim gibi uzunluk konusuna dair öğrencide bilgi eksikliği vardır diyebilirim. Bunun yanında eksik ve yanlış öğrenmeler yaşamış ve bu yolla bir kez doğru sonuca ulaştığı için buna benzer her durumda aynı yöntemden faydalanıyor olabilir.(ÖA10-Anket)

Zeynep 'in cevabı doğrudur. Anacak noktaları sayarak değil de her bir aralığı sayarak ya da her bir aralığa 1 cm yazarak bulması daha güvenilir bir sonuç çıkartır. Noktaları sayması karıştırmasına neden olabilir. Ayrıca yanlış bir ifade oluşturur. Her bir noktanın uzunluğunun 1 cm olması gibi. Ama aradaki mesafe 1 cm dir. Ön bilgilerinin eksikliğinden kaynaklanmış olabilir. Uzunluk kavramını tam olarak anlayamamıştır. Çünkü soyut bir kavramdır. Somutlaştırılarak anlatılmadığı sürece karışıklık yaşanabilir.(ÖA11-Anket)

Öğrenci küçük karelerin uzunluğundan ziyade noktalara odaklanarak soruyu çözmüştür. Cevap doğru bulmuş ama gidiş yolunda hata var.  *yapıp noktaları saymak yerine noktaların arasındaki birimleri saymalıydı. (tabii ki eşit birimler olduğunu kabul ediyoruz) daha sonra aşağıda bir birimin 1 cm olduğunu görerek çevreyi hesaplamalıydı. Bu şekilde bir yolla doğru cevaba ulaşmış ama her yerde ulaşamayabilir.(ÖA12-Anket)*

Zeynep'in cevabı kesinlikle yanlıştır. Çünkü birimleri sayması gerekirken noktaları saymıştır. Ve hata yapmıştır. Buda öğrencinin kavram yanılgısı içerisindedir. Sonucu yanlış yoldan doğru bulmuştur. (ÖA13-Anket)

SONUÇ VE ÖNERİLER

Elde edilen bulgular değerlendirildiğinde, sınıf öğretmeni adaylarının uzunluk ölçme konusunda öğrencilerin kavram yanılgısını tespit etmekte zorlandıkları söylenebilir. Öğretmen adaylarının büyük bir çoğunluğu, öğrencinin çevre uzunluğunu bulurken kullandığı yanlış yaklaşımı matematiksel olarak analiz edememişlerdir. Öğrencinin ölçülen nitelik, niteliğin miktarı ve birim arasındaki ilişkiyi kuramadığı çoğu öğretmen adayı tarafından fark edilememiştir. Başka bir ifade ile dikdörtgenin çevre niteliği, çevrenin uzunluğu ve 1 cm olarak verilen birim arasındaki koordinasyon eksikliği öğretmen adayları tarafından teşhis edilememiştir. Uzunluk ölçme konusu perspektifinde sınıf öğretmen adaylarının pedagojik alan bilgisinin bir bileşeni olan öğrenci bilgilerinin zayıf olduğu söylenebilir. Bu sonucun öğretmen adaylarının kendi alan bilgilerinin zayıf olmasından ve öğrenci düşüncelerine yönelik farkındalıklarının yeterli seviyede olamadığından kaynaklandığı düşünülmektedir. Bu yüzden sınıf öğretmeni adayları kendi alan bilgilerinden hareketle öğrencilerin algı biçimlerini yorumladıkları söylenebilir. Elde edilen bu sonuç literatürle de paralellik göstermektedir. Van Driel ve arkadaşları (1998), öğretmenlerin konu alan bilgileri yeterli olduğu durumlarda, öğrencilerin kavram yanılgılarının daha kolay fark edilebildiğini ileri sürmüştür.

Araştırma sonuçlarına dayalı olarak aşağıdaki öneriler sunulabilir;

- Sınıf öğretmenliği lisans programlarında, öğretmen adaylarının öğrencilerdeki kavram yanılgılarının neler olduğunu, bunların sebeplerinin neler olabileceğini ve bu kavram yanılgıların giderilmesi hususunda neler yapılabileceğine ilişkin öğretim faaliyetlerine yer verilmelidir.

- Sınıf öğretmeni adaylarının öğretmen olduklarında sınıf ortamlarında karşılaşabilecekleri kavram yanılgıları anket formunda yer alan örnek olaylar gibi kurgulanıp matematik öğretimi derslerinde ayrıntılı bir şekilde tartışılabilir. Bu sayede hem öğretmen adaylarının sınıf ortamına girmeden öğrenci algı biçimlerine karşı tecrübe kazandırılabilir hem de bu kavram yanılgılarına sahip öğretmen adaylarının kendilerini düzeltmelerine fırsat verilmiş olur.

EXAMINING THE CONCEPT CARTOONS BY PRE-SERVICE PRIMARY SCHOOL TEACHERS

Şule BAYRAKTAR
Necmettin Erbakan University
sulebayraktar@yahoo.com

ABSTRACT: In this study, examples of concept cartoons created by pre-service primary teachers related to certain science topics were presented. The concept cartoons created by student-teachers were examined in terms of topics they were related to, type of the characters, forms of expressions in presenting different claims of the characters. Results of the study showed that student-teachers were well aware of the misconceptions that primary school students might have posses in various science subjects and they have gained adequate skills to create appropriate concept cartoons to diagnose these misconceptions.

Keywords: Concept cartoons, science teaching, pre-service primary teachers, misconceptions

INTRODUCTION

Concept cartoons are one of the most effective tools that can be used to detect students' misconceptions. Concept cartoons, unlike regular cartoons are not for humor purposes. Concept cartoons were created in 1992 for instructional purposes and based on the dialogs of cartoon characters (Keogh & Nylor, 1999). Generally they involve three or more characters which might be human, animal or non living things. Each one of these characters presents an idea about a scientific phenomenon. At least one of these ideas indicates a misconception, one presents the scientific idea and the ideas of other characters might be scientific or nonscientific ideas. Students are introduced with the cartoons and they are asked which character they are agree with. Students' conceptions or misconceptions can be identified by examining the ideas of the character which s/he indicated that s/he is agreed on.

Concept cartoons have a special place in especially science education since that they can relate sophisticated scientific concepts with the situations which we encounter in everyday life. They can be considered as practical visual instructional tools which are very effective in attracting students' attention and creating curiosity. Besides motivating students, concept cartoons can be used to initiate discussion during the class session, to give students feedback. They can also be used as an alternative assessment tool.

The main phases of the instruction with concept cartoons are: a) introducing the cartoon to students, b) Discussion of the ideas that the cartoon characters proposed c) Inquiry process d) re-evaluating the ideas proposed by the cartoon characters in the light of the data obtained during the inquiry process.

Students' misconceptions can be changed by means of discussion and cognitive processes which was initiated by concept cartoons (Andrews, Kalinowski, and Leonard, 2011) Concept cartoons do not tell students which idea is correct. For this reason, they can stimulate students' thought process which might lead them to question their existing ideas and as a result change the incorrect ideas and construct scientific conceptions as well as increasing their motivation for the lesson to be taught. (Keogh & Naylor, 1996; Long & Marson, 2003).

In the literature, there are many studies focusing on the effects of concept cartoons in different educational levels in Turkey (Demir, 2008 ; İnel, Balım & Evrekli, 2009; Kabapınar, 2005; Oluk & Özalp, 2007) and in the world (Keogh & Naylor, 1999; Morris, Merritt, Fairclough, Birrell, and Howitt, 2007; Chin & Teou, 2009). The cartoons found to be an effective tool in teaching of various subjects (İnel & Balım, 2013; Gölgeli & Saracoğlu, 2011; Perales-Palacios & Vílchez González, 2005) and overcoming misconceptions (Ekici, Ekici & Aydın, 2007). Concept cartoons are also practical as an alternative assessment tool (Kandil-İngeç, 2008; Naylor, Keogh, & Downing, 2007; Song, Heo, Krumenaker, &Tippins, 2008; Şaşmaz-Ören & Ormancı, 2011).

METHOD

The purpose of this research presents a different aspect from the research done previously in this area. This research examines the concept cartoons drawn by pre-service primary teachers in some respects. The researcher is an academician who works in a teacher training institute with primary education majors. In the science methods course which she instructs, first she introduced the concept cartoons to the primary education students. The instructor then, showed sample concept cartoons to the class and allow them to examine the cartoons in detail. Then, she presented the techniques on how to use concept cartoons during the instructional process and performed a sample lesson. Primary Education majors were aware of the misconceptions that primary school children's might possess in several science subjects, since they have examined the primary school curriculum already and they have identified the most common misconceptions of children of these grades. Afterwards, pre-service primary teachers were asked to prepare concept cartoons which were related to one subject of their preference which takes place in the primary school science curriculum. They were given time as much as they desire, the completed concept cartoons gathered together and examined regarding different aspects of them.

The sample of this study consisted of 49 concept cartoons. Concept cartoons drawn by pre-service primary teachers were analyzed by using categorical content analysis. This technique of content analysis is not restricted to textual analysis, but may be applied to other areas such as coding student drawings (Stemler, 2013).

Concept cartoons were examined in terms of: a) the subjects they were related to b) type and the number of the characters c) forms of expression they used to present the misconceptions. The results obtained by examination of the cartoons according to the designated categories are presented in the following section.

RESULTS

A. Examination of Cartoons by Subjects

Table1. Cartoons by Subject

Teaching Unit (Subject)	f (%)
Living Things	20(40.8)
Matter and Change	10(20.4)
Earth, Sun & Moon	9(18.36)
Light & Sound	3(6.12)
Electricity	4(8.16)
Others	3(6.12)
Total	49(100)

Most of the student teachers' concept cartoons (40.8%) were related to living things teaching unit. Second popular subject was Matter and Change teaching unit (20.4%) followed by Earth and the Space(18.6%). There were fewer cartoons related to other subjects in science curriculum. It was especially noteworthy that there was only one cartoon related to force and movement unit.

B. Examination of Cartoons by Character Type

Table 2. Cartoons by Character Type

Character Type	f (%)
Human	29(59.18)
Animal	9(18.36)
Nonliving things	6(12.24)
Combination	5(10.20)
Total	48(100)

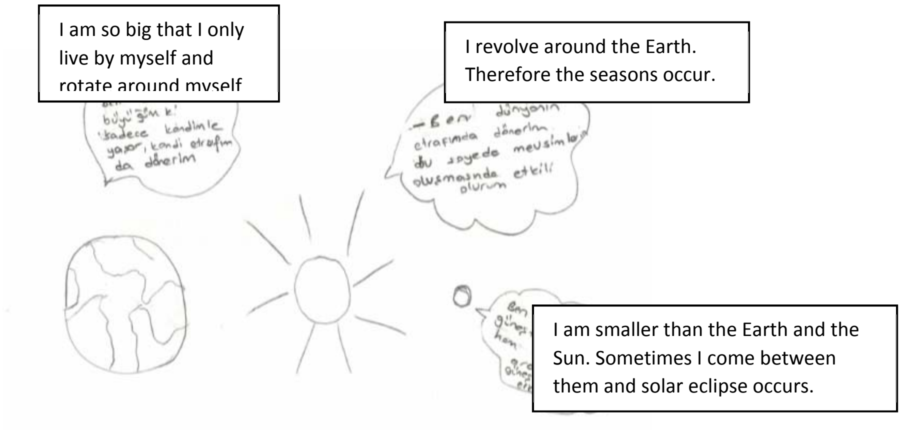
When the characters examined, it is seen that student teachers mostly chose to draw human characters and most of them had 3 characters (n= 24) and others 4 or more (n=5). Some drawings contained animal characters (n=9). Examining the drawings it was seen that those drawings with animal characters were related to the topic of habitats and classification of animals. The other characters such as plants and nonliving things were chosen concordant with the topic of misconceptions.

C. Examination of Cartoons by Form of Expression

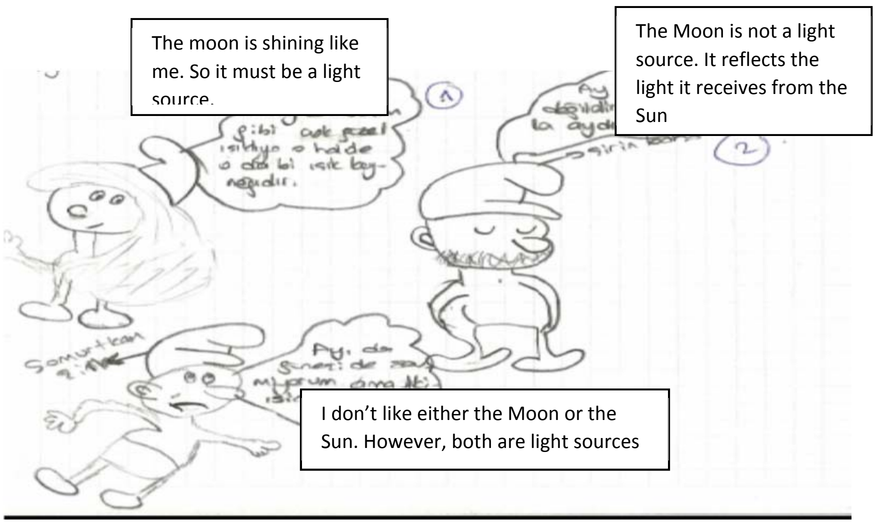
Table 3. Cartoons by Form of Expression

Form of Expression	f (%)
Personification	17(34.69)
Dialog (Direct expression)	13 (26.53)
Express in a Story -or using real life examples	19(38.77)
Total	49(100)

1. Personification: In 17 of the 49 cartoons animals, plants and nonliving things (earth, sun, moon, cars, other objects) were made to talk. In these cartoons the student teachers preferred to use the specific objects of the examined phenomena instead of humans as actors. These cartoons were mostly about Earth and Space, classification of the animals, habitats, and properties of living things and matter.



2. Dialog (Direct Expression): Direct expression or dialog of people were chosen as a form of expression for presenting misconceptions which were related to the following topics: evaporation of liquids (n=2), electricity (n=2), shape of the Earth (n=1) Respiration of plants (n=1) Matter (n=2), Movements of the Sun, Earth and Moon (n=3) Classification of animals (n=2).



3. Generating a story or relating the real life examples. Student teachers used stories or real life examples especially for the topics of matter and change teaching unit such as: evaporation (n=1), mass conservation (n=2) Impurities-boiling point (n=1) granular solids (n=1) properties of living things (n=1), Elevation-temperature relation (n=1).

DISCUSSION

The examination of the concept cartoons created by student-teachers revealed that they were aware most of the misconceptions that their future students might have possess. Student teachers created fewer concept cartoons for some teaching units especially “force and movement” and “light and sound”. The reason for that might be there were fewer misconceptions reported in the literature on these specific topics and the content of them were relatively less than the other topics in primary science curriculum in Turkey. However, it is also possible that student teachers might not aware of the misconceptions peculiar to those topics. However, since student teachers decided themselves on the topics of the cartoons they draw, it is not possible to know the reason for their not drawing cartoons about some particular topics. They might also have difficulties about how to express the misconceptions about certain topics, so they did not chose to draw cartoons about those topics. An interview with the student teachers might have shed light on this issue.

Results of this study also showed that student teachers were well aware of the function and elements of a concept cartoon. Except for three of them, all the concept cartoons possess all the qualities that a concept cartoon must have. Furthermore, student teachers were successful in using appropriate expression forms for their cartoons which is compatible wit the subject they chose. They insert their cartoons in a story or present real life examples to make abstract concepts more concrete. It is also remarkable that student teachers added various contents in the background of their drawings which are highly related to the subject, such as a container filled with water on fire in the cartoon about boiling point; and the natural environment around the animals in the cartoon about the habitats.

CONCLUSION

A comparison with earlier studies cannot be made for this study since it is one of the firsts. However, the result of the study is significant. Student teachers’ concept cartoons showed that they were aware of the misconceptions in various topics of the science curriculum and that they gained the skills to create a concept cartoon which is one of the most effective tools for diagnosing students’ misconceptions. To create concept cartoons correctly, student-teachers should be knowledgeable about the misconceptions of students as well as the elements and the properties of a concept cartoon itself. Student teachers’ creating their own concept cartoons could be a beneficial practice in science methods courses.

ABSTRACT: In this study, we investigated the effect of information technology in teaching physics course, in students. In order to prove this claim, we design a questionnaire consisting of 12 questions. The gathered answers from student were categorized as “right”, “wrong” and “no responded”. Survey of 150 students from high school in qualitative and quantitative is performed. Also we considered scores of physics course in previous and later of use information technology in teaching for related students as parameter in evaluation research. For enhance the accuracy of these questionnaires we were interviews with 25 students. The result of this investigation, show that there is Significant relationship between information technology and teaching physics courses. Based on the results obtained from this study suggestion were presented to enhance use of information technology.

Key words: Information Technology, teaching physics course

INTRODUCTION

Information technologies in education refer to teaching and learning the subject matter that enables understanding the functions and effective use of Information and Communication Technologies (ICTs)[1-2]. As of 2004, a review and the literature on teaching ICT[3] as a subject implied that there was limited, systematically-derived, quality information. In order to use technology effectively, educators need to be trained in using technology and they need to develop a good understanding of it. Information Technology[4-5] is used to enhance learning; therefore it is important for educators to be comfortable using it to ensure that students get the full advantages of educational technology. Teaching with technology is different from teaching in a typical classroom. Teachers must be trained in how to plan, create, and deliver instruction within a technological setting. It requires a different pedagogical approach. Teachers must find a way to assess students on what they take away from a class and meaningful, known knowledge, especially within an eLearning setting. Education will only change when our design methods, perspectives, and values change. Teachers have many roles when instruction is designed. They can be artists, architects, craftspeople, and engineers. Technology does not mean that using interactive electronic boards and LCD PowerPoint presentation is the most effective. So many more applications are available for students to be hands-on with their learning and gain deeper knowledge than they could before. Technology training appears to focus mainly on technology knowledge and skills while overlooking the relationships between technology, pedagogy, and content. As a result, teachers learn about “cool” stuff, but they still have difficulty applying it for their students’ learning. Teacher candidates need opportunities to practice effective technology integration strategies in supportive contexts during technology courses, technology-integrated methods courses, and field experiences. Experienced teachers also need opportunities to learn about new technologies and ways to integrate them effectively in their classroom. Teacher education programs can facilitate improvements not only in students’ technology skills but also in their beliefs and intentions regarding integrating technology into instruction. Technology training directly affects pre-service teachers’ self-efficacy and value beliefs, which in turn influence their student-centered technology use.

However, physics as a science oriented course or discipline is known for its abstract nature (having nonmaterial existence). Sometimes the physics teacher does not have adequate knowledge, but have to fall on ideas which lead to contradictions with what the physics theory says or meant. Students are left on their own, even when they are to read on their own, they find no material to read, where it is available most of them are obsolete material. That is, some of these materials include textbook, journals, research publications and news papers e.t.c. where these materials are lacking the students are forced to lose interest, motivation and passion; in some cases frustration sets in and students abandon the discipline or subject matter (physics) for another which they can cope with i.e.

students leaving science class because of physics to commercial or Art subjects, simply point to the fact that other disciplines are not abstract in nature like that of physics. However, physics is a unique subject, which promotes the acquisition of specialized science skills and Knowledge, which explain the natural phenomena of life in the society. It is a subject that grew up with civilization as man's quantitative needs increased. It arose out of practical problems and mans need to solve these problems. It has contributed to the development of the sciences and to the development of civilization. Despite the abstract nature of physics its teaching is to bring about scientific thinking in students; a mindset that requires students to test out, through experimentation. However, through the use of IT, whether CD-Rom, power point, etc the teaching and learning of physics is interesting.

Information Technology in physics teaching

Schools' access to Information and communication Technologies (ICT)[7] poses tremendous challenges to physics teaching and learning. Physics is one of the first areas where the possibilities that computers may offer for the employment of new teaching methods have been and are still explored. A variety of computer applications have been developed and used in teaching Physics, such as computer-based laboratories, multimedia, simulations and intelligent tutors. Furthermore, research has often been employed to direct educational software design and development. Today numerous IT applications are available, aiming to stimulate students' active and offering the opportunity to work under conditions that are extremely difficult, costly or time-consuming to be created in the classroom or even the physics lab. The use of such IT applications has developed a new research field in physics education. Among the various IT applications, Information Technologies are of special importance in Physics teaching and learning. Information Technologies offer new educational environments, which aim to enhance teachers' instructional potentialities and to facilitate students' active engagement. IT offers a great variety of opportunities for modeling concepts and processes [8-9]. IT provides a bridge between students' prior knowledge and the learning of new physical concepts, helping students develop scientific understanding through an active reformulation of their misconceptions [10]. Specifically, they are developing their understanding about physical laws through a process of hypothesis-making, and ideas testing and isolate and manipulate parameters and therefore helping them to develop an understanding of the relationships between physical concepts, variables and employ a variety of representations (pictures, animation, graphs, vectors and numerical data displays) which are helpful in understanding the underlying concepts, relations and processes and express their representations and mental models about the physical world investigate phenomena's which are difficult to experience in a classroom or lab setting because it is extremely complex, technically difficult or dangerous, money-consuming or time-consuming, or happen too fast.

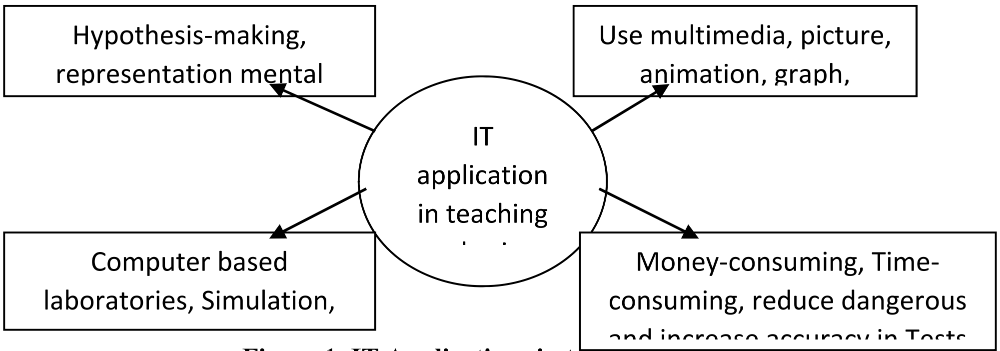

Figure 1. **IT Applications in teaching physics course**

Today a wide variety of educational software is available for teachers and students helping them to present and model physical phenomena and processes, or solve physics problems. Computer simulations have been successfully applied from high school to university physics teaching. They have been used to diagnose and remedy alternative conceptions of velocity, and confront alternative students' conceptions in mechanics. A recent study showed that simulations were equally effective to micro-computer based labs in facilitating the comprehension of concepts involving the free fall of objects. Other studies focus on the effects of the use of computer simulations on students' conceptual understanding.

Information technology (IT) is concerned with the use of technology in large organizations .In particular, IT deals with the use of electronic computers and computer software to convert, store, protect process, transmit and retrieved information.

METHODS

Purpose of study

This study investigated the effect of IT on teaching and learning of physics course and found out whether students were taught physics with the use of IT materials such as computer system, internet facilities, projector, video player and etc performed better than those taught with textbook and traditional teaching.

Research hypothesis

Information Technology has effect in improving the students learning and knowledge in physics.

Participants

150 high school students, who were attending a physic course in Iran, participated in the study. This physic course is teaching in three hour per week. Of the 150 students. Our research was carried out during the academic year 2011-2013 and took place about 5 months after students had received school teaching on basic physic concepts. Physics is the first teaching topic described in the Iran Ardebil high school Curriculum.

The educational intervention

Our educational intervention took place approximately one year after students in the experimental group had received traditional classroom teaching on the relevant topics. All students from the experimental group were offered two 2-h lessons in the Information Technology lab. During the year lesson the teacher, with the collaboration of a researcher. Furthermore, all students had a short period of practice in order to familiarize with the Information Technology environment.

During the lesson students were engaged in tasks demanding the use of Interactive Physics representations. They also used the simulation software to represent various physical quantities in graphical form, understand the relationships between physical concepts and, finally, to develop an in-depth understanding of the physical laws. Students in the experimental did not use other Technology to experiment with other types of trajectory in physic course.

Instrument

Data were collected using two basic instruments namely: Information Technology Effect on Teaching Physic course (ITETP) the instrument was a structured questionnaire. The ITETP was used to collect information on respondents' Quantitative –Information Technology Effect on Teaching (QITET).
This measurement tool can be used for finding out the high education school students' about their physic problem with use of Information Technology. After implementation of the inventory to 150 students from different classes (2th,3th, 4th) compare result of inventory, The results are presented in the table 2.

Qualitative – Focus Interview
After completion of the implementation of the inventory, teachers choose twenty five students from classes according to their interest and success with Information Technology. One of the researchers conducted a focus group interview with a structured interview form. The questions below were asked to the students:
Did you have difficulty with the Information technology?
How much IT has been effective in the process of doing physics experiments?
Is the IT accurate than the traditional approach of physics experiments?
What was your favorite aspect of Information technology?
Do you like teaching with Information technology?
Do you use information technology in your interest towards physics has been effective?
Of the 25 students who participated to the focus group interview, 12 were female and 13 were male.

Context and Process

The research tool was a questionnaire based on open-ended questions. This questionnaire was administered to all students in using Information Technology Effect on Teaching (ITFT). Students were asked to answer questions based on descriptions of the tasks and provide the necessary justifications to their responses. In particular, the students were asked to evaluate qualitatively the experimental processes of the tasks. The questionnaire included questions concerning the concepts of topics physic field. The questions focused on two parameters: before use of Information Technology and the use of the Information Technology in teaching physic course. The statistical treatment of data collected was analyzed using statistical packages for social science (SPSS) and these include: Simple percentages Chi – Square. In compliance with a pre –study of the instrument was carried out and tested with Cronbach alpha coefficient and a reliability coefficient of 0.91 was obtained, which showed a strong reliability of the research instrument.

RESULTS AND FINDINGS

Data analysis

The data analysis and results are presented with special reference to the research two hypotheses in the use of the IT study. Student-based research group, and the status of the problem is properly assessed, measured in accordance with Table 2 were designed based on this table were analyzed.

Table 1. Show respond for questionnaire

Respond
Empty (E)
Right (R)
Wrong (W)

H0: Information Technology will not have any significant impact on teaching and tear ling of physics.

In testing the above hypothesis, Chi-square statistics was adopted using question asked to ascertain the use of IT in enhancing teaching and learning of physics. The results are presented in the table below:

Table 2. ICT will not have any significant effect on teaching and learning of physics

Respond	observed	Expected
R	13	50
W	135	50
E	2	50
Total	150	150

χ^2 =217.96 df =2 Sig=.000

According to table2, χ^2 =217.96, df=2 and $p<.01$ show that participants believe that ICT has positive effect on teaching and learning of physics.

CONCLUSION

If our schools throughout the country are to maintain maximum educational standards, they should be Provided with adequate funds, infrastructural facilities in terms of modern classrooms equipped with electronic computer system which are connected to internet, well equipped laboratories, workshops, Libraries, instructional materials and highly qualified personnel that can effectively utilize these resources. With the introduction of information and communication Technology, a new challenge for science and physics education has emerged.

Information Technology is significant because it is necessary for the development of our educational system. Therefore, there is no doubt that the world are in the grip of a telecommunications resolution. This means that we are at the advantage to develop our educational system to meet the demand of other developed countries. So the need for information Technology is of great advantage for our schools. Schools should be introduced to IT so that government will pay more attention to educational system of the country and provide necessary support to the growing trend of education to meet the standard of the developed countries.

Finally, our high school students should be given the best in education with modem facilities which will in turn draw out the best in every student and ensures the utility of these students to the development of Iran and the world at large.

RECOMMENDATION

The major focus of the study was actually to evaluate the Effect of Information Technology on teaching and learning of physics in our high schools. Based on this investigation, it is considered very important to make the following recommendations:

1. Government should encourage attracting state, local, international bodies and Non-governmental organizations to invest on IT related projects in secondary and high schools.
2. IT equipment and facilities such as internet, and equipment of IT should be made available to all secondary and high schools.
3. Only qualified and competence physics teachers should be have skills in using information technology to teach physics course in classrooms.
4. Physics teachers should be encouraged to study further in the IT.
5. Attention should be paid of facilities in our secondary and high schools. Also ICT system together with necessary peripherals should be bought. This will enhance the teaching and learning of physics and allow discovery of more facts.
6. Conferences, seminars and workshops and relevant programs should be organized by professionals of IT to teach physics teachers and science teachers on modern technology and its uses.
7. IT relevant curriculum should be developed specially for primary schools, secondary schools and institutions.
8. Establishing facilities for electronic distance learning networks opportunities in our schools.
9. Creating IT Application, in Research Design and Development strategy.

ÖZET: Literatürde yer alan Fen Eğitimi araştırma sonuçlarına göre, ilköğretimden üniversite seviyesine kadar çok sayıda öğrenci, maddenin parçacıklı yapısı ile ilgili kavramları öğrenmede zorluk çekmektedir. Buna bağlı olarak öğrencilerde atom ve molekül kavramları ile ilgili yanlış kavramalar oluşmaktadır. Böylece bu iki temel kavram üzerine kurulmuş olan diğer kavramlar da tam olarak anlaşılamamaktadır. Maddenin parçacıklı yapısını oluşturan atom ve moleküller ile ilgili kavram yanılgılarının aşılması, Fen Bilimleri öğretiminin sağlıklı olarak yapılabilmesi açısından büyük önem taşımaktadır. Bir fen öğretmenin, bir fen eğitimcisinin öğretimde başarılı olabilmesi, büyük ölçüde, öğrencilerinin neleri kavramakta zorluk çektiğinin farkına varmasına bağlıdır. Aynı zamanda öğrencilerinin var olan kavram yanılgılarının iyileştirilmesi için uygun öğretim ortamları hazırlayarak, uygun yöntem ve teknikler kullanmalıdır. Fen eğitiminde yer alan maddenin parçacıklı yapısı kavramı, öğrencilerin duyu organları ile algılayamadıkları soyut bir kavramdır. Bu kavramın öğretiminde modele dayalı aktivitelerin kullanılması, öğrencilerin zihinlerinde kavramı somutlaştırmaları ve var olan kavram yanılgılarının giderilmesi açısından önemlidir. Bu çalışmanın amacı ilköğretim öğrencilerinin maddenin parçacıklı yapısıyla ilgili başarı düzeylerini belirlemek ve bu konudaki öğrenme zorluklarını (kavram yanılgılarını) iyileştirmek için, modele dayalı aktivitelerin etkisini araştırmaktır. Çalışma, karşılaştırmalı nicel geriye dönük bir araştırmadır. Çalışmada tarama modeli ve tek grup öntest-sontest modeli kullanılmıştır. Araştırmanın tarama grubunun örneklemini 278 ilköğretim öğrencisi, deney grubunun örneklemini ise 166 ilköğretim öğrencisi oluşturmaktadır. Evreni, araştırmanın yapıldığı ders yılında 4-8 sınıflarındaki toplam öğrenciler oluşturmaktadır. Veriler, Maddenin Parçacıklı Yapısı Kavram Testi (MPYKT, $\alpha = .79$) ile toplanmıştır. Deney grubuna MPYKT öntest olarak uygulanmış, ardından modele dayalı aktivitelere dayanan ders anlatımı yapıldıktan sonra MPYKT son test olarak uygulanmıştır. Araştırmanın hipotezleri, SPSS 10.0 programı kullanılarak İlişkili Örneklem t-Testi, İlişkisiz Örneklem t- Testi ve tek faktörlü varyans analizi ile test edilmiştir. Kestirel istatistik sonuçları, betimsel analiz sonuçları ile de desteklenerek sunulmuştur. Sonuç olarak öğrencilerde maddenin parçacıklı yapısı ile ilgili var olan kavram yanılgılarının giderilmesinde, modele dayalı aktivitelerin başarılı olduğu görülmüştür.

Anahtar sözcükler: modele dayalı aktiviteler, kavram yanılgısı

BECERİ TEMELLİ ELEŞTİREL DÜŞÜNME EĞİTİMİNİN İLKOKUL 3. VE 4. SINIF ÖĞRENCİLERİNİN ELEŞTİREL DÜŞÜNME BECERİLERİNİ GELİŞTİRME DÜZEYİNE ETKİSİ

THE EFFECTS OF SKILL-BASED CRITICAL THINKING EDUCATION ON THE LEVELS OF DEVELOPING CRITICAL THINKING SKILLS OF 3RD-4TH GRADE PRIMARY SCHOOL STUDENTS

ÖZET: Bu çalışmada, ilkokul 3-4. Sınıf öğrencilerinin eleştirel düşünme becerilerini geliştirme düzeyleri üzerinde beceri temelli eleştirel düşünme eğitiminin etkisini araştırmak amaçlanmıştır. Bu program kapsamında fen dersi programında yer alan enerji tasarrufu ve enerjinin verimli kullanımı konusu temel alınmıştır. Araştırmaya katılan ilkokul 3-4. Sınıf öğrencileriyle okuldaki serbest etkinlik saati kapsamında 5 hafta süreyle çalışmalar yürütülmüştür. Araştırmada veri toplamak amacıyla nitel araştırma tekniklerinden yapılandırılmış görüşme tekniği kullanılmıştır. Öğrencilere araştırmacılar tarafından oluşturulan yedi tane açık uçlu soru yöneltilmiştir. Elde edilen verilerin analizinde betimsel analiz kullanılarak araştırmacılar tarafından daha önceden belirlenen temalara göre özetlenmiş ve yorumlanmıştır. Araştırma bulgularından elde edilen sonuçlar öğrencilerin farklı bakış açıları kazandıkları, hayal güçlerini geliştiği, düşünmeyi öğrendikleri ve eleştirel düşünme düzeylerinin geliştiğini ifade ettikleri görülmüştür. Bu sonuçlar, ilkokul döneminde erken yaşlardan başlayarak öğrencilere düşünme eğitimleri verilmesinin geliştirilmesinin ne kadar önemli olduğuna dikkat çekmektedir.

Anahtar sözcükler: Beceri temelli eleştirel düşünme, Cort düşünme programı, eleştirel düşünme düzeyi, ilkokul

ABSTRACT: In this study, it was purposed to investigate the effects of skill-based critical thinking education on the levels of developing critical thinking skills of 3rd-4th grade primary school students. Within the framework of this program, energy saving and productive energy using subjects that rank among science course program were used as base. With primary school students that participated in the research, studies were conducted for five weeks within the frame of free activity hours. In the research, interview technique structured with qualitative research techniques was used in order to gather data. Students were addressed seven open-ended questions that were prepared by the researchers. We summarized and interpreted data obtained according to themes that were predetermined by researchers using descriptive analysis. According to findings, it was concluded that students expressed that they have gained different view of points, developed their imaginations, learned thinking, and developed their critical thinking levels.

Key words: Skill-based critical thinking, Cort thinking program, critical thinking level, primary school

GİRİŞ

Eleştirel düşünme, öğrenimin ilk yıllarından itibaren toplumun tüm bireylerine kazandırılması gereken önemli düşünme becerilerindendir. Aslında düşünme, sebep-sonuç ilişkisini kurarak akıl yürütme eylemi iken, eleştirel düşünme, sebep-sonuç ilişkisini kurarken, eski öğrenilenler ile yeni öğrenilenler arasında bir bağ kurma ve bu sırada akılcı olmayan ilişkileri eleme sürecidir (Kahraman, 2008). Eleştirel düşünce; olayları analiz etme, düşünce üretme ve onu örgütleme, görüşleri savunma, karşılaştırmalar yapma, çıkarımlarda bulunma tartışmaları değerlendirme ve problem çözme yeteneğidir (Chance, 1986; Akt. Şahinel, 2007).

Eleştirel düşünebilmenin yolunun iyi bir eğitimden geçtiği düşüncesiyle nitelikli insan yetiştirmek için eğitimi araç olarak kullanmak en kolay ve en etkili yol olacaktır. Ancak yapılan çalışmalar; bu eğitimin sınırlı alanda ve belirli bir yaştan sonra yapılmasının yeterli ve beklenen düzeyde gerçekleşmediğini göstermektedir (Kökdemir, 2012). 21. yüzyıl eğitimi, esneklik, kendi kendine öğrenme, olaylara geniş bir açıdan bakabilme, eleştirel düşünebilme ve yaratıcı problem çözme yeterliliğine sahip vatandaşlar gerektirmektedir (Kepenekçi, 2000). Bu gereksinim neticesinde Watson ve Glaser (1964)'in belirttiği gibi eleştirel düşünme; problem çözme, sorgulama ve araştırma gibi edimleri kapsayan genel bir süreç olarak tanımlanmaktadır (Akt. Vural ve Kutlu, 2004). Öyleyse var olan, öğrenilebilecek ve öğretilebilecek bir takım eleştirel düşünme yetenekleri öğrenilebilir ve uygun bir şekilde kullanılabilir. Bu yeteneklerin gelişmesi uzun ve zorlu bir düşünmeci süreci yaşamaktan geçmektedir.

Eleştirel düşünme alanyazını incelendiğinde, araştırmacıların ve yazarların eleştirel düşünme öğretiminin gerekliliği konusunda görüş birliği içinde oldukları görülmektedir. Ancak, eleştirel düşünmenin nasıl öğretileceği, hangi yaklaşımın daha etkili olacağı soruları tam olarak cevaplanamamıştır. Beyer (1991), eleştirel düşünme becerilerinin geliştirilmesinin zaman alacağını belirterek, bu becerilerin uzun süreçli düşünme incelemelerinin içinde tutulan öğrencilerin kazanabileceğini ileri sürmekte, beceri temelli olarak öğretilebileceğini belirtmektedir. (Akt. Aybek, 2007). Enis (1991)'e göre eleştirel düşünme beceri temelli öğretilmelidir. Beceri temelli öğretildiğinde, konu içerisindeki temel disiplinlerin tekrarlanmasından kaçınılmış olur ve aynı zamanda kazanılan bilişsel becerilerin diğer derslere uygulanması ve o dersler tarafından desteklenmesi kolay olur (Aybek, 2007). Beceri temelli eleştirel düşünme eğitiminin en önemli savunucusu olan ve CORT (Cognitive Research Truth) programını hazırlayan Edward De Bono'dur. Oldukça basit bir program olan cort, çoğu durumlar için uygulanabilir 10 dersten oluşmaktadır. Edward De Bono'ya göre Cort düşünme programı, düşünme becerilerini geliştirmek için hazırlanmış bir programdır. Düşünmeyi bir beceri olarak geliştirmenin avantajı, bu becerinin tek bir alanda geliştirilmediği için her durumda kullanılabilmesidir. Düşünme doğal değildir. Nasıl yapıldığını öğrendikten sonra yüzme gibi bisiklet sürme gibi doğal hale gelebilir (Kurnaz, 2011).

Fen ve Teknoloji dersinin öğretim programı dersin amacını tanımlarken eleştirel düşünmeyi öne çıkarmıştır. Bilimsel süreç becerilerine sahip bireyleri, günlük yaşamlarındaki olayları sorgulayan ve araştıran, eleştirel düşünebilen, karşılaştıkları problemleri bilimsel yollarla çözebilen, karar verme becerileri gelişmiş bireyler olarak tanımlanmaktadır (İleri, 2012).

Gelişen teknoloji, enerjinin kullanımı ve dünyamızdaki kaynakların sınırlılığı, öğretim programına konu olmaktan öteye giderek ünite haline gelmiştir. Geleceğin bireyleri olacak olan öğrenciler, yetişkin bireyler olduklarında elde ettikleri becerileri elbette kullanacaklardır. Beceri temelli düşünme eğitimlerinin daha küçük yaşlarda verilmesi ve kazanılan becerilerin nasıl kullanılması gerektiğinin öğretilmesi gerekmektedir. Bu durumda eleştirel düşünme öğrenmede beceri temelli yaklaşımın, eleştirel düşünme becerileri kazanmadaki etkisinin araştırılması önem kazanmaktadır. Bu amaçla bu çalışmada, beceri temelli eleştirel düşünme eğitiminin ilkokul 3. ve 4. Sınıf öğrencilerinin eleştirel düşünme becerilerini geliştirme düzeylerine etkisinin araştırılması amaçlanmıştır.

YÖNTEM

Araştırma Modeli

Araştırmada model olarak nitel araştırma modeli kullanılmıştır.

Çalışma Grubu

Araştırmanın çalışma grubunu 2013-2014 eğitim-öğretim yılında Konya Mehmet Hasan Sert İlkokulunda okuyan 3. ve 4. sınıfında öğrencileri oluşturmaktadır. Araştırmaya 26 kız, 25 erkek olmak üzere toplam 51 öğrenci katılmıştır.

Veri Toplama Aracı

Araştırmada veri toplamak amacıyla nitel araştırma tekniklerinden yapılandırılmış görüşme tekniği kullanılmıştır. Öğrencilere araştırmacılar tarafından oluşturulan yedi tane açık uçlu soru yöneltilmiştir.

Verilerin Analizi

Elde edilen verilerin analizinde betimsel analiz kullanılarak araştırmacılar tarafından daha önceden belirlenen temalara göre özetlenmiş ve yorumlanmıştır.

BULGULAR

Öğrencilerin Cort Düşünme programı sırasında uygulanan konu ve beceri temelli düşünme programında verdikleri yanıtlara ilişkin bulgular

Araştırmaya katılan 3. ve 4. Sınıf öğrencilerinin Cort düşünme programındaki 10 ders programı kapsamında, grup çalışmaları sonucunda ortaya koydukları görüşler Tablo 1'de verilmiştir.

Tablo 1: Cort Düşünme Programı Kapsamında Öğrenci Görüşleri

Cort Düşünme Programı Dersler	Uygulama Basamakları	3. sınıf	4. sınıf
1	**Uygulama 2** Evde elektrikli araçların kullanımı yasaklanmalıdır.	• Karanlıkta korku hikâyeleri anlatırız. • Ödevlerimizi yapamayız. • Teknolojiden yararlanamayız. Bol bol bahçeye iner oyun oynarız.	• Daha çok tasarruf yapabiliriz (çocuklar tasarruf yapmayı öğrenir.) Aile bağımız daha çok güçlenir. • İletişim kurmamızı azaltır. • Çocuklar doğa ve tabiat ile daha çok ilgilenir.
2	**Uygulama 1** Evinize elektrikli ısıtıcı alacağınız zaman nelere dikkat edersiniz?	• Kalitesine • Güvenli mi? • Emniyet kilidine • Fazla elektrik tüketmemesine	• Sağlığımıza zarar verir mi? • Garanti belgesine. • Markasına. • Ne kadar elektrik harcadığına. • Dekoratif olmasına.
3	**Uygulama 1** Evimize gelen elektrik faturası çok fazla. Faturayı azaltmak için 4 kural belirleyiniz.	• Gereksiz ışıkları söndürürüz. • Elektrikli eşyaları tasarruf yaparak kullanmak. • Gizlice televizyonla ve bilgisayarla oynamak yasak!	• Açık gördüğümüz lambaları kapatmak • Evdeki aydınlanma lambaların tasarruf lambaları ile değiştirmek. • Çocukları tasarruf yapmaya alıştırmak.
	Uygulama 2 1. sorudan devam (fikirlerin ele alınış yöntemi, pozitif, negatif, ilginç)	• Evimizdeki aydınlatma lambalarının yerine tasarruf lambalarının takılması (pozitif) • Tasarruf yapılabilmesi (ilginç)	• Tasarruf yapmış oluruz (pozitif). • Lambaların fiyatı artar (negatif). • Sağlığımızı korumuş oluruz.
	Uygulama 3 Evinizde bir tane televizyon var ve herkes farklı kanallar izlemek istiyor. Sizde bir program yaparak bunu düzene koyacaksınız. Bunu yaparken nelere dikkat	• Programın ailemin istediği gibi olması • Başkasının fikrine önem göstermemek • Hafta sonu herkesin izleyeceği bir şey açarız.	• Herkesin süresi aynı olmalıdır. • Çocuklar ödevlerini yaptıktan sonra izlemeli. • Aile bireylerinin uygun oldukları zamanda izlemelerini sağlamak

	edersiniz?		
4	**Uygulama 1** Enerji tasarrufu yapmak için evlerde kullanılan aydınlanma araçlarının akşam 8'den sonra kullanılması yasaklanmıştır. Bu durumun kısa vade, orta vade, uzun vade sonuçları neler olur? (vade kelimesinin anlamını bilmiyorlardı)	• Birkaç ay sonra akşam 8 de yatmak zorunda kalırız. (UV) • Lambaya ihtiyaç olmayabilir. (OV) • Körebe oynarız. (KV)	• Elektrik tasarrufu yapabiliriz (UV). • Işıklar olmadığında daha çok sıkıldığımız için bilgisayar ve televizyona daha fazla bakarız. Buda olumsuz sonuç doğurur (UV). • Erken yatmaya alışırız (OV).
5	**Uygulama 3** Her insan televizyon seyretmek ister. Annenizin, babanızın, kardeşinizin, televizyon üreticisinin, elektrik dağıtım firmasının televizyon konusundaki amaçları neler olabilir?	• Yemek programları ve dizi (anne) • Maç ve haber izlemek (baba) • Çizgi film izlemek (kardeş) • Para kazanmak (üretici) • Para kazanmak, işlerimizi kolaylaştırmak (dağıtıcı firma)	• Yemek programları ve dizi (anne) • Maç ve haber izlemek (baba) • Çizgi film izlemek (kardeş) • Çocuk şeylerini izleyip hayal gücünü geliştirmek için (kardeş) • Para kanmak (üretici) • Para kazanmak, (dağıtıcı firma)
6	**Uygulama 1** Hükümet aldığı bir kararla, bütün arabaların dönüşümlerinin yapılarak elektrikle çalışır/kullanılabilir duruma gelmesini zorunlu hale getirmiştir. Hükümetin amaçları neler olmalıdır?	• Doğa kirliliğini engelleme • Egzozdan çıkan dumanın hava kirliliği yapmaması • Elektrikle daha yavaş gidip kaza yapmamak.	• Çevreyi temiz tutmak. • Arabamızın tasarruflu olmasını sağlamak • Tüplü arabalara oranla daha güvenli.
	Uygulama 2 Hükümet ne yapmalıdır? Üç aşamalı bir plan yapınız.	• Arabalarını elektrikli yapanlara para vermek. • Sanayiyi geliştirmek. • Elektrikli olmayan arabaların paralarını çoğaltmak! • Afişler asmak, halkı bilgilendirmek. • Kazalar azalır mı, azalmaz mı diye kamera koymak. • Vergiyi azaltmak.	• Benzin istasyonlarının yerine elektrikli istasyonlar yapılmalı. • Reklam yaparak halk bilinçlendirilmeli. • İlk önce araba yapanlarla anlaşılmalı. • Arabayı elektrikli yapmayanlar ceza almalı.
	Uygulama 3 Yukarıdaki planlardan birini seçerek bu planı kısa (1-5 yıl) ve orta (5-25 yıl) dönem sonuçlarını yazınız.	• Kazalar azalır. (UV) • Bir yıl sonra elektrikli arabalara zam gelir. (KV) • Bizim ülkemizi örnek alarak başka ülkelerde kullanmaya başlar (UV)	• Daha az para gider tasarruf yaparız (KD). • Ülke daha zengin olur (UD). • İnsanlar sağlıklı olur (KD). • Çevremiz temiz olur (UD).
7	**Uygulama 2** Kardeşinizin gece yatarken sürekli TV'yi açık bıraktığını	• TV bir ay içinde her zaman kapatırsa ödül alabiliriz. • Saat kurma düğmesini öğretirim (otomatik kapanma).	• Kapatmadığında paramızın boşa gittiğini söylerim. • Alarm sistemini kurarım.

	fark ettiniz, ne yaparsınız?	• Televizyonu kapatırsa tasarruf olacağını söylerim.	
8	**Uygulama 3** Ülkedeki enerji tüketimi çok fazla arttı. Eğer enerji bakanı olsaydınız bu sorunu çözmek için ne tür alternatifleriniz olurdu?	• Az elektrik harcayan ampulleri zorunlu yaparım, az elektrik harcayana ödül vereceğimi söylerim. • **Çocuklara enerjinin ne demek olduğunu öğretmek için enerji oyuncağı çıkarırım.**	• Elektriği azaltan makine yaparım. • Kampanya düzenlerim. Halkı bilgilendiririm. • Herkese belirli miktarda elektrik veririm. • Halktan daha çok para alırım.
9	**Uygulama 1** Bir arkadaşınızın sınıfın elektrik priziyle oynadığını gördünüz ve sınıfta sadece siz varsınız. Acil karar vermek zorundasınız. Ne yaparsınız?	• Başka bir şeye yönlendiririm. • Sigortayı kapatırım. • En yakındaki görevliye haber veririm.	• Nöbetçi öğretmene haber veririm. • Onunla oyun oynarım, bu şekilde prizden uzaklaştırırım. • Şalteri indiririz.
10	**Uygulama 2** Enerji kullanımını uygun hale getirmek için yeni elektrikli araçlar üretilmiştir. Bu buluşa devletin, üretici firmanın, babanızın ve sizin bakış açınız nasıldır?	• Devlet; Ülkenin tasarruflu olmasını sağlamak. Enerji kaynaklarını az kullanmak. • Firma; para kazanmak. • Baba; elektrik faturasının az gelmesi.	• Devlet: Kaynakları düzgün kullanmak. • Baba: daha tasarruflu oluruz. • Üretici firma: para kazanmak. • Ben: enerjiyi daha uygun kullanmayı öğrenmek.

Öğrencilerin Cort Düşünme programı sonrasında kendilerine yöneltilen 7 açık uçlu soruya verdikleri yanıtlara ilişkin bulgular

3. sınıf öğrencilerinin açık uçlu sorulara verdikleri yanıtlar uygun kategoriler altında toplanarak; öğrencilerin bu kategorilerde verdikleri örnek ifadeler Tablo 2'de gösterilmiştir.

Tablo 2: 3. Sınıf Öğrencilerinin Açık Uçlu Sorulara Verdikleri Yanıtlara İlişkin Görüşler

SORULAR	KATEGORİLER	ÖRNEK İFADELER
Soru 1	**Evet;** • Zevkli/güzel/heyecanlı • Düşünme becerisini geliştirme • Fikirleri ve görüşleri geliştirme, paylaşma • Hayal gücünü geliştirme • Grup dinamiği • Eğitici • Oyun oynayarak öğrenme	"Çok zevkliydi. Çünkü herkes düşüncelerini, fikirlerini ve görüşlerini söyledi." "Yaptığımız eğitim hem eğlenceli hem de eğiticiydi, bir de arkadaşlarımla beraber olmak çok güzeldi." "Hayal gücümü geliştirdim, çok eğlendim."
	Hayır; • Sıkıcı	"Son zamanlar biraz sıkıcı geçti çünkü cevap bulmada zorlandık."

Soru2	• Nasıl düşündüğümüzü belirlemek • Hayal gücümüzü geliştirmek • Zekamızı geliştirmek • Farklı bakış açıları kazanmak • Fikirlerimizi geliştirmek • Çalışkan ve bilgili olmamızı sağlamak	"Bu eğitimden sonra günlük hayata farklı açılardan bakıyorum."
Soru 3	**Evet;** • Alış verişte daha dikkatli • Bardağından dolu tarafından bakma • Daha fazla düşünerek hareket etme • Farklı bakış açısı kazanma • Saygı • Daha dikkatli	"Evet, çünkü bakış açım değişti." "Geçen gün bana bir mp3 çalar alacaktık. Ben eğitimden sonra ürünleri daha çok araştırdığım için mp3 çaları araştırdım, meğerse kalitesiz bir ürünmüş." "Evet, mesela bazı şeyler alırken daha dikkatli oluyorum. Faturaları alıyorum, garanti belgesini alıyorum." "Evet, mesela para biriktiriyorum, lambaları kapatıyorum.
	Hayır; • Henüz karşılaşmadım.	-
Soru 4	**Evet;** • Eskisinden daha farklı eleştirel bakış • Öncesi ve sonrasında ne yapacağımı bilme • Daha fazla düşünme • Farklı açılardan bakabilme • Pozitif ve negatif yönlerini görebilme • Yanlışı ve doğruyu görme • Arkadaş seçiminde • Hayata bakış	Gelişti, çok düşünemiyordum. Her şeye farklı açıdan bakabiliyorum. Her şeyin pozitif negatif yönlerini öğrendim. Biraz, çünkü bir şey yaparken artık daha uzun hayal edebiliyorum.
	Hayır; • Pek değil.	
Soru 5	**Evet;** • Olayların olumlu ve olumsuz yönlerine dikkat etme • Farklı bakış açısı kazanma • İyi ve kötü yanlarını görebilme • Gereklilik	Evet daha eleştirel bakıyorum. Bakış açım değişti. Evet çünkü her şeyin iyi ve kötü yanlarını öğrendim."
	Hayır; • Arkadaşlar kırılabilir.	
Soru 6	**Evet**	• 7, 8, 9. Aşamalarda zorlandık.
Soru 7	**Evet;** • Günlük hayatı kolaylaştırma • Günlük hayatta kullanma • Eğlenceli/zevkli/güzel • Daha iyi düşünebilme becerisi • Yeni fikirler bulmak • Bilgi edinmek • Umut	"Devam etmesini istiyorum. Çünkü, zevkli, eğlenceli ve daha bir sürü şey." "Evet çünkü orada çok eğleniyordum, düşünmek ve yeni fikirler bulmak güzeldi. Beni çok mutlu ediyordu." "Umudumu kaybetmemek için."
	Hayır;	

	• Sıkıcı • Zor • Eleştirmeyi sevmiyorum. • Süresi uzun	

4. sınıf öğrencilerinin açık uçlu sorulara verdikleri yanıtlar uygun kategoriler altında toplanarak; öğrencilerin bu kategorilerde verdikleri örnek ifadeler Tablo 3'te gösterilmiştir.

Tablo 3: 4. Sınıf Öğrencilerinin Açık Uçlu Sorulara Verdikleri Yanıtlara İlişkin Görüşler

SORULAR	KATEGORİLER	ÖRNEK İFADELER
Soru 1	**Evet;** • Zevkli /Eğlenceli • Düşünme becerisini geliştirme • Fikirleri ve görüşleri paylaşma • Hayal gücünü geliştirme • Zekâmız gelişti • Eğitici	"Çok zevkliydi. Çünkü herkes düşüncelerini, fikirlerini ve görüşlerini söyledi." "Zevk aldım çünkü herkes yapabildi." "Eğitici ve daha iyi düşünmemizi sağladı."
	Hayır; • Cevap bulma zorluğu • Sıkıcı • Grup dinamiği	"Son zamanlar biraz sıkıcı geçti çünkü cevap bulmada zorlandık." "Hayır, çünkü gurubum kötüydü."
Soru2	**Evet** • Nasıl düşündüğümüzü belirlemek • Düşünme becerimizi geliştirmek • Hayal gücümüzü geliştirmek • Zekâmızı ölçmek ve geliştirmek • Farklı bakış açıları kazanmak • Kendi düşüncelerimizi paylaşmak • Bilgi seviyesini ölçmek	
Soru 3	**Evet;** • Alış verişte daha dikkatli • Bardağından dolu tarafından bakma • Daha fazla düşünerek hareket etme • Doğru karar verebilme • Düşünme gelişimi • Tasarrufu öğrettiği için • İyi şeyler düşünme • Hayal gücünü geliştirme • Tutumlu olma	"Evet, bakabiliyorum, hayal gücümü kullanıp değişik şeyler yapıyorum."
Soru 4	**Evet;** • Eskisinden daha farklı eleştirel bakış • Öncesi ve sonrasında ne yapacağımı bilme • Eskisinden daha başarılı olma • Düşünme becerisinin gelişimi • Çevresiyle daha iyi anlaşabilme • Her şeyin önemini daha iyi anlama	"Evet çünkü Sherlock Holmes olduk ve çok işe yarıyor." "Bence gelişti ama buna ben değil çevrem karar verir."

	• Zekâyı güçlendirme	
Soru 5	**Evet;** • Olayların olumlu ve olumsuz yönlerine dikkat etme • İnsanlar farklı olabilir. • Öğretmenimiz çok emek verdi. • Düşünme gelişimi • Mantıklı düşünmeyi fark etme • Zekâm gelişti. • Çevresiyle daha iyi anlaşabilme • Daha tutumluyum. • Düşünerek karar verme • Daha çalışkan olma	"Evet, öyle çünkü daha mantıklı düşündüğümü fark ettim." "Evet, çünkü bu çalışmadan sonra düşünerek karar veriyorum."
	Hayır; • İnsanları eleştirmeyi sevmeme • Herkesin kendi hayatının olması	"Hayır, çünkü herkesin kendi hayatı var."
Soru 6	**Evet**	• 7, 8, 9. aşamalarda
	Biraz	• 3. aşamada
	Hayır	-
Soru 7	**Evet;** • Günlük hayatı kolaylaştırma • Eğlenceli • Zevkli • Daha iyi düşünebilme becerisi • Hayal gücü gelişimi	"Devam etmesini istiyorum. Çünkü zevkli, eğlenceli ve daha bir sürü şey."
	Hayır; • Sıkıcı • Eleştirmeyi pek sevmem	

SONUÇ VE ÖNERİLER

Araştırma bulgularından elde edilen sonuçlar ışığında öğrencilerin farklı bakış açıları kazandıkları, hayal güçlerinin geliştiği, düşünmeyi öğrendikleri ve eleştirel düşünme düzeylerinin geliştiğini ifade ettikleri görülmüştür. Bu sonuçlar, ilkokul döneminde erken yaşlardan başlayarak öğrencilere düşünme eğitimleri verilmesinin geliştirilmesinin ne kadar önemli olduğuna dikkat çekmektedir. Korkmaz ve Yeşil'e göre (2009), İlköğretim ile ortaöğretim kademeleri son sınıf öğrencilerinin eleştirel düşünme eğilim ve düzeyleri arasında, ilköğretim kademesindeki öğrencilerin lehine anlamlı bir farklılaşma vardır. Eleştirel düşünme eğilim ve düzeylerinin alt boyutları incelendiğinde ise; açık fikirlilik, kendine güven ve sistematiklik alt boyutlarında ilköğretim kademesindeki öğrenciler lehine anlamlı bir farklılaşman varken diğer alt boyutlarda anlamlı farklılaşma bulunmamaktadır. İlgili araştırma bu çalışmanın bulgularını da desteklemektedir. Eleştirel düşünme, disiplinler arası bir yaklaşım ve *beceri* öğretimi yaklaşımı içerisinde öğretildiği zaman, hem farklı disiplinler içerisinde konuların tekrarlanmasına gerek kalmayacak hem de bilişsel bir beceri olarak tüm disiplinlerin öğretiminde etkin olarak kullanılarak geliştirilebilecektir. Buradan hareketle; eleştirel düşünme becerilerini öğrencilere kazandırmak için okullarda eleştirel düşünme becerilerinin kazandırılıp geliştirilebilmesi için hem teorik düzeyde hem de uygulamalı olarak eleştirel düşünme öğretiminin yapılması gerektiği söylenebilir Korkmaz ve Yeşil, 2009). Aybek (2007) tarafından yapılan çalışma sonunda, eleştirel düşünmenin beceri temelli olarak öğretilmesinin öğrencilerin eleştirel düşünme eğilimini ve düzeyini daha çok arttırdığı söylenilebilir. MEB tarafından okullarda uygulanan seçmeli etkinlik kapsamında bulunan kulüp çalışmalarına "Düşünme Kulübü" başlığı altında bir kulüp kurulması; eleştirel düşünme becerilerini geliştirmeye yönelik etkinliklerin yapılacağı daha geniş bir çalışma alanının yaratılmasına destek verecektir (Kahraman, 2008). Okullarımızda, her sınıf seviyesinde yapılan kulüp çalışmaları ile daha küçük yaşlarda öğrencilerin eleştirel düşünme ile tanışmaları sağlanmış olacaktır. Okullarımızda, her sınıf seviyesinde yapılan kulüp çalışmaları ile daha küçük yaşlarda öğrencilerin eleştirel düşünme ile tanışmaları sağlanmış olacaktır. Bu çalışma sonunda; beceri temelli eleştirel düşünme eğitimlerinin ilkokul seviyesinde farklı konu içeriklerinde de Cort1 programı ile uygulanması önerilmektedir. Öğrencilere sunulacak sınıf ortamı, grup ve işbirlikli çalışma durumuna uygun olarak düzenlenmelidir.

ÖZET: 20. yüzyılın başından beri tartışılan bir konu olan ve birçok kitle iletişim aracının kullanımının insan üzerindeki etkilerini ele alan medya okuryazarlığı ülkemiz açısından yeni bir kavram olmakla birlikte özellikle 2005 yılında Marmara Üniversitesinde düzenlenen Medya Okuryazarlığı konferansı sonrasında kitlelerin dikkatini çekmeye başlamıştır. Aynı dönemde RTÜK tarafından başlatılan ve 2006 yılında Milli Eğitim Bakanlığı ile imzalanan bir protokolle ilköğretim ikinci kademe öğrencilerine medya okuryazarlığı dersi seçmeli olarak okutulmaya başlanmıştır. Bireylere medya okuryazarlığının kazandırılması ile kesin doğruyu verip vermediği tartışmalı olan kitlesel medya araçlarına karşı eleştirel bir bakış açısıyla yaklaşmaları ve doğru bilgiyi edinmeleri amaçlanmaktadır. Günümüzde toplumlar üzerinde medyanın önemi ve etkisi düşünüldüğünde üniversite öğrencilerinin medya okuryazarlık düzeyleri önem arz etmektedir. Bu araştırma ile üniversite öğrencilerinin medya okuryazarlıkları düzeylerinin bazı değişkenler açısından incelenmesi amaçlanmıştır. Araştırmaya 585 (290 Kız, 295 Erkek) üniversite öğrencisi katılmıştır. Sonuçlar üniversite öğrencilerinin medya okuryazarlık düzeylerinin yüksek olduğunu göstermektedir. Üniversite öğrencilerinin medya okuryazarlık düzeylerinin incelendiği bu çalışmada erkek öğrencilerin kız öğrencilere, üst sınıflarda bulunan öğrencilerin alt sınıflarda bulunan öğrencilere, yaş olarak daha üst gruplarda bulunan öğrencilerin daha alt gruplarda bulunan öğrencilere, internet bağlantısına sahip olan öğrencilerin sahip olmayan öğrencilere, internette daha fazla zaman geçiren öğrencilerin daha az zaman geçiren öğrencilere, düzenli kitap ve gazeteleri okuyan öğrencilerin okumayan öğrencilere, not ortalaması yüksek olan öğrencilerin düşük olan öğrencilere, ailelerinin aylık geliri yüksek olan öğrencilerin düşük olan öğrencilere göre medya okuryazarlık düzeylerinin daha yüksek olduğu ortaya çıkmıştır. Ancak sosyal medya sitelerine üye olmanın, televizyon izleme oranın ve ebeveynlerin eğitim durumunun öğrencilerin medya okuryazarlıkları üzerine bir etkisi bulunmamıştır.

Anahtar Kelimeler: Üniversite öğrencileri, Medya, Medya okuryazarlığı.

ABSTRACT: Media literacy which is a controversial issue since the beginning of the 20th century and argues out the impacts of different kinds of mass media on mankind, is a new concept for our country. It began to draw attention of the society especially after the Media Literacy Conference that has been held in Marmara University in 2005. At that time media literacy lessons were put into primary schools' curricula as an elective course via a protocol cosigned between Radio Television Supreme Council (RTUK) initiated the process and Ministry of Education in 2006 with the aim of giving media literacy to individuals while making them capable of reaching the true information by using a critical approach to controversial mass media organs. Today, the media literacy levels of university students are so crucial considering the importance and influence of the media on society. It was aimed to examine university students' media literacy levels in terms of some variables in this study. 585(290 girls and 295 boys) university students participated in the study. The results have shown that university students have high levels of media literacy. It has also been found that media literacy was higher in male students compared to female students, in senior classes compared to junior classes, in elders compared to youngers, in those who had internet access compared to those who didn't, in those who used the internet more frequently compared to those who used less frequently, in those who read books and newspapers regularly compared to those who didn't, in those with higher GPA compared those with lower GPA and in those who had higher income level compared to those who had lower income level. However, this paper has shown that social media membership, frequency of watching TV and parents' education levels didn't have effect on media literacy.

Keywords: University students, Media, Media literacy.

ÖĞRETMENLERİN RUTİN OLMAYAN MATEMATİKSEL PROBLEMLERİ ÇÖZMEDE KULLANDIKLARI STRATEJİLER

SOLUTION STRATEGIES USED BY BOTH MATHEMATICS AND CLASSROOM TEACHERS ABOUT NON ROUTINE PROBLEM TYPES

Ayten Pınar BAL
Çukurova Üniversitesi
apinar@cu.edu.tr

ÖZET: Bu çalışmanın temel amacı matematik ve sınıf öğretmenlerinin rutin olmayan problemlerin çözümünde kullandıkları stratejileri belirlemektir. Araştırmanın çalışma evrenini 2013-2014 yılında Adana ili merkez ilçelerinde Milli Eğitim Bakanlığı'na bağlı farklı ilkokul ve ortaokullarda görev yapan 27 öğretmen oluşturmuştur. Araştırmada bireylerin çeşitliliğini maksimum derecede yansıtmak amacıyla, amaçlı örneklem yöntemlerinden maksimum çeşitlilik örneklemesi kullanılmıştır. Çalışmada veri toplama aracı olarak araştırmacı tarafından geliştirilen "Strateji Belirleme Testi (SBT)" kullanılmıştır. Strateji Belirleme Testi (SBT) on problemi ve açık uçlu iki soruyu kapsamaktadır. Araştırmanın sonunda hem matematik hem de sınıf öğretmenlerinin sıklıkla şekil çizme, muhakeme yapma ve problemi basitleştirme stratejilerini kullanırken rutin olmayan tarzdaki problemlerin sınıf içinde uygulanması konusunda öğretmenlerin hepsinin olumlu görüşler bildirdikleri bulgusuna ulaşılmıştır. Bu bulgulardan yola çıkarak bu tür stratejilerin geliştirilmesine yönelik özellikle lisans düzeyinde eğitim verilmesi; ilköğretimden başlayarak matematik programlarında rutin olmayan problemlere daha fazla yer verilmesi önerilebilir.

Anahtar sözcükler: matematik öğretmeni, sınıf öğretmeni, rutin olmayan problem, problem çözme stratejileri

ABSTRACT: The main purpose of this study is to find out solution strategies used by both mathematics and classroom teachers about non routine problem types. The population of this study is 27 teachers working at different public primary and elementary scools in central districs of Adana province during 2013-2014 academic years. While defining population, maximum variation sampling technique was used in order to reflect individuals' variations in maximum degree. As data collection tool, "Test of Identifying Strategy (TIS)" was developed and used by researcher during the study. TIS enhances ten problems and two open-ended questions. At the end of the study it was found out that, both mathematics and classroom teachers often use strategies related to drawing figures, reasoning and simplification of the problem while all the teachers are of the opinion about using non routine type problems in classroom. Based on these findings, helding courses related to developing solution strategies about non routine problem types in undergraduate level and starting from primary education giving more place to non routine problem types in mathematics curriculums can be suggested.

Key words: mathematics teachers, classroom teachers, non routine problem, problem solving strategies

GİRİŞ

Genel bir ifade ile problem, karşılaşılan sorunlara bireyin hemen bir çözüm getiremediği, ve çıkmaza düştüğü durumlardır (Blum & Niss, 1991; Polya, 1990; Altun, 2009; Van De Walle, 2007). Matematiğin temelini oluşturan problem çözme ise farklı çözüm yollarının sınanmasıyla karmaşık durum ya da olguları sonuçlandırma sürecidir. Problem çözme, matematik öğrenmenin temel bir parçası olup öğrencilerin matematiksel bilgilerinin ve düşüncelerinin gelişmesinde de önemli bir araçtır (NCTM, 2000). Ho' ya (2009) göre de okul matematiğinde kazandırılması gereken temel becerilerden biri olan problem çözme öğrencilerin düşünme süreçlerini ve zihinsel yeteneklerini geliştirmede önemli bir etmendir. Problem çözme sürecinde birey, bir problemle karşılaştığında çözüm için uygun stratejiyi seçer ve sonuçları yorumlar (Altun, 2008). Problem kavramı pek çok matematik eğitimcisi tarafından rutin ve rutin olmayan problemler olarak tanımlanmaktadır (Anderson, 2009; Laterell, 2013; Lee & Kim, 2005; Reusser & Stebler, 1997; Verschaffel, De Corte ve Borghart,1997; Verschaffel, De Corte ve Lasure, 1994). Gerçek yaşam problemlerini kapsayan rutin olmayan problemler ilköğretim okullarında matematik öğretim programlarının en önemli unsurlarından biridir (Anderson, 2009; NCTM, 2000; Xin, Lin, Zhang, Yan, 2007). Rutin olmayan problemler öğrencilerde gerçek yaşamda karşılaştıkları problem durumları ile ilgili farklı çözüm stratejileri oluşturma ve yorum yapma becerilerinin gelişmesi açısından da büyük önem taşımaktadır. Öte yandan, öğrencilerin temel aritmetik ve dört işlem becerilerini sınayan rutin problemler ise genelde belli bir formüle dayalı ve yorumdan uzak ezber youluyla çözülen problemler olarak tanımlanmaktadır (Altun, 2009; NCTM, 2000; Polya, 1990; Van de Walle, 2007).

Literatürde rutin olmayan matematiksel problemlerin çözüm süreçlerini irdeleyen çalışmaların büyük ölçüde öğrenciler üzerine odaklandığı görülmektedir (Altun ve Aslan, 2006; Artut ve Tarım, 2006; Bayazıt, 2013; Çelebioğlu ve Yazgan, 2009; Reusser, Stebler, 1997; Verschaffel, De Corte, Lasure, Van Vaerenbergh, Bogaerts, & Ratinckx, 1999; Xin, Lin, Zhang ve Yan, 2007; Yazgan, 2007; Yazgan ve Bintaş, 2005; Yoshida, Verschaffel ve De Corte, 1997). Ancak bu kapsamda öğretmen ve öğretmen adaylarına yönelik olarak yapılan çalışmaların ise sınırlı sayıda olduğu göze çarpmaktadır (Asman & Markovits, 2009; Inoue 2005; Kılıç, 2011; Lee ve Kim, 2005; Verschaffel ve diğerleri, 1997). Bu çalışmalardan elde edilen bulgular ise genelde rutin olmayan problemlerin çözümüne yönelik sorunlara işaret etmektedir. Bu bağlamda, Lee ve Kim (2005) sınıf öğretmeni adayları ile yaptıkları araştırmada sınıf içerisinde kullanılan problem türlerinden hangilerinin "iyi problem" olduğunu belirlemeye çalışmışlardır. Araştırmanın sonucunda öğretmen adaylarının çoğunluğunun tek bir çözümünün olması, kolay ve basit olması ve çok fazla düşünme sürecini içermemesi nedeniyle rutin problemlerin iyi problemler olduğu görüşünde oldukları sonucuna ulaşılmıştır. Öte yandan, Verschaffel ve diğerleri (1997) ise araştırmalarında üç farklı bölümde lisans eğitimlerini sürdüren 332 öğretmen adayının rutin olmayan gerçek yaşam problemlerini nasıl çözdüklerini ve problem çözmede gerçek yaşam bilgisini sürece ne kadar yansıttıklarını incelemişlerdir. Araştırmanın sonucunda öğretmen adaylarının rutin olmayan problemlerin çözümünde gerçek yaşamı çözüm süreçlerine dahil etmeden soruları doğrudan cevaplandırma eğiliminde oldukları bulgusuna ulaşmışlardır. Yine, Asman & Markovits (2009) araştırmasında öğretmenlerin ve öğretmen adaylarının sözel problemlerin çözümünde gerçek yaşam bilgisine ne kadar başvurduklarını ve problem çözmeye dair inançlarını incelemişlerdir. Görüşme yoluyla elde edilen verilerde öğretmen ve öğretmen adaylarının rutin olmayan gerçek yaşam problemlerinin çözümünde çok zorlandıkları ve mesleki deneyimlerinin problem çözümünde önemli bir etmen olduğu bulgusuna ulaşılmıştır. Öte yandan, Kılıç da (2011) araştırmasında ilköğretim matematik öğretmeni adaylarının rutin olmayan problemlere ne türden yanıtlar verdiklerini ve problemlerin çözümüne yönelik olarak yapmış oldukları yorumları irdelemiştir. Araştırmanın sonucunda öğretmen adaylarının genellikle rutin olmayan problemlere gerçekçi olmayan yanıtlar verdikleri gözlemlenmiştir.

Yukarıda sınırlı sayıda ki çalışmalardan da görüldüğü gibi öğretmenlerin ve öğretmen adaylarının rutin olmayan problemlerin çözüm süreçlerine ilişkin sorunlar yaşadıkları; bu kapsamda rutin problemleri ve gerçekçi olmayan mekanik yaklaşımları daha çok tercih ettikleri açıkça görülmektedir. Bu olgudan yola çıkarak bu çalışmanın amacı öğretmenlerin rutin olmayan problemlerin çözümünde kullandıkları stratejileri irdelemektir. Bu genel amaç doğrultusunda aşağıdaki sorulara yanıt aranmıştır.

1) Matematik ve sınıf öğretmenlerinin rutin olmayan matematik problemlerini çözmede kullandıkları stratejiler nelerdir?
2) Matematik ve sınıf öğretmenlerinin rutin olmayan matematik problemlerinin uygulanabilirliği konusundaki görüşleri nelerdir?

YÖNTEM

Bu çalışma, öğretmenlerin rutin olmayan problemlerin çözümünde kullandıkları stratejileri belirlemek ve bunların uygulanma sürecine ilişkin görüşlerini ortaya koymak amacıyla yapılan nitel bir araştırmadır.

Çalışma Grubu

Araştırmanın çalışma grubunu 2013-2014 yılında Adana ili merkez ilçelerinde Milli Eğitim Bakanlığı'na bağlı ilkokul ve ortaokullarda görev yapan 27 öğretmen oluşturmuştur. Araştırmada probleme taraf olabilecek bireylerin çeşitliliğini maksimum derecede yansıtmak amacıyla, amaçlı örneklem yöntemlerinden maksimum çeşitlilik örneklemesi kullanılmıştır. Bu bağlamda cinsiyet, branş, mesleki kıdem değişkenleri göz önünde bulundurularak öğretmenlerle görüşmeler yapılmıştır. Görüşmeye katılan öğretmenlerin 15'i bayan ve 12'si erkektir. Branş olarak öğretmenlerin on altısı matematik, on biri ise sınıf öğretmenidir. Mezun olunan okul türü açısından öğretmenlerin yimi beşi eğitim fakültesi mezunu iken ikisi ise yüksek lisans mezunudur. Mesleki kıdem açısından ise, 0-5 yıl kıdeme sahip beş, 6-10 yıl kıdeme sahip dokuz, 11-15 yıl kıdeme sahip sekiz, 16-20 yıl kıdeme sahip beş öğretmenle görüşme yapılmıştır.

Veri Toplama Aracı

Veri toplama sürecinde öğretmenlerin rutin olmayan problemlerin çözümünde kullandıkları stratejileri belirlemeye yönelik olarak araştırmacı tarafından geliştirilen "Strateji Belirleme Testi (SBT)" kullanılmıştır.

Strateji Belirleme Testi (SBT) on problemi ve açık uçlu iki soruyu kapsamaktadır. SBT'inde yer alan problemler ilgili literatürden (Inoue, 2005; Verschaffel ve diğerleri, 1994; Xin ve diğerleri, 2007) yararlanılarak hazırlanılmıştır. Bunun yanında testte öğretmenlerin rutin olmayan problemlerin uygulanması konusundaki görüş ve önerilerini belirlemeye yönelik açık uçlu iki soru da yeralmaktadır. SBT'nin geçerliğini sınamak üzere, matematik eğitimi alanında iki uzman tarafından testin ölçmeyi hedeflediği davranışlar yönüyle, kapsam ve görünüş geçerliğine sahip olduğu belirlenmiştir. SBT'nin anlaşılabilirliğini ve uygulanabilirliğini test etmek amacıyla gönüllülük ilkesine bağlı kalarak üç matematik öğretmeni ile pilot uygulama yapılmış ve bu süreçte herhangi bir sorunla karşılaşılmamıştır.

Verilerin Analizi

Veriler, nitel araştırma tekniklerinden betimsel analiz ve içerik analizi ile yorumlanmıştır. Bu bağlamda, öncelikle rutin olmayan problemlerin analizi yapılırken, elde edilen veriler daha önce ilgili literatürde belirtilen (Altun, 2008; Verschaffel ve diğerleri, 1999; Tertemiz, Çelik ve Doğan, 2014) stratejilere göre kodlanmıştır. Ayrıca öğretmenlerin açık uçlu sorulara verdikleri yanıtlarda ise içerik analizi yöntemi uygulanmıştır. Bu süreçte toplanan veriler önce kavramsallaştırılmış, daha sonra belirlenen kavramlara göre alt başlıklar şeklinde belirlenmiş ve uygun tema ve kodlar oluşturulmuştur (Yıldırım ve Şimşek, 1999).

Araştırmanın güvenirliğini artırmak için SBT'den elde edilen veriler matematik eğitimi alanında bir uzman tarafından da analiz edilmiş ve iki kodlayıcı arasındaki uyuşma oranı .92 olarak hesaplanmıştır. Daha sonra kodlayıcı ve araştırmacı arasında görülen farklı ifadelerde fikir birliğine varılmıştır.

BULGULAR

Bu bölümde araştırmanın alt amacı doğrultusunda matematik ve sınıf öğretmenlerinin rutin olmayan problemlerin çözümünde kullandıkları stratejiler yer almaktadır. Bu konuda öğretmenlerin problemlerin çözüm aşamasında uyguladıkları stratejiler Tablo 1'de gösterilmiştir.

Tablo 1. Matematik ve Sınıf Öğretmenlerinin Branşlarına Göre Rutin Olmayan Problemlerin Çözüm Aşamasında Uyguladıkları Stratejilerin Frekans Dağılımı

	Şekil (Şema, Diyagram) Çizme		**Muhakeme Yapma**		**Tahmin-Kontrol**		**Problemi Basitleştirme**		**Bağıntı Kurma**		**Deneme Yanılma**		**Sistematik Liste Yapma**

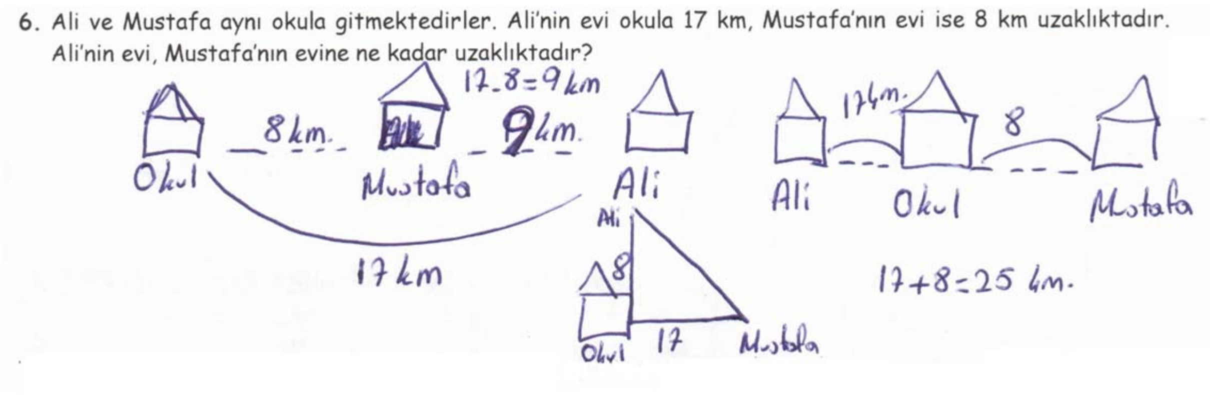
P10	-	-	4	5	-	-	-	4	2	-	-	-	12	10

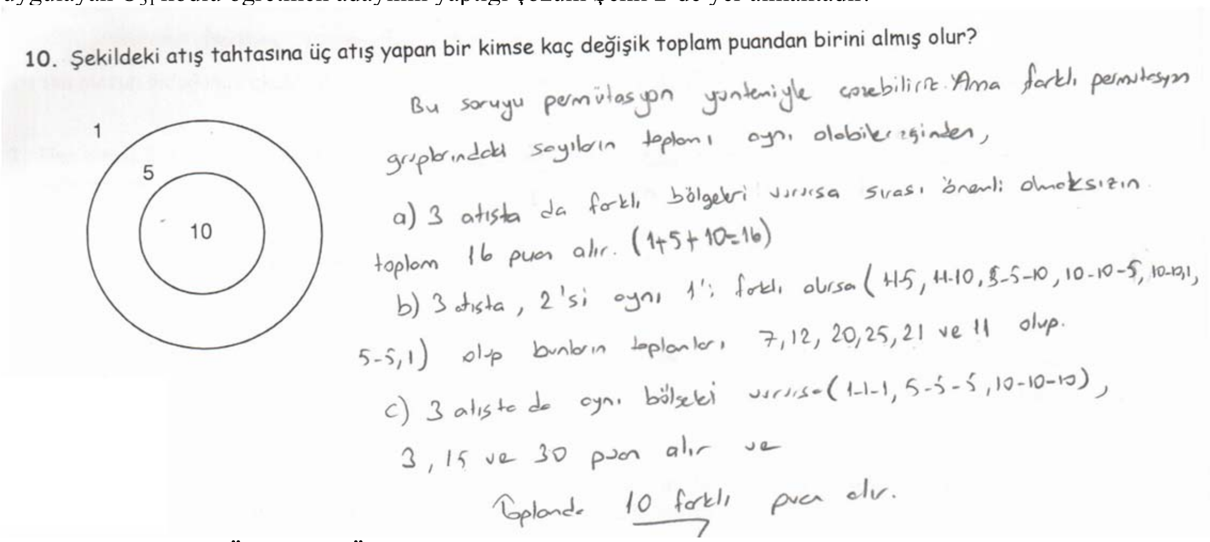
MÖ: Matematik Öğretmeni; SÖ: Sınıf Öğretmeni

Tablo 1 incelendiğinde hem matematik hem de sınıf öğretmenlerinin şekil çizme, muhakeme yapma ve problemi basitleştirme stratejilerini sıklıkla kullandıkları görülmektedir. Örneğin, $Ö_{19}$ kodlu öğretmenin 6. sorunun çözümünde kullandığı şekil çizme stratejisi Şekil 1'de yer almaktadır.



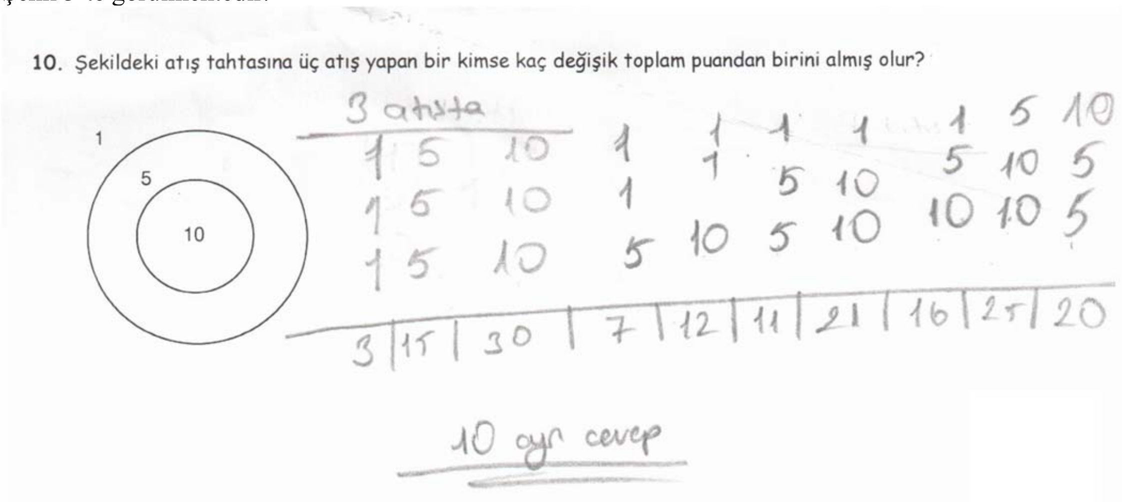
Şekil 1. Ö$_{19}$ Kodlu Öğretmenin 6. Soruda Kullandığı Şekil Çizme Stratejisi

Şekil 1'de okulun konumu net olarak verilmediğinden dolayı Ö19 kodlu öğretmenin her iki durumu da göz önüne alarak bir şekil çizme stratejisi uyguladığı görülmektedir. Diğer taraftan muhakeme yapma strajesini uygulayan Ö$_{31}$ kodlu öğretmen adayının yaptığı çözüm Şekil 2'de yer almaktadır.



Şekil 2. Ö$_{31}$ Kodlu Öğretmenin 10. Soruda Kullandığı Muhakeme Yapma Stratejisi

Şekil 2 incelendiğinde, Ö$_{31}$ kodlu öğretmenin üç atışın farklı bölgelere isabet etme durumunu, iki atışın aynı bölgeye isabet etme durumunu ve tüm atışların aynı bölgeye isabet etme durumunu göz önünde bulundurarak bir muhakeme yaptığı görülmektedir. Ayrıca sistematik liste yapma stratejisinin de aynı problemde uygulandığı Şekil 3'te görülmektedir.

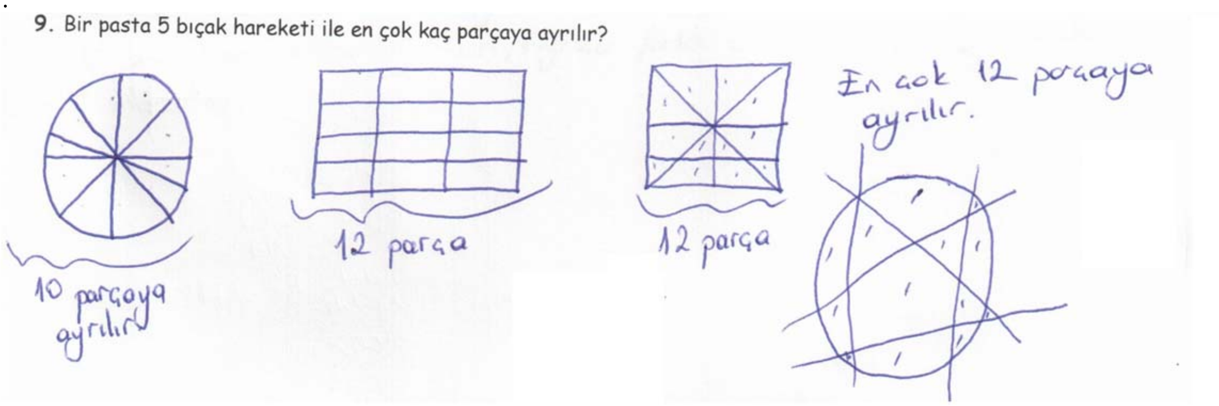


Şekil 3. Ö$_{20}$ Kodlu Öğretmenin 10. Soruda Uyguladığı Sistematik Liste Yapma Stratejisi

Şekil 3 incelendiğinde, $Ö_{20}$ kodlu öğretmenin 10. sorunun çözümünde sistematik olarak önce her üç atışın aynı bölgeye, sonra iki atışın aynı bölgeye ve son olarak da üç atışında farklı bölgelere isabet etmesi durumunu göz önüne alarak bu sorunun çözümüne ulaşılmıştır.

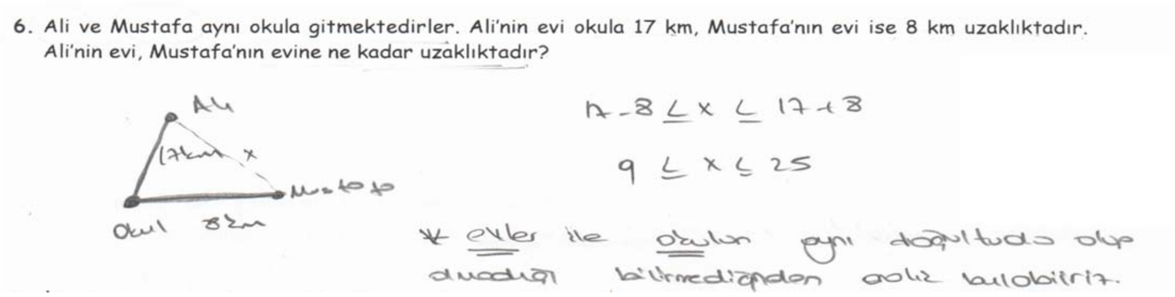
Ancak Tablo 1 incelendiğinde tüm öğretmenlerin tahmin kontrol, bağntı kurma ve deneme yanılma stratejilerini çok az kullanıldığı görülmektedir. Örneğin, $Ö_5$ kodlu öğretmenin 9. sorunun çözümünde kullandığı deneme yanılma stratejisi Şekil 4'de yer almaktadır.

.



Şekil 4. $Ö_5$ Kodlu Öğretmenin 9. Soruda Kullandığı Deneme Yanılma Stratejisi

Şekil 4 incelendiğinde, $Ö_5$ kodlu öğretmenin 9. sorunun çözümünde uyguladığı deneme yanılma stratejisinde pastanın yuvarlak, kare, dikdörtgen olma durumu ve farklı bıçak hareketlerini değerlendirerek çözüme ulaştığı görülmektedir. Bununla birlikte bağıntı kurma stratejisine ilişkin $Ö_{14}$ kodlu öğretmenin uyguladığı çözüm Şekil 5'te yer almaktadır.



Şekil 5. $Ö_{14}$ Kodlu Öğretmenin 6. Soruda Uyguladığı Bağıntı Kurma Stratejisi

Şekil 5'de okulun konumu net olarak verilmediğinden dolayı Ö14 kodlu öğretmenin sorunun çözüm aşamasında üçgen eşitsizliği bağıntısından yararlanıldığı görülmektedir..

Araştırmanın ikinci alt amacında matematik ve sınıf öğretmenlerinin rutin olmayan problemlerin sınıf içi uygulanabilme süreçlerine ilişkin görüşleri yer almaktadır. Araştırmaya katılan öğretmenlerin tamamı bu tür problemlerin sınıf içinde uygulanması gerektiğini belirtmiştir. Bu tür problemlerin uygulanabilirliği konusundaki görüşler Tablo 2'te gösterilmiştir.

Tablo 2. Rutin Olmayan Problemlerin Uygulanabilirliğine İlişkin Öğretmenlerin Görüşleri

Temalar	Kodlar	f
Öğrencilere Kazandırdıkları	Matematiği günlük yaşamla ilişkilendirebilme	11
	Üst düzey düşünebilme becerisi kazandırma	10
	Farklı bakış açısı kazandırma	8
	Düşünmeye yöneltme	8
	Matematiğe yönelik olumlu tutum geliştirme	4
	Konuyu daha iyi kavrama	2
Öneriler	Sınıf seviyesine göre düzenlenme yapabilme	3
	Bireysel özellikleri göz önünde bulundurma	

Tablo 2'de görüldüğü gibi, öğretmenlerinin yaklaşık üçte biri matematiğin günlük yaşamla ilişkilendirilebildiğini (11) ve öğrencilerin üst düzey düşünebilme becerilerini geliştirdirdiğini (10) belirtmiştir. Bu bağlamda, Ö23 kodlu öğretmen "*öğrencilere bu tür problemler öğretilmelidir. Öğrenci farklı düşünmesinin yanında karşısına gelecek diğer sorularda da yorum gücü artar….düşünme, problem çözme ve sorgulama becerisini geliştirir. Ayrıca sadece okuldaki ders için değil bence güncel hayatta da karşısına gelebilecek tarzda sorular olup zekasını da çalıştırır…*" şeklinde görüş belirterek öğrencilerin üst düzey düşünme becerilerine vurgu yapmıştır. Ayrıca öğretmenlerin dörtte biri rutin olmayan problemlerin farklı bakış açısı kazandırdığını ve öğrencileri düşünmeye yöneltiğini de belirtmişlerdir. Örneğin Ö16 kodlu öğretmen "*…elbette bu tür problemler öğrencileri düşünmeye, çabalamaya yönlendiriryor. ..üst düzey düşünme becerilerini geliştiriyor. Çözdükleri çeşitli yöntemler gereği, çizdikleri şekiller gereği bilgi düzeylerini, hazırbulunuşluk düzeylerini gözden geçiriyor. Sadece öğrenciler değil biz öğretmenler de ne öğrettiğimizi, nasıl öğretttiğimizi, harcadığımız emeğin ne derece işe yaradığını görmüş oluyoruz…" biçiminde görüşünü belirtmiştir.* Diğer taraftan öğretmenlerden çok azı ise matematiğe yönelik olumlu tutum geliştirdiğini (4) ve konuyu daha iyi kavradıklarını (2) belirtmişlerdir. Bu yönde Ö$_6$ kodlu öğretmen "*..bu tür günlük yaşamla ilişkilendiren problemler sayesinde çocuğun konuyu daha iyi algılaması sağlanır*" şeklinde görüş belirterek konunun daha iyi anlaşıldığını ifade etmektedir.

SONUÇ ve ÖNERİLER

Matematik ve sınıf öğretmenlerinin rutin olmayan problemlerin çözümünde kullandıkları stratejileri belirlemek ve bu problemlerin uygulanma sürecine ilişkin görüşlerini ortaya çıkarmak amacıyla yapılan araştırmanın sonucunda hem matematik hem de sınıf öğretmenlerinin sıklıkla şekil çizme, muhakeme yapma ve problemi basitleştirme stratejilerini kullandıkları görülmektedir. Ancak sınıf öğretmenlerinin tahmin kontrol, bağntı kurma ve deneme yanılma stratejilerini hemen hemen hiç kullanmadıkları araştırmadan açıkça görülmektedir. Öte yandan, öğretmenlerin tamamının rutin olmayan tarzdaki problemlerin sınıf içinde uygulanması konusunda olumlu görüşler bildirmeleri de yine araştırmadan elde edilen diğer önemli bir bulgudur. Bu bulgulardan yola çıkarak bu tür stratejilerin geliştirilmesine yönelik özellikle lisans düzeyinde eğitim verilmesi; ilköğretimden başlayarak matematik programlarında rutin olmayan problemlere daha fazla yer verilmesi önerilebilir.

EXPLORING THE RESULT OF THALES THEOREM AND ITS RELATIONSHIP TO OTHER SHAPES AMONG IRANIAN MATHEMATIC HIGH SCHOOL STUDENTS

Roghayeh AKHBARI

Zahra_akhbari@yahoo.com

Abstract:This paper sheds more lights on finding out a new methodology in teaching Thales theorem results and working with fractions in similarity to help students analyze Thales theorem and come up to some solutions with solving any problems related to the pieces of Cross Chords of Circle, Right Triangle and Right Trapezoid. In this regarding, I have come to a conclusion, from fourteen years of teaching experience in mathematics to Iranian high school students, that the best way could be starting from theorem statements to hypotheses as well as using properties of fractions. Therefore, in this study pre test-post test experimental design with control group was used and sample of the study was composed of 44 Iranian second graders at high school. It was concluded that meaningful differences in favor of experimental group and success in pre test-post test comparisons were obtained.

Keywords: Thales theorem results; fraction properties; similarity.

INTRODUCTION

Recently, there has been more emphasis upon teaching geometrical concepts and knowledge. The need has been increasing to establish a mathematics education in which students can relate the concepts to their own lives and to the other disciplines and which aims to have students acquire the basic skills and strategies at the high school(NCTM, 1991).One of the most important objectives of geometry education is to develop students' problem solving skills. These days in Iran most of the students have problem with Thales theorem concept especially in secondary school. In this study I will confine solving skills to just Thales theorem. In other words I am going to explore and find out how students deal with this problem and are able to find a better relationship between Thales theorem and other shapes in high school. The success of my Iranian students in geometry is going to be exploited in this paper. That is, this achievement highlights not only the academic achievements of the Iranian students but also their learning and teaching processes and methods.

Purpose of the study

In this research the aim was to examine the effect of a new teaching method supported by using geometry I book for Iranian high school student of the second grade. I have found this method useful for students especially in developing their attitudes, achievement and math intelligence.

METHOD

Design of the Experiment

In this study pre test-post test experimental design with control group was used to shed more lights on more reliable result. Therefore, this study is a quantitative one.

Sample of the Study

Research was carried out with students of second grade from two high schools in Mashhad. The participants were 44 second graders students in these schools. As you can see in table 1 the detailed information of the participants has been shown.

Table1. Participants Features

Variables		N
Group	1.	22
	2.	22
Age	16	
Gender	F	

TOTAL		44

Procedural Way and Data Gathering Instruments

The achievements tests as pre and post test were prepared considering the two units in the second grade for two groups of students from two different majors; mathematics and experiential science. Control and experimental groups were randomly selected in HefdahShahrivar and Professor Reza high schools in Mashhad. It is nice to add that the pre-test was used to select two homogeneous groups for this study. In the following table, you can see the reliability as well as some other statistical information regarding both pre-test and post-test for both groups.

Table 2. One-Sample Kolmogorov-Smirnov Test

		Pre-test (Science)	Post-test (Science)	Pre-test (Math)	Post-test (Math)
N		22	22	22	22
Normal Parameters	Mean	9.6818	10.8295	12.2955	16.4432
	Std. Deviation	4.50276	3.61658	5.00870	3.21634
Most Extreme Differences	Absolute	.161	.100	.102	.134
	Positive	.161	.075	.062	.134
	Negative	-.124	-.100	-.102	-.127
Kolmogorov- Smirnov Z		.757	.469	.481	.630
Asymp. Sig. (2-tailed)		.616	.980	.975	.822
a. Test distribution is Normal.					

The Cronbach's Alpha reliability for all variables was 0.81.

Result and Conclusion

To describe the statistical information, first we refer to the students of control group (Science major). As the following table describes, the mean score for this group was 9.68 for the pre-test that was increased to 10.82 in the post-test.

Table 3. Descriptive Statistics

	N	Minimum	Maximum	Mean	Std. Deviation
Pre-Test	22	.00	19.50	9.6818	4.50276
Post-Test	22	3.25	17.00	10.8295	3.61658
Valid N (list wise)	22				

In addition, based on the following figure, about 59 percents of students possessed median score.

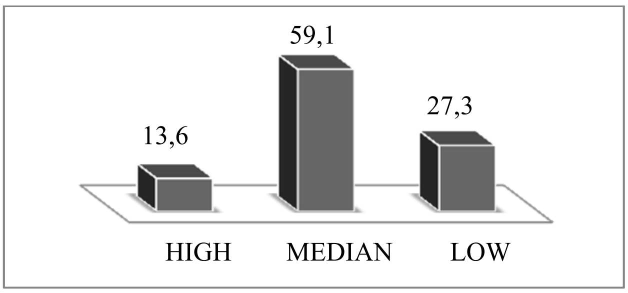

Figure1. Descriptive Statistics for Control Group (Pre-Test)

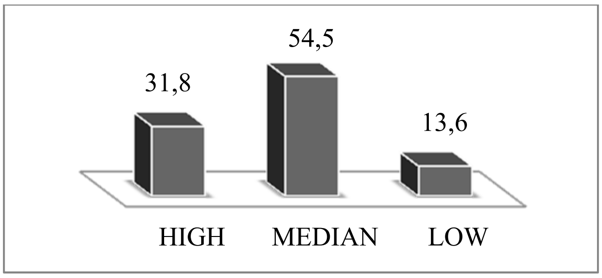

Figure2. Descriptive Statistics for Control Group (Post-Test)

After pair-t test, we could come to this conclusion that the mean score for this group was not significant

Table4. Paired Samples Test

		Paired Differences					t	df	Sig. (2-tailed)
		Mean	Std. Deviation	Std. Error Mean	95% Confidence Interval of the Difference				
					Lower	Upper			
Pair 1	Pre-post test	-1.14773	4.34704	.92679	-3.07510	.77964	-1.238	21	.229

Now, about the experimental group (Math major) the statistical information was elaborated in the following table.

Table5. Descriptive Statistics

	N	Minimum	Maximum	Mean	Std. Deviation
Pre-test	22	.00	20.00	12.2955	5.00870
Post-test	22	10.00	20.00	16.4432	3.21634
Valid N (list wise)	22				

The mean score for pre-test was 12.29 increased to 16.44 after taking the post-test.
Moreover, based on the figure came bellow, 54.5 percents of the students owned median score and 63.6 percents possessed high score.

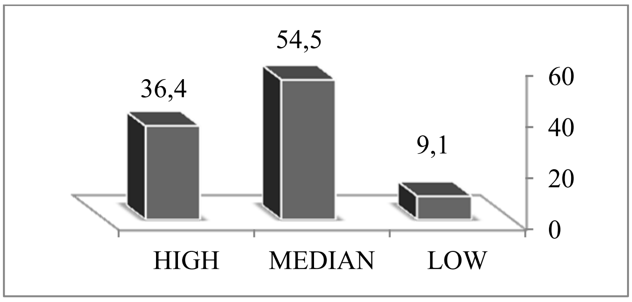

Figure3. Descriptive Statistics (Pre-Test)

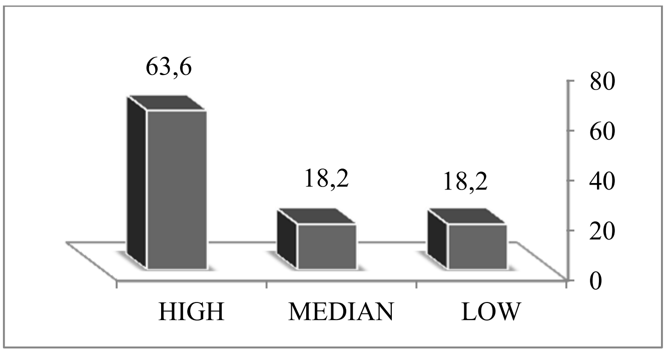

Figure4. Descriptive Statistics (Post-Test)

After pair-t test, we could come to this conclusion that the mean score for this group was significant. P-value=0.02

Comparison of the Two Groups

Table6. Independent Samples Test

		Levene's Test for Equality of Variances		t-test for Equality of Means						
		F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
									Lower	Upper
VAR00001	Equal variances assumed	.760	.388	-1.820	42	.076	-2.61364	1.43594	-5.51147	.28420
	Equal variances not assumed			-1.820	41.533	.076	-2.61364	1.43594	-5.51244	.28516

Comparing these two groups together (control and experimental groups) lead us to this conclusion that for pre-test the difference was not significant. However, after post-test the mean scores of the students of the experimental group were considerably increased.

Table7.Pre-Test

	VAR00002	N	Mean	Std. Deviation	Std. Error Mean
VAR00001	Science	22	9.6818	4.50276	.95999
	Math	22	12.2955	5.00870	1.06786

Table8. Post-Test

VAR00002	N	Mean	Std. Deviation	Std. Error Mean
Science	22	10.8295	3.61658	.77106
Math	22	16.4432	3.21634	.68573

In sum, I found this new method useful for the high school students and highly recommended to the teachers.

S0LVING A GEOMETRICAL EXERCISE FROM FOUR PERSPECTIVE

Roghayeh AKHBARI

Zahra_akhbari@yahoo.com

Abstract: This paper sheds more lights on finding four different ways for solving a geometrical exercise which refers to any Right trapezoid having two diagonal which are vertical and its altitude is geometry average between two bases of Right trapezoid. It is nice to mention that I have come up to these four solutions from fourteen years of teaching experience in mathematics and geometry to Iranian high school students. The first way is dividing the surface of two right triangles that exist in Right trapezoid. The three other ways can be analyzed by considering the different triangles in the trapezoid. The three other ways can be analyzed by considering the different triangles in the trapezoid. That is to say, we can change these similar triangles by considering three pairs of them. Finally this study puts more focus on this conclusion that teaching students these four different ways for solving such an exercise will provide more opportunities to have better digestion.

Keywords: Geometrical average; similarity; fraction properties; right triangle surface.

INTRODUCTION

Teaching geometry for the 21 ST century

In recent years geometry seems to have been lost large parts of its former central position in mathematics teaching in most countries. However, new trends have begun to counteract this tendency. There is an increasing awareness that geometry plays a key role in mathematics and learning mathematics. Although geometry has been eclipsed in the mathematics curriculum, research in geometry has blossomed as new ideas have arisen from inside mathematics and other disciplines, including computer science. Due to reassessment of the role of geometry, mathematics educators and mathematicians face new challenges (ICME, 1994).

Learning Teaching and teaching geometry

Teaching and learning geometry may seem just as difficult for teachers as it is for students. Geometry instruction begins as early as kindergarten, which may make it easier to teach this subject, because the lessons begin very simply. These lessons are added to gradually throughout the elementary years until geometry becomes a full-blown high school course. Take one concept at a time and use some of the tips found here to make geometry more comprehensive for teachers and their students (NCTM, 1987).

METHOD

In this study solving a special problem is explained which refers to any Right trapezoid having two diagonal which are vertical and its altitude is geometry average between two bases of Right trapezoid. For more clarification, an example has been mentioned in the appendix. The following solutions are based on the example.

First Way

The first way is dividing the surface of two right triangles that exist in Right trapezoid. Calculating the area *T* of a triangle is an elementary problem encountered often in many different situations. The best known and simplest

$$T = \frac{1}{2}bh$$

Where *b* is the length of the base of the triangle, and *h* is the height or altitude of the triangle. The term "base" denotes any side, and "height" denotes the length of a perpendicular from the vertex opposite the side onto the line containing the side itself (Geometry I, 2014).

The first solution refers to dividing the surface of two right triangles that exist in Right trapezoid. As it can be clearly seen in the example, we have two right triangles which named ABC and ADC. If we divide their surfaces and use similarity, we will come to the statement.

Second Way

As it's known ABD triangle is similar to ADC, therefore, as the second solution, after writing similarity's ratio and multiplying two of them to each other the statement will be proved.(Fraction properties is used).

Third Way

For the next solution, we use the transitivity between similar triangles and mix it with fraction properties .Moreover; we use a new triangle which is named ODC which is similar to ABD, so we can reach to our statement. (For more elaboration refer to Appendix).

Fourth Way

There is a well-known theorem to which the sum of interior angles of every triangle is equal to 180 degree. For the forth solution we use its properties for proving that the similarity between ABD triangle and ADC triangle. Based on this solution, these two triangles are similar to each other which is different from the three others. Consequently, multiplying the similar fractions lead us to the statement. (To get the example you can refer to the appendix).

CONCLUSION

In sum, I have come up with these methods to this conclusion that they can be used in geometry classes in order to help the students to get better understanding and better conception over this type of exercises.

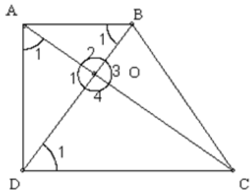
Third Way



$$\left.\begin{array}{r}\widehat{O}_1 = \widehat{D} = 90 \\ \widehat{A}_1 = \widehat{A}_1(\text{common})\end{array}\right\} \Rightarrow \overset{\Delta}{ADC} \sim \overset{\Delta}{AOD} *$$

$$* \Rightarrow \frac{AD}{AC} = \frac{AO}{AD} = \frac{OD}{DC} \Rightarrow AD^2 = AC.AO **$$

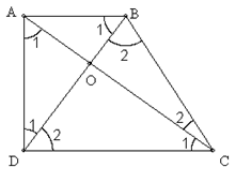
$$\left.\begin{array}{r}\text{First Way} \Rightarrow \overset{\Delta}{ABD} \sim \overset{\Delta}{ADC} \\ ** \Rightarrow \overset{\Delta}{ADC} \sim \overset{\Delta}{AOD}\end{array}\right\} \Rightarrow \overset{\Delta}{ABD} \sim \overset{\Delta}{AOD} \Rightarrow \frac{BD}{AD} = \frac{AD}{OD} = \frac{AB}{AO} \Rightarrow AD^2 = BD.OD ***$$

$$** \ \& \ *** \Rightarrow BD.OD = AO.AC$$

$$\left.\begin{array}{r}AB \parallel DC, BD(\text{diagonal or oblique}) \Rightarrow \widehat{B}_1 = \widehat{D}_1 \\ \widehat{A} = \widehat{O}_4 = 90\end{array}\right\} \Rightarrow \overset{\Delta}{ABD} \sim \overset{\Delta}{ODC} \Rightarrow \frac{BD}{DC} = \frac{AB}{OD} = \frac{AD}{OC} \Rightarrow BD.OD = AB.DC ****$$

$$*** \ \& \ **** \Rightarrow AD^2 = AB.DC$$

Fourth Way



$$\left.\begin{array}{r}\widehat{A} = \widehat{D} = 90 \\ \widehat{B}_1 + \widehat{D}_1 = \widehat{A}_1 + \widehat{D}_1 = 90 \Rightarrow \widehat{B}_1 = \widehat{A}_1\end{array}\right\} \Rightarrow \overset{\Delta}{ABD} \sim \overset{\Delta}{ADC} \Rightarrow \frac{AD}{DC} = \frac{AB}{AD} = \frac{BD}{AC} \Rightarrow AD^2 = AB.DC$$

A SOFTWARE SIMULATION FOR MULTI-CHANNELS WDM BY HYBRID EDFA/RA SYSTEM

Essa Ibrahim ESSA
Department Computer Science, College of Computer Sc. and Math., Tikrit University, Salah AL-Deen, Iraq.
E-mail: essaibrahimessa@yahoo.com

ABSTRACT: In this paper we provide a software simulation to enhancement performance system using hybrid Erbium doped fiber amplifier EDFA/RA, by the way Raman amplifiers (RA) provides a continuous amplification along the fiber. The (8 × 10Gb/s) wavelength division multiplexing (WDM) system show successful transmitter work at (1552.52, 1551.72, 1550.92, 1550.12, 1549.32, 1548.51, 1547.72, 1546.92nm) all input channels have the same power with (-6.6666dBm) these signal are amplified through EDFA and RA of (20km), two pump laser used with wavelength and power is (1450nm, and 800nm, 980nm, and 100mw) respectively. The total output signal is (29.3643dBm), total output noise is (-13.5326dBm), and output optical-signal-to-noise ratio (OSNR) is (0dB). The average maximum Q-factor for all 8-channels is (4.7962), and the average of minimum BER is $3*10^{-7}$. This mean the optical network is exploiting for high speed network communication with low error rate, and the major contribution is the development of the multi-destination communication over the lightwave WDM system. The system is simulated, tested, and verified using OptiSystem Software Package.

Key words- EDFA, RA, pump laser, WDM, OSNR, and BER.

INTRODUCTION

The Stimulated Raman scattering (SRS) nonlinearities with optical fiber provide an optical amplification process. To development of transparent optical amplifier the erbium doped fiber amplifier (EDFA) technology are adopted the amplification modules are placed after 40-50km of link, this due to initial power and attenuated signal after propagate it in fiber, Raman effect is a scattering effect of light. Light scattering occurs as a consequence of fluctuations in optical properties of a medium. There are three types of scattering: (Rayleigh, Brillouin, and Raman scattering) (Agrawal G. P. (2002)).

The main features of the Raman amplifier (RA) is continuous amplification along the fiber, bidirectional in nature are offers more stability, intensitivity to reflections (Aoki Y. et al. (1988)). The use of RA allows the confinement of the signal inside the limits imposed by the signal-to-noise-ratio (SNR) degradation as a result from higher link distances this is an advantage of the distributed Raman over lumped amplification (André P.S. & et. al. (2007) & Emori Y. & et al. (2002)). As the traffic increases, wavelength division multiplexing (WDM) technology arises to expand transmission capacity, in turn, requires flexible and broadband architectures with enforcement the interest in RA (ITU-T G.694.1. (2002)).

To amplify an optical signal with a conventional repeater, one performs photon to electron conversion, electrical amplification, retiming, pulse reshaping, and then electron to photon conversion. These processes are work well in single wavelength systems, but at high speed optical network can adopted all-optical amplifiers such as EDFA, and RA to overcome conversion from electrical-to-optical and vice-versa (Wasfi M. (2009)).

Whereas an EDFA requires a specially constructed optical fiber for its operation, the input powers to EDFA vary as slowly as their gain relaxation time in WDM networks because wavelength channels which pass through the EDFA can change as a result of network configurations or any other partial failure (Ellis A. D. & et.al. (1994)). To implement RA using optical fiber as gain medium requires that the pump and information signals must be injected into the same fiber. A basic scheme for RA architecture is illustrated in Figure 1.

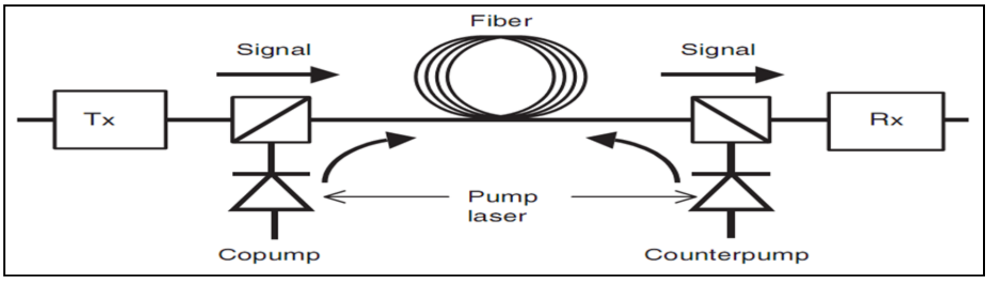


Figure 1: Optical Communication System Employing Raman Amplification.

In general approach the power evolution of pumps signals and amplified spontaneous emission (ASE) in forward and backward directions with time along the fiber distance is given by the following set of equations (Agrawal G. P. (1995) & Karasek M. & et.al. (2004)):

$$\frac{dP_s}{dz} = g_R\, P_p - \alpha_s P_s \ldots (1)$$

and

$$\mp \frac{dP_p}{d_z} = -\frac{\omega_p}{\omega_s}\, g_R\, P_p\, P_s - \alpha_p P_p \ldots (2)$$

Where $g_R\ (W^{-1}m^{-1})$ is the Raman gain coefficient of the fiber α_s and α_p are the attenuation coefficient at signal and pump wavelength respectively, ω_s and ω_p are the angular frequencies of the signal and pump, P_s and P_p are signal power and pump power.
By integration Eq. 1 to obtain Eq. 3

$$P_s(L) = G(L)P_{s(0)} \ldots (3)$$

Where $G(L)$ is the signal gain, L is the amplifier length.
The relation between on-off Raman gain and the Raman gain efficiency is given as (Agrawal G. P. (1995)):

$$G_A = \frac{P_s\,(L)\text{with pump on}}{P_s\,(L)\text{with pump off}} \ldots (4)$$

The noise figure can be calculated as:

$$\text{NF (dB)}=10\log\left(\frac{S_{in}/S_{in}}{S_{out}/N_{out}}\right) \ldots (5)$$

Amplifier spacing has opposite effects on noise generated due to the fiber nonlinearities effects SRS, four wave mixing (FWM), and the ASE noise introduced by in-line optical amplifications. Decreasing in the amplifier spacing the SRS and FWM effects increase, while the ASE noise reduces (Mohammed A. A. & et. al. (2009) & Kaur G. & et. al. (2009)).

Based on the nature of Raman physics it has many advantages: (i): Raman gain exist in every fiber that is mean existing link can be upgrade even though they are already installed, (ii): gain is available over the fiber ranging from 0.3 to 2 microns, and (iii): RA is that the gain spectrum can be tailored by adjusting the pump wavelengths, multiple pump can be use to increase the optical bandwidth (Islam M. N. (2004), Seo H. S. & et. al. (2004) &. Headley C. & Agrawal G. P. (2005)). The major contribution of this work is to development the multi-destination communication over the lightwave WDM system by hybrid EDFA/RA. Section II illustrate the simulation model, section III present some results and general discussion, and finally, section IV demonstrate some conclusions and suggested possible for future works.

SIMULATION MODEL

The system simulation consists of three main parts: (i) optical transmitter, (ii) optical transmission link, and (iii) optical receiver. In the following subsections we demonstrate them in details. Our simulation are designed, tested, and verified using OptiSystem software package it is Canadian corporation license product (Optisystem. (2007)).

The first component of transmitter is the WDM transmitter with 8-channels with frequencies of (193.1THz, to 193.8THz), frequency spacing is 100GHz, power is -6.6666dBm, and modulation format is NRZ, all channels are multiplexed by 8×1 equal spacing multiplexer with frequency of 193.1THz, frequency spacing is 100GHz, and bandwidth is 10GHz, then the output signal from multiplexer are entered into the transmission link to post-amplified as booster by EDFA with gain of 10dB, and noise figure is 6dB, after amplification process the optical signal lunched into the Raman amplifier (RA) the main properties of it are length with 20km, attenuation is 0.2dB/km, effective interaction area is $55\mu m^2$, Raman gain peak is 9.5×10^{-14} , Raman gain reference pump is 1000nm, temperature is 300k, polarization factor is 2, Rayleigh back scattering is $5 \times 10^{-5}\ {}^{1}/_{km}$, upper pump reference is 1500nm, noise center frequency is 1540nm, noise bandwidth is 80nm, noise bins spacing is 4nm, noise threshold is -100dB, and noise dynamic is 3dB, the backward pump laser with frequency of 1450nm, and power is 800nm, also the signal after RA are pre-amplified to aim to place a large signal at the receiver by EDFA with gain of 10dB, and noise figure is 6dB, the power combiner 2×1 used to combine two signal (origin, and pump laser signal with frequency of 980nm, and power is 100mw), after round trip signal are entered into the WDM equal spacing demultiplexer of 1×8 with frequency of 193.1THz, frequency spacing is 100GHz, and bandwidth is 10GHz. After demultiplexing process each signal are separate on its port, and filtered by Bessel optical filter with frequency of 193.1THz, bandwidth is 10GHz, insertion loss is 0dB, depth is 100dB, and order of 1, then at the receiver side are detected by optical receiver with positive intrinsic diode (PIN), and filtered by low pass filter with depth of 100dB, order is 4, add-signal-noise, add ASE noise, add shot noise, add thermal noise, and thermal noise is 1×10^{-22} , and finally each signal are monitored by bit error rate (BER) analyzer to calculate Q-factor, and minimum BER. The bit rate of this simulation is 10Gb/s, sequence length is 128bits, sample per bit is 64, and number of samples is 8192. The schematic diagram for the hybrid EDFA/RA simulation is shown in Figure 2.

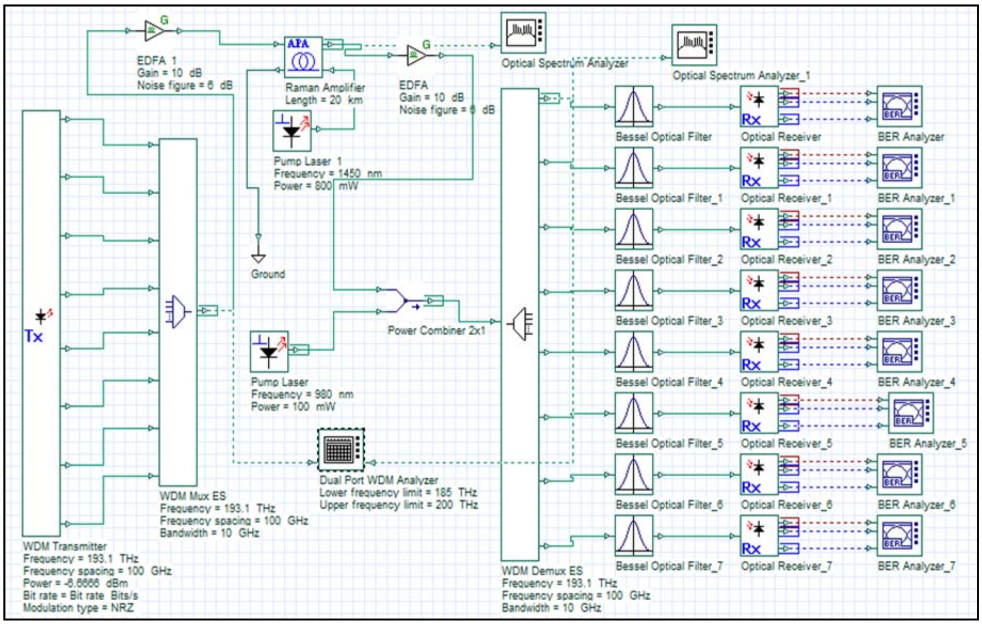

Figure 2: The Schematic Diagram For Hybrid EDFA/RA System.

RESULTS AND GENERAL DISCUSSION

The numerical data (set of controlling parameters) of our system model are employed to obtain the performance of multi-pumped, Raman amplifiers, and EDFA in WDM optical networks as to improve the OSNR, and reduce the nonlinear effects in transmission system. Through Fig. “3” to Fig. “14” will be demonstrating some results of this work:

1) Fig. “3”: show all input signal spectrum before launched into the transmission link.
2) Fig. “4”: illustrate all signals after RA, red color (signal), and green (noise).
3) Fig. “5”: show Raman gain versus frequency, the high peak appear between 10THz and 20THz.
4) Fig. “6”: demonstrate output signal (193.1THz) after demultiplexer, there are some noise added by amplifiers.
5) Fig. “7”: gain (dB) versus wavelength iteration for all channels (gain increase when wavelength increases).
6) Fig. “8”: show noise figure (NF) (dBm) versus wavelength for all signals (NF decrease when wavelength increase).
7) Fig. “9”: demonstrate power (dBm) versus wavelength iteration (power increase when wavelength increases).
8) Fig. “10”: output channels power versus wavelength, there is some degradation in power this is due to nonlinearities problem.
9) Fig. “11”: show Q-factor for output channel_1 (193.1THz) from BER analyzer.
10) Fig. “12”: show the minimum BER for the output channel_1 from BER analyzer.
11) Fig. “13”: show Q-factor for output channel_8 (193.8THz) from BER analyzer.
12) Fig. “14”: show the minimum BER for the output channel_8 from BER analyzer.

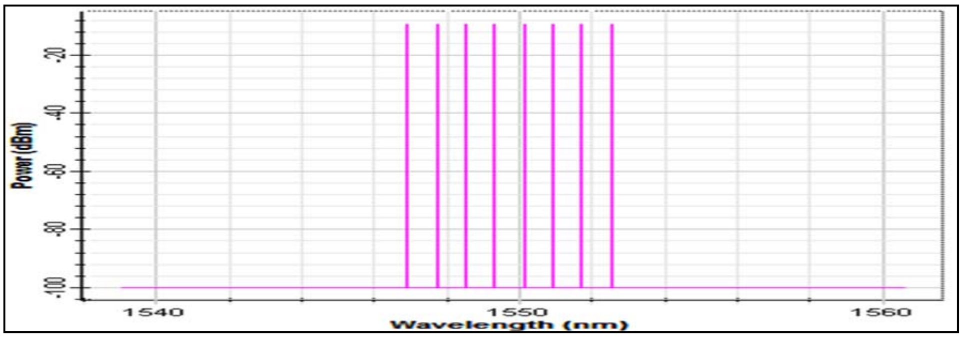

Figure 3: Input Spectrum Signal Iteration.

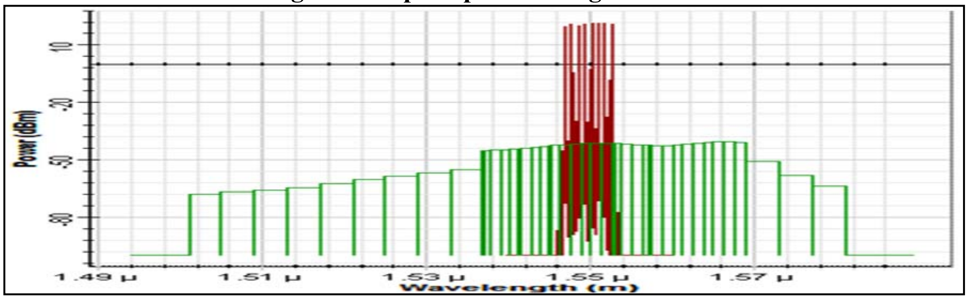

Figure 4: All Signals After RA From OSA.

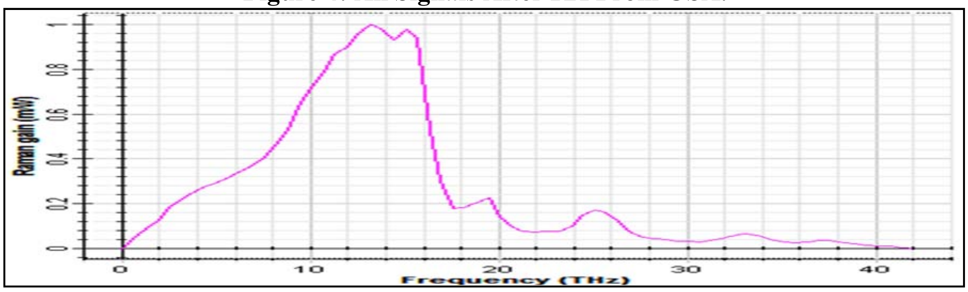

Figure 5: Raman Gain Versus Frequency.

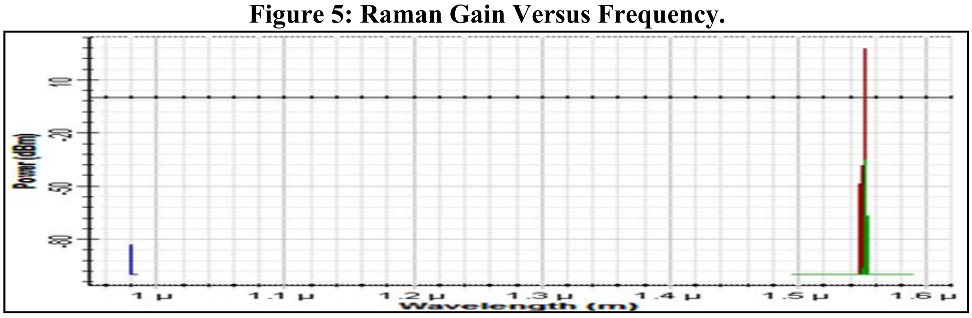

Figure 6: Output Signal (193.1THz) After Demultiplexer From OSA_1.

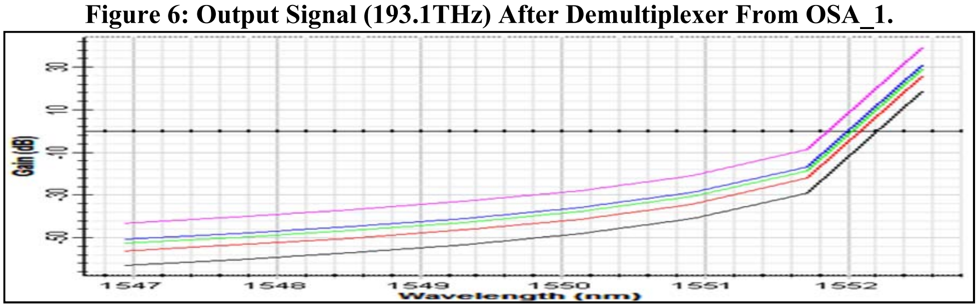

Figure 7: Gain Versus Wavelength Iteration

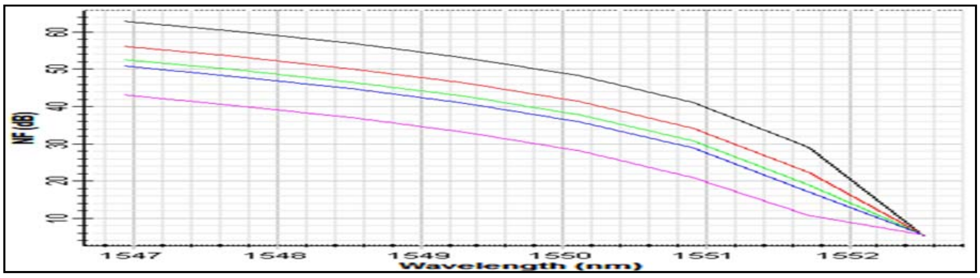

Figure 8: Noise Figure Versus Wavelength Iteration.

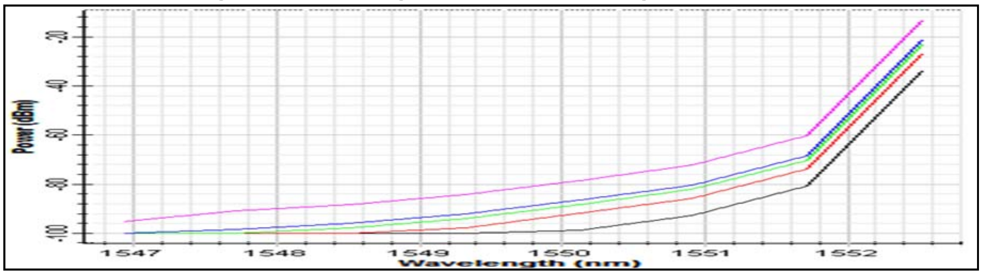

Figure 9: Output Noise Spectrum Iteration

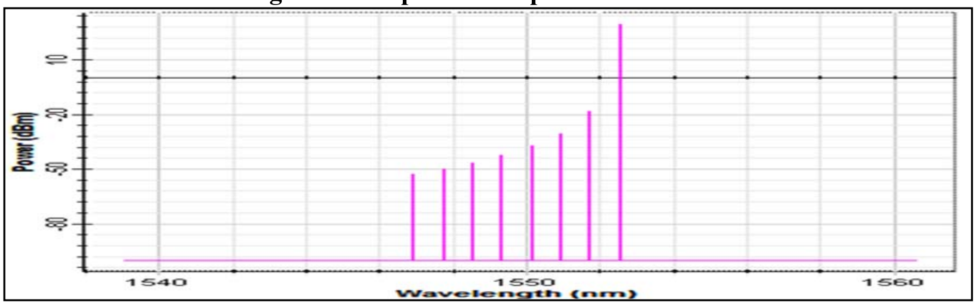

Figure 10: Output Signal Spectrum Iteration.

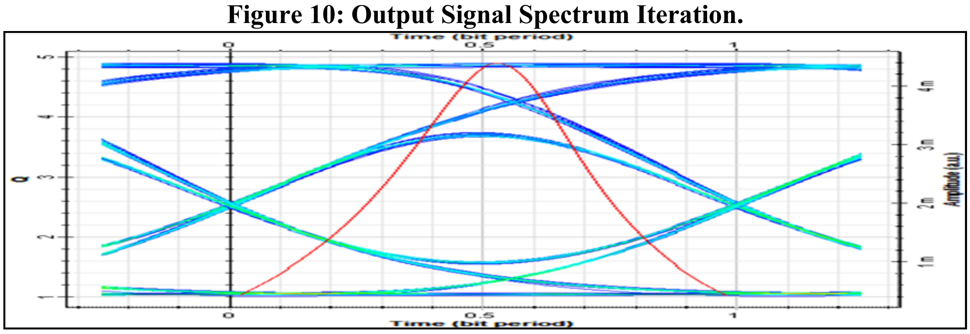

Figure 11: Q-Factor For The Output Channel_1 (193.1THz) From BER Analyzer.

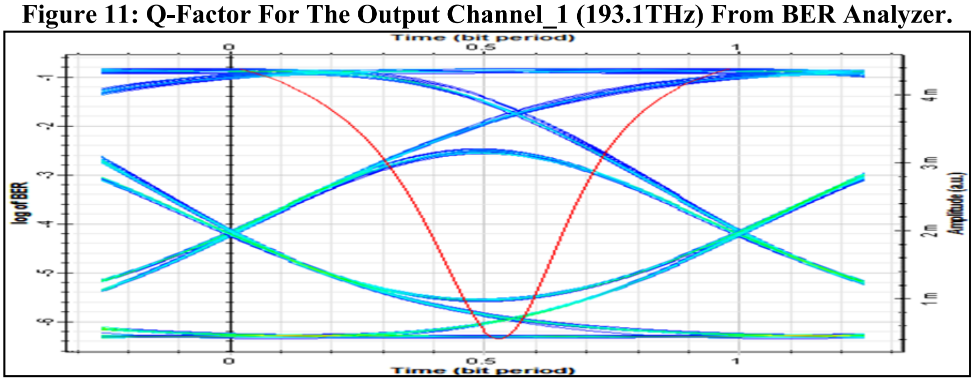

Figure 12: Minimum BER For The Output Channel_1 (193.1THz) From BER Analyzer.

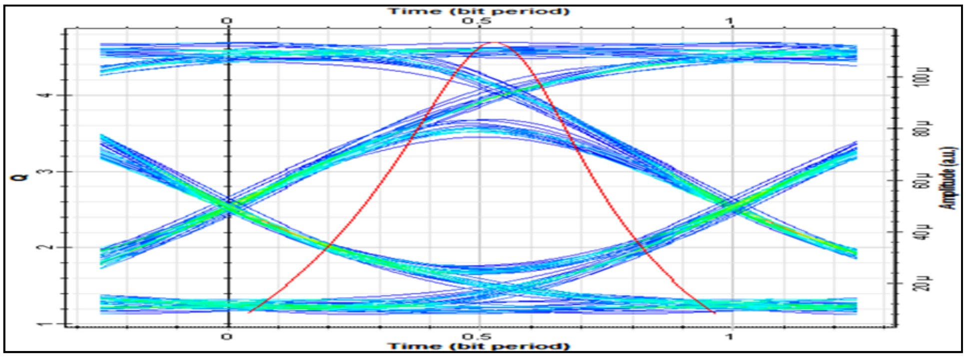

Figure 13: Q-Factor For The Output Channel_8 (193.8THz) From BER Analyzer_7.

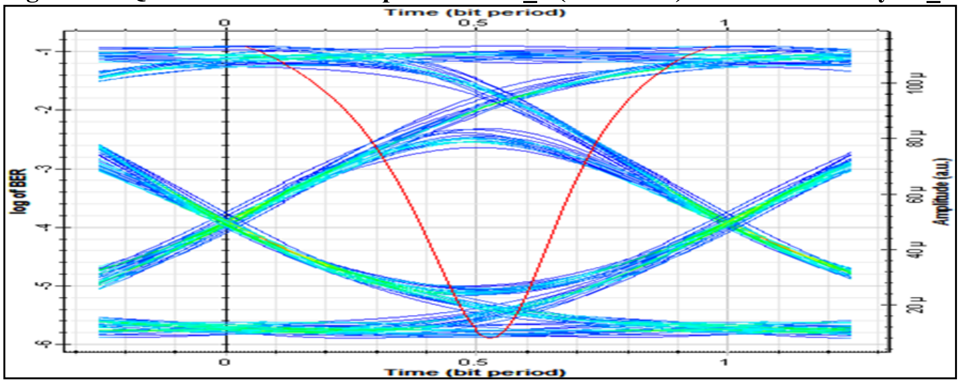

Figure 14: Minimum BER For The Output Channel_8 (193.8THz) From BER Analyzer_7.

From the dual port WDM analyzer the total output signal is 29.3643dBm, and ratio Max/Min is 82.101, the total output noise is -13.5326dBm, and ratio Max/Min is 81.7984 and the total output OSNR is 0dB, and the ratio Max/Min is 81.7984.

CONCLUSION

Through this paper there are simulated systems of 8×10Gb/s WDM transmission over 20km of RA with EDFA. The main benefit of this work is to use hybrid amplification process over WDM optical communication network. To reduce the fiber nonlinearities the NRZ format was adopted. The gain of multi-pumped RA in WDM is affected by two important parameters (wavelength, and power). The EDFA/RA improves the OSNR this lead to maximum bit rate or capacity over optical network. The average maximum Q-factor for all 8-channels is 4.7962, and the average of minimum BER is 3×10^{-7} . No architecture changes were needs for the existing infrastructure. Also, can be modified this work to involve network reconfiguration by add optical add-drop multiplexer (OADM), or discrete RA.

ÖZET: Bu çalışmanın amacı öğretmen adaylarının matematik tarihinin matematik eğitiminde kullanılmasına yönelik tutum ve inanışlarını belirlemek ve cinsiyet, sınıf ve mezun olunan lise türü değişkenleri açısından tutum ve inanç ortalama puanlarını incelemektir. Bu amaçla 2013-2014 eğitim öğretim yılı güz döneminde Dokuz Eylül Üniversitesi Eğitim Fakültesi İlköğretim Matematik Öğretmenliği programında okuyan toplam 208 öğretmen adayı ile betimsel bir çalışma yürütülmüştür. Çalışmada veriler Alpaslan (2011)' e ait "Matematik Tarihinin Matematik Eğitiminde Kullanılmasına yönelik Tutum ve İnanışlar Anketi" ile elde edilmiştir. Bulgularda matematik öğretmen adaylarının tutum ve inanç ortalama puanlarının yüksek olduğu tespit edilmiştir. Matematik öğretmen adaylarının tutum ve inanç ortalama puanlarının cinsiyete göre farklılık göstermediği ancak sınıf düzeyleri açısından ortalama puanlarda anlamlı bir farkın olduğu anlaşılmıştır. Matematik öğretmen adaylarının matematik tarihinin matematik eğitiminde kullanılmasına yönelik tutum ve inançları başka değişkenler açısından da incelenebilir ve olumsuz tutum geliştiren adayların bu tutumlarının altında yatan nedenler araştırılabilir.

Anahtar sözcükler: matematik tarihi, tutum ve inanç, matematik öğretmen adayı, matematik eğitimi

ABSTRACT: The aim of this descriptive study is to assess the prospective mathematics teachers' attitudes and beliefs towards using mathematics history in mathematics education and to search possible effect of gender, type of the high school graduated from and grade of prospective teachers on the average scores of attitudes and beliefs test. To gain information, we implemented a questionnaire to 208 prospective teachers from Dokuz Eylül University in first semester of 2013-2014 education year. We used ''Attitudes and Beliefs towards Use of History of Mathematics in Mathematics Education Questionnaire'' as data collection instrument. This questionnaire belongs to Alpaslan (2011). Findings tell us that scores were high and there were no difference created by gender. On the contrary, level of the year - grade- made a significant difference on average scores. The prospective mathematics teachers' attitudes and beliefs could be examined with other variables and it could be searched why some prospective teachers have negative viewpoint.

Key words: mathematics history, attitudes and beliefs, prospective mathematics teacher, mathematics education

GİRİŞ

Matematik dersi bir çok öğrenci tarafından zor, anlaşılmaz, nerden geldiğini anlamadığı pek çok terimle dolu ve kendisine sıkıntı veren bir ders olarak görülmektedir. Pek çok öğrenci matematik dersini okulu bitirince kurtulacağı bir sorun olarak görmekte, ancak bazı öğrenciler de matematik dersini sevebilmektedir(Sertöz, 2002). Buradan çıkarılabileceği üzere matematiği sevmeyen öğrencilerin olduğu aşikardır. Ortaokullar matematik öğretim programının genel amaçlarından biri de matematiğe karşı olumlu tutumlar geliştirmiş ve matematik alanında özgüvenli bireyler yetiştirmektir(MEB-2013).

Matematik dersine motive etmek, problem çözme becerilerini geliştirmek ve matematiksel kavramların anlaşılabilirliğini artırmak kaliteli bir matematik eğitimin amaçları arasında yer alır. Bu amaçlar arasında yer alan matematiğe karşı motivasyonu arttırmak için somut materyallerden, oyunlardan faydalanılabilir ve matematiksel kavramların tarihi gelişiminden ve tarihi kişiliklerden bahsedilebilir (Yenilmez, 2011).

Tarih ile matematik birbirinden ayrı çalışma alanları gibi gözükebilir. Ancak, matematik öğreniminde geçmişteki uygulamaları öğrenmek matematik alanındaki çalışmalara ilham kaynağı olmaktadır. Teoremleri ortaya atan bilim insanlarının, teoremlerin bulunuş hikayelerinin, o tarihteki yaşam biçimi ve geçmişteki insanların matematikle olan etkileşimlerinin öğrenilmesi matematik alanında çalışanlar için motivasyon kaynağı olmaktadır. Yine matematik tarihi eğitimi, matematik dersine yönelik farklı bir bakış açısı sağlamakta, farklı öğretim tekniklerine esin kaynağı olmaktadır. Matematik tarihi, kullanımı derslerde göz ardı edilebilen kütüphane çalışmalarının ve planlı yazma alışkanlıklarının destekleyicisi olmaktadır [Fauvel, Keynes & van Maanen (2000); Gürsoy (2010); Furinghetti (2000)].

Bidwell (1993)' e göre matematik tarihini öğrencilerle tanıştırmak, öğrencileri matematik adasından kurtarıp insanları duygularla dolu, canlı ve ilginç bir hayatın olduğu matematik ana karasına çıkartmak gibidir. Matematik tarihi, matematiği insancıllaştırır (Bidwell, 1993). Yani matematik, soyut kavramlar bütünü olmaktan çıkarak bir insan aktivitesi olarak karşımıza çıkmış olur.

Matematik tarihinin matematik eğitiminde kullanılmasına yönelik çalışmalar oldukça eskilere dayanmaktadır. Yeni bir yöntem yada çalışma alanı olarak 1960 larda düşünüldüğünde bile henüz duyulmamış bir kavram yada alan değildir (Fried, 2001).

Ülkemizde de matematik tarihinin matematik eğitiminde kullanılmasına yönelik araştırma ve çalışmalar mevcuttur. Alpaslan (2011) yüksek lisans tez çalışmasında ilköğretim matematik öğretmen adaylarının matematik tarihi bilgileri ve matematik tarihinin matematik eğitiminde kullanılmasına yönelik tutum ve inanışlarını incelemiştir. Matematik tarihinin matematik eğitiminde kullanılmasına yönelik tutum ve inançlarda, ilköğretim matematik programı eğitim sürecinde geçirilen süre arttıkça olumlu yönde artış gözlenmiştir (Alpaslan, 2011). Yenilmez (2011), çalışmasında matematik öğretmen adaylarının matematik tarihi dersine ilişkin düşüncelerini araştırmıştır.

''Matematik öğretmeni adaylarının matematik tarihi dersine ilişkin düşünceleri' başlıklı çalışmasında Yenilmez (2011), *"Bir ilköğretim matematik öğretmeni adayı olarak Matematik Tarihi dersini almış olmak size ne kazandırdı?"* sorusunu sormuş ve *''Bir matematikçi olarak matematik konularının tarihini ve gelişimini bilmek çok önemlidir. Matematiğin gelişim aşamalarını adım adım anlama imkanımız oldu." , "Matematik tarihini öğrenmek, matematiğe olan ilgimi artırdı."* , *"Bilim adamlarının bizlerden çok farklı olmadıkları ve her şeyin çalışarak elde edilebileceğini gördüm. En önemlisi de bir matematikçinin içinde merak ve içgüdü olmalı."* gibi cevaplar alınmıştır. Bunun yanında *"Dersin seçmeli olması daha iyi olurdu." , "Buluşlar, keşifler ilginçti ancak dersin sözel oluşu biraz sıkıcı."* gibi cevaplar da gelmiştir. Ancak çalışma incelendiğinde öğretmen adaylarının matematik tarihi dersine karşı çoğunlukla olumlu tutum gösterdikleri anlaşılır (Yenilmez, 2011).

Ancak Fried (2001) e göre matematik tarihini matematik eğitimiyle bütünleştirmek sanıldığı kadar kolay ve sorunsuz bir süreç değildir. Müfredatını genişletmek istemeyen öğretmenler, mühendislik ve bilimsel çalışmalar için daha ön planda olan uygulamalı matematiği ön plana çıkarma zorunluluğu hissetme ve zaman yetersizliği sadece pratikte karşılaşılacak problemler olmakla birlikte, matematik tarihi ile matematik eğitimini bütünleştirmenin teorik anlamda da yaşattığı bir ikilem vardır (Fried, 2001). Ancak Fried bu makalesinde bahsettiği bu problemleri matematik tarihinin matematik eğitiminde kullanılmasının önüne set çekmek için yazmadığını belirtmiştir. Fakat matematik tarihini matematik eğitimine entegre etmek isteyenlerin dikkatini bu sorunlara çekmeyi amaçlamıştır (Fried, 2001).

İlköğretim matematik kitaplarında matematik tarihindeki önemli kişilere ait kısa bilgilere ve eski matematikçilere ait portre ve fotoğraflara yer verilmektedir. Yine bazı konuların öğretiminde matematik tarihi ile ilişkili keşfetirmeye yönelik etkinlikler kullanılmaktadır. Matematik derslerinde matematik tarihinden yararlanmak öğrenci motivasyonunu olumlu yönde etkileyebilir. Örneğin Pisagor Bağıntısı öğretilirken Pisagor' a ait bir kaç ilginç bilgi yada o dönemden biraz bahsetmek öğrencilerin ilgisini çekebilir. Bu bağlamda program, matematik derslerinde matematik tarihini kullanmayı tavsiye etmektedir (MEB, 2013) .

Matematik tarihi ortaokul matematik öğretim programlarında yer alabildiği gibi (MEB-2013), üniversite dersleri arasında 2005 ten itibaren genel kültür dersi olarak yer almaya başlamıştır (Yenilmez, 2011). Yine matematik tarihinin kullanımına matematik eğitimi araştırmalarında da rastlanmaktadır. ‘ Sonsuzluk kavramına ilişkin tarihi problemler ve paradokslar: Apos analizleri 1-2’ başlıklı çalışmalarında Dubinsky, Weller, McDonald ve Brown (2005), Aristo (M.Ö 384-322) nun ikilemi, Zenon Paradoksu, Bolzano (1741-1848) nun sonsuzluk algısı ve eklenebilecek pek çok tarihi içerikten, problem, kavram yada kişiden yararlanmışlardır. Bu da matematik tarihinin matematik eğitiminde üst düzeylerde de, genelleyecek olursak her düzeyde karşımıza çıktığına yönelik bir örnektir.

Bu çalışmanın da amacı literatürde karşımıza çıkan matematik tarihi ve matematik eğitimi çalışmalarının doğrultusunda, ilköğretim matematik öğretmen adaylarının matematik tarihinin matematik eğitiminde kullanılmasına yönelik inanç ve tutumlarını; cinsiyet, sınıf düzeyi, mezun olunan lise türü, daha önce matematik tarihinden bahsedilme, matematiksel yayınları takip sıklığı değişkenleri ile incelemektir.

1.1Araştırma Problemi:

İlköğretim matematik öğretmen adaylarının matematik tarihinin matematik eğitiminde kullanılmasına yönelik tutum ve inanışları bazı değişkenlere göre değişmekte midir?

1.2 Alt problemler :

1) Matematik öğretmen adaylarının matematik tarihinin matematik eğitiminde kullanılmasına yönelik tutum ve inanışları ne düzeydedir?

2) Matematik öğretmen adaylarının matematik eğitiminde matematik tarihinin kullanılmasına yönelik tutum ve inançlar ortalama puanları cinsiyete göre farklılık göstermekte midir?

3) Matematik öğretmen adaylarının, matematik eğitiminde matematik tarihinin kullanılmasına yönelik tutum ve inançlar ortalama puanları, öğretmen adaylarının mezun oldukları lise türüne göre farklılık göstermekte midir?

4) Matematik öğretmen adaylarının, matematik eğitiminde matematik tarihinin kullanılmasına yönelik tutum ve inançlar ortalama puanları sınıf düzeylerine göre faklılık göstermekte midir?

5) Matematik öğretmen adaylarının, matematik eğitiminde matematik tarihinin kullanılmasına yönelik tutum ve inançları ile matematik tarihi içerikli yayınları takip etme sıklığı arasında ne tür bir ilişki vardır?

YÖNTEM

Bu çalışmada ilköğretim matematik öğretmen adaylarının matematik tarihinin matematik eğitiminde kullanılmasına yönelik tutum ve inançları incelenmeye çalışılmış ve betimsel tarama modeli kullanılmıştır.

2.1 Evren ve Örneklem

Bu araştırmanın evrenini, İlköğretim Matematik Öğretmenliğinde okuyan öğrenciler oluşturmaktadır. Örneklemi ise bu üniversitenin belirtilen anabilim dallarında iki, üç ve dördüncü sınıflarında öğrenim gören toplam 208 öğretmen adayı oluşturmuştur. Araştırmada öğretmen adaylarının matematik tarihinin matematik eğitiminde kullanılmasına yönelik tutum ve inançları, mezun oldukları lise türü, sınıf düzeyleri ve cinsiyetlerine göre karşılaştırılmıştır. Ayrıca matematik öğretmen adaylarının matematik tarihi içerikli yayınları takip etme sıklığı ile matematik tarihinin matematik eğitiminde kullanılmasına yönelik tutum ve inanışları arasındaki ilişki incelenmiştir. Bu bağlamda örnekleme ait sınıf, cinsiyet, okul türü, matematik tarihinden daha önce bahsedilmiş olması ve yayın takip sıklığı değişkenleri hakkındaki bilgiler Tablo 1’de sunulmuştur.

Tablo 1’ deki verilere göre örneklem cinsiyet değişkenine göre incelendiğinde kızların sayısının erkeklerin sayısından oldukça yüksek olduğu görülür. Sınıf değişkeni ele alındığında çoğunluğun üçüncü sınıfta olduğu anlaşılmaktadır. Mezun olunan lise türleri değişkeni incelendiğinde ise büyük çoğunluğu anadolu lisesi ve anadolu öğretmen lisesi mezunu öğretmen adayları oluştrmaktadır. Matematik tarihi içerikli yayın takibi sıklığına ise öğretmen adaylarının çoğunluğu bazen cevabını vermiştir.

Tablo 9: Öğretmen adaylarının tanımlayıcı değişkenlere göre dağılımı

Değişkenler	Özellik	N	%
	Erkek	54	26,47
Cinsiyet	Kız	154	73,53
	2 inci	45	21,6
Sınıf	3 üncü	90	43,3
	4 üncü	73	35,1
	Anadolu Öğrt. Lisesi	97	46,6
	Anadolu Lisesi	91	43,8
Okul Türü	Genel Lise	17	8,2
	Diğer	3	1.4
Mat. Tarihinden Bahsedilmiş Olma	Bahsedilmedi	110	52,9
	Bahsedildi	98	47,1
	Hiç Bir Zaman	62	29,8
	Bazen	135	64,9
Yayın Takip Sıklığı	Çoğunlukla	9	4,3
	Daima	2	1

2.2 Veri Toplama Aracı

Bu çalışmada veri toplama aracı olarak Alpaslan (2011) tarafından geliştirilen ‘‘Matematik Tarihinin Matematik Eğitiminde Kullanılmasına yönelik Tutum ve İnanışlar Anketi’’ kullanılmıştır. Ölçek, 5 li likert tipi olup ‘1’ ‘kesinlikle katılmıyorum’ ‘5’ ‘kesinlikle katılıyorum’ olacak şekilde 1 den 5 e doğru puanlanmıştır. Ölçek 35 maddeden oluşmaktadır. 35 maddenin 13 ü olumsuz maddeler olup bu maddeler değerlendirilirken puanlar dönüştürülmüştür. Bu bağlamda ölçekten alınabilecek en yüksek puan 175 iken en düşük puan da 35 tir. Alpaslan (2011) çalışmasında Cronbach alfa iç tutarlılık güvenirlik katsayısını .93 olarak hesaplamıştır. Bu çalışmadaki örnekleme dayanarak ölçek için Cronbach alfa iç tutarlılık güvenirlik katsayısı .94 olarak bulunmuştur.

2.3 Veri Analizi

Çalışmanın verileri incelenmeden önce eksik verili ölçekler, çalışmadan çıkartılmıştır. Cinsiyet değişkeni ile matematik tarihinin matematik eğitiminde kullanılmasına yönelik tutum ve inançlar arasındaki ilişki incelenirken bağımsız gruplar için t-testi kullanılmıştır. Öğretmen adaylarının tutum ve inançlarındaki, mezun olunan lise türü ve sınıf düzeyleri arasındaki farklılığı ortaya koymak için tek yönlü varyans analizi (ANOVA) kullanılmıştır. Yine matematik yayın takip sıklığı ile tutum ve inançlar arsındaki ilişkiyi incelemek için basit korelasyon Pearson Korelasyon katsayısı kullanılmıştır.

BULGULAR

Bu bölümde Dokuz Eylül Üniversitesi İlköğretim Matematik öğretmenliği anabilim dalında öğrenim görmekte olan öğretmen adaylarına uygulanan matematik tarihinin matematik eğitiminde kullanılmasına yönelik tutum ve inanışlar anketinden elde edilen bilgilerin istatistiksel analizi yapılmış ve sunulmuştur.

Araştırmanın birinci alt probleminde “Matematik öğretmen adaylarının matematik tarihinin matematik eğitiminde kullanılmasına yönelik tutum ve inanışları ne düzeydedir?’’ sorusuna yanıt aranmıştır. Matematik öğretmen adaylarının matematik tarihinin matematik eğitiminde kullanılmasına yönelik tutum ve inanışları ortalama puanlarına ilişkin bulgular Tablo 2’de sunulmaktadır.

Tablo 2: Öğretmen adaylarının tutum ve inanış düzeylerine ait bulgular

	N	Min.	Max.	$\overline{X}$	ss	Skewness	Kurtosis

						Stat.	SE	Stat	SE
Tutum ve İnanışlar Anketi Sonuçları	208	1.77	4.89	3.70	.52	-.81	.17	1.88	.34

Tablo 2' deki sonuçlarda matematik öğretmen adaylarının tutum ve inanç puan ortlamaları .52 standart sapma değeri ile 5 üzerinden 3.70 olarak bulunmuştur. Çarpıklık katsayısı -.81, basıklık katsayısı ise 1.88 olarak bulunmuştur. Bu değerlere göre ortalama puanların normal dağılım gösterdiği söylenebilir.

Araştırmanın ikinci alt probleminde ''Matematik öğretmen adaylarının matematik eğitiminde matematik tarihinin kullanılmasına yönelik tutum ve inançlar ortalama puanları cinsiyete göre farklılık göstermekte midir?'' sorusuna yanıt aranmıştır. Cinsiyete göre tutum ve inanç puanlarında farklılık olup olmadığına bakmak üzere bağımsız örneklemler için t testi kullanılmıştır. Sonuçlar Tablo 3' te gösterilmektedir.

Tablo 3: Öğretmen adaylarının cinsiyetlerine göre tutum ve inanç ortalama puanlarına ilişkin t testi sonucu

Cinsiyet	N	$\overline{X}$	ss	t	p
Erkek	54	3.57	.67	-1.87	0.65
Kız	154	3.76	.46		

Tablo 3' te görüldüğü üzere öğretmen adaylarının cinsiyete göre tutum ve inanç ortalama puanlarında kızların tutum ve inaçları puan ortalaması .19 puan daha yüksek bulunmuştur. Ancak bu fark istatistiksel olarak anlamlı bulunmamaktadır ($t= -1.87$; $p >0,05$).

Araştırmanın üçüncü alt probleminde ''Matematik öğretmen adaylarının, matematik eğitiminde matematik tarihinin kullanılmasına yönelik tutum ve inançlar ortalama puanları, öğretmen adaylarının mezun oldukları lise türüne göre farklılık göstermekte midir?'' sorusuna cevap aranmış ve istatistiksel inceleme için tek yönlü varyans analizi yapılmıştır. Anova analizinde ilk olarak grupların varyanslarının eşitliği levene testi ile test edilmiştir. Levene testi 1.08 sonucuna göre $p= .36$ ($p>0.05$) olduğundan grupların varyansları eşittir. Anova testine ilişkin bulgular Tablo 4'da verilmektedir.

Tablo 4: Öğretmen adaylarının mezun oldukları lise türüne göre tutum ve inançları ortalama puanlarına ilişkin anova testi sonucu

Varyansın Kaynağı	Kareler Toplamı	sd	Kareler Ortalaması	F	P
Gruplararası	.495	3	.165	.592	.621
Gruplariçi	56.839	204	.279		
Toplam	57.334	7			

Tablo 4' ten görüldüğü üzere öğretmen adaylarının mezun oldukları lise türlerine göre matematik tarihinin matematik eğitiminde kullanılmasına yönelik tutum ve inançları ortalama puanları arasında bir fark yoktur ($F= .592$; $p>.5$).

Araştırmanın dördüncü alt probleminde ''Matematik öğretmen adaylarının, matematik eğitiminde matematik tarihinin kullanılmasına yönelik tutum ve inançlar ortalama puanları sınıf düzeylerine göre faklılık göstermekte midir?'' sorusuna cevap aranmıştır. Matematik öğretmen adaylarının öğrenim gördükleri sınıfa göre tutum ve inançlar ortalama puanları arasındaki farkı belirleyebilmek için tek yönlü varyans analizi yapılmştır. Anova analizinde ilk olarak grupların varyanslarının eşitliği levene testi ile test edilmiştir. Levene testi .687 sonucuna göre $p=.504$ ($p>0.05$) olduğundan grupların varyansları eşittir. Anova testine ilişkin bulgular Tablo 5' te verilmektedir.

Tablo 5'te görüldüğü üzere öğretmen adaylarının öğrenim gördükleri sınıfa göre matematik tarihinin matematik eğitiminde kullanılmasına yönelik tutum ve inançlar ortalama puanları arasında anlamlı bir farka rastlanmıştır($F=3.173$; $p *<.05$). Bu farkın nereden kaynakladığını tespit etmek için LSD çoklu karşılaştırma testi kullanılmış, 2 ve 4 üncü sınıfların ortalama puanları arasında 4 üncü sınıflar lehine anlamlı bir fark olduğu görülmüştür.

Tablo 5: Öğretmen Adaylarının Öğrenim Gördükleri Sınıfa Göre Tutum Ve İnançları Ortalama Puanlarına İlişkin Anova Testi Sonucu

Varyansın Kaynağı	Kareler Toplamı	sd	Kareler Ortalaması	F	P	Anlamlı Fark
Gruplararası	1.721	2	.861	3.173	.044*	2-4 sınıflar
Grupláriçi	55.612	205	.271			
Toplam	57.334	207				

Araştırmanın beşinci alt probleminde ise ''Matematik öğretmen adaylarının, matematik eğitiminde matematik tarihinin kullanılmasına yönelik tutum ve inançları ile matematik tarihi içerikli yayınları takip etme sıklığı arasında ne tür bir ilişki vardır?'' sorusuna cevap aranmıştır. Matematik öğretmen adaylarının matematik tarihi içerikli yayın takip etme sıklığı ile tutum ve inanç puanları arasındaki ilişki düzeyi ve yönünü belirlemek için basit korelasyon Pearson Korelasyon katsayısı kullanılmıştır. Matematik tarihi içerikli yayın takip etme sıklığı ve tutum ve inanç ortalama puanları arasındaki ilişkiye ait bulgular Tablo 6' da gösterilmiştir.

Tablo 6: Öğretmen Adaylarının Matematik Tarihi İçerikli Yayın Takip Etme Sıklığı İle Tutum Ve İnanç Ortalama Puanları Arasındaki Korelasyon Testine İlişkin Sonuçlar

Değişkenler	N	$\overline{X}$	ss	r	p
Yayın takip sıklığı	208	1.76	.57	.274	.00*
Tutum ve inanç ortalama puanları	208	3.70	.53		

Tablo 6 incelendiğinde matematik öğretmen adaylarının matematik tarihi içerikli yayınları takip etme sıklığı ile matematik tarihinin matematik eğitiminde kullanılmasına yönelik tutum ve inançlar ortalama puanları arasında pozitif yönde düşük düzeyde bir ilişki var olduğu çıkarılabilir (r= .274; p*<.01). Determinasyon katsayısı (r^2= .08) dikkate alındığında toplam varyansın %8' nin matematik yayın takip sıklığından kaynaklandığı söylenebilir (Büyüköztürk, 2013).

SONUÇ

Bu araştırma matematik öğretmen adaylarının matematik tarihinin matematik eğitiminde kullanılmasına yönelik tutum ve inanç düzeylerini belirlemek ve tutum ve inanç düzeylerinin cinsiyet, sınıf, mezun olunan lise türü değişkenlerine göre farklılaşmasını incelemek amacıyla yapılmıştır. Ayrıca öğretmen adaylarının matematik tarihi içerikli yayınları takip sıklığı ile matematik tarihinin matematik eğitiminde kullanılmasına yönelik tutum ve inanç ortalama puanları arasındaki ilişki incelenmiş ve düşük düzeyde pozitif bir ilişkiye rastlanmıştır. Öğretmen adaylarının tutum ve inanç ortalama puanlarının düzeyine ilişkin istatiksel incelemeler sonucunda öğretmen adaylarının ortalama puanlarının yüsek düzeyde olduğu gözlemlenmiştir. Buna göre öğretmen adaylarınının matematik tarihinin matematik etğitiminde kullanılmasına yönelik tutum ve inanışlarının olumlu olduğu söylenebilir. Bu sonuçlar Alpaslan (2011) ve Gürsoy (2010) çalışmaları ile uyum göstermektedir. Cinsiyet değişkenine göre inanç ve tutum ortalama puanları arasındaki fark incelendiğinde; öğretmen adaylarının tutum ve inanç ortalama puanlarının cinsiyete göre anlamlı bir farklılık göstermediği ortaya çıkmıştır. Bu sonuç, Alpaslan (2011) ait çalışmada kızların tutum ve inanç ortlama puanlarının daha yüsek olduğu bulgusuyla çelişki içindedir. Bu çelişki örneklem farklılığına bağlanabilir. Öğretmen adaylarının tutum ve inanç ortalama puanları sınıf değişkenine göre incelendiğinde ikinci ve dördüncü sınıftaki öğretmen adaylarının ortalama puanları arasında farklılığa rastlanmıştır. Dördüncü sınıf öğretmen adaylarının tutum ve inanç ortalama puanlarının daha yüksek olduğu tespit edilmiştir. Bu bulgular Alpaslan (2011) ait çalışmadaki bulgularla örtüşmektedir. Tutum ve inanç ortalama puanlarındaki artış sebebinin üniversite ders programlarında yer alan üçücü sınıftaki Bilim Tarihi ve dördüncü sınıftaki Matematik Tarihi derslerinden kaynaklandığı tahmin edilmektedir(Alpaslan, 2011). Yine benzer sebeplerle matematik tarihinden bahsedilmiş öğretmen adayı sayısında sınıf düzeylerindeki ilerlemeye göre artış görülmektedir. Öğretmen adaylarının mezun oldukları lise türüne göre tutum ve inançlar ortalama puanlarında anlamlı bir farklılığa rastlanmamıştır.

ÖNERİLER

Öğretmen adaylarının matematik tarihinin matematik eğitiminde kullanılmasına yönelik tutum ve inançları başka değişkenler kullanılarak da incelenebilir. Matematik tarihine ve matematik eğitiminde kullanılmasına yönelik olumsuz tutum geliştiren adayların bu yönde tutum geliştirmelerinin altında yatan nedenler araştırılabilir. Bunun yanı sıra veri toplama teknikleri görüşme formları kullanılarak zenginleştirilebilir ve sonuçlar desteklenebilir.

Matematik tarihini matematik eğitiminde kullanabilmek için matematik tarihi bilgisine sahip olmanın gerekliliği bilinmektedir. Bu konuda Alpaslan (2011)' in öğretmen adaylarının tutum ve inanç puanları ile matematik tarihi bilgileri arasındaki ilişkiyi incelediği çalışması mevcuttur. Bu çerçevede üniversite ders programlarında bu konuya ilişkin derslerin yer alıp almadığına ve dersin işleniş yöntemlerine yönelik araştırmalar ve bu yöntemlerin sonucunda gelişecek tutumlara yönelik araştırmalar planlanabilir.

Matematik tarihini matematik derslerinde kullanmak üzere etkinlikler tasarlanabilir ve bu etkinliklerin uygulanmasının sonuçları incelenebilir. Bu anlamda matematik tarihinin derslerde kullanılabilmesine yönelik materyal sayısında da artış sağlanmış olur.

MESLEK YÜKSEKOKULLARINDA ÖĞRENCİLERİN MATEMATİK BAŞARI SIRASI İLE GENEL BAŞARI SIRALAMASININ İNCELENMESİ

THE EXAMINATION OF THE MATHEMATICS RANKINGS WITH THE OVERALL SUCCESS RANKINGS OF THE STUDENTS IN VOCATIONAL SCHOOLS

Şeyda İLDAN
Selçuk Üniversitesi
seydaildan@selcuk.edu.tr

ÖZET: Tüm dünyada ve ülkemizde yetişmiş ara eleman gücüne ihtiyaç artmaktadır. Ara eleman gücünü ve yetişmiş kalifiye eleman açığını karşılayacak en iyi kurumlar meslek yüksekokullarıdır.

İleri teknolojinin kullanıldığı sanayide, görev yapan kalifiye elemanların fiziki becerilerinin yerini zihinsel becerileri almakta, iş gücünde yeterliliğin çeşitlendiği bilgi-işlem kullanımının vazgeçilmez nitelikler arasına girdiği görülmektedir. Bu nedenle de meslek yüksekokulları kapsamındaki sosyal ve teknik alanlarda matematik dersinin önemi artmıştır. Meslek yüksekokullarındaki matematik derslerinin temel amacı, öğrencilere analitik düşünme ve doğru karar verebilme yeteneğini kazandırmanın yanı sıra matematiksel düşünme yoluyla zihinsel esnekliğe sahip olmalarını sağlamaktır.

Bu çalışmada yetmiş bilgisayar programcılığı öğrencisinin matematik dersi dönem sonu başarı sırası ile dönem sonu genel not ortalamasını sıralanmıştır ve toplanan verilere “ Spearman Brown Sıra Farkları Korelasyon Katsayısı” kullanılarak analiz edilmiştir.

Sonuçlara göre, öğrencileri matematik dersi başarı sırası ile genel not ortalaması başarı sırası arasında bir ilişki gözlenmiştir.

Buna göre, matematik dersinde başarılı öğrencilerin, genel olarak tüm derslerde de başarılı olduğu söylenebilmektedir.

Anahtar sözcükler: meslek yüksekokulları, matematik, Spearman Brown Sıra Farkları Korelasyon Katsayısı

ABSTRACT: Need for qualified intermediate staff has been increased in our country and all over the world. The best institutions to fulfill the need of qualified intermediate staff are vocational schools.

In industry which high technology is used in, the physical abilities of qualified staff are replaced with their mental abilities, and use of information technologies which vary the need in labor is now an indispensable qualification. Therefore, vocational schools whose aim is to make students acquire the ability of analytical thinking and giving the right decision and also to make the students have the ability of mental elasticity through mathematical thinking.

I’ve listed the success of the seventy vocational school students who are training on Computer Technologies by having the base of the semester grade about the level achievement of General Mathematics and final success status by GPA. I’ve applied ″ Spearman Brown Rank Correlation Test ″ for the data which had been collected by me.

According to the results obtained a compromise between the overall success of mathematics rankings and the success of the overall grade point average of all courses.

Accordingly, it has been considered that the students who have high increase at mathematical success have high increase success at the overall performance for all courses.

Key words: vocational schools, mathematic, Spearman Brown Rank Correlation Test.

GİRİŞ

(Turanlı, Türkler ve Keçeli, 2008) Matematik aslında evrensel ve soyut bir iletişim aracıdır. Tüm bilimlerin ortak dili matematiktir. Galileo “Bilim gözlerimiz önünde açık duran ‘evren’ dediğimiz o görkemli kitapta yazılıdır. Ancak yazdığı dili ve alfabesini öğrenmeden bu kitabı okuyamayız. Bu dil matematiktir, bu dil olmadan kitabın bir tek sözcüğünü anlamaya olanak yoktur” demiştir.

Günümüzde bu gerçek değişmedi, hatta ileri teknolojinin kullanıldığı sanayide görev yapan kalifiye elemanların fiziki becerisinin yerini zihinsel becerileri almakta, iş gücünde yeterliliğin çeşitlendiği bilgi-işlem kullanımının vazgeçilmez nitelikler arasına girdiği görülmektedir. Bu nedenle meslek yüksekokulları kapsamında programların birçoğunda matematik dersi zorunlu hale gelmiştir. Burada matematik dersinin temel amacı; öğrencilere analitik düşünme ve doğru karar verebilme yeteneğini kazandırmanın yanı sıra matematiksel düşünme yoluyla zihinsel esnekliğe sahip olmalarını sağlamaktır. Ancak meslek yüksekokulu öğrencilerinin genel olarak matematik ve matematik tabanlı dersleri anlamakta, kavramakta ve işlem yapmakta yetersiz oldukları bilinmektedir.

(Kaya, Özdemir, Utkun, 2013) Bu kadar önemli olan ve insanların geleceğine yön veren bu ders, öğrencilerin çoğu tarafından sevilmemekte hatta sıkıcı ve anlaşılmaz bulunmaktadır. Bu şekilde anlaşılmasının en önemli sebeplerinin başında da öğrencilerin dersle ilgili duymuş olduğu kaygılar gelmektedir. Dersin anlaşılmasının diğer derslere göre daha zor olması, öğrencilerin dersi anlamak ve öğrenmekten ziyade dersi ezberlemek ve geçmek için çalışmaları başarısızlığı etkileyen faktörlerdendir. Bu tutumun gelişmesinde ilköğretimden başlanan yanlış öğrenme metotları ve öğrenciye dersin hayatında ne kadar önemli bir yer tutacağının ve nasıl kullanılacağının yeterince anlatılmamasından kaynaklandığı görülmektedir.

Matematik eğitiminde başarıyı etkileyen faktörler üzerine birçok araştırma yapılmıştır. Reusser (2000) tarafından yapılan çalışmada; genel olarak başarının öğrenme, stratejiler ve inançlarla ilişkili olduğu burada en büyük faktörün aile olduğu vurgulanmıştır. Ayrıca başarısızlığı etkileyen faktörlerden bir diğeri de bizzat öğrencilerin iyi çalışma tutum ve alışkanlıklarına sahip olmamalarıdır. Uysal (2007) tarafından yapılan çalışmada meslek yüksekokullarına sınavsız yerleşen öğrencilerin matematik başarısının daha düşük olduğu ve cinsiyetin başarıda bir etkisinin olmadığı tespit edilmiştir.

Bu çalışmada ise matematik eğitimindeki başarıyı etkileyen faktörler ve matematiğin insanlara kazandırdığı zihinsel esneklik ve analitik düşünebilme yeteneğinin kazandırdıklarından dolayı yetmiş meslek yüksekokulu öğrencisinin 1. Yarıyıl sonundaki matematik dersi ile genel olarak dönem sonu ders notlarının ortalamasının ilintili olduğu gözlenmiştir.

ARAŞTIRMANIN AMACI VE MODELİ

Araştırma meslek yüksekokullarında eğitim gören öğrencilerin matematik tabanlı derslerdeki başarısıyla, diğer derslerdeki genel başarısını karşılaştırma amacıyla yapılmıştır.

Çalışma Grubu

Bu çalışma zaman ve maliyet kısıtından dolayı, Konya ili Akören ilçesinde yer alan meslek yüksekokulunda gerçekleştirilmiştir.

Veri Toplama Aracı

Araştırmada kullanılan veri toplama yöntemi, öğrencilerin 1. dönem aldıkları vize-final sonucu matematik dersi puanları ile 1. dönem tüm derslerin genel ortalamasıdır.

YÖNTEM

Elde edilen veriler Spearman Brown Sıra Farkları Korelasyon Katsayısı (SPEARMAN RHO, rs) yöntemi kullanılarak analiz edilmiştir.

BULGULAR

Araştırmaya Katılanlar Hakkında Genel Bilgiler

Araştırmaya katılan meslek yüksekokulu öğrencilerinin Tablo 1'de görüldüğü gibi %30'u kız ve %70'i erkek öğrenciden oluşmaktadır.

Araştırmaya katılan meslek yüksekokulu öğrencilerinin Tablo 2'de görüldüğü gibi %97.14'ü meslek lisesi, %2,8' i düz lise mezunudur.

Tablo 1. Meslek yüksekokulu Öğrencilerinin Genel Özellikleri

Değişkenler		Frekans	Yüzde
Cinsiyet	K	21	30
	E	49	70
TOPLAM		70	100

Tablo 2. Mezun Olunan Lise Türü

Değişkenler		Frekans	Yüzde
	Düz lise	2	2.86
	Meslek lisesi	68	97.14
TOPLAM		70	100

Meslek Yüksekokulu Öğrencilerinin Matematik Dersi Başarı Sırası İle Dönem Sonu Genel Not Ortalaması Başarı Sırası

Öğrencilerin vize-final sonucu aldıkları puanlar sonucu matematik dersindeki aldıkları puanlar yüksekten düşüğe doğru sıraya dizilir, daha sonra en yüksek puana 1 verilerek sıra değerleri elde edilir. Daha sonra öğrencilerin 1. Dönem sonunda vize-final sonucu aldıkları notlara göre bütün dersleri için elde edilen genel not ortalamaları baz alınarak yüksekten düşüğe sıralanır, daha sonra en yüksek puana 1 verilerek sıra değerleri elde edilir. Tablo 3 hazırlanır.

Tablo 3. Meslek Yüksekokulu Öğrencilerinin Matematik Dersi Başarı Sırası İle Dönem Sonu Genel Not Ortalaması Başarı Sırası Ve Sıra Farkları

n=70	**n=70**	**$\Sigma d = -741$**	**$\Sigma d^2 = 12218$**

SONUÇ

Analizde r_s=0,787 bulunmuştur. Bu bulgu, 70 öğrencinin matematik dersi başarı sırası ile genel not ortalaması başarı sırası arasında bir uyuşmanın olduğunu gösterir. Buna göre, matematik dersinde başarılı olan öğrencilerin genel olarak diğer derslerde de başarılı olduğu söylenebilir.

ÖNERİLER

Birçok bilimin çıkış noktası olan matematik çağdaş dünyamızda da geleceğe yön vermek isteyenlerin başarılı olmasının şart olduğu bir bilimdir. Bu kadar önemli bir bilim olmasına ve okul hayatındaki genel başarıyı doğrudan etkilemesine rağmen öğrencilerin büyük bir kısmı dersi anlamakta ve uygulamakta zorluk çekmektedirler. Bugüne kadar yapılan birçok çalışmada öğrencilerin matematik dersinde zorlanmasının birçok nedeni olduğunu özellikle dersin anlaşılmasında eksikliğin olduğunu ve çalışma metotlarındaki yanlışların öğrencileri başarısızlığa ittiğini göstermiştir.

Çoğunlukla meslek liselerinden sınavsız geçişle gelen meslek yüksekokullarındaki öğrencilere fen ve matematik dersleri yeterince öğretilmemektedir. Bunun sonucunda da bu öğrenciler genel olarak matematik ve matematik tabanlı dersleri anlamakta, kavramakta ve işlem yapmakta yetersiz kalmaktadır. Hatta matematiğin insana kazandırdığı zihinsel esnekliğe yeterince sahip olunamamasından da dolayı matematik başarı sırası ile genel başarı sırası arasında uyumlu bir ilişki vardır.

Bu nedenlerden dolayı meslek yüksekokullarında matematik eğitimini her bölüm yeterince almalıdır. Matematik eğitimi uygulanmasında öğrencinin istek ve ilgisi arttırılmalı. Öğrencilere matematiğin önemi kavratılmalı ve mesleki olarak da matematiği kullanabileceği alanlarla ilgili uygulamalar yapılmalıdır.

MATHEMATICS ACTIVITIES OF PEOPLE AT DIFFERENT LEVEL

Yunus GÜDER
Ministry of Education
yunusguder2010@hotmail.com

ABSTRACT: The purpose of this study, the mathematical sciences in different age groups and different levels of education is to reveal how it is used by people. For this purpose liteart on the history of mathematics has been examined in detail and compared with the use of today. Study participants consists of illiterate and not subject to any formal education 4 people, literate and formal education through a variety of 4 people, finally started school but do not have the skills to four operations a total of 12 people including four kindergarten students. In the study, case study method was used. Data were obtained through various interviews and observations. As a result of this study, it was determined that, four operations are often used in different ways, people have developed a method that suits them and any symbol or formula is not used in the calculations.

Key words: mathematics education, four operations skills, different calculations

ORTAOKUL 5.SINIF FEN BİLİMLERİ DERSİ ETKİNLİKLERİNİN LABORATUVAR KULLANIM TEKNİKLERİ VE KAZANIMLARA UYGUNLUĞU AÇISINDAN İNCELENMESİ

Cemil AYDOĞDU*

Halil İbrahim AKILLI**

ÖZET: Bu çalışmanın amacı, Ortaokul 5. Sınıf fen bilimleri ders kitabındaki etkinliklerin laboratuar kullanım teknikleri ve Fen bilimleri kazanımlarına uygunluğu açısından incelenmesidir. Çalışmada, nitel araştırma yöntemlerinden doküman incelemesi tekniği kullanılmıştır. Ders kitabındaki etkinlikler laboratuar kullanım teknikleri açısından ve kazanımlara uygunluk açısından incelenmiş; ulusal ve yerel basından laboratuarlarda meydana gelen kazaların sonuçları ayrıca değerlendirilmiştir. Sonuçta bazı etkinliklerin kazanımları karşılamadığı ve laboratuar kullanım teknikleri açısından uygulanmasının sakıncaları olduğu belirlenmiştir. Laboratuardaki kazaların önlenebilmesi ve konuların daha iyi anlaşılabilmesi için kazanımlarda laboratuar kullanım teknikleri ile ilgili bölümlerin de olması gerektiği ve öğretmenlerin yapılan etkinlikler sırasında kullanılan malzemelerin özellikleri hakkında daha fazla bilgi sahibi olmaları gerektiği düşünülmektedir.

Anahtar Kelimeler: Fen ve Teknoloji etkinlikleri, kazanım, laboratuar kazaları, öğretmenlerin davranış tarzı

ABSTRACT: The purpose of this study , 5 Secondary Class activities in science textbooks and science laboratory techniques is to analyze the suitability of the gains . In this study, document analysis techniques of qualitative research methods were used. In the textbook activities and achievements in terms of the use of laboratory techniques examined in terms of compliance with the national and local press, the result of accidents that occur in the laboratory were also evaluated . The result does not meet some of the activities and achievements of the use of laboratory techniques in terms of implementation it was determined that the drawbacks . In the laboratory accident prevention and issues better understanding gains for the use of laboratory techniques related departments also should be teachers and the activities used during the properties of materials Learn more about owning the products need to be .

Keywords:Science and Technology activities, gain, laboratory accidents, teachears behaviour manners

1.GİRİŞ:

Bilimsel bilginin gittikçe arttığı, teknolojik gelişmelerin büyük bir hızla ilerlediği, fen ve teknolojinin etkilerinin yaşamımızın her alanında belirgin bir şekilde görüldüğü günümüz bilgi ve teknoloji çağında, toplumların geleceği açısından fen ve teknoloji eğitiminin anahtar bir rol oynadığı açıkça görülmektedir (Aydoğdu & Kesercioğlu, 2005). Bu amaçla, başta gelişmiş ülkeler olmak üzere bütün toplumlar sürekli bir şekilde fen ve teknoloji eğitimini yaygınlaştırmak ve kalitesini daha da arttırma uğraşı içerisindedirler. Fen bilimleri, kişinin yaşantısını etkilediği ölçüde önem ve değer taşır.

Çocuklar bu derste, doğadaki varlıkları ve olayları bilimsel yönden ele alıp; gözlemleme, inceleme ve anlama olanağı elde ederler. Fen ve Teknoloji okuryazarlığı; bireylerin araştırma-sorgulama, eleştirel düşünme, problem çözme ve karar verme becerileri geliştirmeleri, yaşam boyu öğrenen bireyler olmaları, çevreleri ve dünya hakkındaki merak duygusunu sürdürmeleri için gerekli olan fenle ilgili bilgi, beceri, tutum ve değerlerin bir bileşimidir(Tunç ve ark., 2010a).2004 öğretim programı ile öğrenci merkezli, dolayısıyla etkinlik merkezli, bilgi ve beceriyi dengeleyen öğrencinin kendi yaşantılarını ve bireysel farklılıklarını dikkate alarak çevreyle etkileşimine olanak sağlayan yeni bir anlayış yaşama geçirilmeye çalışılmaktadır (MEB, 2005a).

Ders kitapları okullarda yaygın olarak kullanılan ders araçlarındandır. Öğretimde, her zaman önemli bir yere sahip olan ders kitapları teknolojideki ilerlemelere rağmen kullanılma özellik ve önemini hala sürdürmektedir. Ders kitabı, belirli bir dersin öğretim programında öngörülen konuların işlenişi için gereken bilgileri içeren bir araçtır (Akınoğlu, Şahin ve Gürdal, 2002). Ders kitapları eğitim programının temel unsurlarından birisidir. Eğitim programı ile öğrenci arasındaki en iyi temel iletişim kaynağıdır. Öğretimde öğretmenin gücünü daha iyi kullanmasına, vermek istediklerini daha sistematik vermesine; öğrencinin de öğretmenin anlattıklarını istediği zaman ve yerde istediği tempoda tekrar etmesine olanak sağlayan temel araçlardır (Aycan ve ark., 2002). Ders kitapları bilginin taşınabilir bir şeklidir ve öğrenciler, istedikleri yer ve zamanda arzu ettikleri düzeyde bilgi edinebilmektedirler (Koseoğlu ve diğerleri, 2003).Ders kitapları, eğitim amaçlarını gerçekleştirmek üzere öğrencinin öğrenmesine kaynaklık eden (Aycan ve diğerleri, 2002), öğretim programlarında yer alan konulara ait bilgileri planlı ve düzenli bir bicimde inceleyip açıklayan, bilgi kaynağı olarak öğrenciyi dersin hedefleri doğrultusunda yönlendiren ve eğiten temel bir ortamdır (Unsal ve Gunes, 2003: 116).

Ders kitaplarıyla ilgili yapılmış pek çok çalışma bulunmaktadır. Yapılan çalışmalarda ders kitaplarının içerik, organizasyon, okunma düzeyi, resimler ve ders kitabının fiziksel görünümü gibi özelliklerinin daha ayrıntılı olarak incelendiği göze çarpmaktadır (Demirbaş, 2008; Balım ve ark., 2007; Maskan ve ark., 2007). Ancak ders kitaplarının sadece görünüş açısından incelenmesi kitapların yeterlilikleri anlamında bilgi vermekten oldukça uzaktadır. İyi bir ders kitabında yanlış-eksik bilgiler yer almamalı, öğrencileri kavram yanılgılarına sürükleyecek ifadelere yer verilmemelidir.Ders kitabı fen sınıfındaki temel kaynak olarak kabul edilir ve öğretmenlerin ilk başvurdukları kaynaklardan biridir (Tulip ve Cook, 1991; Elgar, 2004).Ders kitaplarının hazırlanmasının temel amacı; kitapların öğretim programında belirlenen bilişsel, duyuşsal ve psikomotor davranışları öğrencilere kazandıracak faaliyetleri içermesi ve bu faaliyetlere rehberlik edici nitelikte olmasıdır. Bu da öğrencilerin mümkün olduğunca çok ve değişik etkinliklere yöneltilmesi ile olabilir. Ders kitaplarında konu ya da ünitenin başlangıcında öğrencilerin dikkat ve ilgisini o konuya çekmek, onları istekli kılarak hazırlamak, ünite konuları işlenirken hedeflenen davranışların kazandırılması aşamasındaki öğrenme yaşantılarını sunmak ve ünite sonunda kontrolü ve pekiştirmeyi sağlamak amaçlarıyla öğrencinin gezi, gözlem, deney ve araştırma yapmasına ve belli sonuçlara kendi kendine ulaşmasına fırsat verilmelidir (Kaptan, 1999).(Akt:Maskan , Maskan ve Atabay ,(2007).

Yapılandırmacı yaklaşım, Fen öğretim ortamlarında kullanılan materyallerde de yeniden düzenlemeler yapılmasını gerekli kılmıştır. Söz konusu öğretim materyallerinden belki de en önemlisi ders kitaplarıdır. Ders kitabı fen sınıfındaki temel bir kaynak olarak kabul edilir ve öğretmenlerin ilk başvurdukları kaynaklardan biridir (Tulip ve Cook, 1991; Elgar, 2004). Öğrenciler, yasadıkları toplumda ve dünyada olan değişiklikleri daha iyi anlayabilmek ve kavrayabilmek için olay ve olguları kavramalarını kolaylaştıracak araç ve gereçlere ihtiyaç duymaktadırlar. Bu araçların en basında da ders kitapları gelmektedir (Ceyhan ve Yiğit, 2003: 17-18). Eğitimin bütün aşamalarında kullanılan ders kitapları, öğrencilere belirli ipuçlarını veren ve onları amaçlar doğrultusunda gerekli davranışları kazanmak üzere inceleme ve araştırmaya yönelten bir araç olarak önem taşımaktadır (Morgil, Yılmaz ve Ozcan, 1999: 156).

Türkiye'deki öğrencilerin Fen ve Teknoloji dersindeki başarılarının, diğer derslere oranla önemli ölçüde düşük olduğu ve diğer ülkelere göre geride kaldığı yapılan araştırma sonuçlarından anlaşılmaktadır (OECD, 2007). Elde edilen bu sonuçlara neden olan pek çok faktör arasında, öğretmenlerin laboratuar çalışmalarındaki yetersizlikleri de sayılabilir. Laboratuar çalışmaları, bir yandan öğrencilerin fenle ilgili etkinliklere katılmalarına ve bilimsel yöntemi tanıyarak takdir etmelerine olanak sağlarken, diğer taraftan öğrencilerin gözlem yapmalarına, fikir üretmelerine ve yorum yapma yeteneklerinin gelişmesine katkıda bulunmaktadır (Ayas, Çepni, Akdeniz ve Kaptan, 1998). Bu yöntem ayrıca, öğrencilerde, akıl yürütme, eleştirel düşünme, bilimsel bakış açısı geliştirme, problem çözme gibi becerileri geliştirmektedir (Serin,2002). Fen eğitimi alanında çalışan birçok araştırmacı, öğretmenlerin bilimin doğasını anlamadan, örgencilerinin fen ile ilgili kavramları anlamalarına yardım etmelerinin imkânsız olacağını vurgulamaktadır(Hadson, 1998; Palmquist ve Finley, 1997).Laboratuar çalışmaları aracılığı ile örgencilere kazandırılması gereken bilgiler, beceriler, tutumlar, öğretmenlerin bu konudaki bilgileri, becerileri ve tutumları ile doğru orantılıdır. Bu konuda yapılan birçok araştırmada, öğretmenler, fen öğretiminde laboratuar çalışmalarının gerekli olduğunu vurgulamışlar ancak bu gereğin yeterince yerine getirilmediğini belirtmişlerdir (Ayas, Çepni, Akdeniz ve Kaptan, 1998; Alpagut, 1984) Öğretmenler, laboratuar kullanmayı engelleyen faktörleri malzeme yetersizliği, ders saatinin az olması, ortamın uygun olmaması, öğrencilerin laboratuar ortamında kontrolünün zor olması seklinde ifade etmişlerdir (Akdeniz, Çepni, Azar,1999).

Öğretmenlerin derslerinde laboratuara az yer vermelerinin önemli bir nedeni de eğitimleri sırasında uygulamalı eğitime yönelik yetiştirilmemeleri; deneyleri nasıl uygulayacakları, bir deneyi nasıl kurup, geliştirecekleri ve laboratuar yöntemini nasıl kullanacakları konusunda eğitim verilmemesidir (Öztas ve Özay, 2004). Başka bir çalışmada ise, öğretmenlerin derslerinde laboratuarı yeterince kullanamama nedenlerinin basında, laboratuar kullanmaya yönelik çok fazla sayıda hizmet içi eğitim kurslarının açılmaması olduğu belirtilmiştir (Nakiboglu ve Sarıkaya, 1999). Aynı araştırmada düzenlenen hizmet içi eğitim kurslarının öğretmenlerin görev yaptıkları bölgelere uzak kalması nedeniyle öğretmenlerin tercih edemedikleri belirlenmiştir.

2.YÖNTEM:

Bu çalışmada nitel araştırma yöntemlerinden doküman incelemesi tekniği kullanılmıştır. Var olan kayıt ve belgeleri inceleyerek veri toplamayı "belgesel tarama" (Madge, 1965), "belgesel gözlem" (Duverger, 1973), Rummel (1968) ve daha pek çok araştırıcı "doküman yöntemi" olarak tanımlamaktadırlar. Best (1959) ise bu yöntemi mevcut kayıt ya da belgelerin, veri kaynağı olarak, sistemli incelenmesi olarak ifade etmektedir (Karasar, 2008). Doküman incelemesi tekniği, araştırılması hedeflenen olgu veya olaylar hakkında bilgi içeren yazılı materyallerin analizini kapsamaktadır (Yıldırım ve Şimşek, 2008). Nitel araştırma yöntemlerinde veri toplanması, analizlerin yapılması ve sonuçlara ulaşma aşamalarına birden fazla araştırmacının dahil edilmesi hem araştırmacılar arasında oluşacak uzlaşma noktalarını hem de araştırma güvenirliğini artırması bakımından önemlidir (Yıldırım ve Şimşek, 2008).

Bu çalışmada izlenen yöntem basamakları aşağıdaki şekilde düzenlenmiştir:

1) 2013-2014 yılında Ankara ili Kızılcahamam ilçesinde okutulan 5.Sınıf Fen Bilimleri ders kitabındaki etkinlikler laboratuar kullanım teknikleri açısından incelenmiştir.

2) 2013-2014 yılında Ankara ili Kızılcahamam ilçesinde okutulan 5.Sınıf Fen Bilimleri ders kitabındaki etkinliklerin programdaki kazanımlara uygunluğu incelenmiştir.

3) Laboratuarda meydana gelen kazalar laboratuar teknikleri açısından incelenmiş ve değerlendirilmiştir.

3.BULGULAR

1) 2013-2014 yılında Ankara ili Kızılcahamam ilçesinde okutulan 5.Sınıf Fen Bilimleri ders kitabındaki etkinlikler laboratuar kullanım teknikleri açısından incelenmesi:

5.Sınıf ders Kitabı sayfa 8'de bulunan Patatesin Gizemini Keşfedelim (Etkinlik 1.3) etkinliğinde İyot çözeltisi patates üzerine damlatılarak renk değişimi gözlenmek istenmiştir. Etkinlikte iyot çözeltisinin çözelti oranı ve iyot çözeltisinin zararları hakkında herhangi bir bilgi verilmemiştir. İyot çözeltisi, içerisinde katı iyot oranı fazla olduğu zaman solunması sakıncalı bir maddedir. İyot çözeltisinin çözelti oranları belirtilmeli, kimyasal özellikleri bilinmeli ve öğretmenlerin iyot çözeltisinin kimyasal özellikleri hakkında bilgi sahibi olmaları gerekmektedir.

5.sınıf ders Kitabı sayfa 115'te bulunan Erime ve Donma (Etkinlik 3.1) etkinliğinde, sayfa 118'de bulunan Buharlaşma ve Yoğuşma (Etkinlik 3.2) etkinliğinde, Sayfa 120'de bulunan Süblimleşme ve Kırağılaşma (Etkinlik 3.3) etkinliğinde, sayfa 132'de bulunan Erime ve Donma Noktası (Etkinlik 3.4) etkinliğinde, sayfa 135'te bulunan Maddenin Ayırt edici Özellikleri:Kaynama noktası(Etkinlik 3.5) etkinliğinde, Sayfa 143'te bulunan Isı ve Sıcaklık(Etkinlik 3.7) etkinliğinde, Sayfa 144'te bulunan Isı Alışverişi (Etkinlik 3.8) etkinliğinde , Sayfa 153'te bulunan 1 TL'ye Neler oluyor(Etkinlik 3.9) etkinliğinde, Sayfa 154'te bulunan Sıvılarda Genleşme ve Büzülme (Etkinlik 3.10) etkinliğinde, Sayfa 156'da bulunan Gazlarda Genleşme ve Büzülme (Etkinlik 3.11) etkinliğinde; 6.sınıf ders kitabı sayfa 107'de Madde Aynı Madde mi?(9.Etkinlik), 6.sınıf sayfa 109 da bulunan Maddeye ne Oldu?(10.Etkinlik) , 6.sınıf ders kitabı sayfa 184'te bulunan Isıtalım Gözlemleyelim (1.Etkinlik), 6.sınıf ders kitabı sayfa 193'te bulunan Hangisi erken, Hangisi geç ısınır? (4.Etkinlik), 6.sınıf sayfa 257'de bulunan Toprak çeşitlerini keşfedelim (5.Etkinlik) etkinliklerinde ispirto ocağı kullanılmıştır. İspirtonun teknik özellikleri ve kullanım alanları ile ilgili herhangi bir bilgi verilmemiştir.

İspirtonun içeriği büyük oranda alkolden oluşmaktadır. Alkol ise çabuk alev alabilen, yanıcı özelliği sayesinde fen laboratuarlarında ısı kaynağı olarak kullanılmaktadır. İspirto ocağı devrilme ve kırılma durumunda çabuk alev aldığı için öğrencilerde ve öğretmenlerde çeşitli yaralanmalara sebep olmaktadır.Deneylerde ispirto ocağı yerine çeker ocak kullanılmalıdır. Çeker ocaklar çalışma alanında oluşan asit buharı, ısı, proses aroması gibi gazları uzaklaştırabilecek emiş gücüne sahip, çalışma alanındaki zararlı havayı sisteme bağlı bulunan baca bağlantısı ile dış ortama atan cihazlardır. Öğretmenlerin deneyler esnasında kullandıkları malzemelerin özellikleri ve deney sırasında oluşturabileceği tehlikeleri hakkında önceden bilgi edinmeleri oldukça önem taşımaktadır. Fen ve teknoloji ders kitapları öğretmen ve öğrenciler için birincil kaynak olduğundan ders kitapları laboratuar kullanım tekniği konusunda bilgiler içermelidir. Ayrıca öğretmenler deney esnasında öğrencileri deney düzeneğine çok fazla yaklaştırmamalı, belirli bir mesafeden izlemelerini sağlamalıdırlar.

5.sınıf ders Kitabı sayfa 120'de Süblimleşme ve Kırağılaşma (Etkinlik 3.3) etkinliğinde Naftalin kullanılmıştır. Deneyde naftalin bir kap içerisinde ısıtılarak süblimleştirilmektedir.

Naftalin, oda şartlarında süblimleşen bir madde olduğu için solunması akciğerlerde zararlara neden olacağı için solunmamalıdır. Etkinlik 3.3'te naftalin kabının ağzı açık vaziyette ısıtıldığı için öğrenciler tarafından solunacaktır. Naftalin, havada kolayca süblimleşebilen beyaz bir katı maddedir. Petrol, kömür gibi fosil yakıtlarında doğal olarak bulunur. Hava ile karışınca yanıcı özellik gösterir. Naftaline temas etmenin ve uzun süre naftaline maruz kalmanın sağlık açısından zararları vardır. Uzun süre ya da aşırı solunması sonucu kırmızı kan hücrelerine zarar verir. Bitkinlik, halsizlik, solgun beniz gibi belirtileri olan kansızlık rahatsızlığı baş gösterebilir. Ayrıca mide bulantısı, baş dönmesi, kusma, bayılma, ciğerlerde hasar meydana getirebilir. Gözleri de tahriş edebilir. Sadece solunum yoluyla değil temas edilmesi durumunda cilt ile de vücuda geçe bilir ve çeşitli zararlar meydana getirebilir. Deney kapalı bir kapta yapılırsa ortama süblimleşen naftalin ulaşmayacak ve öğrenciler zarar görmeyecektir.

5.sınıf Ders Kitabı sayfa 135'te Maddenin Ayırt edici özellikleri: Kaynama noktası (Etkinlik 3.5) etkinliğinde, etil alkol açık ortamda bulundurulmakta ve kaynatılmak suretiyle buharlaştırılmaktadır. 6.sınıf Ders Kitabı sayfa 130'da bulunan Hangi Maddeler Elektrik enerjisini iletir? (1.Etkinlik) etkinliğinde Etil Alkol açık ortama bırakılmış elektrik iletkenliğine bakılması istenmiş.Etil alkol açık ortama bırakıldığı zaman buharlaşacak ve zehirlenmelere neden olabilecektir.

Etil Alkol; Sıcak yüzeylerle veya alevle temasında patlayıcı özellik gösterir.Kolay tutuşur. Deri ve göz ile temasında tahribatlara sebep olur. Yutulduğunda ve teneffüs edildiğinde tahriş edici özelliği vardır. Yutulduğu zaman ve solunduğu zaman zehirlenmelere yol açar.Deneyde Etil alkol kaynatıldığında gaz hali başka bir kaba aktarılarak öğrencilere gösterilebilir.Etil alkol kullanılırken eldiven ve maske kullanılmalıdır.

6.sınıf Ders Kitabı sayfa 89'da bulunan İyoda ne oldu? (2.Etkinlik) etkinliğinde katı iyot saat camı üzerine bırakılmış. Katı iyot oda sıcaklığında süblimleşen bir madde olduğu için buharı göz ve akciğerlere zarar verecektir. Deneyde katı iyot kapalı bir kapta muhafaza süblimleştirilebilir.

2) 2013 ve 2014 yılında Ankara ili Kızılcahamam ilçesinde okutulan 5.sınıf ders kitaplarında etkinliklerin kazanımları karşılayıp karşılamadığı ile ilgili de aşağıdaki bulgulara rastlanmıştır.

Tablo 1:5.SınıfFen Bilimleri Ders Kitabı (MEB yayınları, Evos Basım, Ankara 2013)

Ünite	Konu	Etkinlik	Kazanım	**Etkinliğin Kazanımı Sağladığına Yönelik Değerlendirme**
1.ÜNİTE: VÜCUDUMUZUN BİLMECESİNİ ÇÖZELİM	Besinler ve içerikleri	Etkinlik 1.1 Etkinlik 1.2 Etkinlik 1.3 Etkinlik 1.4 Etkinlik 1.5 Etkinlik 1.6	5.1.1.1. Besin içeriklerinin, canlıların yaşamsal faaliyetleri için gerekli olduğunu fark eder.	Etkinlikler kısmen uygun çünkü sadece proteinlerin ve yağların yararına yöneliktir. Karbonhidratların yararını anlatan bir etkinlik yapılmamış; sadece protein,yağ ve karbonhidratların içerikleri belirlenmiş. Dolayısıyla etkinlikler kazanımı karşılamamaktadır.
	Besinlerin Sindirimi	Etkinlik 1.15	5.1.2.3. Diş sağlığı için beslenmeye, temizliğe ve düzenli diş kontrolüne özen gösterir	Etkinlik kazanımı karşılamıyor. Etkinlik sadece diş ağrısının sebepleri üzerinde öğrencileri düşündürüyor.Konuyla ilgili daha kapsamlı bir etkinlik hazırlanabilirdi.
		Etkinlik 1.14	5.1.2.4. Besinlerin sindirildikten sonra vücutta kan yoluyla taşındığı çıkarımını yapar.	Etkinlikler kazanımı karşılamıyor. Burada öğrenciler besinlerin kan yoluyla taşındığı çıkarımını yapamıyor, sadece besinlerin izlediği yolu görüyor.
3.ÜNİTE:MADDENİN DEĞİŞİ	Maddenin değişimi	Etkinlik 3.1 Etkinlik 3.2	5.3.1.1. Maddelerin ısı etkisiyle hâl değiştirebileceğine yönelik deneyler	Kısmen uygun(Etkinlik 3.3 te naftalinin süblimleşecektir. Bu durumda tehlikeli tehlikeli sonuçlar ortaya çıkaracaktır.)Naftalin kapalı bir kapta ısıtılırsa tehlikeli sonuçlar

Mİ		Etkinlik 3.3	yapar, elde ettiği verilere dayalı çıkarımlarda bulunur.	ortadan kalkacaktır.
4.ÜNİTE:IŞIĞIN VE SESİN YAYILMASI	Sesin Yayılması	Etkinlik 4.6 Etkinlik 4.7 Etkinlik 4.8	5.4.4.1. Sesin yayılabildiği ortamları tahmin eder ve bu tahminlerini test eder.	Etkinlik 4.8 de sesin gaz ortamda yayılması ile ilgili farklı gaz ortamlarda etkinlik olsaydı, konunun anlaşılması daha etkili olabilirdi.
	Sesin Farklı ortamlarda farklı duyulması	Etkinlik 4.9	5.4.5.1. Farklı cisimlerle üretilen seslerin farklı olduğunu deneyerek keşfeder.	Kısmen uygun Çünkü, burada kullanılan madde sayısı az olmuş, daha fazla madde kullanılarak çıkardığı seslere bakılabilir.
5.ÜNİTE:CANLILAR DÜNYASINI GEZELİM TANIYALIM	Canlıları Tanıyalım	Etkinlik 5.1 Etkinlik 5.2 Etkinlik 5.3 Etkinlik 5.4	5.5.1.1. Canlılara örnekler vererek benzerlik ve farklılıklarına göre gruplandırır.	Kısmen Uygun(Öğrencilerin mantarların yapısını gözleyebileceği, çevresindeki hayvanları gözlediği ve bunları birbiriyle kıyaslayabileceği bir etkinlik tasarlanabilirdi.)
	İnsan ve Çevre İlişkisi	Etkinlik 5.5 Etkinlik 5.6	5.5.2.1. İnsan faaliyetleri sonucunda oluşan çevre sorunlarını araştırır ve bu sorunların çözümüne ilişkin önerilerde bulunur.	Kısmen uygun Çünkü etkinlik 5.5 te öğrencilerin yaşı küçük olduğu için yaşadıkları çevredeki geçmişten günümüze kadar olan değişimleri fark edemeyebilirler. Yine Etkinlik 5.6 da çevre sorunlarına karşı çözüm önerileri belirtilmemiş, sadece hava kirliliğinin nasıl oluştuğu anlatılmış.
7.ÜNİTE:YER KABUĞUNUN GİZEMİ	Yerkabuğunda Neler Var?	Etkinlik 7.2	5.7.1.2. Kayaçlarla madenleri ilişkilendirir ve madenlerin teknolojik ham madde olarak önemini tartışır.	Kısmen uygun çünkü sadece altın madeni ile ilgili etkinlik verilmiş. Diğer madenleri de kapsayan etkinlikler olabilirdi.Etkinlik kazanımı karşılamamaktadır.
		Etkinlik 7.3	5.7.1.3. Fosillerin oluşumunu ve fosil çeşitlerini araştırır ve sunar.	Kısmen uygun çünkü etkinlik fosillerin oluşumunu gösteriyor ama fosil çeşitleriyle ilgili bilgi sunmuyor. Fosil çeşitlerini de içeren bir etkinlik olabilirdi.

Tablo 1 de de görüldüğü gibi, bazı etkinlikler laboratuar kullanım teknikleri açısından uygun değilken, bazı etkinlikler de ilgili olduğu kazanımı karşılamamaktadır. Ayrıca 5.sınıf ders kitaplarında pek çok kazanıma yönelik herhangi bir etkinlik bulunmamaktadır.

3)Laboratuardaki kazaların laboratuar teknikleri açısından incelenmesi ve değerlendirilmesi;

Laboratuarlarda meydana gelen kazalar incelendiğinde çoğunlukla,civa zehirlenmesi, deney tüpü patlaması, kimyasal maddelerin yayılması, gaz çıkışı, ispirto tüpünün patlaması, çakmak tüpü patlaması, ampul patlaması ile ilgili oldukları görülmektedir.Bu kazaların başlıca sebepleri; öğretmen ve öğrencilerin kimyasal maddelerin özellikleri hakkında yeterince bilgi sahibi olmamaları ya da yanlış bilgi sahibi olmaları, kimyasal maddelerin döküldüğünde ya da yayıldığında nasıl müdahale edileceğinin bilinmemesi, deney sırasında yapılan dikkatsizlikler, öğretmen gözetimi olmaksızın öğrencilerin deney malzemelerini bilinçsizce kullanmaları ve deney süresinde meydana gelebilecek tehlikeler karşısında nasıl bir davranış tarzı geliştirileceğinin bilinmemesi olarak gösterilebilir.Ayrıca, laboratuarla ilgili öğretim programında kazanımlar yer almamaktadır.Eğer öğretim programında laboratuar kullanım teknikleri ile ilgili kazanımlara yer verilirse öğretmenler kimyasal maddelerin özelliklerini ve laboratuar kullanım tekniklerini öğrenme konusunda kendilerini daha zorunlu hissedeceklerdir.Sonuçta laboratuar kazalarının da önüne geçilmiş olacaktır.

4.TARTIŞMA VE SONUÇ

5.sınıf Fen Bilimleri ders kitaplarındaki etkinlikler incelendiğinde de görüldüğü gibi; bazı etkinliklerin laboratuar kullanım teknikleri açısından uygun olmadığı gözlenmiştir.Etkinliklerde en sık gözlenilen sorunlar; ispirto ocağının kullanımından kaynaklanabilecek tehlikeler, Naftalinin açık şekilde kullanılarak süblimleşip ortama yayılması, Katı iyot çözeltisinin açıkta kullanılması, İyot çözeltisinin hangi oranda kullanılacağının belirtilmemesi,

Etil alkolün açıkta kullanılması gibi durumlar olmuştur. Etkinliklerin laboratuar kullanım tekniklerine dikkat edilmeden hazırlanmasından dolayı laboratuar kazaları meydana gelmektedir. Yapılan araştırmalar da bu verileri destekleyen sonuçlar ortaya koymaktadır.

Aydoğdu ve Yardımcı (2013) çalışmalarında Laboratuar kazalarının başlıca sebeplerini; öğretmen ve öğrencilerin kimyasal maddelerin özellikleri hakkında yeterince bilgi sahibi olmamaları ya da yanlış bilgi sahibi olmaları, kimyasal maddelerin döküldüğünde ya da yayıldığında nasıl müdahale edileceğinin bilinmemesi, deney sırasında yapılan dikkatsizlikler, öğretmen gözetimi olmaksızın öğrencilerin deney malzemelerini bilinçsizce kullanmaları ve deney süresinde meydana gelebilecek tehlikeler karşısında nasıl bir davranış tarzı geliştirileceğinin bilinmemesi olarak gösterilebilir. Bu kaza sebepleri, öncelikle fen laboratuarında kullanılan kimyasal maddeler ve değişik deney malzemelerinin tanınması, kullanım şekillerinin çok iyi bilinmesi gerekliliğini ve laboratuar kullanım tekniği bilgisinin eksikliği olarak göstermektedirler. Morgil ve Yılmaz (2000), yaptıkları araştırmada öğrencilere uygulamalara başlarken yapacakları deneylerin nasıl güvenli bir şekilde yapılacağı ile ilgili ön bilgilerin verilmesi gerekliliğini rapor etmişlerdir (Akt; Yılmaz, Uludağ ve Morgil, 2001). Öğretmenlerin laboratuarda bilgi ve beceri eksikliğinin uygulamalar sırasında isteksiz olmalarına sebep olduğu da birçok araştırmacı tarafından vurgulanmıştır (Aydoğdu 1999; Coştu, Ayas, Çalık, Ünal ve Karataş 2005). Yapılan başka çalışmalar sadece ilköğretim düzeyinde değil, lise ve üniversite düzeyindeki öğrencilerin de deney malzemelerinin kullanımı konusunda zorluk çektiklerini göstermiştir. Temiz ve Kanlı (2005) lise 1, 2 ve 3 fizik ders kitaplarındaki deneylerde en çok adı geçen ve kullanılan laboratuar araçlarının öğrenciler tarafından ne derecede tanındığını ve bilindiğini ortaya çıkarmak için yaptıkları araştırmalarında, liseden yeni mezun olan öğrencilerin büyük bir çoğunluğunun ampermetre, voltmetre ve dinamometre dışındaki birçok laboratuar aracının adını ve ne işe yaradığını bilmeklerini ortaya çıkarmıştır. Harman (2011), sınıf öğretmeni adayları ile yaptığı çalışmasında öğretmen adaylarının fen ve teknoloji öğretiminde yapılan deneylerde sıklıkla kullanılan araç-gereçler, mikroskobun kısımları, bu kısımların görevleri ve mikroskobun kullanımı ile ilgili bilgi sahibi olmalarının yanı sıra bu konuda bazı eksik ya da yanlış bilgilere sahip oldukları sonucuna ulaşmıştır. Ayrıca kimyasal maddelerin üzerinde bulunan tehlike işaretlerinin anlamlarının bilinip bilinmediği konusunda yapılan çalışmalara da rastlanmıştır (Anılan, 2010). Yılmaz, Uludağ ve Morgil (2001)'in araştırmasında üniversite öğrencilerinin bile organik kimya laboratuarında kullanılan bazı çözücü ve maddelerin toksik etkileri ve korunma yöntemlerine ilişkin bilgilerinin orta ve az derecede olduğu ortaya çıkmıştır ki ilköğretim öğrencilerinin bu konuda daha dikkatli olmaları beklenmektedir. İlköğretim düzeyindeki deneylerde çok çeşitli ve fazla sayıda kimyasal kullanımı gerekmediğinden zararlı kimyasallar yerine günlük yaşamda kullanılan, daha hafif ve o kimyasalın yerini tutabilecek başka maddeler öğretmenler tarafından kontrollü bir şekilde kullanılarak kaza riski azaltılabilir. Nitekim kazaların meydana gelme sebepleri irdelendiğinde birinci sorumlu olarak öğretmenler karşımıza çıkmaktadır. Öğretmenlerin olası kazalar ve riskler karşısında yerleşmiş bir davranış tarzı geliştirmeleri ve bu konuda donanımlı olmaları büyük önem taşımaktadır. Ayrıca ders kitaplarında yer alan deneylerde kullanılan kimyasal malzemeler ve diğer malzemeler ile ilgili yeterli düzeyde bilgi verilmesi gerekmektedir. Yılmaz (2005)'in çalışmasında lise-1 kimya ders kitabında yer alan deneyler incelenmiş ve bu deneylerde kullanılan kimyasal maddeler ile ilgili insan sağlığı ve laboratuar güvenliği açısından uyarıcı nitelikteki bilgilerin yeterlilikleri araştırılmıştır. Çalışmanın sonuçları, lise-1 kimya ders kitabında deneysel uygulamalarda kullanılan kimyasal maddelere ilişkin hiçbir güvenlik bilgisinin verilmediğini ortaya çıkarmıştır. Güneş, Şener, Germi ve Can(2013) çalışmalarında, okullarda laboratuar bulunmasına rağmen laboratuar etkinliklerine veya deneysel uygulamalara yeterince yer verilmediği, ayrıca günlük yaşamda kullanılan malzemelerle yapılabilecek deneylerin bile uygulama yapılmadan geçiştirildiği ortaya çıkmaktadır. Çalışma sonuçlarına göre öğretmenlerin yaklaşık olarak yarısının okulda bulunan araç-gereçlerin yetersiz olması nedeniyle, önemli bir kısmının da laboratuarların yetersiz olması nedeniyle fazla deney yapamadığı, deney yapamayan öğretmenlerin de çoğunlukla yanlarında götürdükleri basit malzemeler ile sınıflarda uygulama yaptıkları veya modeller ile ders anlattıkları dikkati çekmektedir. Öğrencilerin de önemli bir kısmı laboratuarda araç-gereç yetersizliği nedeniyle deney yapılamadığını belirtirken bir kısmı ise öğretmenlerinin deney yapmak istemediğini, bazı öğretmenlerin ise sınıfa getirdikleri malzemeler veya modeller ile ders anlatılmasının ise çoğunlukla biyoloji ünitelerinde gerçekleştiğini, fizik ve kimya konularında ise öğretmenlerin sınıf içi uygulamalar için fazla malzeme kullanmadıklarını ifade etmişlerdir. Fen bilimleri ile ilgili öğretmen adaylarının laboratuar kullanımı konusunda eksik olduğu, dolayısıyla bu öğretmenlerin yeterli düzeyde laboratuar kullanmayacakları ve bu nedenle öğretmen adaylarının deney yapma konusunda temel bilgi ve becerilerinin mutlaka yeterli olacak şekilde eğitilmesi gerektiği (Coştu ve diğer., 2005) ileri sürülmüştür (Akdeniz ve diğer., 1999). Fen eğitiminin laboratuara dayalı deneysel olarak yapılması ise bilginin teoriden pratiğe ve günlük yaşama dönüştürülmesini kolaylaştıracaktır, ayrıca laboratuarda deneyip yanılarak veya hata yaparak öğrenen öğrenciler öğrendiklerinden gerçek yaşamda yararlanma şansını elde etmiş olacaktır.

5.Sınıf Fen Bilimleri kitabındaki etkinliklerin programdaki kazanımlara uygunluğu incelendiğinde, bazı etkinliklerin kazanımın içeriğini tam karşılamadığı ve bazı etkinliklerin de kazanıma uygun olmadığı belirlenmiştir. Bazı kazanımlara karşılıkta hiçbir etkinliğin olmadığı gözlenmiştir. Çalışmada incelediğimiz etkinlikler sırasında kimyasal malzemelerin özellikleri ve tehlikeleri hakkında yeterli bilgi verilmediği için, öğretmen ve öğrenciler etkinlikleri yaparken çeşitli kazalara maruz kalabilmektedir. Bazı etkinliklerin etkili olduğu kazanımı karşılamaması ve bazı etkinliklere yönelik kazanım bulunmaması, konunun anlaşılmasını zorlaştıracaktır. Öğretmenlerin daha önceki eğitimlerinde laboratuar teknikleri ile ilgili yeterli bilgi sahibi olmamaları ve kimyasal maddelerin özelliklerini bilmemelerinden dolayı ya bu etkinlikleri hiç yapmadıkları ya da yaparken kazalar yaşadıkları görülmektedir. Eğer ders kitaplarındaki etkinlikler kazanımları tam olarak karşılarsa, öğrencilerin konuyu öğrenmeleri daha kolay olacaktır. Fen derslerinde etkinlik öğretimi önemli bir yere sahiptir. Eğer etkinlikler öğrenciler tarafından tam olarak anlaşılmazsa konunun öğrenilmesi de çok zor olacaktır.Öğrencilerin etkinlikleri yapmaları sayesinde öğrenci merkezli öğrenme de gerçekleşecektir.Ders kitapları hazırlanırken kazanımlar daha dikkatle, taranmalı, mümkünse her kazanımı karşılayan bir etkinlik bulunmalıdır.Hazırlanan kazanımların ilgili olduğu kazanımın içeriğini eksiksiz olarak karşılaması gerekmektedir.Çünkü bazı etkinliklerin ilgili olduğu kazanımların tamamını kapsamadığı, veya kısmen kapsadığı görülmüştür.Bazı etkinliklerde de laboratuar kullanım teknikleri açısından sorunlar gözlenmiştir.Etkinlikler hazırlanırken laboratuar kullanım teknikleri de dikkate alınmalıdır.

Maskan, Maskan ve Atabay(2007) çalışmalarında, ders kitaplarının eksiksiz, abartısız ve hatasız olması gerektiğini, eğer, öğrencilerin eksik ve yanlış bilgi sahibi olurlarsa, çevrelerinde olup bitenleri, sahip oldukları ve değiştirmedikleri yanlış kavramlarla açıklamaya çalışacaklarını ve ilköğretim döneminde öğrencilerin zihinlerinde yerleşen yanlış kavramaların ileride telafi edilmesinin kolay olmayacağını belirtmişlerdir. İnaltekin, Özyurt ve Akçay (2012) çalışmalarında, ders kitaplarındaki etkinliklerin içerikleri anlama-öğrenme alanlarına göre incelendiğinde tüm sınıf düzeylerindeki kitaplarda etkinliklerin dinleme ve konuşmaya dayandırıldığını gözlemiştir. Bununla beraber yazma ve okuma temelli etkinliklere daha az yer verildiğini, 6., 7. ve 8. sınıflar düzeyinde etkinlikler incelendiğinde deneylerin kitaplarda çok geniş bir yer kapladığı sonucuna ulaşmışlardır. İncelenen üç kitapta da deneyleri çizelge doldurma etkinlikleri izlemiş. 6. ve 8. sınıf kitaplarında metin yazma ve tamamlama, şiir, şarkı sözü yazma ve drama gibi fen eğitiminin genel amaçlarında da vurgulandığı gibi öğrencilerin öğrendiklerini yazıya aktaracakları etkinliklere hiç yer verilmediği belirlenmiştir. Ayvacı ve Ernas (2009) çalışmalarında, Yaratıcı bireyler yetiştirilmesinde de ders kitaplarındaki etkinliklerin önemli bir rolü vardır. Ders esnasında kullanılan bu etkinliklerle öğrencilerin öğrendiklerini anlamlandırmaları amaçlanmaktadır. Bunun kalıcı olabilmesi ve öğrencinin etkinlikleri ilgisi dağılmadan yapabilmesi için içeriğin iyi hazırlanması gerekir. Aynı zamanda ders kitaplarında yer alan etkinlikler çeşitlendirilmesi gerektiğini belirtmişlerdir. Erdoğan (2007), yapmış olduğu çalışmasının sonucunda yeni öğretim programının etkili bir şekilde uygulanabilmesi için alt yapı ve materyal eksikliğinin olmaması ve gerekli kaynakların öğretmenlere sağlanması gerektiğini belirtmiştir. Dindar ve Yangın (2007), yeni hazırlanan programın program geliştirme uzmanları tarafından teorik olarak uygun görünmesine rağmen, uygulama koşullarına uygun olmayan bir programın başarısının zayıf olacağını belirtmişlerdir. Öğretmenler açıkça materyal ve araç-gereç eksikliği çektiğini ifade etmişlerdir.

Etkinlikleri uygulama sürecinde öğretmenler birtakım destekleri de görmeyi beklemektedirler. Birçok öğretmen laboratuar ortamının fiziki donanım açısından yetersiz olduğunu dile getirmekte ve deneylerinin sağlıklı bir şekilde yapılamadığından şikâyet etmektedir. Yetersiz bir laboratuar ortamı tehlikenin boyutlarını artırmakta, kazaları tetiklemektedir. Bu durumda Milli Eğitim Bakanlığı'nın okullarla ve öğretmenlerle sıkı bir işbirliği içinde olması gerektiği karşımıza çıkmaktadır. Fiziki donanım sağlandıktan sonra, deneyler sırasında öğretmene rehberlik edecek kılavuz kitapçıkları ve de fen teknoloji ders kitapları belli uzmanlar tarafından laboratuar kullanım tekniğine uygunluğu araştırılarak kullanıma sunulmalıdır. Laboratuar kullanım tekniği konusunda öğretmenlerin bilgilendirilmesi gerekmektedir. Bu bilgilendirmenin yapılabilmesi için ise hizmet içi eğitim kursları önemli hale gelmektedir. Bu kurslarla öğretmenlere ve üniversite eğitimi alan öğretmen adaylarına iyi bir laboratuar kullanım tekniği verilmelidir. Laboratuar çalışması öncesi, çalışma sırasında ve çalışma sonrasında uygulanması gerekli kurallar, deneylerde kullanılan kimyasalların kullanım teknik ve yöntemi ve deneyde kullanılan araç – gerecin kullanımına yönelik teknik bilgilerin tümü laboratuar kullanım tekniği olarak isimlendirilebilir.(Aydoğdu, Yardımcı 2013)

Sonuç olarak; ders kitaplarındaki etkinlikler hazırlanırken, etkinliklerin kazanımları karşılamasına, uygulanmasının kolay olmasına ve laboratuar kullanım tekniklerine uygun olmasına dikkat edilmelidir. Öğretim programında laboratuar teknikleriyle ilgili de kazanımlarında bulunması gerekmektedir.Fakültelerin fen bilimleri öğretmeni yetiştiren bölümlerinde laboratuar tekniklerine önem verilmelidir.

ABOUT 8th GRADE STUDENTS' SKILLS IN TRANSLATING AMONG MULTIPLE REPRESENTATIONS

Ramazan GÜRBÜZ
Adıyaman Üniversitesi
rgurbuz@outlook.com

Seda ŞAHİN
Adıyaman Üniversitesi
seda.sahin@windowslive.com

ABSTRACT: The aim of this study is to find out 8th grade students' skills in translating among multiple representations (verbal, table, equation and graph). The research was carried out with 4 eighth grade students (3 girls, 1 boy). Case study which is a qualitative research design was used for the study. Data were collected through "Translating Among Multiple Representations Test (TAMRT)" and semi-structured interviews which were developed by researcher. Descriptive analysis method was used to analyze the data. The results of the data indicated that the most difficult translations were from verbal, table and equation representations to graph. The translations from verbal, equation and graph representations to table were the easiest translations for students. Additionally, findings suggest that the students' mistakes in translating table, equation and graph representations among verbal statement were stemming from lack of students' writing skills.

Key words: mathematics education, multiple representations

AŞKIN SAYILAR ŞADIRVANI

THE FOUNTAIN OF TRANSCENDENTAL NUMBERS

Tuğba HORZUM
Necmettin Erbakan Üniversitesi
thorzum@gmail.com

ÖZET: Bu çalışmada özellikle Konya (Alâeddin Camii, Karatay Medresesi, İnce Minareli Medrese, Aziziye Camii, Şerafettin Camii, Kapu Camii, İplikçi Camii, Selim Sultan Camii) ve Kırşehir (Melik Gazi Kümbeti, Ahi Evran Türbesi, Cacabey Camii ve Medresesi, Aşık Paşa Türbesi) illerinde Anadolu Selçuklu Devleti ile Osmanlı İmparatorluğu dönemlerinde inşa edilen ve günümüze kadar gelebilmiş mimari yapılar geometrik ve estetik açıdan incelenerek, bu iki mimarinin harmanlanmasıyla tasarlanan bir şadırvan üzerinde e ve π aşkın sayıları, farklı bir bakış açısıyla görselleştirilmiştir. Bu görselleştirmeyi yapabilmek için önce e ve π sayılarının ilk 2500 ondalık basamağındaki rakamlar Microsoft Excel programında 50x50'lik bir tabloya yerleştirilmiş, ardından 0'dan 9'a kadar tüm rakamlara bir renk atanmış ve tablonun her bir hücresi, hücreye karşılık gelen rakam yerine atanan renk ile renklendirilmiştir. Bu şekilde yapılan renkli Excel tablosu resim formatına dönüştürülmüştür. Son olarak tasarlanan şadırvan üzerinde gerekli ışıklandırmalar planlanarak bu renklendirmelerin akşam vaktinde gökyüzüne yansıtılarak e ve π sayılarına dikkat çekilmesi amaçlanmıştır.

Anahtar sözcükler: aşkın sayılar, e sayısı, π sayısı, matematik ve mimari, Osmanlı ve Selçuklu mimarisi

ABSTRACT: In this study, the transcendental numbers e and π were visualized on a fountain, which is designed via examining with a geometric and aesthetic viewpoint and blending the survived architectural structures of the Anatolian Seljuk Empire and the Ottoman Empire especially in Konya (Karatay/İnce Minareli Madrasa, Alaeddin/Aziziye/Serafettin/Kapu/İplikci/Selim Sultan Mosque) and Kırsehir (Melik Gazi/Ahi/Aşık Pasha Tomb, Cacabey Mosque and Madrasa), with a different perspective. To make this visualization, the numbers of first 2500 decimal places of e and π were placed on the size of 50x50 table in Microsoft Excel. Then, all the numbers from 0 to 9 were assigned different colors and each cell of the table was colored with the corresponding assigned colors instead of numbers. The colored Excel table made in this way was converted into image format. Finally, it was intended to draw attention to the number e and π via planning the illumination on the designed fountain and reflecting these colors in the sky in the evening.

Keywords: transcendental numbers, the number e, the number π, mathematics and architecture, Seljuk and Ottoman architecture

MOODLE ÖĞRENME YÖNETİM SİSTEMİNİN KULLANILABİLİRLİĞİNİN İNCELENMESİ

Erhan ÜNAL
Afyon Kocatepe Üniversitesi

auzun@aku.edu.tr

ÖZET: Bu çalışmanın amacı, Öğrenme Yönetimi Sistemi olarak Moodle'un kullanılabilirliğini belirlemektir. Tarama yönteminin kullanıldığı çalışmaya, 2012-2013 öğretim yılında Afyon Kocatepe Üniversitesi Bilgisayar ve Öğretim Teknolojileri Eğitimi (BÖTE) Bölümü'nde öğrenim gören 137 öğretmen adayı katılmıştır. Çalışmada veri toplama aracı olarak, kişisel bilgi formu ve Kılıç-Çakmak, Güneş, Çiftçi ve Üstündağ (2011) tarafından geliştirilen "*Web Sitesi Kullanılabilirlik Ölçeği"* kullanılmıştır. Çalışma sonuçlarına göre Moodle'un kullanılabilirliğinin orta düzey olduğu çıkmıştır. Ayrıca kullanılabilirlik puanlarının cinsiyet ve sınıfa göre farklılaşmadığı bulunmuştur.

Anahtar Kelimeler: İnsan-bilgisayar etkileşimi, kullanılabilirlik, öğrenme yönetim sistemi

ABSTRACT: The purpose of this study was to explore the usability of Moodle as a learning management system. Survey method was used in this study. Data were gathered from 137 pre-service teachers studying at Computer Education and Instructional Technologies Department, Afyon Kocatepe University during 2012-2013 academic year. Personal Information Form and Web Site Usability Scale which was developed by Kılıç-Çakmak, Güneş, Çiftçi ve Üstündağ (2011) were used as data collection tool. The results of the study showed that the usability of Moodle was found at level of medium. On the other hand usability scores did not differ according to gender and classes.

Key Words: Human-computer interaction, usability, learning management system.

GİRİŞ

Bilgi ve iletişim teknolojilerinin eğitimde kullanılmasıyla, uzaktan eğitim, e-öğrenme, m-öğrenme, çevrimiçi öğrenme gibi birçok yeni kavramlar ortaya atılmıştır. Tüm bu öğrenme yollarının altında yatan temel yaklaşım, bilgi ve iletişim teknolojilerinin farklı özelliklerini kullanarak öğrencilerin öğrenmelerini kolaylaştırmak ve böylece etkili öğrenme ortamları oluşturmaktır. Artık e-öğrenme, uzaktan eğitim, çevrimiçi öğrenme, m-öğrenme birçok kurum tarafından yeni bilgilerin öğretiminde kullanılmaktadır.

Uzaktan eğitim, öğrenmenin farklı mekanlarda, çeşitli teknolojiler ve kurumsal organizasyonlarla gerçekleştiği planlı öğrenme ve öğretmedir (Moore ve Kearsley, 2012). Bir diğer tanımda ise, "uzaktan eğitim, öğrenci danışmanlığı, öğrenci başarısının gözetilmesi ve korunması ve öğrenilen materyalin gösterilmesinde, her biri sorumluluk alan öğretmenlerin oluşturduğu bir ekip tarafından yürütülen kendi kendine çalışma şeklinin sistematik olarak düzenlenmesidir." (Kaya, 2005; s.11). Tanımlar incelendiğinde, öğrenci ve öğretmenin zaman ve mekandan bağımsız yapısı, öğrenme etkinliklerinin ve etkileşimin çeşitli bilgi ve iletişim teknolojileri ile gerçekleştiği bir öğretim yöntemi olduğu görülmektedir. Uzaktan eğitim farklı şekillerde sunulabilmektedir. Bunlardan en yaygını artık günümüzde bilgi ve iletişim teknolojilerinin kullanıldığı uzaktan eğitim türleridir.

Uzaktan eğitimde öğrenme gerçekleşirken üç farklı etkileşim meydana gelmektedir. Bunlar, öğrenci-içerik etkileşimi, öğrenci-öğretmen etkileşimi ve öğrenci-öğrenci etkileşimidir (Moore, 1989). Bu etkileşim türleri dikkate alındığında uzaktan eğitim etkileşiminde öğrencinin önemli olduğu görülmektedir (Oral, 2011). Öğrencinin bu etkileşim ortamında başarılı olması için sistemin iyi yapılandırılması gerekmektedir. Bu nedenle uzaktan eğitimde öğretimin tasarımı ve yönetimi önemlidir.

Öğrenme Yönetim Sistemleri

Günümüzde uzaktan eğitim yapılırken, derslerin yönetimi, öğrenenin yönetimi, içeriğin hazırlanması ve sunumu, değerlendirme gibi geleneksel öğrenme ortamlarında gerçekleştirilen her türlü öğrenme-öğretme etkinlikleri için öğrenme yönetim sistemi (Learning Management System) denilen yazılımlar kullanılmaktadır. Öğrenme yönetim sistemleri, öğrenme ile ilgili tüm etkinliklerin yönetimini sağlayan yazılımlardır. Öğrenme yönetim sistemi öğrenim sürecini planlamayı, değerlendirmeyi, uygulamayı sağlayan bir yazılımlardır (Aydın ve Biroğul, 2008). Öğrenme yönetim sisteminin, derslerin yönetimi, içeriğin sunumu, ödev verme ve notlandırma, sınav uygulama, öğrencileri yönetme, öğrenci kayıtlarını tutma gibi birçok özelliği vardır (Paulsen, 2002).

Öğrenme yönetim sistemleri açık kaynak kodlu ve ticari sistemler şeklinde ikiye ayrılır. Açık kaynak kodlu öğrenme yönetim sistemlerine Moodle, aTutor, Dokeos, OLAT, Sakai, eFront, Claroline örnek verilebilir (Özarslan, 2008). Açık kaynak kodlu öğrenme yönetim sistemlerinin en çok kullanılanı şüphesiz Moodle (Modular-Object-Oriented-Dynamic-Learning-Environment-Esnek Nesne Yönelimli Dinamik Öğrenme Ortamı) gelmektedir. Moodle ücretsiz olarak dağıtılan, birçok sistemle entegre bir şekilde çalışabilen açık kaynak kodlu öğrenme yönetim sistemidir. Diğer öğrenme yönetim sistemleri gibi Moodle üzerinde ders materyalleri paylaşılabilmekte, ödevler, quizler, sınavlar yapılabilmekte, forum, wiki, anket gibi özellikleri kullanılabilmektedir (Moodle, 2013).

Kullanılabilirlik

International Standarts Organization (1994), kullanılabilirlik kavramını, bir ürünün, belirli bir kullanım bağlamında, belirli kullanıcılar tarafından, belirli amaçları gerçekleştirmek üzere, etkin (effective), verimli (efficient) ve tatmin edici (satisfactory) bir biçimde kullanılabilmesi olarak tanımlamıştır (Gürses, 2006; s. 15). Nielsen'e (2012) göre kullanılabilirlik, kullanıcının etkileşimde bulunduğu arayüzlerin kullanımının ne kadar kolay kullanılabildiğini belirleyen özelliktir. Ayrıca kullanılabilirlik kelimesi, tasarım sürecinde kullanım kolaylığı sağlamak için yöntemler olarak da kullanılır. Kullanılabilirlik 5 bileşeni olan bir özelliktir. Bu bileşenler şunlardır (Nielsen, 2012):

- Öğrenilebilirlik: Kullanıcının etkileşimde bulunduğu arayüzlerle karşılaştığında temel görevleri ilk girişiminde başarabilmesi ile ilgilidir.
- Etkililik: Kullanıcının etkileşimde bulunduğu arayüzleri öğrendikten sonra görevleri ne kadar hızlı yapabildiği ile ilgilidir.
- Hatırlanabilirlik: Kullanıcı etkileşimde bulunduğu arayüzleri bir süre kullanmadığında, yeniden arayüz karşısında yeterliğini kolayca göstermesiyle ilgilidir.
- Hata: Kullanıcının etkileşimde bulunduğu arayüzlerde ne kadar hata yaptığı, bu hataların kaçının ciddi hatalar olduğu, bu hataları kolaylıkla nasıl düzeltilebileceği ile ilgilidir.
- Memnuniyet: Kullanıcının etkileşimde bulunduğu arayüzlerin kullanımından ne kadar memnun olduğu ile ilgilidir.

Kullanılabilirlik, kullanıcı, çevre ve görevler gibi faktörleri içeren kullanım bağlamı ile de doğrudan ilişkilidir. Arayüz kalitesinin ve kullanılabilirliğin sağlanmasında, sistemin hedef kullanıcı kitlesinin iyi analiz edilmesi ve tasarımların kullanıcı beklentileriyle uyumlu olması gerekmektedir. Norman (1988), bir sistemin ancak kullanıcısının onunla ne yapacağını kolayca anlayabildiği ölçüde kullanılabilir olduğunu vurgulamaktadır. Literatürdeki kullanılabilirlik tanımlarının geneli etkililik, hata toleransı, memnuniyet, verimlilik gibi özellikler üzerinde durmaktadır. Kullanılabilirlik, kullanılabilirlik testleri, inceleme yöntemleri ve sorgulama yöntemleri ile ölçülebilmektedir (Gürses, 2006).

İlgili Araştırmalar

Alanyazın incelendiğinde Moodle'un kullanılabilirliği ile ilgili olarak Kakasevski, Mihajlov, Arsenovski ve Chungurski (2008), Moodle'un modüllerinin kullanılabilirliğini incelemişlerdir. Bu amaçla 84 öğrenci kullanılabilirlik anketi doldurmuşlar, modüllerle ilgili çeşitli görevler yerine getirmişlerdir. Ayrıca uzmanlar da modülleri değerlendirmişlerdir. Araştırma sonuçlarına göre, Moodle'un genel olarak kullanılabilirliği iyi olarak bulunmuştur. Kullanılabilirliğin alt faktörlerine bakıldığında kullanıcıların ortalama puanları hatırlanabilirlik, memnuniyet, kullanım kolaylığı, etkililik ve verimlilik olarak sıralanmaktadır.

Martin, Martínez, Revilla, Aguilar, Santos ve Boticario (2008), Moodle, Sakai ve dotLRN öğrenme yönetim sistemlerinin kullanılabilirliklerini karşılaştırmışlardır. Bu amaçla, kullanılabilirlik alanında uzman 5 kişi bu üç platformu belirlenen görevleri gerçekleştirerek değerlendirmişlerdir. Araştırma sonuçlarına göre, en yüksek kullanılabilirlik puanını dotLRN daha sonra Sakai ve en düşük puanı da Moodle almıştır.

Kirner, Custódio ve Kirner (2008), yaptıkları çalışmada hazırladıkları değerlendirme modeli ile Moodle'un kullanılabilirliğini değerlendirmişlerdir. Bu amaçla Moodle'u kullanan 39 öğretmen, sezgisellik, işlevsellik, verimlilik, öğrenilebilirlik, etkililik ve memnuniyet boyutlarında Moodle'u değerlendirmişlerdir. Araştırma sonuçlarına göre Moodle'un genel olarak ve tüm alt boyutlarda memnun edici kullanılabilirliği olduğu bulunmuştur.

Çevik (2010), Bilgisayar ve Öğretim Teknolojileri Öğretmenliği Bölümü'nde (BÖTE) öğrenim gören öğretmen adaylarının Moodle'u kullanırken karşılaştıkları zorlukları ve Moodle'un içerdiği uygulama kategorilerinin gerekli olup olmadığına ilişkin öğrenci görüşlerini belirlemiştir. Bu amaçla, araştırmacı tarafından geliştirilen, Kullanıcı İşlemleri, Ders Ekranı, Ders Menüsü, Bloglar alt bölümlerinden oluşan anket 111 öğretmen adayına uygulanmıştır. Araştırma sonuçlarına göre, Moodle'un kullanılabilirliği kolay olarak bulunmuştur. Ayrıca Moodle'daki uygulama kategorilerinin (Kullanıcı İşlemleri, Ders Ekranı, Ders Menüsü, Bloglar), tüm öğretmen adayları tarafından gerekli olduğu belirlenmiştir.

Tüm bu tartışılan literatür ve yapılan araştırmalara göre kullanılabilirlik değerlendirmesinde farklı yöntemler uygulandığı ve farklı sonuçlar alındığı görülmektedir. Bu nedenle bu çalışmanın problemini, öğrenme yönetimi sistemi olarak Moodle'un kullanılabilirliğini belirlemek oluşturmaktadır.

Çalışmanın Amacı

Bu çalışmanın amacı öğrenme yönetimi sistemi Moodle'un kullanılabilirliğinin incelenmesidir. Bu amaçla aşağıdaki sorulara cevap aranmıştır:

1. Kullanıcıların öğrenme yönetimi sistemi Moodle'un kullanılabilirliğine ilişkin görüşleri nedir?
2. Kullanıcıların öğrenme yönetimi sistemi Moodle'un kullanılabilirliğine ilişkin görüşleri
    a. Cinsiyete,
    b. Sınıfa

   göre farklılaşmakta mıdır?

YÖNTEM

Araştırmada nicel araştırma yöntemlerinden tarama modeli kullanılmıştır. Bilindiği gibi tarama modelinde var olan bir durum olduğu gibi betimlenmeye çalışılır. Genel tarama modeli, çok sayıda elemandan oluşan bir evrende, evren hakkında genel bir yargıya varmak amacı ile evrenin tümü ya da ondan alınacak bir grup örnek ya da örneklem üzerinde yapılana tarama düzenlemeleridir (Karasar, 2005).

Çalışma Grubu

Araştırmanın çalışma grubunu 2012-2013 öğretim yılında Afyon Kocatepe Üniversitesi BÖTE Bölümü'nde öğrenim gören ve Moodle üzerinden ders alan 137 öğretmen adayı oluşturmaktadır. Bu öğretmen adayları Moodle'u takip ettikleri derslere ulaşmakta, dersler ilgili haftalık ödevlerini yapmakta ve buraya yüklemekte, dersle ilgili öğrenme nesnelerini takip etmekte, dersle ilgili duyurulara erişmekte, sınavları uygulamakta kullanmaktadırlar. Araştırmaya katılan öğretmen adaylarının sınıf ve cinsiyetlerine ilişkin istatistikler Tablo 1'de verilmiştir.

Tablo 10: Katılımcılara ait istatistikler

Sınıf	Kız		Erkek		Toplam	
	f	%	f	%	f	%
2	22	16.1	26	19.0	48	35.0
3	24	17.5	25	18.2	49	35.8
4	19	13.9	21	15.3	40	29.2
Toplam	65	47.4	72	52.6	137	100

Veri Toplama Aracı

Araştırmada veri toplama aracı olarak, kişisel bilgi formu ve Kılıç-Çakmak, Güneş, Çiftçi ve Üstündağ (2011) tarafından geliştirilen "*Web Sitesi Kullanılabilirlik Ölçeği"* kullanılmıştır. Ölçeğin tercih edilmesindeki amaç, geçerlik ve güvenirlik analizlerinin bir öğrenme yönetim sisteminin kullanılabilirliğinin belirlenmesinde yapılmasıdır. Web sitelerinin kullanılabilirliğini belirlemeye yönelik geliştirilen "Web Sitesi Kullanılabilirlik Ölçeği" 25 maddeden oluşmaktadır. Ölçek, maddelerine verilecek cevaplar likert tipi beşli derecelendirme ölçeği ile toplanmaktadır. Ölçek, “Kesinlikle katılıyorum (5)”, “Katılıyorum (4)”, “Kararsızım (3)”, “Katılmıyorum (2)” ve “Kesinlikle katılmıyorum (1)” seçeneklerinden oluşmaktadır. Ölçekteki maddelerin 21’i olumlu 4’ü ise olumsuz maddedir. Ölçekten alınacak en düşük puan 25, en yüksek puan ise 125’tir. Ölçekten alınacak yüksek puan, web sitesinin kullanılabilirliğinin yüksek olduğunu göstermektedir.

BULGULAR

Öğretmen adaylarının *Web Sitesi Kullanılabilirlik Ölçeği’nden* aldıkları puanlara ilişkin aritmetik ortalama ve standart sapma değerleri Tablo 2’de verilmiştir.

Tablo 11: Kullanılabilirlik puanlarının dağılımı

Değişken	N	X	SS
Gezinme Kolaylığı	137	35.03	6.73
Tasarım	137	24.90	5.41
Erişim Kolaylığı	137	13.45	3.32
Kullanım Kolaylığı	137	11.38	2.99
Kullanılabilirlik	137	84.77	13.21

Tablo 2 incelendiğinde Moodle’un genel olarak kullanılabilirliğinin “Orta” olduğu bulunmuştur. Ölçeğin alt boyutları olan Gezinme Kolaylığı, Tasarım, Erişim Kolaylığı, Kullanım Kolaylığı boyutlarında da “Orta” olduğu bulunmuştur. Bu bulguya göre öğretmen adaylarının Moodle öğrenme yönetim sisteminin kullanılabilirliğini orta düzey olarak görmektedirler.

Ayrıca ölçeğe verilen cevaplar analiz edilerek, Moodle’un kullanılabilirliğine ilişkin olumlu ve olumsuz yönleri bulunmuştur. Ortalama puanı 3’ten yüksek olanlar olumlu, düşük olanlar olumsuz olarak değerlendirilmiştir. Moodle’un kullanılabilirliğine ilişkin en olumlu yanları, maddeler, boyut ve ortalama puanları ile birlikte aşağıda verilmiştir.

- Sitede rahatlıkla geziniyorum (Tasarım boyutu X=3.69).
- Arkaplan rengi okumayı kolaylaştırıyor (Tasarım boyutu X=3.69).
- Sitede, site haritası, gezinme çubuğu, önceki ve sonraki sayfaya geçiş gibi gezinmeye yardımcı araçlar bulunmaktadır. (Gezinme kolaylığı boyutu X=3.67).
- Arkaplan-metin renk uyumu okumayı kolaylaştırıyor (Tasarım boyutu X=3.67).

Moodle’un kullanılabilirliğine ilişkin olumsuz yanları, maddeler, boyut ve ortalama puanları ile birlikte aşağıda verilmiştir.

- Siteyi kullanırken teknik desteğe ihtiyaç duyuyorum (Kullanım kolaylığı boyutu, X=2.56).
- Sitenin kullanımını öğrenmek çok zaman alıyor (Kullanım kolaylığı boyutu, X=2.69).
- Siteyi karmaşık buluyorum (Kullanım kolaylığı boyutu, X=2.86).

Öğretmen adaylarının *Web Sitesi Kullanılabilirlik Ölçeği’nden* aldıkları puanların cinsiyete göre anlamlı bir şekilde farklılaşıp farklılaşmadığına Bağımsız Örneklemler için t-Testi ile bakılmıştır. Analiz sonuçları Tablo 3’te verilmiştir.

Tablo 12: Kullanılabilirlik puanlarının cinsiyete göre t-Testi sonuçları

Değişken	Cinsiyet	X	SS	sd	t	p
Gezinme	Kız	35.44	6.54	135	.672	.503
Kolaylığı	Erkek	34.66	6.91			
Tasarım	Kız	25.14	4.99	135	.481	.632

Tablo 4 incelediğinde kullanılabilirlik puanlarının ve alt boyutlarının sınıfa göre anlamlı bir farklılık göstermediği bulunmuştur (p>.05).

SONUÇ VE ÖNERİLER

Uzaktan eğitimde bilgi ve iletişim teknolojilerinin kullanımının artması beraberinde kullanılan bu teknolojilerin öğrenenlerin memnuniyetini karşılamasını getirmiştir. Bu nedenle kullanılan yazılımların, sitelerin, öğrenme yönetim sistemlerinin etkili, verimli ve işlevsel olması gerekmektedir (Kılıç-Çakmak, Güneş, Çiftçi ve Üstündağ, 2011).

Bu araştırmada uzaktan eğitimde kullanılan öğrenme yönetim sistemi Moodle'un kullanılabilirliği araştırılmıştır. Araştırma sonucunda Moodle'un kullanılabilirliğinin orta düzey olduğu bulunmuştur. Bu bulguya göre, Moodle'un arayüz kullanımı orta düzeyde kullanışlılığını göstermektedir. Bir diğer taraftan Moodle'un tasarımının, gezinme, erişim ve kullanım kolaylıklarının kullanıcılar tarafından orta düzeyde kullanılabilir olduğu ifade edilebilir. Literatürde de Moodle'un kullanılabilirliğine yönelik olumlu sonuçların bulunduğu benzer çalışmalar vardır (Arsenovski ve Chungurski, 2008; Çevik, 2010; Kirner, Custódio ve Kirner, 2008). Ayrıca Moodle'un kullanılabilirliği cinsiyet ve sınıf değişkenlerine göre farklılaşmamaktadır. Kullanılabilirlik, doğrudan kullanıcının etkileşimde bulunduğu arayüzlerin kullanım memnuniyeti ile ilgilidir. Dolayısıyla olduğundan Moodle'un kullanılabilirliğinin cinsiyete ve sınıfa göre fark bulunamamıştır.

Gelecekteki çalışmalarda öğrenme yönetim sistemlerinin kullanılabilirliği ile ilgili benzer çalışmalar yürütülebilir. Nicel çalışmaların yanı sıra nitel ve karma çalışmalar yürütülebilir. Kullanılabilirliğin kullanılabilirlik testleri, inceleme ve sorgulama gibi farklı tekniklerle (Gürses, 2006) ölçülmektedir. Bu çalışmada kullanılabilirlik testi tekniği kullanılmıştır. Buna ek olarak, inceleme ve sorgulama teknikleri kullanılarak farklı çalışmalar tasarlanabilir.

ÖZET: İki öğretim programı temel ilkeler, içerik, hedefler, öğrenme-öğretme süreci ve değerlendirme olmak üzere beş boyutta bilimsel süreç becerileri (BSB) açısından karşılaştırılmıştır. Araştırmada nitel araştırma yaklaşımlarından doküman incelemesi ve içerik analizi yöntemleri kullanılmıştır. Çalışmanın sonuçlarına göre temel ilkeler boyutunda her iki öğretim programında da BSB'ye yer verildiği; içerik boyutunda ise her iki öğretim programında da BSB'nin diğer öğrenme alanları ile örüntülü bir şekilde ele alındığı; hedefler boyutunda sadece Fen ve Teknoloji dersi öğretim programında BSB kazanımlarının sınıflandırılarak verildiği ve bazı bilgi kazanımlarıyla eşleştirildiği Fen Bilimleri dersi öğretim programında ise böyle bir durumla karşılaşılmadığı; ancak öğrenme-öğretme sürecinde Fen ve Teknoloji dersi öğretim programında bazı etkinlik örneklerinin BSB kazanımlarıyla eşleştirilse de Fen Bilimleri dersi öğretim programında böyle bir uygulamayla karşılaşılmadığı; değerlendirme boyutunda ise her iki öğretim programında BSB'ye doğrudan yapılan bir atıfla karşılaşılmadığı görülmüştür. Her iki öğretim programında verilen etkinlik örnekleri ve kazanımlardaki BSB vurgularından BSB'nin ihmal edilmediği ama özellikle güncellenen programda BSB vurgusunun daha müphem olduğu sonucuna varılmıştır.

Anahtar sözcükler: Bilimsel Süreç Becerileri**,** Fen Programı, Öğretim Programı

ABSTRACT: A content analysis was made for both curricula in terms of core principles, content, aims, teaching and learning processes, and evaluation for science process skills. Both curricula emphasized reaching the goal of possesing science process skills for all elementary students in their visions. In addition both curricula were interweaved science process skills with other learning domains. In Science and Technology curriculum (2005), mentioned science process skills were also matched with the sample activities in the curriculum document. Science process skills were not emphasized in the evaluation parts of the both curricula. Both curricula highlighted science process skills but the stress was vague in the updated science curriculum (2013).

Key words: Science Process Skills, Science Curriculum, Curriculum

ÖZET: Bu çalışmayla 2013-2014 Eğitim-Öğretim yılında kademeli olarak uygulamaya konulan Fen Bilimleri Dersi Öğretim Programına yönelik lisansüstü öğrencilerinin görüşlerini ortaya çıkarmak amaçlanmıştır. Araştırma, doğası gereği nitel bir çalışma olup, özel durum çalışması yöntemi kullanılmıştır. Nitel araştırmalarda, örneklemi derinlemesine araştırabilmek için örneklem grubu küçük seçilmesi gerektiğinden bu çalışmada amaçlı örnekleme yöntemi tercih edilmiştir. Araştırmanın verileri, lisansüstü öğrenim görmekte olan 5 akademisyen ile yapılan yarı yapılandırılmış mülakatlardan elde edilmiştir. Mülakatlardan elde edilen verilerin analizinde betimsel analiz kullanılmıştır. Araştırma sonunda, katılımcıların yeni Fen Bilimleri Dersi Öğretim Programı'na ilişkin görüşleri incelendiğinde yeni programda kazanımların azaltıldığı, öğretmenin bu programda daha rahat olduğu, öğretim strateji ve yöntemlerine programda fazla yer verilmediği, programın felsefesinin tam olarak ifade edilmediği, öğrencilerin girişimciliğine yönelik ifadelerin yer aldığı ancak onları araştırma sorgulamaya yönlendirmede eksikliklerin olduğu sonucuna ulaşılmıştır. Bu sonuçların aksine lisansüstü öğrencilerinin çoğu yeni öğretim programını daha uygulanabilir bulmuştur.

Anahtar sözcükler: fen bilimleri dersi, öğretim programı, lisansüstü öğrencilerinin görüşleri.

ABSTRACT: This study aims to reveal the opinions of postgraduate students on Science Curriculum which is going to be put in into practice in 2013-2104 school year. This is a qualitative work by the nature of research and case study method is used. Since it is necessary to select a small sample group to be able to do the research profoundly, purposeful sampling is preferred. The data of the research is collected from the semi-structured interviews which are made with 5 academicians. Descriptive analysis is used to evaluate the data from the interviews. When the participants' opinions on the new science curriculum are examined, it is concluded in the passage that the gains are lessened; the teacher is more comfortable with this program, teaching strategies and methods are not given place, the philosophy of the program is not mentioned precisely, there are some expressions about entrepreneurship of the students but there is a lack of orientation for the students. On the contrary to this results, the majority of the graduate students found the new teaching program more applicable.

Key words: science lesson, teaching program, opinions of graduate students.

GİRİŞ

Bireylerin, ülkenin eğitim amaçları kapsamında istenilen düzeye gelebilmeleri için öğretim programları geliştirilmektedir (Demirbaş, 2008). Fakat bu program geliştirme çalışmaları, hızla gelişen bilim ve teknolojiden, toplumsal alandaki gereksinimlerden etkilenmektedir (Gömleksiz, 2007). Bu değişimlerden etkilenen öğretim programlarından biri de fen öğretim programıdır.

Günümüzde eğitim yenilik hareketlerine liderlik eden temaların başında program geliştirme gelmektedir. Dünyadaki birçok program geliştirme çalışmasında öğretme ve öğrenme içeriği tekrar kontrol edilmekle kalmayıp, aynı zamanda öğretim programı teknik bir araç ve süreç olarak algılanmaktadır (Lönnqvist, Horn & Berktay, 2005). Öğretim programlarının gelişimi de hiç bitmeyen bir süreçtir. Bu süreç "planlama, geliştirme, tartışma, uygulama, değerlendirme ve eğitim ortamlarında veya gerçek hayatta öğrenmeyi kolaylaştırmaya dayanan mekanizma ve uygulamaları gözden geçirme" basamaklarından oluşan karmaşık bir döngüyü içermektedir (Crisan, 1993).

Ülkelerin gelişmesinde önemli bir yer tutan fen bilimleri eğitiminin kalitesini arttırmak için sarf edilen çabalar genelde, müfredat programlarını iyileştirme ve bu programların etkinliğini sağlayacak okul ortamları geliştirme üzerine yoğunlaşmaktadır (Ayas, 1995). Eğitim sistemlerine işlerlik kazandıran en önemli unsurun öğretim programları olduğu (Erden, 1998) düşünüldüğünde, dinamik bir yapıya bürünmüş eğitim sistemleriyle uyumlu dinamik öğretim programlarının gerekliliği de kaçınılmazdır. 2004 yılında köklü bir değişimle geliştirilen Fen ve Teknoloji Dersi Öğretim Programı, yapılandırmacı yaklaşıma dayanan, öğrenci merkezli bir programdı. Fen ve teknoloji okur-yazarı olarak yetişen bireyler, bilgiye ulaşmada ve kullanmada, problem çözmede, fen ve teknoloji ile ilgili sorunlar hakkında muhtemel riskleri, faydaları ve mevcut seçenekleri dikkate alarak karar verebilecek ve yeni bilgi üretmede daha etkin olacaktı (TTKB, 2006). Bununla birlikte öğretim programlarının uygulama boyutu ya da içerik yapısı gibi unsurlarından kaynaklanan sorunlar, öğrencilerin fen ve teknoloji okuryazarı olarak yetişmesinin önünde engel olmaktadır (Hobson, 2001). Vizyonda belirtilen fen okur-yazarı birey yetiştirme, 2013-2014 Eğitim-Öğretim yılında uygulamaya konacak olan İlköğretim Kurumları Fen Bilimleri Dersi Öğretim Programı'nın da vizyonunun temelini oluşturmaktadır. Uygulamaya konacak olan yeni programda kazanım sayıları, öğrenme-öğretme stratejileri, bireylere girişimcilik ve kariyer bilinci aşılama gibi konular kapsamında yenilikler getirilmiştir.

Roehrig, Kruse ve Kern. (2007), çalışmasında 27 kimya öğretmeniyle birlikte yürüttüğü çalışmada, öğretmenlerin bilgi ve inançlarıyla okul karakteristiğinin yürürlüğe giren yeniliğe dayalı kimya öğretim programının uygulanmasına olan etkisini incelemeyi amaçlamıştır. Mülakatlar sonucunda elde edilen verilere göre öğretmenlerin genel olarak programdan memnun oldukları ama programın nasıl uygulanması gerektiği konusunda yalnız kaldıkları belirlenmiştir. Gömleksiz (2007) yaptığı çalışmada 2004 yılında uygulamaya konan programın pilot olarak uygulandığı okullarda görev yapan öğretmenlerle, programın uygulanmasına ve etkililiğine ilişkin görüşlerini çeşitli değişkenler açısından incelemiş; programın uygulamada en önemli sorunların öğrenci mevcutlarının fazla olduğunu ve sahip olunan fiziki donanımların yetersiz kaldığını tespit etmiştir. Ayrıca sunulan rehberlik hizmetleri açısından da sıkıntı yaşanıldığı belirlenmiştir. Bununla birlikte öğretmenlerin programa dayalı eğitim ortamında çeşitli sorunlar yaşadıklarını da tespit etmişlerdir. Güneş, Dilek, Hoplan ve Güneş (2011)'in 2004 yılı İlköğretim Fen ve Teknoloji programını, içerik ve uygulama açısından öğretmen görüşlerine göre değerlendirdiği çalışmada; öğretmenlerin dersin deneylerle yürütülmesi düşünmelerine rağmen laboratuvarı nadiren kullandıklarını, ders süresinin yetersiz olmasından dolayı konuları yetiştiremediklerini, programın içeriğinin fazla olduğunu ve öğretmenlerin geleneksel öğretim yöntem ve tekniklerinin dışına çıkmadıklarını belirlemişlerdir. Ayrıca öğretmenlerin 2004 yılı Fen ve Teknoloji dersi öğretim programından pek memnun olmadıklarını da sonucuna ulaşmışlardır. Tüysüz ve Aydın (2009), 312 fen ve teknoloji öğretmeninin programa yönelik görüşlerini likert tipi bir ölçekle belirledikleri çalışma sonucunda, programın bazı avantajlarının yanı sıra kalabalık sınıflarda uygulanmasının oldukça zor olduğu ifade edilmiştir.

Yapılan çalışmalara genel olarak bakıldığında, 2004 yılında yürürlüğe giren programın uygulanma aşamasına yönelik görüşleri ve karşılaşılan zorlukları ortaya çıkarmaya yönelik olduğu görülmektedir. Yapılan bu çalışmada ise belirtilen çalışmalardan farklı olarak veriler, programın uygulanmasına başlamadan önce toplanmıştır. Buradaki amaç, 2013-2014 Eğitim-Öğretim yılında uygulamaya girecek olan yeni programa yönelik, uygulama öncesi bakış açılarını, sorun oluşturabilecek konuları, öğretim programlarından beklentileri ortaya çıkarmak ve ileride yapılacak olan program değerlendirme çalışmalarına içerik kaynağı oluşturmaktır. Bu amaç kapsamında lisansüstü öğrencilerinin görüşlerinin alınmasına gerek duyulmuştur

YÖNTEM

Çalışmada Fen Bilimleri dersi öğretim programına ilişkin akademisyen görüşlerini belirlemek amaçlandığından, özel durum çalışması yöntemi kullanılmıştır. Özel durum çalışması, adından da anlaşılacağı üzere özel bir durum üzerine yoğunlaşmayı sağlayarak kısa sürede araştırılmasına imkân verdiğinden, özellikle bireysel yürütülen çalışmalar için uygundur. Bu tür çalışmalarda genelleme amacı olmamasına rağmen, çalışmanın sonuçları genele ışık tutabilir (Çepni, 2012).

Katılımcılar

Araştırmada bulunan katılımcılar 2013-2014 Eğitim Yılı Bahar Dönemi Karadeniz Teknik Üniversitesi Fatih Eğitim Fakültesi'nde okuyan ve Tablo 1'de yer alan bölümlerde görev alan lisansüstü öğrencilerden seçilmiştir.

Tablo 1. Katılımcıların Lisansüstü Eğitime Yönelik Özellikleri

Katılımcı	Doktora Süreci	Lisansüstü Eğitim Çeşidi	Lisansüstü Eğitim Yapılan Bölüm	Program	Lisansüstü Eğitim Süresi
K1	Ders Aşaması	Doktora	İlköğretim	Fen Eğitimi	2 Dönem
K2	Tez Aşaması	Doktora	İlköğretim	Fen Eğitimi	12 Dönem
K3	Tez Aşaması	Doktora	İlköğretim	Fen Eğitimi	12 Dönem
K4	Ders Aşaması	Doktora	İlköğretim	Fen Eğitimi	6 Dönem
K5	Ders Aşaması	Doktora	İlköğretim	Fen Eğitimi	8 Dönem

Veri Toplama Aracı

Araştırmada veri toplama aracı olarak yarı yapılandırılmış mülakat soruları kullanılmıştır. Katılımcılara yöneltilen sorular; yeni fen bilimleri öğretim programının üniteleri, öğrenci kazanımları, öğrenme - öğretme stratejileri hakkındaki görüşleri, yeni fen bilimleri dersi öğretim programının uygulanabilirliği hakkındaki görüşleri ve eski ile yeni öğretim programı arasında tercih yapma durumunda kalınırsa hangisini tercih edersiniz şeklinde 3 sorudan oluşmaktadır. Yarı yapılandırılmış mülakat soruları her bir katılımcıya ayrı ayrı sorularak ses kayıt cihazı ile kayıt yapılmıştır.

Çalışmada yapılan analizlerin geçerliliği için katılımcılara indirgenmiş veriler okutularak onlardan yanlış veya eksik gördükleri yerleri düzeltmeleri istenmiştir. Kodlama süreci, elde edilen verileri bölümlere ayırmayı, incelemeyi, karşılaştırmayı, kavramsallaştırmayı ve ilişkilendirmeyi gerektirir (Strauss ve Corbin, 1990). Kodlamalar yapıldıktan sonra aynı veriler bir başka araştırmacıya da kodlattırılmıştır. Daha sonra iki araştırmacının kodları karşılaştırılarak görüş ayrılıkları ve görüş birlikleri belirlenmiştir. Kodlama güvenirliği, Görüş Birliği/(Görüş Birliği + Görüş Ayrılığı) (Miles & Huberman, 1994) formülü yardımıyla hesaplanmış ve güvenirlik katsayısı 0.84 bulunmuştur. Kodlar belirlendikten sonra her bir mülakat sorusu için kod listesi oluşturulmuştur. Analizler sonucu ortak kodlar oluşturulmuş ve bu kodlar göz önünde bulundurularak temalar ortaya çıkarılmıştır. Verilerin analizinden sonra lisansüstü öğrencilerinin YFBÖP'na ilişkin lisansüstü öğrencilerinin görüşleri matrislerle şematize edilmiştir. Daha sonra oluşturulan bu tablo ve şema yorumlanarak her bir tema ile ilgili verilerden örnekler verilmiştir.

BULGULAR

Şekil 1. YFBÖP'na İlişkin Görüşlerin Tema ve Kodları

Şekil 1'de lisansüstü öğrencilerinin YFBÖP'na ilişkin görüşlerinin tema ve kodları verilmiştir. Katılımcıların YFBÖP'na içeriğine yönelik görüşlerini ifade ettikleri, olumlu ve olumsuz yönlerini belirttikleri ve ilk tema olan YFBÖP içeriği toplam 16 koddan oluşmaktır. İkinci tema ise programın uygulanabilirliğidir. Bu temada katılımcıların 2013-2014 eğitim-öğretim yılında uygulamaya konulan olan YFBÖP'nın uygulanabilirliği irdelenmiştir. Bu temada bütün katılımcıların YFBÖP'nın uygulanabilir olduğunu belirttikleri görülmektedir. Son tema ise, katılımcıların belirttikleri düşünceler doğrultusunda hangi programı tercih edeceklerine yönelik olup program tercihi başlığında ifade edilmiştir

YFBÖP'nin içerik temasına ait bulgulara bakıldığında katılımcıların olumlu ve olumsuz görüşlere sahip olduğu görülmektedir. Katılımcıların içerik bağlamında olumlu görüşleri "*kazanımların sadeliği, öğretmen ve öğrencilerin serbestliği, araştıran-sorgulayan bireylerin olması, öğrenci seviyesine uygunluk, girişimcilik, sosyo-bilimsel konuların ve bilimin doğasının varlığı"* şeklindedir. Olumsuz görüşlere ait kodlar ise " *basitleştirilmiş içerik, konuların azlığı, geleneksel yaklaşım, konu listesi şeklinde olması, öğrenilenlerin tekrarı niteliği, öğretim stratejilerinin eksikliği"* şeklindedir. Bu bağlamda bazı katılımcıların görüşlerine aşağıda yer verilmiştir:

> K_1: *Öğretme ve öğrenme stratejilerine baktığım zaman daha çok eskiye dönüş yani* ***geleneksel yaklaşıma dönüş*** *olduğunu fark ediyorum.* ***Öğretmenin rolü artırılmış****. Öğrencinin yükü hafifletilmiş.*
> K_2:***Kazanım sayılarında büyük oranda bir azalma*** *olmuş. Belki de bu programın en önemli değişikliklerinden birisi de FTTÇ alanında yapılmıştır. Özellikle* ***girişimcilik*** *var. Ondan sonra* ***bilimin doğası*** *var.* ***Sosyo-bilimsel konular*** *var.*

Katılımcıların yeni programın uygulanabilirlik temasına ait kodları incelendiğinde, hepsinin programın uygulanabilirliği hakkında olumlu görüşe sahip olduğu görülmektedir. Ancak katılımcılardan her biri, farklı sebeplerden dolayı "*programın kullanışlılığı, öğretmen merkezli yaklaşımı benimsemiş olması, eski programın özeti niteliğinde olması, verimli olamayacağı düşüncesi ve öğretmenlerin mesleki deneyiminin önemi bağlı olması"* şeklinde görüşlerini belirtmiştir. Aşağıda bazı katılımcıların programın uygulanabilirliğine ait görüşleri yer almaktadır.

> K_2: *Onun için genel itibariyle yeni neslin özellikle mesleki deneyimi* ***5 yılı 10 yılı geçmeyen öğretmenlerin*** *bu programı rahatlıkla uygulayabileceğini ama özellikle kıdem yılı 15in üzerinde olan öğretmenlerin uygulayabileceğini pek zannetmiyorum.*
> K_1: *Yeni öğretim programı bence eski programa göre* ***daha kullanışlı. Uygulanabilirliğinin yüksek*** *olduğunu düşünüyorum.*

Son olarak, katılımcılardan yaptığı bütün yorumlara göre, eski ve yeni program arasından hangisini tercih edeceği sorulmuştur. Bu bağlamda 3 katılımcı yeni öğretim programını tercih ederken 2 katılımcı eski öğretim programını tercih etmektedir. Yeni öğretim programını tercih eden katılımcılar bunun sebebini, *kazanımların azlığı, sürenin yeterli ve etkin kullanılabilmesi, öğrenme kolaylığı, sınıfa hâkimiyetin kolaylığı, öğretmenin rahat hareket edebilmesi, öğrencilerde girişimciliğin ön plana çıkarılmış olması ve öğrencileri proje geliştirmeye yönlendiriyor olması* şeklinde açıklamıştır. Eski programı tercih eden katılımcılar ise tercih sebeplerini; *öğrenci merkezli olması, öğretmene rehber olması, uygulanabilirliğinin daha yüksek olması ve öğrencileri araştırmaya yönlendiriyor olması* şeklinde açıklamıştır. Bu bağlamda bazı katılımcıların eski ve yeni öğretim programı hakkındaki yorumlarına aşağıda yer verilmiştir:

> *K2: Şimdiden* ***proje geliştirmeye, girişimci olmaya*** *yöneltilen öğrencilerin ileride problemlere daha rahat çözüm bulacağını düşünüyorum. Bu yüzden yeni programı tercih ederim.*
> *K_3:Bir önceki (2004 yılı) olanı tercih ederim. Eğer bizi ileriye götürecek,* ***alternatif düşünebilen, kritik edebilen, fen-teknoloji icat edebilen, yeni bir şey ortaya koyabilen, yapılanı kopyalamayan, girişimci olan, aklı başında gençler yetiştirmek*** *istiyorsak bunun programı bu değil bence.*

SONUÇ

Çalışmada YFBÖP'nin içeriğine yönelik sonuçlar incelendiğinde, bu programın, basitleştirilmiş içeriğe, eski öğretim programı ile aynı felsefeye sahip olduğuna, programın içeriğinin konu listesi şeklinde yer aldığına, öğretim stratejileri bağlamında eksiklikler olduğuna, öğretmen ve öğrencinin bu programa göre daha esnek davranabilme fırsatı tanıdığına, programda yer alan konuların birleştirilerek azaltıldığına, bu konuların öğrenci seviyesine uygun olduğuna, öğrencileri araştırma-sorgulamaya ve girişimciliğe yönlendirme konusunda çabaların yer aldığına ilişkin sonuçlara ulaşılmıştır. Ayrıca bu programda yer alan konuların sosyo-bilimsel konular ve bilimin doğasına yönelik konular olduğu ifade edilmiştir. Benzer şekilde Gömleksiz (2007)'nin 2004 yılında kabul edilen öğretim programı hakkında öğretmenlerin görüşlerini alarak yürüttüğü çalışmasında, öğretim programında öğrencilerin bireysel farklılıklarının dikkate alındığı bulgusu belirlenmiştir. Burada

Gömleksiz, programın özelliklerinden ziyade, öğretmenlerin programa yönelik inançlarının olumlu olması ve programı en iyi şekilde uygulayabilmesinin daha önemli olduğunu ifade etmiştir. Roehrig vd. (2007) 'nin kimya öğretmenleriyle yürüttüğü çalışmada öğretim programının öğretmenlere liderlik etmesi ve programı nasıl uygulayacaklarını göstermesi gerektiğini belirtmiştir. Katılımcıların YFBÖP'nin öğretmene rehberlik etmediğini düşündükleri belirlenmiştir.

Ayrıca katılımcıların bir kısmı yeni öğretim programını uygulanabilirliğine ait olumlu görüşlere sahipken bazıları ise yeni programın, eski öğretim programının özeti şeklinde olduğunu düşünmektedir. Bu bağlamda katılımcılar öğretim programının uygulanabilirliği paralelinde program tercihlerini ifade etmişlerdir. Benzer şekilde Gömleksiz (2007)'nin çalışmasında yeni programın etkili biçimde uygulanması ve istenilen verimin alınması öğretmenlerin programı tanımalarına, benimsemelerine bağlı olduğu görülmektedir.
Sonuç olarak lisansüstü öğrencilerinin YFBÖP'ye ilişkin görüşleri incelendiğinde yeni programda kazanımların azaltıldığı, öğretmenin bu programda daha rahat olacağına inanıldığı, öğretim strateji ve yöntemlerine programda fazla yer verilmediği, programın felsefesinin tam olarak ifade edilmediği, öğrencilerin girişimciliğine yönelik ifadelerin yer aldığı ancak onları araştırma sorgulamaya yönlendirmede eksiklilerin olabileceği konusunda bulgulara ulaşılmıştır. Ancak çalışmaya katılan lisansüstü öğrencilerinin tamamı yeni öğretim programını daha uygulanabilir bulmuştur.

ÖNERİLER

Lisansüstü öğrencilerinin yeni fen bilimleri öğretim programına ilişkin görüşlerinin belirlendiği bu çalışma beş katılımcıyla yürütülmüştür. Bu bağlamda katılımcı sayısının arttırılarak görüşlerde oluşabilecek muhtemel farklılıklar daha derinlemesine irdelenmelidir. Ayrıca farklı demografik değişkenler ve çalışma gruplarıyla benzer çalışmalar yürütülmelidir. Program uygulama sürecine girdikten sonra, programla daha çok muhatap olan öğretmenler, öğrenciler, idareciler ve velilerin görüşlerini belirlemeye yönelik çalışmalar yürütülmelidir.

ÖZET: Bu araştırmanın amacı; 2013 öğretim yılından itibaren uygulamaya konulan fen bilimleri dersi 3. 4. 5. 6. 7. ve 8. sınıf öğretim programına göre, 2013-2014 öğretim yılında hazırlanan 5.sınıf Fen Bilimleri ders kitabına ilişkin öğretmen görüşlerini belirlemektir. Araştırmanın çalışma grubunu Aydın, Zonguldak, Bartın, Kayseri ve Konya'da görev yapmakta olan 22 adet Fen Bilgisi öğretmeni oluşturmaktadır. Araştırmanın verileri için açık uçlu sorulardan oluşan yapılandırılmış bir görüşme formu kullanılmıştır. Araştırma sonuçlarına göre, çalışmaya katılan öğretmenlerin çoğu kitabın kazanımlarla uyumlu olduğunu ve görsel tasarımın öğrenci seviyesine uygun olduğunu düşünmektedir.

Anahtar sözcükler: ilköğretim, fen bilgisi eğitimi, konu alanı ders kitabı incelemesi

ABSTRACT: Aim of the present study was to determine teachers' opinions about 5th grade science textbook which is based on 3. 4. 5. 6. 7. 8. grade science curriculum. The participants of the study were twenty two science teachers who work in Aydın, Zonguldak, Bartın, Kayseri and Konya. Interview form which included open-ended questions was used to collect data. The result of the study reveals that most of the participants think the course book is consistent with outcomes and visual design of the book is appropriate to the student level.

ÖZET: Matematikte kavramlar ve kavramlara ait tanımlar kavramın öğrenilmesinde önemli rol oynar. Tanımlar bireyler tarafından birbirlerinden farklı olarak kurulabilir, bu da bireyin kavram hakkındaki kişisel düşüncelerini ve deneyimlerini veya kavram imgelerini yansıtmaya daha yakındır. Burada kavram imgesi bir kavramla ilgili bilişsel yapının tamamını içerir. Bu durum da öğrencilerinin geometrik kavramlara ilişkin öğrenmelerinin nasıl gerçekleştiği hakkında bilgi verebilir.

Bu araştırmada 8. Sınıf öğrencilerinin geometrik cisimlere ilişkin kavram imgelerinin neler olduğunu ortaya çıkarmak amaçlanmıştır. Amaçlı örnekleme yöntemi ile 5 farklı ortaokuldan farklı başarı düzeylerine göre belirlenen 20 öğrenciyle yarı yapılandırılmış görüşme yapılmıştır. Görüşme, geometrik cisimleri tanımlatan sorular ve görsel olarak tanımayı içeren sorulardan oluşmaktadır. Araştırmada elde edilen verilerin analizinde içerik analiz tekniği kullanılmıştır. Bu yöntemle elde edilen veriler belirlenen temalar çerçevesinde analiz edilmiş olup frekansları sunulmuştur.

Elde edilen bulgulara göre öğrencilerin formal tanımlardan çok uzak oldukları, prizma ve piramitlerde yüzey özelliklerinin imgelerde ön plana çıktığı bulunmuştur. Bazı öğrencilerin ise çevredeki nesneleri kullanarak tarif ettikleri tespit edilmiştir. Ayrıca cisimlerde öğrencilerin kavram imgelerine yön veren aşırı genellemelere sebep olan yanılgılar da bulunmuştur. Sonuç olarak cisimlerin öğretiminde yol gösterici ipuçlarına ulaşılmıştır.

Anahtar sözcükler: geometrik cisimler, kavram imgesi, geometri öğretimi

ABSTRACT: In mathematics, concepts and concept definitions play an important role in learning. Definitions can be established different by individuals. This is close to reflect their personal thought and experience about the concept or concept image. Here, the meaning of the concept image is that includes all the cognitive structure about it. So, this can give information about how children learn geometric concepts.

The purpose of this study was to investigate 8th students' concept images of solids. It was conducted with 20 students chosen by purposive sampling method. These students who were different academic levels, attending 5 different schools. The data were collected by semi-structured interview. During the interviews, the students were asked about definition of solids and visual recognition of them. The collected data were analyzed by content analysis. Based on the content analysis, the themes that each participant used, were determined and then presented in frequencies.

From the findings were determined that participants were far from the formal definition. Properties of solids' surface had been found to come forward in the image of prisms and pyramids. Some participants described the solids by using everyday objects. In addition, misconceptions lead to over generalization and giving direction to image had been also found. As a result, some teaching implications about solids were raised.

Key words: Solids, concept image, teaching geometry

TEACHER VIEWS ON STUDENTS' MISTAKES AND MISCONCEPTIONS: EQUATION EXAMPLE

Doç. Dr. Ramazan GÜRBÜZ
Adıyaman Üniversitesi

Zeynep ÇAVUŞ ERDEM
MEB

ABSTRACT: Theaim of this study is to examine the opinions of teachers on students' misconceptions and mistakes about equation. For this purpose, semi-structured interviews related to the causes of errors and mistakes in equations and removing those were conducted with six teachers who work in six different middle schools in a city. Descriptive analysis technique was used to analyze the interviews. After the analyses , it has been determined that teachers associate students' mistakes and misconceptions with teaching methods, lack of time and the students' faulty learning and that they tried to have students memorize the solutions of math problems, instead of focusing on the cognitive structure constituting the source of the problems.

ABSTRACT: The aim of this study is to reveal the way used the people who aren't studying mathematics to solve the mathematical problems encountered in daily life. The study is a case study used in qualitative research. The study group consisted of 4 adults who never went to school and 4 students who went first grade primary school. Data was collected through unstructured interviews. Content analysis was used to analyze the data. The results observed that the adult individuals solved the math problems encountered in daily life by one to one matching, trial and error, taking any number as reference, grouping etc. Also it was seen that children of primary school age solved problems by grouping and matching. It is suggested that the practical methods resulting from research should be added to the primary and secondary school mathematics curriculum and then different thinking techniques should be gained for students in math.

Key words: Daily mathematics, mathematics education.

DYSLEXİA AND DİFFİCULTİES İN MATHEMATİCS

Goran NEDOVİC,

Ivana SRETENOVİC

Dyslexia is a permanent disorder of written language, specifically in acquiring reading and writing, and computing. Children with dyslexia have difficulty in decoding and understanding the symbols of written language, and in the mathematics this is transferred to the numerical symbols, mathematical operations with symbols and understanding of mathematical language.

This paper presents examples of difficulties in mathematics that children with dyslexia may have. Because of the difficulty in reading and understanding the instructions and tasks presented with words, the child often does not solve the problem or can not learn a new concept, as it is not able to read instructions from a collection of tasks. The next difficulty is reflected in the poor understanding of mathematical vocabulary. In fact, many children with dyslexia have poor vocabulary of general terms and it is difficult to master specific mathematical vocabulary. Then, there are difficulties in adopting the concept of numbers and relationships among numbers and difficulties in the use of number sequence, difficulty in remembering and automation and reproduction of all types of numerical sequences, difficulty in learning, in memory and in reproduction of arithmetic tables, rotation, inversion, omission and addition of digits in numbers, and the difficulties in adopting the visual appearance of individual symbols. Procedural errors in simple arithmetic are consequence of the difficulties in learning, memory and reproduction sequence of procedures in the algorithms.

Difficulties which in mathematics have children with dyslexia can be removed by using custom methods. When a student has a good teacher who knows mathematics, methods of work and the nature of the child's difficulties, problems begin to slowly disappear.

ÖZET: Bu çalışma, 6. sınıf matematik dersinde probleme dayalı öğrenme yaklaşımının matematiğe ilişkin tutuma etkisini ortaya çıkartmak amacıyla yapılmıştır. Araştırmanın çalışma grubunu Düzce ili İsmetpaşa İlköğretim okuluna devam eden 79 altıncı sınıf öğrencisi oluşturmuştur. Araştırma, ön test-son test kontrol gruplu deneme modelinde tasarlanmıştır. Veri toplama aracı olarak "Matematiğe Yönelik Tutum Ölçeği" uygulanmıştır. Araştırmada tutum ölçeğinden elde edilen veriler kovaryans analizi ile sınanmış ve anlamlılık düzeyi p<.05 olarak alınmıştır. Araştırma sonunda elde edilen verilere göre, tutum ölçeği son test puanları açısından deney grubu lehine anlamlı bir fark bulunmuştur. Bu bağlamda, probleme dayalı öğrenme tekniğinin matematiğe yönelik olumlu tutum geliştirmeye fayda sağladığı sonucuna ulaşılmıştır.

Anahtar sözcükler: matematik öğretimi, matematiğe yönelik tutum, probleme dayalı öğrenme

ABSTRACT: This study aims to find out how problem based learning approach effects on the attitudes of sixth grade mathematics students. The study has been conducted in İsmetpaşa Primary school in the district of Düzce with 79 students. The courses have been taught by the researcher both in experimental and control group. "Mathematics Attitude Scale" developed by Baykul (1990) have been administered at the beginning of the study as pre-test, at the end of the study as post-test to both experimental and control groups. Covariance analysis has been conducted on the data obtained from the attitude scale. The level of significance has been taken p<.05. Regarding the findings obtained from the "Mathematics Attitude Scale", there has been a significant difference among the groups in favour of the experimental group. Students stated that they found the courses more interesting and different, so they loved the course. They performed enduring learning with the real life stories and they were more motivated to be involved in the courses. They also added that this technique has enabled them to communicate well with their friends and to help each other.

Key words: mathematics education, mathematics attitudes, problem based leaning

GİRİŞ

Matematik, yapı ve bağıntılar yoluyla genellemelere ulaşan soyut bir kavramdır. Bu bağlamda, soyut kavramların kazanılmasının zor olması ve sınıf içi etkinliklerde matematiksel problemlere yönelik öğrencilerin aktif bir tutum sergileyememeleri matematiğe karşı olumsuz tutumlara neden olmaktadır. Ancak, özellikle son yıllarda yapılandırmacı öğrenme yaklaşımları ile birlikte öğretmen odaklı klasik öğrenme süreçleri yerini aktif katılımın sağlandığı, bilgiyi elde etme ve bilgiyi kullanma becerilerinin önem kazandığı, sürece odaklı bir matematik eğitimi anlayışına bırakmıştır. Ülkemizde, 2005 ilköğretim matematik öğretim programında, öğrencilerin bireysel farklılıklarına, ilgilerine ve ihtiyaçlarına cevap vermeyi amaçlayan yöntem ve tekniklerle aktif öğrenme yaşantılarının hazırlanması gerekliliği vurgulanmaktadır (MEB, 2009). Bu kapsamda, yapılandırmacı yaklaşımın alt dallarından birisi olan Probleme Dayalı Öğrenme (PDÖ) yaklaşımları büyük önem taşımaktadır. Probleme dayalı öğrenme öğrenci merkezli ve etkin öğrenmeyi geliştiren öğretimsel bir yöntemdir. Problemin çözümü ya da anlaşılması yoluyla uygulama sürecinden sonuç çıkaran bir öğrenmedir. Probleme dayalı öğrenme modeli öğrencilerde sorumluluk duygusunu artırırken matematiğe karşı olumlu tutumların oluşmasın da öncülük eder (CIDR, 2004).

[1] Bu çalışma Gülcan Uyar'ın yüksek lisans tezinden üretilmiştir.

İlgili literatür incelendiğinde yapılan çalışmaların genelde probleme dayalı öğrenme yaklaşımı ile akademik başarı değişkeni arasındaki bağa odaklandığı görülmektedir. (Akın, 2006; Ayvacı, 2011; Elshafei, 1999; Eski, 2011; Günhan, 2006; Polanco, Calderon ve Delgado, 2004; Özdil, 2011; Özgen, 2007; Özgen ve Pesen, 2008; Uslu, 2006; Usta, 2013). Ancak, tutuma yönelik olarak ise sınırlı sayıda çalışma göze çarpmaktadır (Günhan, 2006; Özgen, 2007; Özdil, 2011). Bu kapsamda, Günhan (2006) araştırmasında Probleme Dayalı Öğrenme yönteminin 7. sınıf öğrencilerinin matematiğe yönelik tutumları ve akademik başarıları üzerindeki etkilerini incelemiştir. Deneysel olarak tasarlanan araştırmanın sonunda, Günhan, probleme dayalı öğrenme yaklaşımının öğrencilerde matematiğe yönelik olumlu tutumlar oluşturduğunu ve akademik başarılarını arttırdığını ortaya çıkarmıştır. Benzer şekilde Özgen (2007) de yaptığı araştırmada probleme dayalı öğrenme yaklaşımlarının öğrencilerin akademik başarısı, matematik dersine yönelik tutumları ve hatırda tutma düzeyleri üzerindeki etkisini incelemiştir. Araştırmanın sonucunda; probleme dayalı öğrenme yaklaşımının, öğrencilerin; akademik başarı düzeylerini arttırdığı, matematik dersine yönelik tutum düzeylerinin yükseldiği bulgusuna ulaşılmıştır.

Yukarıdaki bilgilerden de açıkça görüldüğü gibi, probleme dayalı öğrenme yaklaşımı ile ilgili yapılan çalışmaların genelde akademik başarı değişkeni üzerine odaklandığı ve tutuma yönelik çalışmaların ise sınırlı düzeyde olduğu görülmektedir. Bu olgudan yola çıkarak bu çalışma ile 6. sınıf matematik dersinde probleme dayalı öğrenme yaklaşımının matematiğe ilişkin tutuma etkisi irdelenmeye çalışılmıştır.

YÖNTEM

Bu araştırma ön test-son test kontrol gruplu yarı deneysel modele göre tasarlanmıştır. Deney grubunda probleme dayalı öğrenme yöntemi, kontrol grubunda ise mevcut yöntem kullanılmıştır. Araştırmanın çalışma evrenini Düzce ilinde bulunan altıncı sınıf öğrencileri oluşturmaktadır. Çalışma grubunu ise aynı bölgede bulunan İsmet Paşa İlköğretim Okulu altıncı sınıf öğrencileri oluşturmaktadır. Bu grupların çalışma grupları olarak alınmasında; kişisel bağımsız değişkenlerden olan cinsiyet ve anne-baba öğrenim düzeyinin bu sınıflarda homojen olarak bulunması etkili olmuştur. Uygulama yapılan ilköğretim okulunun altıncı sınıfından iki derslikte okuyan 79 öğrenci, deney (39) ve kontrol (40) gruplarını oluşturmuştur.

Veri toplama aracı olarak Baykul'un (1990) geliştirdiği "Matematik Tutum Ölçeği" öğrencilerin matematiğe ilişkin tutumlarını ölçmede kullanılmıştır. Yapılan faktör analizi sonuçlarına göre, tek faktörle açıklanabilen ölçeğin varyans oranı 0,56 olarak bulunmuştur.

Verilerin analizinde öğrencilerin tutum ölçeği öntest puanlarına göre düzeltilmiş sontest ortalama puanları arasında farklılaşma olup olmadığı gerekli ön varsayımlar sağlandıktan sonra kovaryans analizi ile test edilmiştir.

BULGULAR

Araştırmada probleme dayalı öğrenme yaklaşımının uygulandığı deney grubu ile mevcut öğretimin uygulandığı kontrol grubundaki öğrencilerin, matematiğe yönelik tutumları ön puanları kontrol altına alındığında, son puanları arasında deney grubu lehine anlamlı bir farklılık olup olmadığına ilişkin bulgular bölümde yer almaktadır. Buna göre deney ve kontrol gruplarında yer alan öğrencilerin matematiğe yönelik tutum ölçeğinden aldıkları ön puan ve son puanlarına ilişkin aritmetik ortalama, standart sapma değerleri, son test düzeltilmiş ortalama puanları ile standart hata değerleri Tablo 1'de verilmiştir.

Tablo 1. Deney ve Kontrol Gruplarında Yer Alan Öğrencilerin Matematik Dersine Yönelik Tutum Ölçeğinden Aldıkları Ön Puan ve Son Puanların Ortalamaları, Düzeltilmiş Ortalamaları ve Standart Hata Değerleri

Gruplar	N		Toplam Puanlar		Düzeltilmiş Son test Ortalamaları	
			□	SS	□d	SH
Deney	39	Öntest	81.33	9.04	92.05	1.30
		Sontest	92.16	7.24		
Kontrol	40	Öntest	80.28	8.38	81.52	1.24
		Sontest	81.43	8.44		

Tablo 1 incelendiğinde, matematik dersine ilişkin tutum ölçeği son puanlarının ön puanlarına göre deney ve kontrol gruplarında yükseldiği görülmektedir. Düzeltilmiş son ortalama puanları deney grubunun 92.05, kontrol grubunun ise 81.52'dir. Gözlenen bu farkın anlamlı olup olmadığını test etmek için kovaryans analizi uygulanmış, elde edilen sonuçlar Tablo 2'de verilmiştir.

Tablo 2. Deney ve Kontrol Gruplarında Yer Alan Öğrencilerin Matematik Dersine İlişkin Tutum Ölçeği Son Puanlarının Kovaryans Analizi Sonuçları

Varyansın Kaynağı	Kareler Toplamı	Sd	Kareler Ortalaması	F	p
Kontrol Edilen Değişken (Öntest)	102.379	1	102.379	1.66	.201
Gruplama Ana Etkisi	2112.644	1	1056.322	34.28	.000
Hata	4560.423	74	61.627		
TOPLAM	6878.701	77			

Tablo 2 incelendiğinde görüldüğü gibi, kovaryans analizi sonuçları ön puanları kontrol altına alındığında, son düzeltilmiş ortalama puanları açısından gruplama ana etkisinin anlamlı bir farkın olduğu bulunmuştur ($F(1,74)=34.28$; $p<.01$). Matematiğe yönelik tutum ölçeğinden elde edilen bulgular, son puanlar açısından deney grubu lehine anlamlı bir fark olduğunu göstermektedir.

TARTIŞMA, SONUÇ VE ÖNERİLER

Probleme dayalı öğrenme yönteminin altıncı sınıf öğrencilerinin matematiğe yönelik tutuma etkisini belirlemek amacıyla, deney ve kontrol gruplarının ön tutum - son tutum toplam puanları üzerinde istatistiksel işlem olarak kovaryans analizinden yararlanılmıştır. Yapılan kovaryans analizi sonuçları ön puanları kontrol altına alındığında, son düzeltilmiş ortalama puanları açısından gruplama ana etkisinin anlamlı bir farkın olduğu bulunmuştur. Matematiğe yönelik tutum ölçeğinden elde edilen bulgular, son puanlar açısından deney grubu lehine anlamlı bir fark olduğunu göstermektedir. Araştırmadan elde edilen bu sonuç, literatürdeki diğer çalışma bulgularıyla da paralellik göstermektedir (Aka, 2012; Biber, 2012; Gülcan, 2006; Karataş, 2008; Özdil, 2011; Özgen, 2007; Uslu, 2006; Usta, 2013).

Günhan (2006) probleme dayalı öğrenmenin öğrencilerin matematiğe yönelik tutumlarına etkisini incelediği çalışmanın soncunda, bu yöntemin öğrencilerin matematiğe yönelik tutumlarını olumlu yönde arttırdığını ortaya koymuştur. Özgen de (2007) yaptığı araştırmanın sonucunda; matematik eğitiminde probleme dayalı öğrenme yaklaşımının, öğrencilerin; matematik dersine yönelik tutum düzeylerini yükselttiği sonucuna ulaşmıştır. Hmelo-Silver (2004) probleme dayalı öğrenme stratejisi kullanarak yaptıkları çalışmalarında yöntemin içsel motivasyonları yüksek tutmayı arttıracak yönde etki sağladığını söylemektedirler.

Bu araştırmada, probleme dayalı öğrenme tekniğinin matematik dersine yönelik tutuma olan etkisi incelenmiştir. Yapılacak benzer çalışmalarla da bu yöntemin farklı duyuşsal özellikler (hatırda tutma, demokratik tutumlar, matematik kaygısı vb.) üzerinde etkili olup olmadığı araştırılabilir.

ÖZET: İçinde yaşadığımız dünya 3 boyutlu iken görüntüleme ekranı ise 2 boyutlu bir düzlemdir. Üç boyutlu nesnelerin, iki boyutlu bir yüzeyde(düzlemde) gösterebilmemiz için Perpektif çizim teknikleri kullanılmaktadır. 8. Sınıf Matematik Öğretim Programına göre, geometri öğrenme alanının izdüşüm alt öğrenme alanında “Bir küpün, bir prizmanın belli bir mesafeden görünümünün perspektif çizimini yapar” kazanımı yer almaktadır (MEB, 2013). Bu çalışmada 8. sınıf öğrencilerine kübün ve prizmanın perspektif çizimlerinin sınıf içinde etkinliklerle verilmesinin ardından öğrencileri değerlendirmek amaçlı günlük hayat uygulaması içeren bir Webquest uygulandı. Webquestler, öğrencilerin etkileşim içinde oldukları, gerekli bilgilerin bir bölümünü ve ya tamamını internet kaynaklarından elde ettiği araştırmaya dayalı bir aktivitedir (Dodge, 1997). Bu çalışmada kullanılan Webquest, perspektif çizim kazanımlarını içermektedir. Öğrencilerin 3-4 kişilik gruplar halinde çalışarak verilen görevleri tamamlamaları istendi. Öğretmenin araştırmacı olduğu aksiyon(eylem) araştırması deseninde yürütülen bu çalışmadan elde edilen sonuçlar sunumda paylaşılacaktır.

Anahtar sözcükler: perspektif çizim, Webquest, 8. sınıf öğrencileri

ABSTRACT: While the world, we live in, is three-dimensional, display screen is a two-dimensional plane. Perspective drawing techniques are used because of the three-dimensional object to be able to show a two-dimensional surface(plane). According to the 8th Grade Mathematics Curriculum, in the projection field of sub-learning of geometry learning area "students make the perspective drawing of a cube, a prism of the view from a distance" gain is located(MEB, 2013). In this study, the 8th grade students in the class of perspective drawings of cubes and prisms were provided with activity. Then a Webquest containing the daily life application was applied for assessing the students. Webquests is an activity based on the research that students to interact and all of the required information obtained from internet sources(Dodge, 1997). Webquest used in this study, include gains of perspective drawing. Working groups of 3-4 students were asked to complete the task. The results obtained from this study that action (action) research conducted in the pattern, teachers as researchers, will be shared in the presentation.

Key words: perspective drawing, Webquest, 8th grade students.

ABSTRACT: There is a tendency to see a new development in the field of ICT-s, and possibly taking advantages of this new technology can be brought to social work. Social work faces a critical need to incorporate ICTs into training social workers, delivering social work services, and the conduct of social work research. The increasing use of ICTs in social work raises some new questions in relation with confidentiality, privacy and data security. Regardless of the level of practice, ICTs will continue influencing the careers of social workers and the clients they serve. Social workers recognize the central importance of human relationships but in the same time social workers need to have an understanding of the roles that such ICTs may play in the lives of their clients. This paper also identifies potential pitfalls and challenges with respect to the adoption of ICT, with recommendations for advancing their use in practice, education. Social workers also need ICT competencies in order to effectively lead different types of social change initiatives or collaborate with professionals of other disciplines who are using ICTs as part of existing strategies.

Key words: ICT, social work, practice, ethic

INTRODUCTION

The term technology refers to the practical application of scientific knowledge, defined as “any electronically mediated activity” used by social workers in the administration and evaluation of social services. We already noted that the ICT has multiple policy objectives, including: increasing accountability, transparency, delivering better management and standardization of good practice. This paper aims to represent how technology can be used in social work practice and the ethical issues. Furthermore, the objective of this study is to identify how these issues can be exceed and the service be effective and secure.

LITERATURE REVIEW

Every aspect of human life today is affected by information and communication technology (ICT) and the future even promises more transformations (Tregeagle &Darcy, 2008; Lahlou, 2008). Technology has played and continue to play a significant role in social work. practice.
Taylor describes four other uses of computers:

- Billing systems – including billing third-party payers and figuring the payroll
- Word processing –including storing progress notes and printing personalised fund raising letters
- Decision support – forecasting future services or budget needs and
- Specialized uses –e.g. scoring personality tests, conducting client assessment interviews.

The council of Social Work in Education 2008 recognise the importance of technology to social work practice and education. Many social services agencies now use computers to increase the efficiency and utility of their information systems Management –information systems for social service organizations are basic to good evaluation. A good management information system should make a sense to the social worker, administrator and the researcher.

Without technology, social work practice today would be ineffective. According to European perspective there are identified a number of challenges in the context of restructuring of public social services and Ict will be an effective instrument for these modern services.

Social work educators need to be capable with ICT in order to design activities, projects that reflect the real-world use of ICT. Beyond higher education, continuing education opportunities respond to recent technology advances which are also necessary in order to help social workers to stay in current with the most relevant and useful technologies. Other disciplines have recognized the importance of ICT and consider it to be important for professional development. One of the dangers of a technology-led approach is that social work need to be understood primarily in the light of the aims of ICT developers, and evaluated in their terms.
Darcy (2008) acknowledge the importance of technology in social work; , about the deployment of ICT in modern welfare practice serves the interests of social work managers and administrators more than the mission of the profession, especially and more importantly the interests of service users.

The most important, is that they should always refer to the NASW Code of Ethics and the NASW/ASWB Standards for Technology and Social Work Practice for guidance in the deployment of technology in practice. Ethical considerations for ICT related issues first appeared under the topic ''Information ethics'' in the Annual Review of Information Science and Technology in 1992. Individuals and organisations therefore be aware for the emergency need to be ethically sensitive as they deploy ICT on their operations. This new development of on line services, offers a lot of advantages to service user in the same time various ethical dilemmas become apparent as we try to define the limits of confidentiality in   social work. One of the most important is the right of service users to privacy means that securing the confidentiality of personal records.

THE IMPACT OF ICT IN THE RELATION SERVICE USER –SOCIAL WORKER

Such interactions or Internet services may be question-and-answer chats, emails about appointments, which may be very helpful to home-bound clients with debilitating illnesses, elderly, women's with babies etc. We know that social work is an imperative work that has a significant emotional content working face to face with service users who may be distressed, angry or otherwise disturbing in their presentation. There is a evidence whom ICT has affected the relation between social workers and services users. Parton (2008), opinion is that technology has made social work more "informational" and less "social" (p. 253), applying technology to practice is good, but one should remember that technology does not care for people, technology is just a tool one utilizes to facilitate care or service delivery.

In some studies are tracked patterns of communication within online groups, and have found that many of the processes used are the same as those used in face-to-face self-help groups (Finn, 1999; Perron, 2002; Salem, Bogat, & Reid, 1997). Given the prevalence of online relationships, social workers and other human service professionals must be aware of the positive (e.g., social support, see Perron, 2002), and negative effects (e.g., cyber-bullying, see Hinduja & Patchin, 2008)

Currently, the social work curricula emphasize the importance and development of in-person relationships, while little attention was for the role of online relationships and computer-mediated relationships. The relation with the social worker is human they can see directly with each other but with computer isn't the same. To remain relevant social work needs to continue to influence systems for the benefit of society while reviewing and updating theories and models to reflect current lifestyles, modes and patterns of communication.

SUPERVISION AND CONTINOUS ICT EDUCATION

Continuing education and staff development should address current knowledge and emerging developments related to social work practice and ethics.

Social workers should strive to become and remain proficient in professional practice, they should remain in current with the news in research. The reality is that the majority of research findings are disseminated and accessed electronically via the Internet.

CHALLENGES OF ICT AND SOCIAL WORK PRACTICE

Despite the continued growth and expansion of technologies, a lot of disadvantaged persons still do not have access to ICT.

The social worker using technologies must consider the advantages and disadvantages of online services (Car & Sheikh, 2004). Without proper training, social workers in practice are at risk of delivering poor quality services or facing legal or ethical issues.

RECOMMENDATIONS

Based on the theoretical, empirical findings and on conclusions derived, it is necessary to consider certain recommendations:

Regard to the use of new technologies social worker has to do with client privacy, competence in the specific technology is important, they need to understand how to properly use computerized client information and know the risks involved.

Social work supervisors should take reasonable steps to provide or arrange for continuing education and staff development and advocate for adequate resources to meet clients' needs. Supervision is very necessary for implementation of technology especially in developing countries whare ICT is relatively new field especially in social work.

SUMMARY

The science of physics neither raises nor solves the "problems" of teaching the laws of nature discovered so far. Ways of conveying knowledge of physics to the student are considered by the methodology of teaching physics. In this presentation we will consider the methodology of active learning based on a problematic situation set up by me, the lecturer of physics.
To explain this methodology of teaching I have used my personal experience in teaching physics as well as my personal results in the process.
The structure of knowledge in physics requires a variety of aspects such as recognition, meaning, application, analysis, as well as generalization of phenomena, connection of sizes-amounts, finding out laws, condition of application, basic principles of physics, etc.
Problematic situation should:

a. involve students thoroughly and intensively deeper than the traditional methodology, especially during the teaching process in schoolrooms;
b. emphasize the cognitive ability before conveying knowledge;
c. Insist that the student find arguments before finding the right answer;
d. Convince the student that physics is coherent rather than a set related with concepts and problems;
e. Clarify that learning process happens via research and active understanding.

Key words and phrases; Process of teaching, development of individuality, science of physics, scientific methodology, problematic and research methodology, physical model, formulae, hypothesis, analyse data, apply, conclusion.

PRINCIPLES THAT GUARANTEE QUALITY AND SUCCESS IN TEACHING

1. Conception of teaching:

Teaching is one of the most important processes in achieving success in educational service offered to both students and pupils.

During this process the Lecturer stimulates debate, encourages active participation and critical thinking of the students based on the processing of the threefold information, thesis, antithesis, synthesis.

What makes teaching effective and qualitative:

Firstly: Non-paternal communication.
It is true that in general terms the Lecturer possesses knowledge and/or sense of analysis superior to that of the student; however, this should not lead to interrupting communication. Each debate between Lecturer and student should seek the identification of common ground and differences in evaluation.

Secondly, the lecturer should play the role of the moderator.
The lecturer should make space for debate, should accept a variety of reasons articulating solutions and/or giving conclusions achieving specific objectives preceding the establishment of a sustainable scientific education.

2. "Pluralistic" character of information.

The student should be exposed to all viewpoints, theories which populate the market of prevailing ideas, theoretical debates, and practical solutions.
To be effective in educating the student we should meet to factors:
- A qualitative preparation of the professorate academic-wise and professional-wise. :
- Freedom of expression.
-

3. Communication.

Communication during the teaching process and behavioral becoming is one of the most important pillars in education.
However, to ensure effective teaching the process, the Lecturer should rely on three pillars:

1. Professional preparation;
2. Pedagogical skills;
3. Communicational skills

Everything that happens in the auditorium is created and supported by the process of communication. Term Curriculum, teaching strategies, explanation of phenomena, critic or estimation of the students proficiency, is accomplished via communication.
Positive results are achievable when:

- The teaching methodology is based on active learning in creating and solving problematic situations.
- The problem to be solved is plainly presented.
- Pros and cons are debated.
- Main thesis is defined, so that through communication, we achieve mutual understanding.
- The argument is well-supported by methodology.
-

4. Lecturer-student relations.

Tolerance and flexibility should prevail.
Straight and righteous relations and responsibilities in the many-component estimation are indispensable.
The concepts that help creating such an atmosphere are:
1) The student's concept regarding school.
✓ Schooling is a choice, a desire, a personal calculation, that requires responsibility, investment, and seriousness.
✓ Free market offers jobs.
✓ Jobs demand high performance quality.
✓ Quality is obtained during qualitative education.
2) Lecturer's role as a concept.
✓ He/she should guide and help the student in case of difficulties advising him/her in the process of becoming.
3) Mechanism of estimation.

Estimation is the process of measuring performance and progress, highlighting the values of the synergy of human knowledge and skills.

Estimation is a delicate process of teaching, because in many cases it tends to be subjective. It is a big challenge for the Albanian school to fight subjectivism.

Sometimes, the words 'test' and 'estimation' are considered synonyms. It is not right.

A test is a method of measuring knowledge and/or skills of a student in a certain field, emphasizing so the concepts of methodology and measure [1]"; a test is a specific instrument which is designed carefully. Furthermore, a detailed diagram which displays a point system should be attached to each test.

While the test is a procedure foreseen in the teaching plan, where the student makes his best to achieve the best possible result, estimation is a continuous process which covers a broader spectrum.

Each time a student answers a question, makes a comment, expresses a word or a new concept, the teacher instinctively estimates the performance of the student.

According to Brown [2], a good teacher never stops estimating his students, whether such an estimation is accidental or on purpose.

The test is a useful and efficient means to estimating the student's knowledge. However, it is part of other procedures and ways the teacher follows to estimate his student.

Thus, a test is only a subset of estimation. It is not the only means of estimating the student.

REAL PROBLEMS IN APPLYING SUCH PRINCIPLES

A. Traditional teaching lack the power to establish solid knowledge, if the alternative teaching is ignored.
B. The multifold information is missing.
In the 'alter-text' you find scientific and methodological deficiencies in treating subject information.
There are no bookstores where one finds books on physics and/or variety of accessible information.
C. Prevalence of word inflation.
Lack of clarity of thought and scientific expression.
D. Authoritarianism of teacher-student relationships.
Absence of a more objective assessment.

SEVERAL ELEMENETS OF METHODOLOGY ON PHYSICS

[1] *Brown, H.D. 2007 Teaching by Principles "An interactive Approach to Language Pedagogy" Pearson, Longman, p. 445*
[2] Ibidem

The science of physics neither raises nor solves the "problems" of teaching the laws of nature discovered so far.

Ways of conveying knowledge of physics to the student are considered by the methodology of teaching physics, which, being closely related with the science of pedagogy, will lead to desirable results.

There is a unique link between the curriculum content and teaching methodology, where the content leads and methodology follows.

The methods of giving and processing knowledge creating skills and habits include: explanation, narration, conversation, lectures, demonstration, instruction, problem-presentation, academic-competition, experimentation, modeling, etc.

Based on long personal experience in teaching physics and the best practices will highlight:

Possessing scientific quality of the course content.

Construction and implementation of research and problematic method in the teaching process.

This method consists in transmission and acquisition of new knowledge creating problematic situations solving problems within the contradiction of theoretical and practical cognitive tasks.

So, the creation of a problematic situation is essential.

This situation arises in physics based on the detection of inconsistencies between the physical knowledge previously acquired and the impossibility of solving the new problems based on the experience previously acquired.

Each lesson topic throughout the course of general physics allows the creation of a problematic situation where one should:

1. Understand the problematic situation.
2. Analyze and define the problem.
3. Searching ways to solving the problem.
4. Formulate hypotheses.
5. Argue and verify the truth in them.
6. Solve the problem.
7. Check and verify the results.

In the learning process, in accordance with the concrete material to be examined, laying problematic situation will require placing the student in the center.

A problematic situation in class requires:

- Placing as much emphasis as possible on cognitive ability, while conveying knowledge;
- Insisting that student find arguments while expecting for the right answer.
- Telling the student the idea that physics is a coherent not a heterogeneous sum up of concepts and problems;
- Cultivating that learning occurs through active understanding and scientific research.
- Each physical model represents the structure of a system with its features. The multiple representations taken together provide the structure of the system.

It is presented with a symbolic representation through words, diagrams and mathematical equations, sketches and other conventional elements.

A variety of models:

1. Hypothesis;
2. Phenomenology;
3. Approximation;
4. Simplification;
5. Analogy;
6. Thoughtful experimentation;

But their common goal is to facilitate solutions to various problems;

- Scientific explanations are reviewed and formulated using logic and evidence.

In the question-answer process students need to argue their opinions.

What would be the expected product?

- Training students in the conception of experimental procedures.
- Interpretation of results and/or data.

Objectives:

Despite the ways of organizing teaching, in the selection of material must meet:

1. Clear and logical presentation of the basic concepts and principles of physics.
2. Formation and understanding of sustainable concepts and principles through a broad range of applications really proven in world experiences.
3. Developing skills for solving problems through a carefully organized approach. To meet these objectives, teachers should:

- Present well-organized physical arguments focused in accordance with to specific objectives.

- Motivate students through practical examples that demonstrate the role of physics as a basic science to other scientific disciplines.
  Independent and/or guided exercise during seminars.
- • Students face hundreds of problems in physics courses. A relatively small number of basic principles form the basis of these problems.
- When faced with a new application, a physics professor forms a pattern of problem that can be solved in a simple way by identifying the fundamental principle that applies to this problem.
  In this very important element for scientific establishment it is recommended:
  - The selection of texts with additional literature for seminar sessions where "Solved Problems" are considered.
  - The selection of those problems that offer an approach of analytical models where their solution consolidates theoretical concepts.
  - The interpretation of physical phenomena in a quantitative assessment of physical sizes.
  - The assessment of logical connections between the phenomenon and quantity where research and practical application in many fields has arisen.
  - Physics problems carefully selected are a very good source[3] of encouraging the student to work independently forming lasting scientific knowledge.

R.P. Feynman, Nobel laureate in physics, said:

"You do not know anything for as long as you do not practice"[4]

In line with this assertion, we strongly recommend: to develop the necessary skills one should solve a wide range of problems.

- The student's ability to solve problems arguing the solution will be one of the main tests of acquisition of knowledge of physics.
- The necessity of understanding the basic concepts and principles before making the due efforts to solving problems.
- Searching for alternative solutions to the same problem.

For example: Students can solve problems in mechanics, using Newton's laws, but more often an alternative method based on energy considerations is more direct.

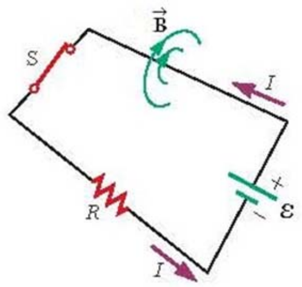
- Enabling the student to solve similar problems working independently.
- Problem-solving approach should be carefully planned.
- Systematic plan is especially important when a problem involves several concepts.

Model Of A Problematic Situation

Theme: The energy of the magnetic field[5].

Situation lay out: Suppose an electrical circuit in a non ferromagnetic and homogeneous situation.

Present the circuit as shown in figure:



Recognition: Which are the elements of the circuit[6]?

Understanding: Should energy depend on the orientation of the circuit?

Analysis: What will happen when switch S is on?

Statement: As (ε) is included in the circuit, current shall start streaming, consequently self-induction (ε_{si}) shall arise.

Analysis: Which is the reason that (ε_{si}) arise?

Application: The law of Ohm is written regarding the moment values of these

amounts:

$$\varepsilon + \varepsilon_{si} = IR \qquad (1)$$

Practical action: Multiply both sides of equation by: Idt and the value of (ε) of the self-induction $\varepsilon_{si} = -L\frac{dI}{dt}$ is substituted then the complete equation is written:

$$\varepsilon Idt = I^2Rdt + LIdI \qquad (2)$$

Analysis: Evaluate the energy terms of the equation (2)
The left side presents the energy given by the source during the time dt, when the stationary regime is set regarding the condition $I = 0$, all energy is transformed into thermal energy whereas when the current changes, not all energy is transformed into thermal energy.
The term shown: $LIdI$during the change of current intensity.
Conclusion: When the current changes the source gives a supplementary energy which is evaluated by the second term of the equation (2) $LIdI$.
Outcome: The only phenomenon that is shown with the placement of stationary current in the circuit is the creation of the magnetic field that varies with the changing I that creates it.
If the current does not change then the magnetic field does not change.
So, to keep constant magnetic field, we should not waste energy.
Analysis: The amount: $LIdI$ is a supplementary energy instead of thermal energy when current is changed from $I = 0$ në $I = I_0$ which shall exist until the set of current I_0.
Application: By calculating this energy from $I = 0$ to $I = I_0$ we find the value of the supplementary energy:
$W = \int_0^{I_0} LIdI = L\int_0^{I_0} IdI = \frac{1}{2}LI_0^2$ (3)
Analysis: Let's accept that there is current in the circuit. Let's suppose that we remove the source of current and turn on the remaining part of the circuit.
Discussion: What will happen then?
Analysis: Current tends to decrease, consequently (ε) of self-induction shall arise which acts in the circuit $\varepsilon_{si} = -L\frac{dI}{dt}$
Application: Let's apply the law of Ohm in this circuit: $-L\frac{dI}{dt} = IR$ (4)
Let's multiply both sides of equation by Idt and we obtain: $-LIdI = I^2Rdt$ (5)
Let's analyze the energy terms of the equation (5)
Conclusion: The left side presents the energy given by ε_{si} , whereas the right side presents thermal energy.
Outcome: All this energy is transformed into thermal energy within the circuit.
Application: Let's calculate the amount of energy that is released from the moment $t = 0$ to ∞
$Q = \int_0^{\infty} I^2Rdt = -L\int_{I_0}^{0} IdI$ ose $Q = \frac{1}{2}LI_0^2$ (6)
Conclusion: So we have a circuit with thermal energy obtained equal to the supplementary consumption.
Analysis: The only occurrence regarding the "disappearance" of current is the "disappearance" of magnetic field.
It is obvious that the amount of energy obtained when the magnetic field disappears is equal to that we consume to create it.
Outcome: In such conditions it is natural to accept that magnetic field possesses energy.
Analysis: In the presented case we have the circuit with electrical current and the magnetic field in its presence.
Naturally we are not able to answer the question:
Where is such energy located?
In the space or in the circuit with current that creates the magnetic field?
Discussion: Is it possible that the magnetic field is created without the presence of the electric current?
Is it acceptable that the electromagnetic waves possess energy?
Conclusion: After calculation it is noticed that this energy is numerically equal to the energy given by (ε_{ai}), therefore to calculate it we dealt only with the second term of the equation (2) which we call electromagnetic energy located in the field.

OUTCOME:

Analyzing of basic principles that guarantees success and quality in teaching, getting to know what guarantees such principles dealt with in general terms, gave us the chance to present several thoughts on the Methodology of Physics, laying out a simple model of a problematic situation.

Choosing this theme as a suggested class model aimed the objective that the knowledge on Physics such as recognition, understanding, application, analysis, generalization in studying occurrences, connection of amounts, discovery of laws, conditions in application, essential principles, etc, must ensure an active cooperation between the lecturer and the student to following every step through which scientific knowledge is conveyed in realizing the objectives of scientific research:

To discover new facts

To verify and prove important facts.

To analyze an occurrence or process in which cause-result relation is identified.

THE PHENOMENON OF CYBER BULLYING IN ALBANIAN CONTEXT: AN EXPLORATIVE STUDY OF STUDENTS' PERCEPTIONS

ABSTRACT: Exponential growth of technology usage has further expanded the concept of an information age. In the prolonged transition of Albania society the perception of the virtual freedom has changed radically. During the last years the Albanian government implemented the extension of Internet connectivity in the rural and urban schools. On the other hand, private cell mobiles companies extended the internet connectivity offering it with affordable fees for the mass population. These initiatives changed the usage of virtual freedom making its usage massive for everyone. Despite the variety of age frequencies everybody can have access to virtual communication by simple gadgets to sophisticated ones. This freedom of communication has affected many social aspects which one of them is cyber bullying. Cyber bullying is defined as using electronic communication to torment others through devices such as Internet, e-mail, text messages or even social networking sites. Most people do not recognize the symptoms of being stalking online and the techniques a cyber stalker employs to target them. The purpose of this exploratory study is to give a brief overview of current knowledge in the literature about cyber bullying. Also, this paper will look at the perceptions of Albanian college students regarding issues related to cyber-bullying phenomenon based on descriptive data gathered out from a comprehensive questionnaire. Alternative tactics for preventing this phenomenon in the field of education were discussed in this study.

Key words: technology, transition, internet extension, cyber bullying, education.

INTRODUCTION

During the last years the Albanian government implemented the extension of Internet connectivity in the rural and urban schools. On the other hand, private cell mobiles companies extended the internet connectivity offering it with affordable fees for the mass population. These initiatives changed the usage of virtual freedom making its usage massive for everyone. Despite the variety of age frequencies everybody can have access to virtual communication by simple gadgets to sophisticated ones. This freedom of communication has affected many social aspects which one of them is cyber bullying. Cyber bullying is defined as using electronic communication to torment others through devices such as Internet, e-mail, text messages or even social networking sites.

Electronic bullying is different from traditional bullying because the anonymity provided by technologies removes the bully from the consequences caused by their actions. Since cyber bullies are virtually removed from their victims, the opportunities for feelings of regret, remorse or sympathy for the victim are removed (Slonje & Smith, 2008). Three main roles that someone may take in an instance of cyber bullying are being *the bully*, the *target*, or *the bystander* (Willard, 2007a). *The bully* is the person who harasses or puts down other people. Individuals may also be *the targets.* These are the people who targeted by the cyber bully, and they are sometimes also known as the victim. Although many individuals may think they are not participating in bullying behavior, being a bystander also means that one is involved in a bullying act.

Willard (2007a) identified two types of bystanders, *helpful bystanders* and *harmful bystanders.* Helpful bystanders are individuals who take action to stop the bully by either protesting against the bullying act, by providing both physical and emotional support for the target, or by seeking the help of an adult to intervene in the situation. Hurtful bystanders, on the other hand, are involved either by supporting and encouraging the bullying behavior or by simply doing nothing to intervene or seek help for the target.

The definition of cyber bullying illustrates that, while it is a form of and involves all of the non-physical attributes of bullying, it is carried out through devices capable of electronic communication. Cyber bullying can assume many different articulations, thus it is difficult to define in a simple sentence (Kowalski, et. al., 2008). However, there are six forms of cyber bullying that are most common:
Harassment: Repeatedly sending offensive, rude, and insulting messages. *Denigration:* Distributing information about another that is derogatory and untrue through posting it on a Web page, sending it to others through email or instant messaging, or posting or sending digitally altered photos of someone. *Flaming:* Online '"fighting" using electronic messages with angry, vulgar language. *Impersonation:* Breaking into an email or social networking account and using that person's online identity to send or post vicious or embarrassing material to/about others.

Outing and Trickery: Sharing someone's secrets or embarrassing information, or tricking someone into revealing secrets or embarrassing information and forwarding it to others. *Cyber Stalking:* Repeatedly sending messages that include threats of harm or are highly intimidating, or engaging in other online activities that make a person afraid for his or her safety (depending on the content of the message, it may be illegal) (Willard, 2007). Although persons involved in cyber bullying identify other persons engaged in similar behavior and believe this behavior is acceptable, cyber bullies are negatively impacting cyber-victims (Brown et al, 2006). Cyber bullying can also be perpetrated through exclusion or ostracism. Examples of this include obviation from groups, chat rooms, or websites that can be the result of another person changing their password, exclusion or omission from a buddy list, and/or being ganged up on by other members (Kowalski et. al, 2008, pp. 49-50).

Cyber bullying is secretive and may spread information rapidly from one person to another (Li, 2006). Results from a study conducted by Ybarra and Mitchell (2004a) found that aggressive adolescents frequently targeted people they knew in conventional environments; 84% of the aggressors indicated knowing the target in person. Cyber bullies may target individuals in their social group, knowing the target's address, phone number, or email due to their past friendship which they use to send threatening messages (Besag, 2006; Ybarra & Mitchell, 2004a). Online and offline bullying are rooted in aggression, which may suggest that the internet may simply be an extension of school bullying (Ybarra & Mitchell, 2004a). Six major means through which cyber bullying may occur are: instant messaging, e-mail, chat rooms or bash boards, small text messaging, web sites, and voting booths (Beale & Hall, 2007). Messaging devices are allowing cyber bullies to attack their victims through means of instant messages. These devices allow users to add other people to their user lists (Beale & Hall, 2007). The devices notify the user when someone comes online, allowing them to initiate a conversation with them. However, cyber bullies can easily switch screen names that hide their true identities, allowing for potential cyber bullying to continue. Cyber bullies are able to send threatening e-mail messages to their victims through e-mail (Beale & Hall, 2007). Although most e-mail programs allow for particular individuals to be blocked, these screening devices are limited. Although it may be easy to identity where an e-mail originated, it is nearly impossible to actually prove who wrote and sent the message. The loss for accountability is one thing that may draw cyber bullies to using this mean. Another form through which cyber bullies harass their victims is through chat rooms or bash boards (Beale & Hall, 2007).

METHODS

This research study is a descriptive exploratory study. Descriptive research is used to describe characteristics of a population or phenomenon being studied. The purpose of this descriptive study is to give a brief overview of current knowledge in the literature about cyber bullying. Also, this paper aims to analyze the perceptions of Albanian college students regarding issues related to cyber-bullying phenomenon based on descriptive data gathered out from a comprehensive questionnaire. The study was designed based on this research questions:

1. What is the perception of cyber bullying phenomenon and what are the symptoms?
2. What is the perception of the consequences of cyber bullying?
3. What kind of cyber bullying form is more used?
4. What is the most used Internet application for cyber bullying?
5. What is the perception for preventing cyber bullying?

Data for this study was gathered using both mixed methods. For the first phase it was used quantitative method that was based on delivering o a self-designed comprehensive questionnaire which was based to determine the level of comprehension about cyber bullying phenomenon. It was filled out completely from 572 students from four different Albanian public universities, who were selected participants by using convenience sampling that is used for both the quantitative and qualitative portions of the study. Participants were assured that individual responses would never be identified and were only be used for research purpose only. For the second phase of the study only 382 students who scored an average level of cyber bullying knowledge were recruited to continue being participants of the research , 48 students dropped out and in total n= 334 students participated in the second phase by conducting individual in depth interview via email.

FINDINGS AND CONCLUSIONS

What really helped in giving a consolid interpretation of the difference level perception of students was the interview codification . Albanian students perceptions about how cyberbullying occurs is not well defined. They have problems in explaining the definiton of term " cyberbullying" by focusing only in few symptoms such as: mocking and using fake identies to denigrate. Girls reported being a cyber bully mostly with girls who they know in high school and very few reported to bully girls from their home university. On the other hand, boys mostly cyber bully girls than boys who they know from their home university. For girls the type of bully that it was used most was denigration and harassment but for boys was flaming and impersonation. According to the analysed of gatherd data , 1 in 2 reported being bullied at least once via facebook which was the most frequent way for cyberbullying followed by messenger and cell phone sms. For the section of cyberbullying prevention during the first phase 72% declared that education and media were powerful mediator for informing and sensibilizing cyberbullying phenomenon. But, few alternatives were given in opened-questions for the prevention of cyber bullying by limited it in training and media awareness campaign. İn general students reported that the conseguences of bullying were based in emotional conseguations such as; anxiety, anger and low self – esteem.These findings should be considered for further long–term studies.This explorative study is a baseline study for further researches of digital stress in the context of academe life. Researchers tend to expand their research in all public universities of Albania. Also, a more detailed examination of variables such as gender, status, type of faculties and individual features such as locus of control etc will be considered to be examined staticscally with types of cyberbullying e experienced from technology usage.

RECOMMENDATIONS

This phenomenon it's a new one for Albanian society and there are just a few empirical studies about cyber bullying. In order to find out the prevalence of this phenomenon in schools, researchers from public and private institutions should be encouraged to develop accurate scientific researches. According to our findings, it is necessary to provide student education about cyber bullying in which extra curriculum trainings would incorporate cyber bullying into life skills or bullying prevention classes. Education policymakers should review policies and procedures related to Internet and mobile communication devices, which may include restricting the use of mobile communication devices during the school day and monitoring of Internet use. Collaboration between multiple resources and personnel is essential in utilizing this phenomenon and understanding ways to deal with cyber bullying within the home and school setting. Education policy makers can utilize prevention efforts involve the education of students about safe Internet usage, collaborating with support personnel to help victims of cyber bullying cope, and establishing firm school policies to prevent cyber bullying..

ABSTRACT: This paper makes an attempt to investigate the nature of mathematics knowledge and ICT-information and communication technology-potential. It proposes that mathematics knowledge be categorized into two parts, Meta knowledge and executive knowledge. Each type of the knowledge requires entirely different planning from the instructors, if they wanted to use ICT in mathematics education. To this end, it is proposed that the class instructor be substituted with a class director, who has been trained by mathematics education system for this purpose. The class director duties will be briefly discussed. When the class director executes the model, the mooted method, s/he is going to produce a valuable lecture which is called evolved-lecture.

Key words: evolved-lecture, Meta knowledge, executive knowledge

INTRODUCTION

This paper wants to challenge the usage of information and communication technology (ICT) in mathematics education, drawing on both Artificial Intelligence (AI) and software programming. Of course, this discussion can extend to all of science education in general. The essential question is whether ICT is a threat to the quality of mathematics education or it is an opportunity for that. Undoubtedly, ICT has found its way to every aspects of human life; however, it shouldn't have entered the educational systems without sufficient study.

In some cases, one assumes that ICT can control the education process entirely. It has grown out of the seed of electronic and computer progresses (Frederic Bourassa, 2011). When students surrender to ICT they might be skeptical of learning mathematics and, in their opinion, it could be enough if they just learned different mathematics software. Of course this willingness is a great advantage, as the educational system won't need to schedule how to teach this different mathematics software.

The paper tries to analyze the mathematics knowledge and to find a division in it before using ICT in mathematics education. Then it wants to propose a teaching method and the way of presenting topics so that students can trust systems of mathematics education because they have to spend a lot of time and energy learning mathematics. Teaching experiences indicate how this confidence fades away (Carmen M.Latterell, 2007).

The goal of the paper is a profound investigation of mathematics' topics' nature. It wants to propose which part of the knowledge of mathematics lends itself well to the facilities of ICT and which part of it may not be so.

Different modes of classroom teaching

In this section some common modes, which are widespread in universities and colleges, will be briefly reviewed.

The traditional teaching mode

The traditional teaching mode, in which instructors do not use ICT, has been being used for quite a long time. In spite of ICT progress, it is not wise to give up traditional mode entirely. In the same way, the invention of the printing industry has given the students an opportunity to have a lot of reference at their disposal with all the details of the topics but it could never take the instructor's place rather it came to be used as means of providing support for the students, that is, thanks to the printings, students attend the classes without overly worrying about complete note-taking.

The variety and abundance of books and libraries have not decreased the importance of traditional classes. In the new age, in spite of ICT's progress, the most popular educational system is still the traditional one. Because, a software package cannot simulate a seasoned teacher who has accumulated his art of teaching in the course of many years.

Some advantages of the traditional mode are as follows:

Instructors have been trained with this mode.
Instructors can make a direct connection with student.
The class is teacher-centered generally.
The students are separated from splendor of virtual environment and ICT.

Some shortcomings of the traditional education are as follows:

It is traditional.

There is a lack of experienced instructors who has teaching talent.

The class is teacher-centered.

The quality of a teacher-centered class is usually mentioned both as an advantage and a disadvantage because it can be very helpful in some cases yet it can also be detrimental in others. In the next sections, mathematics knowledge will be categorized to two parts, Meta knowledge and executive knowledge. Meta knowledge in most parts supports teacher-centered classes while executive knowledge deals with learner-centered classes (Samantha et al, 2009).

The modern teaching mode

The modern teaching mode, that is named e-education, tries to take maximum help from ICT. It wants to minimize human-to-human teaching by using software, hardware and internet network.

Some advantages of the modern education are as follows:

It is modern.

There is a possibility of distance teaching.

It can be learner-centered (Macdonald, 2009).

Some shortcomings of the modern education are as follows:

It is technology-centered.

It has unknown results for educational system.

Traditional and modern modes combined

The modes, mentioned in the previous section, are established in the education system. The traditional mode is the most well-established one. The modern mode, e-education, is used to teach in special conditions such as short time education, lack of experienced people and saving costs (Hennessy et al, 2010).

This paper does not intend to criticize the traditional or the modern education system. It basically seeks to find a way to the traditional and the modern combination modes (e.g. teaching by ICT). The traditional and the modern combination modes have entered educational system in two ways. First, they have been exercised personally by instructors; second, its industrial publicity has paved the way for its entrance into educational system. However, almost neither of them has been utilized professionally on scientifically sound bases.

It will not be suitable for one to sew clothes for the traditional education from ICT. A lot of works have been done to sew such clothes and have found some supporters because they are attractive and new, then they are forgotten because they are not utilized in the educational system (Romiszowski, 2004).

Using of PowerPoint files is the most popular combination mode. These files include sentences, formulas, figures, movies etc. They are prepared to be shown to students by instructors. In this way the topics can be shown very fast. Obviously increasing the speed of showing doesn't necessarily mean that the information is transferred to the students by instructor as fast. This method has minimally gotten help from ICT potentials. This may reduce instructor's mental and physical effort, in the class, but it is not a suitable option for serious teaching in its strict sense.

Of course it is very important that the students be taught faster than the past, because science progresses exponentially. Not only will not the problem be solved by showing the topics faster, but also the instructor's role will be decreased to an unskilled showman. The problems mentioned above and the subjects below made us consider some transformations in the traditional and modern combination mode.

ICT has a lot of potentials to be used in education.

There is a necessity to teach knowledge to students in short intervals.

The students are intensively attracted to ICT.

The next section of this paper wants to deliberate on mathematics knowledge. Because one has to know the road before they choose the kind of car and provisions for their trip.

MATHEMATICS KNOWLEDGE

Now there is a big question; with ICT attendance, is it necessary that whole mathematics knowledge be taught to the next generation? If the answer is not so clear, the question that follows would be which part of mathematics knowledge education needs to be changed basically?

For making this partition, we need to use progresses made in computer science and artificial intelligence, because we have to know which parts of mathematics education can be compatible with ICT. In this paper, knowledge is divided into two parts, Meta knowledge and executive knowledge. In the following sections these subjects will be elaborated on. Firstly we have to remember two definitions, because they are the foundation of computer science.

Algorithm:
A prescribed set of well defined rules or instructions for the solution of a problem, e.g. division algorithm, in a finite number of steps (Oxford Reference, 1990)

Heuristics:
A prescribed set of rules employing a self-learning approach to the solution of a problem, e.g. chess heuristics, in this case, unlike the Algorithm where the result is guaranteed you may or may not be able to solve problems (Oxford Reference, 1990)

Executive knowledge
Some part of Human knowledge that is named executive that can be transformed into algorithm or even heuristics. The following sentences are some examples to clarify the matter.

When one is able to do fundamental operations of arithmetic s/he has executive knowledge about them.
When one is able to calculate square root of a number s/he has executive knowledge about it.
When a football player kicks the ball carefully toward the goal then you can say that s/he has executive knowledge about it.
If a person knows English grammar completely then s/he can put the words in the order without any grammatical mistakes. They have the related executive knowledge.
The examples mentioned above show the abilities and some operations one can perform. At least in the above mentioned examples computers, by using algorithms and heuristics, can perform the operations faster and more accurately than human. So we must be more careful when we teach this part of knowledge, executive knowledge, because students might feel the time and energy that they spend on learning mathematics is wasted due to the fact that they are not only now but always will be far behind computers in mathematics (Heid, 1988).

Meta knowledge
Meta knowledge is knowledge about knowledge (Rich et al, 1991). This part of knowledge has not been able to be transformed into algorithms or even heuristics by artificial intelligence completely, and, it is not expected to happen by simulation of Meta knowledge, at least, in the near future. The following sentences are to provide examples to further clarify the matter.

We have twelve red apples. If we want to divide them among four persons equally. Which arithmetic operation will be needed?
In an isosceles right angled triangle, in which if we know the length of base how can we find the length of hypotenuse?
Which wing of the rival team could be more vulnerable for attacking?
What is the best sentence for a president, who wants to give speech at a present situation on a graduation day?

The following superiorities in executive knowledge will not help to solve any of the above mentioned problems.
To perform quickly fundamental operations of arithmetic.
To calculate square root of a number in less than a second with arbitrary approximation.
To shoot precisely and quickly.
To make thousands of correct sentences, from grammatical point of view, in a short time.

Mathematics educational system must focus on this part of knowledge, Meta knowledge. The structure of Meta knowledge does not suit up with computer science; therefore, it is necessary for the instructors be careful when they want to use ICT in their Meta knowledge classes.
Since the present educational system is based on facilities before ICT age, the instructors and students spend the major part of their time and energy, teaching and learning the executive knowledge. For example, in the differential equation lesson the instructors and their students spend their teaching and learning time on solving techniques- executive knowledge. It is not comparable with the time allocated to Meta knowledge part which exists in the differential equations, which creates certain tendency in students toward executive knowledge rather than Meta knowledge, while the process of education can be fruitful when the students pay more attention to Meta knowledge.

Example: Suppose the aim is to teach the following second order differential equation. Therefore, an instructor wants to teach four subjects to the students.

$$ay'' + by' + cy = g(x)$$

-The differential equation entity and the goal intention of solving that

In this case the instructor must teach the kind of category which includes these equations. S/he has to explain the differences and resemblances between the above mentioned equations and quadratic equations below (Boyce et al, 2005)

$$ax^2 + bx + c = 0.$$

For example, when you're solving the second order differential equation, you'll find some functions and when you solve, the quadratic equation, you'll find two numbers.

-The physical meaning of differential equation

The aim of this part of education, physical interpretation, is to model a phenomenon and produce the differential equation. For example, an instructor may illustrate the point, using the mass, spring and damper mechanism (See Figure 1) (Ahsan, 2005).

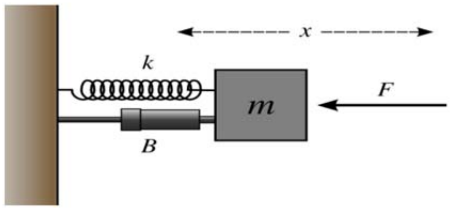

Figure 1: Mass, spring and damper mechanism

$$m\ddot{x} + B\dot{x} + kx = F$$

m, B and k are the mass and constant of damper and spring, respectively. If s/he discusses constant coefficients and point out that they can be variable in practice, then they can practically provide for a deeper understanding of the problem in the students mind.

-Uniqueness and existence of solution

An instructor can expand this part of the topics by further elaboration; of course, the intensity of their explanation will depend on the level of the class (Boyce, 2005).

-Solution techniques

In this part, the instructors want to give solution techniques most of which are algorithmic (Boyce, 2005). As we know, major part of the books, lectures and educational files are allocated to teaching the solution techniques. This might have been justifiable in the absence of ICT, and the students had to exercise different methods of the differential equations, because they had to develop a skill for solving the problems and finding final solutions. Out of the four above-mentioned subjects, only the fourth one is executive knowledge while the other three are Meta knowledge. Usually students focus just on the forth one.

The presence of ICT, makes instructors rethink the teaching process, find it too slow, while it makes the students feel that mathematics education system keeps them in bondage, because they are wanted to do certainty the activities that their computers can do very much faster than them. The subjects 1, 2 and 3 do not make such impressions on the students. This paper does not propose to discard the learning of executive knowledge part in mathematics. The goal is to have mathematics Meta knowledge and executive knowledge be separated and treated differently, regarding the ICT use. In teaching executive knowledge, ICT can be utilized as mean of facilitating and speeding the teaching learning processes. However, as far as Meta knowledge concerned the optimal use of ICT can lead to evolved-lecture, to be explained in the later section.

The frontier between Meta and executive knowledge in mathematics

Although one can give a lot of examples for executive or Meta knowledge in isolation, generally speaking, there is not a clear-out boundary between them, That is, in some cases the frontier is fuzzy (see Figure 2).

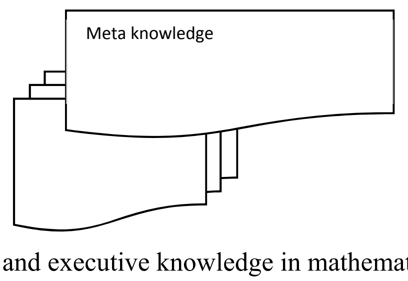

Figure 2: Meta and executive knowledge in mathematics

Example: In calculus, when the hyperbolic parabolic function (Larson, 2006),

$$z = f(x, y) = y^2 - x^2$$

is brought up by instructor, her /his goals are

To present a sample of two variables function (Meta knowledge).
To sketch an example of two variables function (executive knowledge).
To introduce a new point, saddle point, on the surface (Meta knowledge).
To raise the students ability in three dimensional imagination (Meta knowledge).
In this case, if s/he wants to separate executive knowledge from Meta knowledge it, might impair the students learning process.
Example: When an instructor wants to prove the theorem about exact differential equation

$$M(x,y)dx + N(x,y)dy = 0$$

S/he simultaneously teaches the solution technique; while proving the theorem is a part of Meta knowledge and the solution technique is a part of executive knowledge (Boyce, 2005).
Therefore, if a topic falls into the frontier between Meta knowledge and executive knowledge, it is suggested that it be categorize in Meta knowledge part.

THE INSTRUCTOR

The fact that there were just a few good mathematic instructors during our college years can be a good reason proving that there are not a lot of good instructors to teach. However, you can find a lot of researchers in mathematics. The traditional educational style has tried to resolve this discrepancy by books. That means a good instructor has tried to write a book in her or his specialized field so that her/ his experiences would be comprehended by another instructor or students. Nonetheless, by studying different kinds of books on a special topic, it could be understood that the writer had mastered some parts better in comparison with other parts. Therefore, if the students want to understand a topic profoundly, a part from their class lectures, they have to study about it in different works. Maybe the best commentary of a topic, especially in mathematics, may belong to certain at a particular instructor from a university. Now the following questions are mooted:

Can all of the students, who are interested in the topic, benefit from the instructor?
Is making the instructor write a book about a whole topic the only possible way?
How can one find such instructors?
Will the preparation of a video and a documentary from an instructor's class and their presentation in the internet, be suitable?
Can we use social networks for finding the instructor?
How can an instructor use such instructors' methods in her or his class?
To answer the questions above, in the next part, a person will be suggested as the class director – rather than instructor- to manage the class.

The class director as a substitute for an instructor
This section wants to propose that a class director substitute an instructor in the presence of ICT. The class director must not only have mastery over the whole topics of a lesson but also s/he has to manage the following items.

To manage the syllabus.
To find the best innovated way of instruction in a specific topic.
To assemble and to update the resources.
To be well informed about the ways of presentation.
To control the amount of information the students are provided at a given time.

Since the experiences of an instructor are accumulated in a long time, the educational system cannot possibly train them in a short time. However, the education system can train a class director in a short time with ever higher efficiently. Of course, some of the class's directors will be specialize in teaching certain topics. The following parts will extend the mentioned duties of the class directors.

To manage the syllabus
The syllabus will be categorized into two parts, Meta knowledge and executive knowledge, by the director of a class. To carry out such division, the instructor will have to have enough information about the topics, as well as the capabilities of different mathematics software. Only in this way will the director have the required ability to treat the two categories of knowledge differently that is through knowing different mathematics software comprehensively. In the executive knowledge this ability has particular significance, regarding (Wiwatanapataphee et al, 2010).
The division is done in ordinary differential equations in Shabestar Branch, Islamic Azad University practically, some details of which are attached as an appendix.

To find the best innovated way of instruction in a specific topic

Finding the best innovated way of instruction in a specific topic area can a matter of opinion and may depend on personal inclination or judgment and, in some cases, the class directors can find certain unique techniques in their education process. For example, the limit definition is a very difficult topic in calculus and there is no tangible interpretation in the calculus books. But the class director can find a tangible interpretation in limit definition and pliers mechanism (Hosseingholizadeh et al, 2011). For another example s/he can chooses some video from websites (see http://ocw.mit.edu/courses/) and use that in her or his class directly etc. Then, s/he can select the one that has worked best for her/his next semester class.

To assemble and to update the resources

To assemble and to update the resources in a good manner is important to make optimal use of time and energy in teaching and learning processes, and this paper proposes to maximize the usage of internet, websites and different software. Of course, the optimal point is when instructors in the universities promote their relationships and share their lectures, videos and educational files. For example, in the field of Meta knowledge if the class director knows that some parts of a lesson has been taught by a professor in a very good manner and its video or lecture is available, then her/his documents can be used in the class directly. In the field of executive knowledge the class director has to know about different mathematics software, and web sites, so that s/he can seek help with the calculation of long mathematical expressions and to sketch some functions' graphs etc.

When the class director wants to assemble her/his class lectures, they have to prepare a lot of useful links; yet the lecture which has been prepared by the class director may not mature enough. A lecture will mature, when the number of useful links is grown and the volume of primary lectures has shrunk by crossing out some topics and substituting them with the links. This paper calls such a lecture an evolved-lecture. We propose that the volume of the lectures be reduced down to a level which approaches the ideal sample in the worldwide educational viewpoint. These lectures will be the most evolved ones.

Considering the nature of mathematics, it will be possible to generate such evolved-lectures. In this way mathematics' education can make a progress, on the basis of ICT, by generating evolved-lectures.

The ways of presentation

The educational procedure, mathematics education, is a linear process. When a student commences to read a mathematics book, s/he is following the author's thinking line. The linear education process is followed clearly by the students, when they attend the class. In the traditional education, knowledge has been transferred to students in a sorted package of written, oral and body languages of the instructors simultaneously. Therefore, the students cannot move back or forward. So in a complex human relationship, the instructor's line of thinking is followed by the students.

When we use ICT, not only can the students move in any direction in the topic, but also their minds might be strayed by ICT distraction. The class director will need to be educated and trained about the manner of setting and presenting the topics, because the linearity of education process must be maintained (Stokes, 2001).

To control the amount of information the students are provided at a given time

In the traditional education, the amount of information the students are provided at a given time has been controlled automatically. The information has been transferred in an acceptable time by written, oral and body languages of the instructors, so there is enough time for the students to receive the matter. Now if you let the class director be armed with powerful information systems like computer, internet and different software, the control won't happen automatically. Therefore, the class directors should be trained in this case, Meta Knowledge part especially, so that they can control the teaching speed by debating, questioning, answering etc (Means et al, 2010).

One of the principal goals is to transfer Meta knowledge faster and more favorably. As it has already been pointed out, the educational system cannot reach this goal by increasing the speed of teaching, nevertheless, it can save time by categorizing Meta knowledge from executive knowledge and making changes in the teaching method of both knowledge types through using ICT.

PRACTICAL RESULTS

The mooted method has been executed four semesters, two years, in teaching Ordinary Differential Equation class. The students, who took the course, were from different field of engineering like electronic, mechanic, nutrition, civil, computer. The following table shows that the method is not disappointed (Table 1).

Total	Proponents	Opponents	In a daze	Neutral
552	315	98	62	77

Table 1: The students' verdict about the method

Incidentally a survey between proponents and opponents, 413 students, show most of them interested to executive knowledge part of Ordinary Differential Equation (Table 2).

The students' Field	The students' Number	Purely interested to Meta knowledge	Purely interested to executive knowledge	Interested to both part of knowledge
Electronic	92	28	51	13
Mechanic	67	30	26	11
Nutrition	76	18	39	19
Civil	109	16	64	29
Computer	69	10	32	27
Total	413	102	212	99
Percent	100%	24.7%	51%	23.9%

Table 2: The students' verdict about each parts of knowledge

CONCLUSION

Information and communication technology was born by mathematics researches therefore, it is very important that mathematics educational system pays attention when it wants to use ICT because it may be possible for the educational system to be captured in a vicious circle. Investigating lesson syllabuses and the potential of ICT more thoroughly has a higher priority than equipping the class with ICT. That is to say it will be better off if ICT can provide the mathematics education system's recommendations for teaching. That has been the main focus of the paper. Consequently it proposes categorizing mathematics knowledge into two parts, Meta knowledge and executive knowledge, and introduces the class director, who is responsible for the production of the evolved-lecture. Of course, both the duties of the class director and producing the evolved-lecture have a lot of details for future researches.

APPENDIX

Example: This example separates the syllabus of ordinary differential equations (ODE) in two parts, Meta and executive knowledge. The Frontier between Meta and executive knowledge is lodged in the Meta knowledge part.

Part one (Meta knowledge):

To introduce the kinds of differential equations and intend to solve them.
Family of curves and orthogonal trajectories.
The physical methods.
Unique existence theorem of the firs-order differential equations.
Nonlinear first-order differential equations in the form of $M(x, y)dx + N(x, y)dy = 0$.
First-order differential equations applications examples.
Second-order differential equations.
Linear second differential equations and unique existence theorem of them.
Linearly independent solutions of homogeneous linear second-order differential equations (linear combination, linear independence and Wronskian).
Complementary and particular solution of nonhomogenous linear second-order differential equations and a relation between them.
Practical examples of second-order differential equations.
Power series review.
To propose using power series to solve the second-order differential equations when their coefficients are function from the independent variable.
Ordinary point and its theorem.
Regular singular point and its theorem.
Irregular singular point.
To introduce the integral transform and Laplace transform for sample of integral transforms.
Piecewise continuous functions and their Laplace transform and theorems about them.
Relation between a function Laplace transform and its derivative Laplace transform.
Step function and the theorem about inverse transformations.
Impulse function.
Examples of linearly first-order systems applications.
To remember the matrix topics.
Principle theorem of linear first-order systems.

Part two (Executive knowledge):

How can you solve linear first-order differential equations?
Separable differential equations and its solutions?
How can you solve Bernoullii differential equation?
Riccati equation and its solution?
How can you solve the exact differential equations?
How can you solve homogenous equations?
What is an integrating factor? And how can you use it?
How can you find second linear independent solution of a second-order differential equation (reduction of order)?
How can you solve a linear second-order homogeneous with constant coefficients?
How can you solve a linear second-order nonhomogeneous with constant coefficients (undetermined coefficients method)?
What is variation of parameters method?
How can you use power series for solving second-order differential equations at neighborhood of an ordinary point?
How can you solve Euler differential equation?
How can you solve differential equations at neighborhood of regular singular point?
How can you solve Bessel differential equation?
How can you find Laplace transform of important functions?

How can you solve initial value problem by Laplace transform?
How can you evaluate piecewise continuous functions?
How can you solve a differential equation with piecewise continuous function?
How can you solve linear first-order differential equation systems?

MATHEMATICS TEACHER CANDİDATES' METAPHORS ABOUT THE CONCEPT OF "MATHEMATICS"

ABSTRACT: The main purpose of this study was to research mathematics teacher candidates' perceptions about the concept of "mathematics" through the use of metaphors. The research is conducted during 2012-2013 academic year, on a group of 111 mathematics teacher candidates at Necmettin Erbakan University. Of the participants 76 (68%) were female and 35 (32 %) were male. To collect the research data, each participant was asked to complete the prompt "*Mathematic is like . . . because . . .*" The content analysis technique was used in this study in order to evaluate the data collected. As a result of the data analysis, it was found that 67 valid metaphors were developed by the participants. Out of 67 metaphors, 9 were related to the living beings (3 human, 2 animal, 3 plant and 1 virus) while the rest 58 were related to the inanimate (such as, see, building and tree).

Key words: Metaphors about the concept of "mathematic"; mathematics teacher candidates; attitudes towards mathematics

INTRODUCTION

Traditionally, a metaphor is defined as a poetical image and a rhetorical tool which is limited to use in literature. Metaphor was defined as an embellishment or a style of speaking in the past (Lakoff and Johnson, 2003). Metaphor is not a mere embellishment, it is the basic means by which abstract thought is made possible (Lakoff &Nunez, 2000). Metaphor is considered as the strongest device for an individual to comprehend and explain a hypothetical or an abstract, complex fact in a high level (Saban, Koçbeker & Saban, 2006). A metaphor is actually a way of understanding one reality by means of another reality (Romanyshyn, 2001). Metaphors are usually used for the purpose of correlating something unknown or barely known with something better known (Kovecses, 2010). Additionally, metaphors give opportunities for comparing two things, drawing attention to the similarities between two things and explaining one thing in terms of another (Saban, 2004).

Metaphors have many advantages for educators and learners. If our conceptual system and thought processes are largely metaphorical, analyzing metaphorical thinking of people is a good way to understand what happens in their mind (Lakoff & Johnson, 2003). In recent years, there were many studies conducted to investigate the metaphors about "teaching", "learning" and "teacher" concepts (Carlson, 2001; Guerrero and Villamil, 2002; Yob, 2003; Saban, 2004; Saban, Koçbeker & Saban, 2006; Leavy, McSorley & Bote, 2007; Saban, 2009; Alger, 2009; Güler, Öçal and Akgün, 2011).

According to Ernest (2010), mathematics is a complex system. Mathematics truly has many components. Indeed, as is acknowledged, the very term "mathematics" is highly indefinite. Mathematics is an organised body of knowledge, a practice engaged in by mathematicians, a school subject, a cultural object of many meanings, and a language and box of conceptual tools used variously in many different practices. Its name alone (mathematics) is ambiguous because it is a plural word that is treated as naming a single entity.

Mathematics is a mysterious subject, and a number of myths are associated with mathematics. These myths include commonly expressed views including: "mathematics is only for clever people and male"; "your father is a mathematics teacher so you must be good in mathematics too" (Lim and Ernest, 1998). In the some researches, ıt was concluded that mathematics was about number and computation, a boring, difficult and dislike course (Raymond, 1997; Picker and Berry, 2000; Rock and Shaw, 2000; Schinck et al., 2008; Uçar et. al, 2010; Kılıç, 2011). Furthermore most of these views about mathematics are negative. Such negative views are common and seem to be present in many countries (Lim and Ernest, 1998).

Students have various beliefs about mathematics. These beliefs are linked to interpretations of the role mathematics plays in their lives, both within and outside of school. But determining student beliefs is a difficult undertaking. Metaphor provides a means of unpacking the beliefs that students have about mathematics. (Schinck et al., 2008). When literature is analyzed in terms of metaphor, there are some studies had been conducted on metaphorical images of specific content like mathematics (Lim and Ernest, 1998; Lim, 1999; Noyes, 2006; Sterenberg, 2008; Schinck et al., 2008; Reeder, Utley & Cassel, 2009; Kılıç, 2011).

Saban (2004) argued that individuals who come to faculties of education to become teachers bring many attitudes towards many concepts with themselves like teacher and learning depending on their experiences during their primary and secondary education. From this perspective, it is important to reveal and discuss mathematics teacher candidates' concept of "mathematics". Therefore, this study was conducted to reveal perceptions of mathematics teacher candidates with regard to the concept of "mathematics".

The aim of this study is to examine mathematics teacher candidates' perceptions with regard to mathematic through metaphor analysis. With this aim in mind, answers for the following questions were sought:

1. What kind of metaphors do mathematics teacher candidates use to explain the concept of mathematics?
2. In what category do mathematics teacher candidates collect the metaphors they use to explain the concept of mathematics?

METHODS

Participants

A total of 111 mathematics teacher candidates at Ahmet Keleşoğlu Faculty of Education, Necmettin Erbakan University took part in this study. Content analysis, method which is one of the qualitative research methods, was employed in this study. The participants volunteered to take part in the study. 76 (68%) of the participants were female and 35 (32%) were male and their ages ranged between 18 and 22 (mean 20.2). This study was carried out in the fall semester of 2012-2013 academic years.

Data Collection

To determine mathematics teacher candidates' metaphors with regard to "mathematics", cards on which has the sentence *"Mathematics is like………………because ......"* is written were handed out to the participants and they were asked to complete this statement using only one metaphor and explaining the reason of their metaphor. At the beginning of the study, the participants were explained what the concepts of "metaphor" meant and why it was used with examples and they were given 20-30 minutes to write an appropriate metaphor and the reason why they chose that particular metaphor. The time allocated for the students to write the metaphor was considered to be enough as the aim of this study was to make mathematics teacher candidates focus on the very first metaphor that occurred to their mind. The answers students provided for the sentence written on the cards- which is mentioned above- formed the basic source of data for our study.

Data Analysis

When analyzing the metaphors mathematics teacher candidates developed, first appropriate and in appropriate metaphors were determined. A total of 10 metaphor card in which more than one metaphors were determined or metaphors without relation between the target and source were determined, were left out of assessment. A list of metaphor was formed by coding the remaining metaphors.

Second, the sources of the metaphors mathematics teacher candidates developed with regard to mathematics were read carefully and they were categorized. When categories were formed, the common characteristics of teacher candidates with regard to the concepts of "mathematics" were taken into consideration.

Third, the study was validated. Yıldırım and Şimşek (2005) state that detailed reporting of how data and results were obtained is a very important criterion for validity in qualitative research. In line with this, data collection process and analysis process were explained in detail. To ensure reliability of the study, data obtained was analyzed first by the researcher and then b a professor who is an expert in this field of study and metaphors and categories were determined. The analyses carried out by the researchers and expert professor were compared and the number of metaphors and categories that overlapped and did not overlap were determined. The formula (Reliability= the number of overlapping items (metaphors) / (the number of overlapping + not overlapping ones)) developed by Miles and Huberman (1994) was used and reliability level was found to be %92. According to Miles and Huberman, values higher than 90% and over obtained using this formula are regarded to be adequate for reliability.

After metaphors and categories representing them are given are finalized, data were submitted to SPPS software and percentiles and frequencies were calculated as a last step.

RESULTS AND FINDINGS

In this section of the study, results with regard to metaphors by mathematics teacher candidates about the concept of “mathematics” are presented in tables and they were analyzed and interpreted under subheadings determined based on research questions.

1. With what kind of metaphors do mathematics teacher candidates explain the concept of mathematics?

As a result of the study, 67 metaphors in total were found to be related to the concept of "mathematics". 49 of these metaphors were provided by only one teacher candidate and the remaining 18 were provided by a number of teacher candidates ranging from 2 to 9. Top 5 metaphors were found to be: water (9 teacher candidates, 8.1%), puzzle (7 teacher candidates, 6.3%), ocean (5 teacher candidates, 4.5%), sea (4 teacher candidates, 3.6%), and riddle (4 teacher candidates, 3.6%). Among 9 metaphors that were linked with living beings, 3 were human, another 3 were plant, 2 were animal and one was a virus. 46 were tangible, and 12 were intangible objects among the 58 metaphors that were linked with non-living beings.
In Table 1, a list of metaphors developed by mathematics teacher candidates and the number and percentage of teacher candidates representing each metaphor are given.

Table 1. Metaphors Developed Regarding The Concept of "Mathematics" and The Number and Percentage of Teacher Candidates Representing Them.

No.	Metaphor name	Frequency (f)	Percentage (%)	No.	Metaphor name	Frequency (f)	Percentage (%)
1	Water	9	8.1	35	Queen	1	0.9
2	Crossword	7	6.3	36	Tower	1	0.9
3	Ocean	5	4.5	37	Well	1	0.9
4	Sea	4	3.6	38	Love	1	0.9

34	Deadlock	1	0.9		Total	111	100

2. **In what category do mathematics teacher candidates collect the metaphors they use to explain the concept of mathematics?**

However, 60 of the 67 metaphors were under a single category while 7 metaphors were under 2 or 3 categories. For instance, the "ocean" metaphor developed by teacher candidate 54 was under *mathematics as a limitless figure* category, while the "ocean" metaphor developed by teacher candidate 28 took place under the *mathematics as a foundation figure for other fields of science.* Classification of metaphors that were developed by teacher candidates according to their categories and the number of teachers representing them are given in Table 2.

Table 2. Classification of Metaphors Developed by Teacher Candidates According to Categories and The Number and Percentage of Teacher Candidates Representing Them.

Categories		Number of metaphors	Number of teacher candidates	Percentage of teacher candidates
1	Mathematics as a limitless figure	14	22	19.8
2	Mathematics as an ınterconnected figure	11	15	13.5
3	Mathematics as a basic need figure	5	14	12.6
4	Mathematics as a fun figure	6	10	9.0
5	Mathematics as a cumulative figure	7	8	7.2
6	Mathematics as an indispensable figure	8	8	7.2
7	Mathematics as a foundation for other sciences	7	8	7.2
8	Mathematics as a hard-to understand figure.	5	5	4.5
9	Mathematics as a guiding figure.	3	5	4.5
10	Mathematics as a universal language.	2	4	3.6

11	Mathematics as a figure that requires continuity.	3	4	3.6
12	Mathematics as a figure that is yet to be solved.	2	3	2.7
13	Mathematics as a mind-developing figure.	3	3	2.7
14	Mathematics as a figure with a single correct answer.	1	2	1.8

Category 1: Mathematics as a limitless figure

In total, there are 14 metaphors represented by 22 (19.8%) teacher candidates under this category. These metaphors are “ocean” (3), “sea” (4), “space” (3), “infinity” (2), “sky” (1), “vita” (1), “omani” (1), “well” (1), “great plane” (1), “gap” (1), “black” (1), “universe” (1), “star cluster” (1), “cliff” (1). When the metaphors were analyzed, it was found that prospective teachers who developed these metaphors perceive mathematics as limitless. These teacher candidates emphasized that subjects of mathematics are infinite and that there are more to discover as new discoveries in mathematics are made. Quotes from teacher candidates' who came up with the category *mathematics as a limitless figure* are as follows:
"Mathematics is like the star clusters in space because it as limitless as they are. Just like stars, there will be further discoveries as we discover stars and you work on finding another while you have discovered one" (teacher candidate 23, male).
"Mathematics is like the color black, because, to me, black represents infinity and never endlessness. So does mathematics; it is infinite" (teacher candidate 101, female).
"Mathematics is like infinity. Just like it, it has no limit. It makes you think that, once you have achieved something, you find yourself at the very beginning and so it never ends with mathematics" (teacher candidate 4, female).
"Mathematics is like space because it contains many galaxies, stars, planets and many objects that we are yet to discover and learn. You can never say, okay, that is it, it is over, always new subjects come up; they are infinite" (teacher candidate 20, female).
"Mathematics is like the ocean in a way that when the ocean is observed from land, it seems infinite and so it is how mathematics seems when studying a subject; problems, and theorems related to that subject are so broad in scope that we are able to produce hundreds of problems within merely one problem" (teacher candidate 58, female).

Category 2: Mathematics as an interconnected figure

In total, there are 11 metaphors represented by 15 (13.5%) teacher candidates under this category. These metaphors are “puzzle” (4), “tree” (2), “milk way” (1), “destiny” (1), “game” (1), “matryoshka doll” (1), “chain ring” (1), “building” (1), “life” (1), “crossword” (1), “dominos” (1).When the metaphors were analyzed, it was found that the teacher candidates who came up with these metaphors perceived mathematics as an ınterconnected and interrelating figure. These teacher candidates pointed out that the content of mathematics are interrelated and that one could not be formed without the other and that through searching for these correlations it is possible to achieve results. Quotes from teacher candidates' who came up with the category *mathematics as an ınterconnected figure* are as follows:
"Mathematics is like the Milky Way. When we consider that all planets in the Milky Way are connected to one another we can see that mathematics is interrelated within itself as a whole. In the Milky Way, elimination of a planet may destroy everything, similarly in mathematics; a vanishing expression may destroy everything” (teacher candidate 7, male).
"Mathematics is like a tree in a way that the roots, trunk, branches and leaves of a tree are all interconnected. In mathematics, the roots of a tree are definitions. The trunk contains demonstrations. Just like branching in a tree the theorems are interconnected and finally the leaves show the results" (teacher candidate 75, female).
"Mathematics is like a puzzle. When one of the pieces of the puzzle is missing, the puzzle picture cannot be completed and similarly, in mathematics, when a piece of information is missing, it is not possible to achieve results." (teacher candidate 99, female).
"Mathematic is like life. Every year, every month and every day of life is connected to each other. A person cannot run without first learning to walk, one cannot perform an operation without learning about numbers first and if one does not know how to perform an operation then one cannot solve a problem" (teacher candidate 17, female).

Category 3: Mathematics as a basic need figure

In total, there are 5 metaphors represented by 14 (12.6%) teacher candidates under this category. These metaphors are “water” (9), “oxygen” (2), “life source” (1), “money” (1), “clothes” (1).When the metaphors were analyzed, it was found that teacher candidates who came up with these metaphors perceived mathematics as a basic need to continue living. These teacher candidates pointed out that life cannot be sustained without mathematics just like one cannot survive without air and water. Quotes from teacher candidates' who came up with the category *mathematics as a basic need figure* are as follows:

"Mathematics is like water. Life cannot exist without water and so without mathematics. This is because nature is based on a certain balance and people need mathematics in order to understand this balance." (teacher candidate 26, female).

"Mathematics is like money because money always exists in our lives and it is indispensable. When we consider that mathematics is a science which exists for fulfilling human needs and that human needs will always exist and we cannot live without money, we cannot live without mathematics" (teacher candidate 32, female).

"Mathematics is like a source of life because we face it at every moment of our lives. Mathematics is involved with every discovery that carries utmost significance for people." (teacher candidate 59, female).

Category 4: Mathematics as a fun figure

In total, there are 6 metaphors represented by 10 (9%) teacher candidates under this category. These metaphors are “crossword” (4), “game” (2), “mind game” (1), “pizza” (1), “İstanbul” (1), “soccer game” (1).When the metaphors were analyzed, it was found that teacher candidates who came up with these metaphors perceived mathematics as a fun figure. These teacher candidates pointed out that it fun to engage in mathematics and that they it gives them joy. Quotes from teacher candidates' who came up with the category *mathematics as a fun figure* are as follows:

"Mathematics is like a game because engaging in mathematics and learning new things is pleasurable just like playing a game" (teacher candidate 38, male).

"Mathematics is like a soccer game. When people enjoy it while playing with a ball on the field, it is just as much fun to deal with theorems and numbers in mathematics." (teacher candidate 11, male).

"Mathematics is like crossword. Trying to solve mathematical problems gives me just as much pleasure to solve crossword." (teacher candidate 90, female).

"Mathematics is like Istanbul. It is a great pleasure once you have understood it; just like wandering Istiklal Street. Once you have solved a problem you view life from above, just like going on top of the Fortress of Rumeli and watch the view of Bosporus. Sometimes one cannot figure out a theorem and get stuck with it, just like getting stuck in traffic at the E5 highway. Regardless, one becomes happy with mathematics just like one feels in Istanbul." (teacher candidate 72, male).

Category 5: Mathematics as a cumulative figure

In total, there are 7 metaphors represented by 8 (7.2%) teacher candidates under this category. These metaphors are “building” (2), “dominos” (1), “jigsaw” (1), “tower” (1), “ocean” (1), “desk” (1), “dark caves” (1).When the metaphors were analyzed, it was found that teacher candidates who came up with these metaphors perceived mathematics as a cumulative figure. These teacher candidates pointed out that mathematics constitutes an accumulation of heaps of information. Quotes from teacher candidates' who came up with the category *mathematics as a cumulative figure* are as follows:

"Mathematics is like the ocean. The ocean consists of tiny water drops and so mathematics consists of an accumulation of information clusters as a body" (teacher candidate 15, male).

"Mathematics is like a desk at primary school. Somebody writes down on this desk and in the following years every person who sits there makes other additions. Mathematics is just like that." (teacher candidate 21, male).

"Mathematics is like a building. A building is constructed by placing bricks on top of each other and so is mathematics, a science formed by stacking heaps of information." (teacher candidate 69, female).

Category 6: Mathematics as an indispensable figure.

In total, there are 8 metaphors represented by 8 (7.2%) teacher candidates under this category. These metaphors are “virus” (1), “ivy” (1), “life” (1), “salt water” (1), “marsh” (1), “Chocolate wafers” (1), “habit” (1), “illness” (1). When the metaphors were analyzed, it was found that teacher candidates who came up with these metaphors perceived mathematics as an addictive and indispensable figure. These teacher candidates emphasized that they were not able to break off of mathematics once they have studied it and that they would like to continue dealing with it. Quotes from teacher candidates' who came up with the category *mathematics as an indispensable figure* are as follows:

"Mathematics is like a virus. Mathematics is like how an addictive virus without a working cure does not leave the body." (teacher candidate 12, female).

"Mathematics is like a marsh. Once you have entered a marsh, you cannot get out and once you have engaged in mathematics, you cannot leave it." (teacher candidate 110, male).

"Mathematics is like ivy. Once you have made contact it creeps up on you and neither can you break off of it nor can it break off of you." (teacher candidate 34, female).

Category 7: Mathematics as a foundation for other sciences

In total, there are 7 metaphors represented by 8 (7.2%) teacher candidates under this category. These metaphors are “river” (2), “tree” (1), “building foundation” (1), “ocean” (1), “lion” (1), “queen” (1), “garden” (1). When the metaphors were analyzed, it was seen that teacher candidates who came up with these metaphors perceived mathematics as the foundation for other fields of science. These teacher candidates pointed out those other fields of science were nurtured by mathematics and that further advances in those fields could only be made through mathematics. Quotes from teacher candidates' who came up with the category *mathematics as a foundation for other science* are as follows:
"Mathematics is like a queen. It is the outset for all fields of science. We cannot consider any science without mathematics." (teacher candidate 98, female).
"Mathematics is like a lion. Just as the lion is the king of the forest, mathematics is the dominator of other fields of science." (teacher candidate 40, female).
"Mathematics is like the foundation of a building. If we consider other fields of science as buildings, mathematics would be their foundation. Other fields of science are able to stand by means of it." (teacher candidate 67, male).

Category 8: Mathematics as a hard-to-understand figure

In total, there are 5 metaphors represented by 5 (4.5%) teacher candidates under this category. These metaphors are “darling” (1), “thorny rose” (1), “deadlock” (1), “human” (1), “life” (1). When the metaphors were analyzed, it was found that teacher candidates who came up with these metaphors perceived mathematics as a hard-to-understand figure. These teacher candidates pointed out that, to them, mathematics were complicated and hard to understand. Quotes from teacher candidates' who came up with the category *mathematics as a hard-to-understand figure* are as follows:
"Mathematics is like a thorny rose. It is difficult to handle a thorny rose just as understanding mathematics." (teacher candidate 5, male).
"Mathematics is like a darling. It has always been difficult for me to figure out both." (teacher candidate 27, male).
"Mathematics is like a deadlock. It is either difficult or impossible to untie a Gordian knot, just as it is with mathematics. "(teacher candidate 13, female).

Category 9: Mathematics as a guiding figure

In total, there are 3 metaphors represented by 5 (4.5%) teacher candidates under this category. These metaphors are “lantern” (3), “compass” (1), “light” When the metaphors were analyzed, it was found that teacher candidates who came up with these metaphors perceived mathematics as a guiding figure. These teacher candidates see mathematics as a guiding tool that would help understand nature and ease life. Quotes from teacher candidates' who came up with the category *mathematics as a guiding figure* are as follows:
"Mathematics is like light. Light leads others in its environment. Mathematics, similarly to light, guides us to understand nature and helps us make advances in technology." (teacher candidate 53, female).
"Mathematics is like a compass. The route that mathematics leads us is the reference point for us to figure out the whole universe." (teacher candidate 73, male).
"Mathematics is like a lantern. It is a tool that sometimes a physicist, a chemist or an engineer uses to find his/her way." (teacher candidate 41, male).

Category 10: Mathematics as a universal language

In total, there are 2 metaphors represented by 4 (3.6%) teacher candidates under this category. These metaphors are “language” (3), “letter” (1). When the metaphors were analyzed, it was found that teacher candidates who came up with these metaphors perceived mathematics as a language. These teacher candidates stated that mathematics was a language like Turkish, or Persian and that it was a common language spoken by the whole world. Quotes from teacher candidates' who came up with the category mathematics as a universal language are as follows:
"Mathematics is like language, since it contains symbols that are able to express themselves. Therefore it is a common language that anyone can speak, a universal language." (teacher candidate 44, male).
"Mathematics is like a letter. It is such a letter that it tells you everything with its symbols and numbers so wherever in the world you sent it they can read it and understand it." (teacher candidate 1, female).

Category 11: Mathematics as a figure that requires continuity

In total, there are 3 metaphors represented by 4 (3.6%) teacher candidates under this category. These metaphors are “cat” (2), “love” (1), “instrument” (1). When the metaphors were analyzed, it was found that the teacher candidates who came up with these teachers perceived mathematics as a figure that requires continuity. These teacher candidates pointed out that it is necessary to be continuously involved in mathematics, otherwise its knowledge could be quickly forgotten and that it is a field of science which requires continuous interest. Quotes from teacher candidates' who came up with the category mathematics as a figure that requires continuity are as follows:
"Mathematics is like a cat. However much you take care of it, it is ungrateful. Just a bit of decrease in your interest, it will not even recognize you." (teacher candidate 60, female).
"Mathematics is like a musical instrument because mathematics is ungrateful, like a musical instrument. If one does not pick up the instrument for a week, one loses two weeks of progress. So is mathematics, when we take a break from it, our ability to understand diminishes and we become unfamiliar to it." (teacher candidate 89, male).

Category 12: Mathematics as a figure that is yet to be solved

In total, there are 2 metaphors represented by 3 (2.7%) teacher candidates under this category. These metaphors are “crossword” (2), “aids” (1). When the metaphors were analyzed, it was found that the teacher candidates who developed these metaphors perceived mathematics as a figure that is yet to be solved. These teacher candidates stated that mathematics has many problems to which solutions have not yet been found and that they were still in search for answers. Quotes from teacher candidates' who came up with the category mathematics as a figure that is yet to be solved are as follows:
"Mathematics is like a crossword. There are many interesting questions and problems that are yet to be solved. There are problems that have not yet been solved for years in the subject of prime numbers alone." (teacher candidate 63, female).
"Mathematics is like Aids. They both have many details that have not yet been discovered and may never be." (teacher candidate 50, female).

Category 13: Mathematics as a mind-developing figure

In total, there are 3 metaphors represented by 3 (2.7%) teacher candidates under this category. These metaphors are “vitamins” (1), “drug” (1), “brain teaser”. When the metaphors were analyzed, it was found that teacher candidates who developed these metaphors perceived mathematics as a mind-developing figure. These teacher candidates pointed out that engaging in mathematics would broaden one's horizon, increase one's level of intelligence and that it would refresh one's outlook on life. Quotes from teacher candidates' who came up with the category mathematics as a mind-developing figure are as follows:
"Mathematics is like a brain teaser. When a person is in the middle of solving a brain teaser s/he would be exercising logic on one hand and making calculations on the other; s/he would be doing the same when dealing with mathematics. In this way, we are able to develop our minds and at the same time learn to view life from another angle." (teacher candidate 88, female).
"Mathematics is like vitamins. Taking vitamins benefits a person's mind, and so does mathematics. (teacher candidate 93, male).

Category 14: Mathematics as a figure with a single correct answer

In total, there are 1 metaphors represented by 2 (1.8%) teacher candidates under this category. This metaphor is “maze”. When the metaphors were analyzed, it was found that teacher candidates who developed these metaphors perceived mathematics as a figure with a single correct answer. These teacher candidates stated that there were many paths to reach a solution however there is single correct answer. Quotes from teacher candidates' who came up with the category mathematics as a figure with a single correct answer are as follows:
"Mathematics is like a maze. There are many paths to take in a maze. By treading some of them we may not be able to reach the exit and by other we may. However, there is only one exit. Such is mathematics; there are many ways to reach a solution but there is only one solution." (teacher candidate 66, female).
"Mathematics is like a maze. There are many labyrinthine routes in a maze; however, only one exit, which is the case with mathematics, as there is a single correct solution." (teacher candidate 103, female).

DISCUSSION and CONCLUSION

In this study, the perceptions of mathematics teacher candidates were examined through metaphor analysis. In this study, the metaphors developed by mathematics teacher candidates in this study were grouped under 14 categories. According to these categories, about 77% of mathematics teacher candidates perceived mathematics as “Limitless”, “Interconnected”, “Basically needed”, “Fun”, “Cumulative”, “Indispensable” figure and as a figure which laid the “foundation for other sciences”. The remaining 23% perceived mathematics as “Hard-to-understand”, “Guiding”, “Universal language”, “Requiring continuity”, “Yet to be solved”, “Mind developing” and “Having single correct answer” . According to the results of this study, only the group of mathematics teacher candidates who represented“ mathematics as a figure difficult to understand” category had negative perceptions and the mathematics teacher candidates who represent all the remaining categories had positive perceptions with regard to mathematics.

Some of the mathematics teacher candidates in this study defined mathematics as limitless and interconnected figure. Similarly in a study by Kılıç (2011) it was reported that prospective elementary mathematics teachers stated that mathematics subjects were infinite and interconnected. Besides, in a study by Schinck et al. (2008) it was stated that 9th and 10th grade students emphasized that mathematics subjects were interconnected.
Besides, some of the mathematics teacher candidates who took part in this study found mathematics as a fun and enjoyable figure. In similar studies, students, teacher candidates and adults defined mathematics as fun and enjoyable figure (Lim, 1999; Lim and Ernest, 1998; Schinck et al, 2008; Kılıç, 2011). However, some of the teacher candidates in this study perceived mathematics as challenging and incomprehensible. Previous studies also revealed similar findings (Lim, 1999; Lim and Ernest, 1998; Schinck et al., 2008; Uçar et. al, 2010; Kılıç, 2011).

Another finding revealed in this study is that mathematics teacher candidates regarded mathematics as a universal language and as the foundation of other sciences. Similarly, in a study by Noyes (2006) on mathematics teacher candidates, it was found that mathematics was perceived as a universal language and the foundation for other sciences.

Yet another finding of the study is that mathematics teacher candidates hold the view that mathematics is a branch of science which requires effort and permanence. This finding is line with the findings of other related studies (Lim, 1999; Lim and Ernest, 1998; Schinck et al, 2008).

RECOMMENDATIONS

In this study, perceptions of mathematics teacher candidates with regard to mathematics concept were examined and significant findings were obtained. The following suggestions can be made under the light of the results of the study:

1. In pre-service education given to mathematics teacher candidates, education environments which will enable prospective teachers to develop positive perceptions with regard to the concept of mathematics should be created.

2. Courses about history and nature of mathematics can be given to mathematics teacher candidates so that they have positive perceptions about mathematics.

3. In order to determine perceptions of students and mathematics teachers with regard to the concept of mathematics similar qualitative or quantitative studies can be conducted.

ÖZET: Bu araştırmanın amacı; FATİH Projesi il koordinatörlerinin, il eğitici formatörlerinin eğitmenlerinin FATİH Projesi kapsamında verilen eğitmen eğitimlerine ilişkin görüşlerini tespit etmektir. Nitel olarak desenlenen bu araştırma 2013 – 2014 eğitim öğretim yılında görev yapan 20 katılımcıyla gerçekleştirilmiştir. Görüşme tekniği ile elde edilen veriler, içerik analizi yöntemi ile analiz edilmiştir. Araştırmada elde edilen bulgulara göre; katılımcıların yarıdan fazlasının FATİH eğitimlerinin eksik yanının olmadığını belirterek sayı, eğitim saati ve içerik bakımından yeterli buldukları sonucuna ulaşılmıştır. Ayrıca katılımcılar FATİH eğitimlerinin; sosyal etkileşim, yeni bilgi öğrenme, projeyi tanıma, gezi gibi mesleki ve kişisel açıdan kendilerine katkı sağlayacak yönleri olduğunu belirtmişlerdir. FATİH eğitimleri esnasında karşılaşılan zorluklar ise kursiyerlerdeki isteksizlik, yorgunluk, donanımsal problemler ve kurs saatlerinden kaynaklanan problemler şeklinde belirtilmiştir. Katılımcıların görev aldıkları FATİH eğitimlerinin sonunda, kendi kursiyerlerinin aldıkları eğitime yönelik dönütleri ise bu eğitimlerin gerekli ve faydalı olduğu yönünde olmuştur. Katılımcıların büyük çoğunluğu FATİH Projesi kapsamında verilen eğitimlerin zorunlu olması gerektiğini belirtmişlerdir. Çalışmada elde edilen veriler analiz edilmiş, bulgular doğrultusunda tartışılmış ve öneriler getirilmiştir.

Anahtar Kelimeler: FATİH Projesi, Hizmetiçi Eğitim, FATİH Eğitmenleri.

SUMMARY: The purpose of this study is to determine the views of city coordinators and trainers of the FATIH Project on instructor training given in the scope of FATIH project. The study was designed in qualitative method and was performed with 20 participants who were at active duty in the 2013 – 2014 academic year. The data obtained with interview technique were analyzed with content analysis technique. According to the findings of the study, more than half of the participants stated that the FATIH project trainings had no missing points and that they found these trainings successful in terms of training frequency, hours and contents. The participants also stated that the FATIH Project trainings had useful vocational and personal contributions to them in which social interaction, learning new information, recognizing the project better and traveling were involved. The challenges during the FATIH trainings were stated to be the unwillingness in the participants for the trainings, weariness, software problems and course hours. At the end of the FATIH trainings in which the participants took part, the feedbacks they received stated that the trainings were useful and necessary. Most of the participants stated that the trainings provided in the scope of the FATIH Project should be compulsory. The data obtained during the study were analyzed and the findings were discussed and suggestions were made.

Key Words: FATİH Project, In-Service Training, FATİH Instructors.

GİRİŞ

Eğitim en genel haliyle; insanları belli amaçlara göre yetiştirme süreci olarak ifade edilebilir (Fidan, 2012). Eğitim ihtiyacını Turgut (2012); çalışan personelin görevini en iyi şekilde yerine getirebilmesi için gerekli olan bilgi, beceri ve davranışları geliştirmede istenilen önemli bir nokta şeklinde ifade etmiştir. Teknolojinin ise diğer alanlarda olduğu gibi eğitim alanında da geçmişten günümüze birçok yeniliği beraberinde getirdiği görülmektedir. Çünkü teknolojinin eğitimde daha sık kullanılmasıyla birlikte öğretmen ve öğrencilerin işlerinin daha çok kolaylaştığı görülmektedir. Heafner'e (2004) göre eğitimde teknolojinin kullanımı; öğrencilerin öğrenme sürecine yoğunlaşmalarını teşvik ederek, öğrencilerin kendilerine olan güvenlerini artırmalarını sağlamakta, dolayısıyla onların bilişsel becerilerinin de gelişmesini etkilemektedir. İnel, Evrekli ve Balım'ın (2011), teknoloji ve eğitimin bütünleşmesine ilişkin ortak kanısı, öğrenme ve öğretme süreçlerinin daha verimli hale gelerek, daha vasıflı kişiler yetişmesine olanak sağlayacağı inancıdır.

Ülkemizde teknolojinin eğitimde kullanılmasıyla ilgili çalışmalar sürekli artış göstermektedir. Bu projelerin en sonuncusu Milli Eğitim Bakanlığı ve Ulaştırma Bakanlığının ortaklaşa yürüttüğü FATİH (Fırsatları Artırma Teknolojiyi İyileştirme Hareketi) Projesi'dir. Eğitimde FATİH Projesi, eğitim ve öğretimde fırsat eşitliğini sağlamak ve okullardaki teknolojiyi iyileştirmek amacıyla Bilişim Teknolojileri araçlarının öğrenme ve öğretme sürecinde daha fazla duyu organına hitap edecek şekilde, derslerde etkin kullanımı için; okulöncesi, ilköğretim ile ortaöğretim düzeyindeki okullara gereken teknolojik altyapıyı sağlaması için tasarlanmıştır (FATİH Projesi, 2014).

FATİH Projesi beş ana bileşenden oluşmaktadır (FATİH Projesi, 2014). Bunlar:

- ✓ Donanım ve Yazılım Altyapısının Sağlanması
- ✓ Eğitsel e-İçeriğin Sağlanması ve Yönetilmesi
- ✓ Öğretim Programlarında Etkin BT Kullanımı
- ✓ Öğretmenlerin Hizmetiçi Eğitimi
- ✓ Bilinçli, Güvenli, Yönetilebilir ve Ölçülebilir BT Kullanımının sağlanmasıdır.

Bu bileşenlerin dördüncü basamağı olan "Öğretmenlerin Hizmetiçi Eğitimi" maddesi de en az diğerleri kadar önem arz etmektedir. Bir mesleğin koşullarını, daha önceki alınan eğitimlerle yerine getirmekte zorlanan personelin hizmetiçi eğitimle kendini geliştirme zorunluluğu doğmaktadır (Taymaz, 1997). Seferoğlu'na (2004) göre hizmetiçi eğitim; öğretmenlerin niteliklerini arttırma, potansiyellerini tam olarak ortaya çıkarma ve kullanma becerisi kazandırmaya yönelik önemli bir süreçtir. Çünkü okul personelinin performansını, öğretmenlerin mesleki becerisini, kişisel veya genel eğitimini geliştirmek ve kariyer gelişimi için deneyimlerini arttırmak gibi hedefler içermektedir. Hizmetiçi eğitimlerin sonrasında kazanılması amaçlanan en temel öğelerden birisi olan mesleki gelişim kavramını ise Guskey (2002) öğretmenlerin öğrencilerini ilerletmek için, eğitimcilerin mesleki bilgi, beceri ve tutumlarını geliştirmek üzere düzenlenen süreç ve etkinlikler şeklinde tanımlanmıştır.

FATİH Projesi kapsamında okullara kurulan teknolojinin etkili kullanımıyla ilgili öğretmenlere yönelik çeşitli eğitimler planlanmıştır. 2014 Merkezi Hizmetiçi Eğitim planına göre FATİH Projesiyle ilgili aşağıdaki kurslar açılmaktadır (ÖYGM, 2014).:

- ✓ Eğitimde FATİH Projesi (Teknoloji Kullanım Kursu)
- ✓ Eğitimde FATİH Projesi (Pardus Kullanım Kursu)
- ✓ FATİH Projesi BT'nin Bilinçli, Güvenli Kullanımı Semineri
- ✓ FATİH Projesi Ağ Altyapısı Semineri
- ✓ FATİH Projesi Branş Dersleri Uygulama Örnekleri Semineri
- ✓ FATİH Projesi – Teknoloji ve Liderlik Forumu Kursu

Yukarıda belirtilen eğitimlerden, *FATİH Projesi Teknoloji Kullanım Kursu* eğitimi alan kişiler FATİH eğitmeni olmaya hak kazanmaktadırlar (FATİH - Eğitmen Listesi, 2014). Ayrıca 81 ilde FATİH projesinin yürütülmesiyle ilgili görevli il koordinatörleri ve Eğitici BT Formatör Öğretmenleri bulunmaktadır. İl koordinatörleri ve eğitici BT formatör öğretmenlerinin görevleri arasında bulundukları il ya da ilçede FATİH projesinin işleyişini takip etmek ve o yerleşim yerindeki tüm öğretmenlerin FATİH hizmetiçi eğitimlerini almalarını sağlamak da bulunmaktadır. Koordinatör ve eğiticilerin sayı olarak yeterli olmadığı durumlarda ise FATİH eğitmenleri bir yandan okullarındaki görevlerine devam ederken diğer yandan hizmetiçi eğitimlerde görev alma imkânı bulmaktadırlar (Telli, 2012).

Araştırmanın Amacı

Bu araştırmanın amacı FATİH Projesi il koordinatörlerinin, il eğitici formatörlerinin ve FATİH Projesi eğitmenlerinin FATİH Projesi kapsamında verilen hizmetiçi eğitmen eğitimlerine ilişkin görüşlerini tespit etmektir. Bu amaç doğrultusunda aşağıdaki araştırma sorularına cevap aranmıştır:

a) Katılımcıların aldıkları FATİH eğitimlerini yeterli bulma durumları nelerdir?
b) Katılımcıların verdikleri FATİH eğitimlerini yeterli bulma durumları nelerdir?
c) Katılımcıların FATİH eğitimlerinde gördükleri eksiklikler nelerdir?
d) Katılımcıların FATİH eğitimlerinin katkılarına yönelik görüşleri nelerdir?
e) Katılımcıların verdikleri FATİH eğitimlerinde yaşadıkları problemler nelerdir?
f) Katılımcıların FATİH eğitimlerinin zorunlu olmasına yönelik görüşleri nelerdir?
g) Katılımcıların FATİH projesinin katkılarına yönelik görüşleri nelerdir?
h) Katılımcıların kursiyerlerinin FATİH eğitimlerine yönelik görüşleri nelerdir?

YÖNTEM

Araştırma Modeli

FATİH Projesi il koordinatörlerinin, il eğitici formatörlerinin ve FATİH Projesi eğitmenlerinin FATİH Projesi kapsamında verilen hizmetiçi eğitmen eğitimlerine ilişkin görüşlerini tespit etmenin hedeflendiği bu araştırma nitel bir çalışma olup, durum çalışması deseni şeklindedir. Araştırılan olguyu kendi yaşam çerçevesi içinde inceleyen, olgu ve içinde bulunduğu ortam arasındaki sınırların kesin hatlarla belirgin olmadığı ve birden fazla kanıt veya veri kaynağının mevcut olduğu durumlarda kullanılan bir araştırma desenidir (Yıldırım ve Şimşek, 2006; Yin, 1984).

Katılımcılar

Araştırma; 2013 – 2014 eğitim öğretim yılında görev yapan 20 FATİH Projesi eğitmeninin katılımıyla gerçekleştirilmiştir.

Katılımcıların demografik özelliklerine ilişkin frekans ve yüzde dağılımları aşağıda sırasıyla verilmiştir. Görev türüne göre katılımcı sayısı Tablo 1'de belirtilmiştir.

Tablo 1. Görev Türüne Göre Katılımcı Sayısı

Değişken	Gruplar	f	%
Mesleki Görev	BT İl Koordinatörü	3	15
	Eğitici BT Formatör Öğretmeni	10	50
	FATİH Projesi Eğitmeni	7	35

Tablo 1 incelendiğinde; katılımcıların yarısının (n=10) eğitici BT formatör öğretmenlerden oluştuğu görülmektedir. Tablo 2'de katılımcıların cinsiyetleri belirtilmiştir.

Tablo 2. Cinsiyete Göre Katılımcı Sayısı

Değişken	Gruplar	f	%
Cinsiyet	Erkek	17	85
	Kadın	3	15

Tablo 2 incelendiğinde; katılımcıların büyük çoğunluğunu (n=17) erkek öğretmenler oluşturmaktadır. Tablo 3'te katılımcıların mesleki kıdem yılları belirtilmiştir.

Tablo 3. Kıdeme Göre Katılımcı Sayısı

Değişken	Gruplar	f	%
Kıdem	1 – 5 Yıl	2	10
	6 – 10 Yıl	8	40
	11 – 15 Yıl	6	30
	16 – 20 Yıl	2	10
	21+ Yıl	2	10

Tablo 3 incelenecek olursa; katılımcıların yaklaşık %70'i 6 – 15 yaş arası kıdeme sahip oldukları belirtilmiştir. Tablo 4'te katılımcıların FATİH Projesi kapsamında verilen hizmetiçi eğitimlerine katılım durum durumları belirtilmiştir.

Tablo 4. Aldıkları Eğitimlere Göre Katılımcı Sayısı

Değişken	Gruplar	f	%
Eğitim Alma Durumları	FATİH Projesi (Tekn. Kullanımı) Kursu	20	100
	Fatih Projesi Ağ Altyapısı Semineri	14	70
	BT'nin Bilinçli, Güvenli Kullanımı Semineri	9	45
	FATİH Projesi (Pardus Kullanımı) Kursu	8	40

Tablo 4 incelenecek olursa; katılımcıların tamamı *FATİH Projesi (Teknoloji Kullanımı) Kursu* eğitimini başarıyla tamamlayıp FATİH eğitmeni olmaya hak kazanmışlardır. Ayrıca katılımcıların yarıdan fazlasının (n=14) *Fatih Projesi Ağ Altyapısı Seminerini* aldığı görülmektedir. Tablo 5'te katılımcıların FATİH Projesi kapsamında görev aldıkları hizmetiçi eğitimler belirtilmiştir.

Tablo 5. Verdikleri Eğitimlere Göre Katılımcı Sayısı

Değişken	Gruplar	f	%
Eğitim Verme Durumları	FATİH Projesi (Tekn. Kullanımı) Kursu	20	100
	FATİH Projesi Hazırlayıcı Eğitim	14	70
	FATİH Projesi Tanıtım Semineri	11	55
	BT'nin Bilinçli, Güvenli Kullanımı Semineri	9	45
	FATİH Projesi (Pardus Kullanımı) Kursu	2	10

Tablo 5 incelenecek olursa; katılımcıların tamamı *FATİH Projesi (Teknoloji Kullanımı) Kursunun* eğitimini verdikleri görülmektedir. Ayrıca katılımcıların çoğu, *FATİH Projesi (Pardus Kullanımı) Kursu* (n=2) haricindeki kurslarda eğitmen olarak görev almışlardır.

Veri Toplama Araçları

FATİH Projesi il koordinatörlerinin, il eğitici formatörlerinin ve FATİH Projesi eğitmenlerinin FATİH Projesi kapsamında verilen eğitmen eğitimlerine ilişkin görüşlerini tespit etmenin hedeflendiği bu araştırmada araştırmacı tarafından geliştirilen ve on sorudan oluşan bir adet yarı - yapılandırılmış görüşme formu kullanılmıştır. Yarı-yapılandırılmış görüşme formu nitel alanda veri toplama amacıyla kullanılan tekniklerden birisidir. Bu yöntemde katılımcıların sorulara yanıtlar vermesi istenmektedir ve bu yanıtlar sesli olarak kaydedilmekte, sonra yazılı formata dönüştürülmektedir (Creswell, 2005; Yıldırım & Şimşek, 2006). Veriler araştırmacılar tarafından toparlanmış, verilerin kâğıda döküm işlemi gerçekleştirilmiştir.

Verilerin Analizi

Verilerin incelenmesinde nitel araştırmalarda sıklıkla kullanılan "içerik analizi" tekniği kullanılmıştır. İçerik analizi kuramsal anlamda belirgin olmayan temalar ve eğer varsa alt temaların oluşturularak analiz edilmesi şeklinde gerçekleştirilmektedir (Yıldırım & Şimşek, 2006). İçerik analizi için velilerden alınan verilerin indekslere işlenmesi, indekslerden kodların oluşturulması, kodlardan temaların çıkarılması, temaların düzenlenerek tanımlanması ve bu temalar doğrultusunda bulguların ortaya konarak yorumlanması şeklinde içerik analizi için gerekli olan işlemler sırası ile takip edilmiştir (Yıldırım & Şimşek, 2006).

Verilen kodlanması, kodlardan temaların oluşturulması ve temaların tanımlanmasında verilerin güvenilirliği için veriler iki araştırmacı tarafından ayrı ayrı kodlanmıştır. Araştırmacıların yanıtları karşılaştırılarak Miles ve Huberman (1994) tarafından ortaya konan Görüş Birliği / (Görüş Ayrılığı + Görüş Birliği)*100 formülü ile araştırmanın güvenirliği yaklaşık %88 olarak hesaplanmıştır. Güvenilir ve analize uygun olduğu ortaya konulan veriler kodlara, ardından da bu kodlardan temalara dönüştürülerek, başlıklar halinde bulgular yorumlanmıştır.

BULGULAR

Katılımcıların FATİH Projesi kapsamında aldıkları hizmetiçi eğitimleri sayı, eğitim saati ve içerik bakımından yeterli bulup bulmama durumları Tablo 6'da belirtilmiştir.

Tablo 6. Katılımcıların Aldıkları Eğitimi Yeterli Bulma Durumları

No	Gruplar	f	%
1	Yeterli Olduğumu Düşünüyorum	14	70
2	Yeterli Olduğumu Düşünmüyorum	6	30
	TOPLAM	**20**	**100**

Tablo 6 incelendiğinde katılımcıların %70'i katıldıkları hizmetiçi eğitimleri sayı, eğitim saati ve içerik bakımından yeterli bulduklarını belirtmişlerdir. Katılımcıların FATİH Projesi kapsamında eğitimini verdikleri hizmetiçi eğitimleri sayı, eğitim saati ve içerik bakımından yeterli bulup bulmama durumları Tablo 7'de belirtilmiştir.

Tablo 7. Katılımcıların Verdikleri Eğitimi Yeterli Bulma Durumları

No	Gruplar	f	%
1	Yeterli Olduğumu Düşünüyorum	17	85
2	Yeterli Olduğumu Düşünmüyorum	3	15
	TOPLAM	**20**	**100**

Tablo 7 incelendiğinde katılımcıların tamamına yakını (n=17) görev aldıkları hizmetiçi eğitimleri sayı, eğitim saati ve içerik bakımından yeterli bulduklarını belirtmişlerdir. Katılımcıların FATİH eğitimlerinde gördükleri eksik yanlar Tablo 8'de belirtilmiştir.

Tablo 8. Katılımcıların FATİH Eğitimlerinde Gördükleri Eksiklikler

No	Gruplar	f	%
1	Eksiklik Yok	12	57,12
2	Uygulama Yetersiz	3	14,29
3	Süre Yetersiz	3	14,29
4	İçerik Yetersiz	2	9,54
5	Konaklama Hizmetleri Yetersiz	1	4,76
	TOPLAM	**21**	**100**

Tablo 8 incelendiğinde katılımcıların yarısından fazlası (n=12) FATİH projesi eğitimlerinde eksiklik olmadığı görüşünü belirtmişlerdir. Katılımcılara FATİH eğitimlerinde mesleki ve kişisel açıdan ne gibi katkı sağladıkları sorulmuş ve cevaplar Tablo 9'da belirtilmiştir.

Tablo 9. Katılımcıların FATİH Eğitimlerinin Katkılarına Yönelik Görüşleri

No	Gruplar	f	%
1	Sosyal Etkileşim	10	35,71
2	Yeni Bilgi Öğrenme	7	24,99
3	Projeyi Tanıma	6	21,44
4	Kurs Açma İmkânı	3	10,72
5	Gezi	2	7,14
	TOPLAM	**28**	**100**

Tablo 9 incelendiğinde katılımcıların yarısı (n=10) FATİH eğitimlerinin en büyük katkısının sosyal etkileşim olduğunu belirtmişlerdir. Ayrıca yeni bilgi öğrenme, projeyi daha yakından tanıma gibi katkıların olduğu görüşü de ön plana çıkmıştır. Katılımcıların FATİH eğitimlerini verirken yaşadıkları problemler Tablo 10'da belirtilmiştir.

Tablo 10. Katılımcıların FATİH Eğitimlerinde Problem Yaşama Durumları

No	Gruplar	f	%
1	Katılımcılarda İsteksizlik	8	22,88
2	Katılımcılarda Yorgunluk	6	17,16
3	Donanımsal Problemler	6	17,16
4	Kurs Saati	5	14,30
5	İhtiyaç Duymama	4	11,34
6	Karma Branş Olması	2	5,72
7	Teknoloji Acemiliği	2	5,72
8	Elektrik ve İnternet Kesintisi	1	2,86
9	Problem Yaşamadım	1	2,86
	TOPLAM	**35**	**100**

Tablo 10 incelendiğinde katılımcıların eğitimlerde yaşadıkları sıkıntıların başında kursiyerlerin isteksiz ve yorgun olmaları gelmektedir. Ayrıca donanımsal problemler ve kurs saatinin isteklere göre olmaması temaları da eğitimlerde karşılaşılan problemlere örnek olarak belirtilmiştir. Katılımcıların FATİH eğitimlerinin zorunlu olarak verilmesine yönelik görüşleri Tablo 11'de belirtilmiştir.

Tablo 11. Katılımcıların FATİH Eğitimlerinin Zorunlu Olmasına Yönelik Görüşleri

No	Gruplar	f	%
1	Zorunlu Olmalı	14	70
2	Zorunlu Olmamalı	6	30
	TOPLAM	**20**	**100**

Tablo 11 incelendiğinde katılımcıların %70'i FATİH eğitimlerinin zorunlu olmasını istemektedirler. 6 katılımcı ise eğitimlerin zorunlu olmaması gerektiğini belirtmişlerdir. Katılımcıların; FATİH Projesinin eğitime ve eğitimcilere ne gibi katkılar sağlayacağına yönelik görüşleri ve beklentileri Tablo 12'de belirtilmiştir.

Tablo 12. Katılımcıların FATİH Projesinin Katkılarına Yönelik Görüşleri

No	Gruplar	f	%
1	BT Kullanım Becerisi	10	32,30
2	Kolay Öğrenme	7	22,51
3	Fırsat Eşitliği	5	16,13
4	Tablet Dağıtımı	4	12,92
5	Bireysel Öğrenme	3	9,68
6	Katkısı Yok	2	6,46
	TOPLAM	**31**	**100**

Tablo 12 incelendiğinde katılımcılara göre FATİH projesinin en büyük katkılarının bilişim teknolojileri kullanım becerisini geliştireceği, kolay öğrenmenin gerçekleşeceği ve eğitimde fırsat eşitliğinin sağlanacağı maddeleri olduğu görülmektedir. Katılımcılara eğitim verdikleri FATİH kurslarının sonunda kursiyerlerinden ne gibi dönütler aldıkları sorulmuş ve alınan cevaplar Tablo 13'te belirtilmiştir.

Tablo 13. Katılımcıların Kursiyerlerinin FATİH Eğitimlerine Yönelik Görüşleri

No	Gruplar	f	%
1	Gerekli ve Faydalı	17	58,60
2	Süresi Fazla	4	13,80
3	Kendini Yetersiz Bulma	3	10,35
4	Eğitimler Yetersiz	3	10,35
5	Gereksiz	2	6,90
	TOPLAM	**29**	**100**

Tablo 13 incelendiğinde katılımcıların kursiyerlerinin FATİH eğitimlerine yönelik görüşlerinin başında bu eğitimlerin gerekli ve faydalı olduğu gelmektedir. Ayrıca eğitimlerin süresini fazla bulan, eğitimleri yetersiz ve gereksiz bulan veya teknoloji kullanımı konusunda kendini yetersiz bulan az sayıda katılımcı olduğu görülmektedir.

TARTIŞMA ve SONUÇ

Katılımcılara FATİH Projesi kapsamında aldıkları hizmetiçi eğitimleri sayı, eğitim saati ve içerik bakımından yeterli bulup bulmama durumları sorulmuştur. Katılımcıların çoğu eğitimleri yeterli görürken 6 katılımcı (4, 6, 7, 9, 16 ve 19. Kursiyerler) eğitimlerin yeterli olmadığını belirtmiştir. Bunun nedeni katılımcıların aldıkları FATİH Projesi hizmetiçi eğitim sayısının azlığından kaynaklanabilir. 6 katılımcının tamamı ancak bir veya iki defa FATİH eğitimlerinde sertifika almaya hak kazanmışlardır. Her FATİH eğitimi farklı bir alanda konular içerdiği için katılımcıların eğitimleri yetersiz bulmaları bu sebepten kaynaklanabilir. Şahin, Çek ve Zeytin (2011) ise eğitim müfettişlerinin hizmetiçi eğitim kurslarının yeterliliğine ilişkin yapmış oldukları çalışmada hizmetiçi eğitime katılan müfettişlerin %87,4'ünün eğitimleri yeterli bulmadıkları sonucuna ulaşmışlardır.

Katılımcılara FATİH Projesi kapsamında verdikleri hizmetiçi eğitimleri sayı, eğitim saati ve içerik bakımından yeterli bulup bulmama durumları sorulmuştur. Katılımcıların büyük bir kısmı (n=17) eğitimleri yeterli görürken 3 katılımcı (7, 16 ve 19. Kursiyerler) eğitimlerin yeterli olmadığını belirtmiştir. Bu 3 katılımcının ortak yanı, sertifika aldığı FATİH eğitimlerini yeterli bulmayan 6 eğitmenin arasında bulunmasıdır. Katılımcıların eğitim verdikleri kursları yeterli bulmamaları, sertifika aldıkları merkezi eğitimlerden yeterli verimi alamamalarından kaynaklanabilir.

Katılımcılara FATİH Projesi kapsamında aldıkları merkezi hizmetiçi eğitimlerde gördükleri eksiklikler sorulmuştur. Katılımcıların yarıdan fazlası (n=12) eğitimleri yeterli görerek eksiklik olmadığını belirtmiştir. Üçer katılımcı kurs süresince yapılan uygulamaları ve eğitimin süresini yetersiz bulmuştur. FATİH eğitimlerini yeterli bulmayan iki katılımcı (7 ve 16. kursiyer) ise kursların içerik bakımından yetersiz olduğu görüşünü belirtmişlerdir. Eğitimleri yetersiz bulan kişilerin genelde aynı kişiler olması ve bunun nedeninin de az sayıda eğitime katılmalarından kaynaklandığı düşünülecek olursa genel anlamda eğitimlerde ciddi eksiklik yaşanmadığı söylenebilir. Bu sonuç Şahin, Çek ve Zeytin'in (2011) bulgularıyla benzerlik göstermektedir.

Şahin, Çek ve Zeytin'in (2011) araştırmasındaki ilköğretim müfettişlerinin hizmetiçi eğitimlerde gördükleri eksikliklerden; mesleki içerik, sayı, süre maddeleri benzerlik göstermektedir.

FATİH eğitimlerinin katılımcıların mesleki ve kişisel gelişimlerine etkileri incelenecek olursa "sosyal etkileşim" teması ilk sırada yer almaktadır. Ayrıca katılımcılar; yeni bilgi öğrenme, FATİH projesini tanıma, gezi ve turlara katılma ve mahalli kurs açma gibi imkânlar katılımcıların söylemleri arasında yer almıştır. Bu sonuçlar, Arslan (2013) ve Yeşiltepe'nin (2012) çalışmalarıyla örtüşmektedir. Arslan (2013) çalışmasında hizmetiçi eğitimlerin BT öğretmenlerinin mesleki gelişimlerine yeni bilgi öğrenme ve mesleki deneyim gibi katkılar sağladığı, kişisel gelişimlerinde ise sosyal etkileşim ve yeni arkadaşlıklar edinme gibi katkılarının olduğu sonucuna ulaşmıştır. Yeşiltepe'nin (2012) çalışmasında ise, öğretmenler katıldıkları hizmetiçi eğitim faaliyetlerinin, bilgi birikimlerini öğrencilere aktarma konusunda olumlu katkılar sağladığını ve mesleki deneyim kazanma imkânı bulduklarını düşünmektedirler.

Katılımcılara FATİH Projesi kapsamında verdikleri hizmetiçi eğitimlerde problem yaşama durumları sorulmuştur. Katılımcıların kursiyerleriyle problem yaşama durumları genellikle isteksizlik, yorgunluk, donanımsal problemler, kurs saati ve eğitimlere ihtiyaç duymama maddeleri olarak belirlenmiştir. Bu bulguların Şahin, Çek ve Zeytin'in (2011) araştırmasındaki ilköğretim müfettişlerinin hizmetiçi eğitimlerin yeterliliğine ilişkin görüşleriyle örtüştüğü görülmektedir. Şahin, Çek ve Zeytin'in (2011) araştırmasında hizmetiçi eğitimlerin yetersiz olma nedenleri arasında gösterilen eğitim süresinin kısalığı, ihtiyaç analizinin yapılmaması ve branşa göre eğitim yapılmaması maddeleri benzerlik göstermektedir.

Katılımcılara FATİH Projesi kapsamında verilen hizmetiçi eğitimlerin zorunlu olarak verilmesi durumu sorulmuştur. Elde edilen bulgulara göre katılımcıların %70'i zorunlu olması gerektiğini savunurken, %30'u zorunlu olmaması gerektiğini belirtmiştir. Bu bulguların Akar'ın (2007) çalışmasındaki bulgularla benzerlik gösterdiği görülmektedir. Akar (2007) Biyoloji öğretmenlerinin hizmetiçi eğitim ihtiyaçlarına yönelik yapmış olduğu çalışmasında katılımcıların yaklaşık %25'i hizmetiçi eğitimlere katılımın zorunlu olmasının katılımcı ve eğitmenlerde verimi düşürdüğünü belirterek eğitimlerin zorunlu olmaması gerektiğini belirtmişlerdir.

Katılımcılara FATİH projesinin eğitime ve eğitimcilere ne gibi katkılar sağlayacağına yönelik görüşleri sorulmuştur. Elde edilen bulgulara göre katılımcıların yarısı (n=10) projenin BT kullanım becerisine katkı sağlayacağını belirtmişlerdir. Ayrıca öğrenmenin bireysel ve kolay gerçekleşmesi, eğitimde fırsat eşitliği ve donanımsal malzemelerin dağıtımı maddeleri de katılımcıların görüşleri arasında yer almıştır. FATİH Projesinin amacı; eğitim ve öğretimde fırsat eşitliğini sağlamak ve okullardaki teknolojiyi iyileştirmek amacıyla BT araçlarının öğrenme ve öğretme sürecinde daha fazla duyu organına hitap edilecek şekilde, derslerde etkin kullanımını sağlayarak BT destekli öğretimin gerçekleşmesini sağlamaktır (FATİH Projesi, 2014). Dolayısıyla araştırmada elde edilen bulgulara göre katılımcıların görüşlerinin FATİH projesinin amaçlarıyla örtüştüğü söylenebilir.

Katılımcılara FATİH Projesi kapsamında verdikleri hizmetiçi eğitimlerdeki kursiyerlerinin FATİH eğitimlerine ilişkin görüşleri sorulmuştur. Elde edilen bulgulara göre; katılımcıların tamamına yakını (n=17) kursiyerlerinin FATİH eğitimlerini gerekli ve faydalı bulduklarını belirtmiştir. Bunun yanında katılımcıların kursiyerlerinden süreyi uzun bulan, eğitimleri yetersiz veya gereksiz bulan ve kendi teknoloji kullanım seviyesini yetersiz bulan kişiler olduğu görülmektedir.

ÖNERİLER

Araştırma kapsamında elde edilen bulgulara dayalı olarak aşağıdaki önerilerde bulunulabilir:

- ✓ İl koordinatörleri, il eğitici formatörleri ve FATİH Projesi eğitmenlerinin dışında bu eğitimlere katılmış tüm öğretmenleri kapsayan bir araştırma yapılabilir.
- ✓ Katılımcıların FATİH eğitimlerinde gördükleri eksiklikler dikkate alınarak; eğitimlerde uygulama, süre ve içerik konusunda beklentileri karşılayacak adımlar atılabilir.
- ✓ FATİH eğitimlerinde genelde şikâyet konusu olan kurs saatlerinin uygun saatlere kaydırılarak yorgunluk gibi problemlerin önüne geçilebilir.
- ✓ Öğretmenlerin FATİH eğitimlerinin içeriği hakkında kurs öncesinde bilgi edinmelerini sağlayarak isteksizlik gibi problemlerin önüne geçilebilir.
- ✓ Öğretmenlere FATİH eğitimlerinin neden zorunlu olması gerektiği konusunda açıklayıcı broşür, afiş gibi basılı ve yazılı materyaller temin etmeleri sağlanarak ihtiyaç duymama, eğitimleri gereksiz bulma gibi problemlerin önüne geçilebilir.
- ✓ Öğretmenler arasında teknoloji kullanım becerisi yüksek olmayan ya da bu alanda kendini yetersiz hisseden çok sayıda personel bulunduğu göz önünde bulundurularak temel bilgisayar kullanımı ile ilgili hizmetiçi eğitimlerin sayısı artırılabilir.

SELF-CONCEPT AND SELF-EVALUATION IN THE TRANSITION FROM PRIMARY TO LOWER SECONDARY EDUCATION

Pranvera KRAJA
University of Shkodra, Faculty of Educational Science, Albania.
e-mail: v.kraja@yahoo.com

ABSTRACT: In this article I'll present theoretical concepts and empirical results of self-concept and self-esteem of the children in transition from primary school to lower secondary education (LSE). Through the evidences from research literature, this article, aims to provide answers to such questions: How and what aspects of self-concept and self-esteem of children develop and change during childhood and adolescence? Is there a correlation between levels of self-concept and self-assessment that the child has for him and his academic achievements? Why is it important to maintain high levels of self-concept and self-esteem of the child for the life in general, and for the school life in particular? Studies of the last two decades have shown that changes in self-concept and self-esteem of the child are strongly correlated with pupils' academic achievements. Keeping positive levels of self-concept and self-esteem, would facilitate the difficulties of the child's adjustment at the new school.

Keywords: school transition, self-concept, self-esteem, impact, lower secondary education.

INTRODUCTION

It has been paid great attention to children's transition from primary to lower secondary education (AMU), energy and desire by many researchers and university research teams, not only to understand the process, but also to determine the causes and factors affecting to the performance of children in the process. Because of the many changes that occur simultaneously in a child's life, the transition to high school is unique, unrepeatable. Changes that accompany this period include: changes in the learning environment, in the nature and structure of junior high school (Kvaslund, 2000; cited in Tilleczek & Ferguson, 2007; Sutherland, Yee, McNess, Harris, 2010; James, Davison, See & Knowles, 2010); changes in pupils' academic achievement (McGee, Ward, Gibbons & Harlow, 2004; Cox & Kennedy, 2008; Barber & Olsen, 2004; Roeser, Eccles & Samerof, 2000); changes in the child's social relationships, as, for example, relationships with teachers (Eccles, Midgley, Wigfield, Buchanan, Reuman, Flanagan & MacIver, 1993; Cocklin, 1999), in the relationships with peers (Serbin & Bukowski, 2006; Graham & Hill, 2002); and not to forget the physical, physiological and emotional changes that occur in early adolescence (Callagan, Clark & Kellough, 1995; Kroger, 2006; Barrat, 1998).

SELF-CONCEPT AND SELF-ESTEEM

Undoubtedly, the age of child during the transition from primary school to lower secondary education (LSE), is an important index, which affects other indicators. At this age the child has entered into early adolescence. The eary adolescence period is one marked by many changes in biological and psychological characteristics and in relations with peers, teachers, etc. (Wigfield, Lutz, & Wagner, 2005, p. 117).

> "The biological and social changes associated with puberty may also be responsible for some of these changes in young adolescents' self-perceptions" (Wigfield, Eccles, Mac Iver, Reuman, & Midgley, 1991, p. 552).

But despite the great importance that these changes have for the young adolescents' live, I will not dwell on the biological and cognitive changes occurring in adolescence. In this session, I will focus on the child's value system, which is in the centre of the development in early adolescence. This value system is composed of self-esteem, self-concept and identity (Susman & Rogel, 2004; Harter, 1999; cited in Wigfield, Lutz & Wagner, 2005, f. 112-113). In literature self-evaluation and self-concept are sometimes used in place of each other, but it should be said that they do not represent the same thing, although there are multiple definitions for each of them.

Self-concept is a complex network of interactive self-perceptions that a person holds about his beliefs to the adoption of certain behaviors and to have some personal attributes with cultural value (Gresham, Eliot & Evans-Fernandez, 1993; cited in Christensen, 2007, f. 11). It is classified as a cognitive science that organizes abstract and concrete views about yourself and controls the processing of information of the self-belonging (Kihlstrom & Cantor, 1983; cited in Man, Hosman, Schaalma & Vries, 2004, p. 357). Or, more succinctly: self-concept relates to individual beliefs and estimates about characteristics, roles, skills and his relationships (Wigfield, Lutz &

Wagner, 2005, f. 113). Other concepts that are mentioned in the literature as self-image and self-perception, are equivalent to the self-concept (Mann, Hosman, Schaalma & Vries, 2004, p. 357).

While *self-esteem* is the feeling that one individual has for him\herself or values as a person. It is the way you see yourself and how you feel about things you do (Wigfield, Lutz & Wagner, 2005, f. 113; Nemouros from kidshealth.com). Self-esteem is the evaluation and affective dimension of self-concept and it is considered the equivalent of self-belonging and self-value (Harter, 1999; cited in Mann, Hosman, Schaalma & Vries, 2004, p. 357).

Identity is the conscious description of an individual of who he is. If you want to know the identity of a person, ask the person to describe himself (Chapter 15, f. 317). Identity is a broader term that self-concept and self-esteem and refers to the individual's feelings about himself and his psychological reality that includes several different beliefs and attitudes (Wigfield & Wagner, 2005; cited in Wigfield, Lutz & Wagner, 2005). The formation of identity involves not only the success in activities such as: school achievement, social relationships with others, career interests and choices, the exploration in the different roles, but it also involves sexual orientation, gender and ethnic factors (Harter, 1999; Marcia, 1980; Waterman, 1982; cited in Wigfield, Lutz & Wagner, 2005). For example, a person who has a religious identity with important content and purpose, it is very clear for him what to do, what to assess and how to behave (Oyserman, Elmore, & Smith, 2012, f. 73).

Types of self-concept

Self-concept is composed of real self, ideal self and public self.

Real self is how you see yourself. This could be real or not. People can see themselves much better than they actually are and in contrary they may perceive too mach flaw and weakness, thus having a negative self-image of themselves. For example, a teenage boy may perceive himself to be stupid and not likeable to society, when in fact he is very nice and kind. Or, often, teenage girls believe they are overweight when in reality they are slim (Rogers, 1959).

Ideal self is what a person would like to be, such as a good, moral, and well-respected person. The conflict that sometimes occurs between the real self and the ideal self can positively affect if we motivate a person to improve, in order to approximate the ideal image of himself, or it could be the cause to experience anxiety and danger, when ideal self is far away and is not accessible to realized by the person (Capter 15, f. 317).

While *public self* is what a person thinks about what others think of him, and public self influences the real and ideal self. When these three components of self-concept are in resonance with each other, then the self-concept and mental health of the person are positive (Capter 15, f. 317).

THE DEVELOPMENT OF SELF-CONCEPT AND SELF-ASSESSMENT FROM INFANCY TO ADOLESCENCE

Harter (1990) explained that educational and development researchers, often measure self-concept with the competencies or skills of the child to do things. Young children have developed self-concept and have clearly expressed it when they show their skills in different areas (cited in Wigfield, Lutz & Wagner, 2005, p. 113-114).

But at what age children are able to self report their self-concept? To measure the self-concept of the children, researchers are focused primarily on children's abilities to describe and to rank themselves through multiple dimensions. Marsh, Barnes, Cairns, & Tidman, (1984) have argued that children are able to report various dimensions of self-concept since they are in second grade of primary school (cited in Oyserman, Elmore, & Smith , 2012, p. 76).

By the transition from primary to lower secondary education, students’ self-concept decreases. The reason for this decline is the different levels of perception of children’s self-concept. When they are younger, the self-concept that they have for themselves, is much more positive than the powers they really have, which means that they overestimate their abilities. According to researchers, this overestimation happens because the children have not developed enough critical assessment of themselves and they are not able to integrate information from multiple sources. Growing up, pupils understand better how their skills are viewed by others, being so more careful in their self-perception. During the transition to secondary education, levels of self-concept of children are lower than in childhood. According to Harter’s opinion, it passes by the start of secondary education, where adolescents’ self-concept begins to rise gradually (Harter, 1999; cited in Manning, 2007, p. 11).

The researchers believe that self-esteem with all its components, is not fully developed in early childhood. General self-esteem as the self-concept, is fully developed in the middle childhood. Young children are able to judge their skills in some specific areas, but they do not have the ability to make general judgments about their self-value (Harter, 1999; cited in Bos, Muris, Mulkens & Schaalma , 2006, p. 4).

Who can influence in the development of positive self-concept of children and how this can be realized?

The crucial role for the development of infants' positive self-esteem, belongs to parents, which promote self-esteem of their children by encouraging them to take initiatives (to speak, to crawl), congratulating for every good action, smiling and proudly watching. With the growth of the child, the circle and contacts with others expand. Now, other characters enter on stage, as peers, educators, teachers, trainers, orienting the child to do useful things for him\her self. All these people help the child to see himself in a positive manner, boost self-confidence that he\she can succeed even when things are going in the wrong way (Nemouros, kidshealth.org).

When children enter in adolescence (this is the age when they start secondary education), self-esteems become more visible, more separated and some not so important issues in childhood, begin to take importance, as for example the influence of peers, romantic relationships or job competencies (Harter, 2003; cited in Bos, Muris, Mulkens & Schaalma, 2006, p. 4). In addition, another reason that makes a difference in self-esteem among adolescents in this period, is also the importance of peer approval. This index together with parenting style becomes an important predictor of self-esteem in adolescence. It is very important what others think about the person and children catch more easily the opinion that others have for them. For example, the thoughts that people who care for children and other adults with influence on them, have for them (Leary & Mac Donald, 2003; cited in Bos, Muris, Mulkens & Schaalma, 2006, p. 4).

Literature has defined the characteristics of parenting that strongly influence the development of child's self-esteem. The opportunity to build positive and high levels of self-esteem, is too large at parents who are approving, nurturing and responsive. While disapproving, uninterested and unresponsive parents, adversely affect and may break down the child's self-esteem levels (Bos, Muris, Mulkens & Schaalma, 2006, p. 4).

THE IMPORTANCE OF SELF-ESTEEM AND SELF-CONCEPT IN THE CHILD'S LIFE

What positive self-esteem and self-concept develops in children? All children have a positive self-esteem for themselves. To develop this further, it helps kids keep their heads up, they feel proud of themself, urge to try new things and add confidence in themself. Through positive self-esteem, the child develops a high self-esteem for himself, and in this way, others begin to have respect for him; it helps children to be objective and choose healthy alternatives for their mind and body (Nemouros, kidshealth.org).

Positive feelings of self-esteem affect in the growth of children's confidence and in their academic success, for example, enhance the ability to read (Coopersmith, 1967, Marcus & Nurius, 1986, cited in Mann and tj., 2004, p. 359). Dominant strongest predictor of happiness is seen to be self-esteem (Furnham & Cheng, 2000), which together with self-concept and identity are among the key elements of mental health. Our welfare, mental well-being, adjusment, happiness, success and sadisfaction, are strongly associated with positive self-esteem. Even healing some serious diseases, depends heavily on positive self- esteem (Chang & Mackenzie, 1998; cited in Mann and tj., 2004, p. 359).

Whereas self-concept is very important for the person, that his happiness and success in life depend on it. As we highlighted above, self-concept can be positive when people believe in themselves, set goals that can be achieved and self-improved. Several times people with positive self-concept, may also give up some life habits and choose alternatives that preserve their health, for example, when people quit of drinking, smoking (Chapter 15, p. 317). During the transition to Junior High School, promoting a high self-concept of young adolescents, increases academic and life success (Manning, 2007, p. 11).

THE EFFECTS OF SCHOOL TRANSITIONS IN SELF-CONCEPT AND SELF-ESTEEM OF PUPILS

Outcomes from the research literature clearly show that the entry of children in early adolescence, which coincides with the transition of children from primary to lower secondary education, self-esteem and self-concept of children decrease. Studies of the last two decades have shown that changes in self-concept and self-esteem of the child are strongly correlated with changes in student academic achievements (Marsh, 1990; Ssu-Kuang, Ju-Chen, Fang-Ming & Sunny, 2013; Gniewosz, Eccles & Noack, 2011). According to the researchers, the students at risk for low self-concept and for its negative consequences, are those experiencing strong academic difficulties (Elbaum & Vaughn, 2001; cited in Christensen, 2007).

Evidence about changes in self-concept of students in various skills, have brought studies by Eccles et al., (1989), Wigfield et al., (1991), Jacobs et al., (2002), which have reported decreasing self-esteem of pupils immediately after school transition.

Eccles, Wigfield, Flanagan, Miller, Reuman, & Yee (1989) aimed to study the self-concept of pupils about their skills in two major subjects: English and Maths, and how it develops during the transition to Junior High

School. The same interviewed students twice in sixth grade and twice in seventh grade showed that beliefs in their English and Maths abilities, decreased during the transition (cited in Eccles & Wigfield, 2000, p. 155).

The study conducted by Wigfield, Eccles, Mac Iver, Reuman, & Midgley (1991), expanded fields to measure the academic self-perception of children not only in English and Maths, but also in social and sports activities, as well as on self-evaluation. The large number of the study population (N=1850), allowed researchers to make significant generalizations regarding academic self-perception and self-esteem of pupils during the transition to junior high school. Pupils completed the questionnaires twice a year (in spring and winter of the grade 6th and 7th). Results of the study showed that children's self-esteem was lower immediately after the transition, which means in the end of the first semester of 7th grade. This self-esteem, although growing in 7th grade, showed lower levels of self-esteem that these students have had in the 6th grade before the transition. While beliefs about pupils' abilities in Maths, English, and social activities, strongly declined between the end of 6th grade and first semester of 7th grade, but the perception of social skills increased during 7th grade. Perceptions about sport activities decreased during the transition from grade 6 to 7. Like Maths' skills, as well as sports' skills decreasing all the time. Some of the reasons for these declines in academic self-perceptions, were attributed to the differences between environments of primary school and junior high school, by the researchers.

The study undertaken by Jacobs, Lanza, Osgood, Eccles, & Wigfield (2002), who examined changes in beliefs and values of the competence of children from classes 1 to 12, had the same objective but with a much wider range of school years. The findings supported the results of previous studies, concluding that there was a decline in Math, Language Arts and Sports competencies. The strongest decline in Language Arts was marked during the elementary school years, and later it have had slight decreases; declines in Math competencies were similar at all times, while the largest decreases in Sport activities was recorded during the high school years (cited in Wigfield & Tonks, 2002, p. 60).

Toking & Watt (2003) aimed to evaluate the effectiveness of a transition program to self-concept of students in grade 7, by comparing two groups of students: one group was included in the program (No = 47 girls) while the other was not (No = 76 girls). Results indicated that the transition program did not increase student's self-concept levels. Thus, students who continued Junior High School in the same building where they had finished elementary school, had highest self-concept in school competencies and social acceptance than the new students to the school, immediately after the transition. Measurements, which were repeated after 5 months of transition, (in the middle of the academic school year) indicated again that self-concept for social acceptance and academic competencies reached even higher levels than the first measurements. The researchers explained that the maintainance high levels of self-concept in 7th grade, occurred because of the silence that students felt in familiar surroundings and known people for them. While physical appearance, behavior and self-value did not mark statistical differences between those who continued in the same school and those transferred to another school. Perhaps these factors of self-concept do not present dependence from known environments and peer influences.

The different school environments that children found passing from one school to another, complicated the adaption of the children at Junior High School (Tilleczek & Ferguson, 2007). School transition issues plus students' cultural and ethnic factor, and comparison of students with different cultural backgrounds, has been the object of the study of Graham & Hill (2003) in the UK. Results of the study showed some differences between the two-thirds of the children in seventh grade, who identified themselves as white, and one third of students who were of Pakistani Muslim background. Despite the fact that ethnic minority showed a generally positive attitude towards the transition from grade seven of elementary to grade eight of secondary school, and despite the fact that the anxiety of starting a new school disappeared after almost a month, students reported other difficulties. Thus, "about one in ten children with Muslim faith indicated that their school did not allow them to follow their religious beliefs as they wished (e.g. not being able to pray at the appropriate time)". Other difficulties were changes of ethnicity, religion, school dimension, behavior, dressing, the lack of fluency in communication in English language with white peers, also with teachers.

Beside the changes that education researchers have found between environments of primary and secondary school, other factors such as cultural background, socio-economic status, ethnicity, etc., students bring with them into the classroom, and their combination, are seen as risky contexts in school transition (Tilleczek & Ferguson, 2007, p. 17). For examination of these risky factors and their impact on students' self-esteem, a study was undertaken by Rhodes, Roffman, Reddy, & Frederiksen (2004), which measured the interactions between individual and context variables and effects they had in initial self-esteem and its performance during the junior high school years. This 3 year long-lasting study involving a large number of students (No=1804), used Hierarchical Linear Modeling (HLM) techniques to measure students' self-esteem. Results indicated that the interactions between race, social class, socio-economic status of the school and contextual congruity were found to be influential. According to Rhodes et al., (2004) young people with low incomes consistently experienced lowest self-esteem levels and the sharpest declines during the middle school years. Social disagreements were the main cause of such loss.

CONCLUSIONS

School transitions strongly influence not only in the outer issues of the student, which include educational challenges, academic, organizational, geographical and cultural differences, but also in the internal issues of the students, which include individual changes that occur within the child during and after the transition. One of these individual internal changes is self-esteem and self-concept that student has for himself and for his achievements.
Sometimes in literature, self-assessment and self-concept are used in place of each other, but they do not represent the same thing. Children are fully responsible to report on multiple dimensions of self-esteem and self-concept when they reach middle childhood. The studies bring evidences of a strong correlation between the transition and students' self-esteem and self-concept, highlighting the decline of both these indicators during the transition from primary to Junior High School.

Maintaining a high and positive students' self-esteem and self-concept, impact increasing children's confidence and their academic success; makes students feel proud of themselves, encourages them try new things; develops a high self-esteem for themselves, and in this way, others begin to have respect for them; ensures optimum mental health, maintaining a mental wel-being, adjusment, happiness, success and sadisfaction, even curing some serious diseases; helps children to be objective and choose healthy alternatives for their mind and body.

Therefore the task of teachers, parents, policy makers in education, education researchers, etc., is to build school environments, curriculums, and transition programs that help students maintain higher levels of self-esteem and their self-concept.

ASSESSING THE CLIMATE FOR CREATIVITY IN MATHEMATIC'S LESSONS

Alexandre Tolentino de Carvalho
Universidade de Brasília
Alexandre.tolenca@gmail.com

ABSTRACT: In relationships established at school, it creates an psychological climate in this environment that can both promote the development of the creative potential of individuals, as may hinder it. However, in the literature consulted, lacks empirical studies that address the constituent factors of the classroom climate for creativity in mathematics and there are no validated instruments to measure statistically this climate. This article describes an empirical-analytic study realized with 324 students from public and private schools in the age range from 9 to 14 years devoted to understanding the factors present in the formation of the classroom climate for creativity in mathematic's lessons. Shows the Scale of Climate for Creativity in Mathematics lessons, instrument resulting from this study that serves as a tool for teachers, managers, researchers and students can assess strengths and weaknesses involved in the constitution of the favorable climate to creativity in mathematic's lessons.

Key words: creativity in mathematics, mathematics education, classroom climate for creativity

INTRODUCTION

It seems consensus among researchers in mathematics education that math abilities are not worked in their completeness and, apparently, logical scholastic abilities, linked to convergent thinking, receive priority in lesson plans at the expense of abilities that require more time and more attention from the teacher in the direction both to research, to plan, to elaborate and to monitor the development of these classroom. As a result, the attitudes of students with mathematical knowledge become more automated and less reflective.

For example, we can take the studies of Haylock (1997) who noticed that there is a tendency among students of content-universe fixation (i.e., their thoughts about a problem are restricted to a variety of inadequate or inappropriate elements) and algorithmic fixation (in which they adhere to a routine or stereotyped response, even when it becomes inefficient or inappropriate for the problem at question). Then Haylock proposes that overcoming this rigidity of thought may be relevant a aspect for the mathematical problem solving.

Also in this sense, Valdés (2010) identifies that many teachers, guided by a purely formal conception of the nature of mathematics, consider that this school discipline should devote themselves to develop ways of thinking linked to logical thinking. When referring to logical thinking, the author try to define those forms of reasoning developed by the teacher in which he prioritizes convergent thinking, ways of acting "associated with formal thought" (Valdés 2010, p. 8) and comprising inductive, deductive and analogy reasoning. However, the author points out that having a well-developed logical thinking is insufficient for solving mathematical problems that require abilities that go beyond logical thought, i.e., that require a "high dose of imagination, fantasy and creativity" (p. 6).

Logically, these authors are referring to the development of creative skills in math classes, one facet of school mathematics that has been neglected when the teacher prioritizes the indiscriminate use of formulas, algorithms and hard thinking in which you teach, you learn and reproduces only forms of mathematical problem solving. Krutetskii (1978) already demonstrated that mathematics developed in the school presented problems that required students both the domain of logic, i.e., essential algorithms for solving mathematical problems of most, as the domain of creative skills necessary for solving problems which could not be resolved by means of algorithms. However, at present, we still find kinds of problems at schools which, according to Piggott (2007), restrict themselves to address a context that is very familiar to the student, almost always portraying a mathematical concept they have just learned and that nothing brings of challenging, they are given clear clues about the knowledge to be applied to its resolution.

There is not doubt among researchers that the development of the creative potential of students need to be part of the agenda of mathematics abilities to be developed at school space. Fleith (2010) states that one of the environment most investigated in research related to creativity is the school. Being an environment made up of people who are related to each other and relate to mathematical knowledge, is eventually developed a climate in this environment that can both promote the development of creative potential that each individual carries, as the can serve as a barrier that prevents creativity to flourish in this space. As remembered by the author, "the cultural environment has a strong influence on creativity by supporting or inhibiting the development of creative effort" (Fleith 2011, p. 3).

Fernandes (2008) recalls out that in the classroom "converge personalities, motivations and capacities very disparate, not being, therefore, easy to create and nurture relationships of affection, affection and friendship, if there is a good climate of acceptance for differences and mutual respect "(p. 16). Therefore, to study how it organizes the climate of the classroom and, specifically, studying the climate for creativity in mathematics lessons, it is necessary to focus both on the environment as in the people who relate that environment. However, much of the research focuses on identifying talented individuals through application testing and individualized description of the individual's role components of the school room for the creativity to emerge in math classes. In the literature consulted, there aren't empirical studies that specifically address the environmental factors that influence the development of creative abilities in mathematics, nor were found statistically validated instruments to measure climate specifically in mathematics lessons.

Taking into account the importance of undertaking research related to climate for creativity in mathematics classrooms and the lack of studies and measurement instruments of this climate specific in this area of education, this paper is devoted to describe a study conducted in the years 2013 and 2014 with students in the age range 9 to 14 years in search of analyzing the factors and dimensions involved in shaping the climate of the classroom for creativity in mathematics lessons and to present, alternatively for measuring these factors, the Scale Climate for Creativity in Mathematics Lessons, instrument resulting from these studies.

To build an understanding of the climate for creativity in mathematics classes were consulted 5 major areas involving literature on climate of the classroom (Brunet, 1992 and Fernandes, 2008; Rodrigues Garran, 2004; Ĉagran & Schmidt, 2006), Climate for creativity in the classroom (Alencar, 2007; Amabile et al, 1996;. Fleith & Alencar, 2005) and climate in mathematics lessons covering psychological climate in mathematics lessons (Haladyna, Shaughnessy & Shaughnessy, 1983) and social representations in mathematics. (Ramos, 2004). The consultation of literature also encompassed studies on creativity (Alencar & Fleith, 2003; Amabile, 1983; Csikszentmihalyi, 1996; Lubart, 2007; Simonton, 1988; Sternbert, 1991) and on creativity in mathematics (Balka, 1974; Gontijo, 2007; Hadamard, 2009/1963; Hashimoto, 1997; Haylock, 1987, 1997; Kattou 2012; Krutetskii, 1976; Poincaré, 1908). For the sake of synthesis, we won't address the contributions of all these scholars. However, we point out some basic points essential to understanding how we conceive understandings of the climate for creativity in mathematics lessons.

We can also point out the contributions of Brunet (1992) as included in the first area of knowledge, i.e., studies on climate of the classroom. He defends that "organizational climate is the perceptions of school actors in relation to existing practices in a such organization" (in Santos 2010, p. 42). He pointed three variables as determinants of the constitution of the climate of the classroom: (a) the structure: are the physical characteristics of the organization described, for example, in school curricula; (b) the organizational process: the way how one performs the management of human resources, for example, the way in which conflicts are resolved, the policy of rewards and the way in which it organizes educational project; (c) behavioral variables: modes of individual and group organizations. The results of these dimensions are: for the individual is reflected in the level of satisfaction on their income and quality of life; for the group is the cohesion, morale and results; and the organization is educational performance, efficacy, adaptation and evolution.

Fernandes (2008) remind out that a large number of authors defend that the interactions between teacher and students are crucial to the constitution of the atmosphere of the classroom. However, this interaction is seen as essentially asymmetrical depending mostly of the actions of the teacher and to a lesser extent the action of the students. This fact is due to the teacher's rigid posture which expects students to adapt to their way of teaching. In this optical, it becomes clear the important role of the teacher who constitutes a determinant in the process of drafting the climate of the classroom. However, it must be focus that the teacher's role is crucial, but not sufficient, since both the student "devout" as "resigned" and still "revolted" (Amado, 2001, cited in Fernandes, 2008, p . 14) form part of these interactions not always acting passively.

In the second area of the literature, we analyzed the contributions about climate of classroom for creativity. A current and important work related to climate for creativity in classroom can be attributed to Fleith (2010). The author presents the scale Climate for Creativity in the Classroom (Fleith & Alencar, 2005) constructed to assess the climate for creativity in the classroom and validated through factor analysis, where he uses a sample of students in 3rd and 4th-graders (currently 4th and 5th year of primary school). Items are answered through a frequency range of five points, ranging from never to always and are distributed into five factors: support from teacher to student's expression of ideas (consists of 5 items that relate to the support provided by the teacher to which the student can to express your opinion); perception of the student with respect to creativity (contains 4 items related to the image that the student creates about his performance on with regard to creativity); student interest in learning (consists of 6 items that shows the student engagement with the learning process); learner autonomy (displays 4 items corresponding to a personality trait associated with creativity); stimuli from the teacher to the student's production of ideas: composed of 3 items related to attitude of acceptance and encouragement from teachers to the ideas developed by the students. Fleith (2010) observes that the factors this scale lend themselves to evaluate both teacher behaviors that are conducive to the expression of student creativity, as the student characteristics related to creativity.

The discussion about climate in Mathematics lessons, i.e., the third area of literature consulted, was conducted with the use of elements present in studies searching to understand the psychological climate in this area of knowledge and in studies related to social representation in Mathematics. Articulated themselves those elements using up the contributions from each of these studies in order to build an understanding of the climate in mathematics lessons and consequently walked to the conclusion about the climate for creativity in mathematics lessons.

Haladyna, Shaughnessy and Shaughnessy (1983) developed a study wherein elaborated a hypothetical model in which the factors teacher quality, socio-psychological climate of the classroom and climate of the management/organization of the classroom were used to measure attitude toward mathematics of students in the 4th, 7th and 9th grades. Authors define attitude towards mathematics as a general emotional disposition for the school subject of mathematics, valued for to be a important result to the school itself, often by being positive slant and slightly related to the success and power increase tendency to elect mathematics as a career possibility in this field. Therefore, the authors focused on the analysis of endogenous factors to the classroom, postulating that "the development of attitudes toward mathematics is likely to be influenced by the teacher and the learning environment (sometimes referred to as climate variables in classroom) "(p. 20).

Another source of study of which one can get elements to be understanding about climate in mathematics lessons can be found in research on social representations in mathematics. Ramos (2004) developed a study that shows concern for the lack of success in this discipline wherein students, besides having poor results in tests and examinations held during their school career, also shows disinterest with discipline. Another concern raised by the author concerns the fact that, despite technological advances facilitate the tasks of calculations, in conceptual terms, the requirements have become increasingly mathematicized requiring a set of mathematical abilities that go beyond the activities of calculations and pass more by "making decisions, by defining strategies to follow to solve a problem, by a critical perspective in face to the results obtained which allow completed by her reasonableness, or not, by the interpretation of graphs and tables, etc." (Ramos, 2004, p. 71).

The author has in these concerns the motivating issues that led her to analyze social representations in the mathematics building an analysis model consists of four dimensions that interpenetrate: affective (relationship of students with the discipline at the level of affection including the importance given to success in mathematics, the affective relationship with mathematics, perception of abilities with mathematics and the image of a good student with Mathematics), social (aspects that concern to the social environment in which students are inserted such as the importance given by parents to success in mathematics, the importance given by friends to succeed in mathematics and the relationship of the group of friends with Mathematics), academic (school experiences of students such as vision relative at the ease of getting good results in Mathematics and relationship with the teacher) and instrumental (including expectations and convictions about the benefits arising from mathematical knowledge as view of the usefulness of school mathematics).

Ramos resorted at the contributions of Durkheim (1968), Moscovici (1976) and Bourdieu (1972) to substantiate the perspective of social representations used in the research he has done. There by, this perspective of social representations understands that "individuals, not being a mere receptacle of images, when interpret, organize and relate what comes to them from abroad, are themselves to be responsible for new creations" (Ramos, 2004, p . 72). The author continue admiting which also in the Mathematics the individual is not restricted to passively internalize the information, it modifies and creates new representations. Based on these considerations, the author defines social representations as "symbolic tools that give meaning to the information that comes to us coming from social reality, organizing her and using her as a guide to action" (Ramos, 2004, p. 74).

The researchers who are dedicated to studying creativity in the systemic approach show the importance of the environment for the development of creativity and constitute the fourth research area used for understanding the climate for creativity in mathematics lessons. Amabile (1983) reveals the importance of the influences of the social environment for the development of motivation, attitudes and abilities. Csikszentmihalyi (1988) develops all a definition about the social and cultural means where creativity occurs may inhibit or stimulate the creative activity of the individual. Sternberg and Lubart (1991) is referring to the environmental context as an important factor for the development of creativity favoring the generation of new ideas, encouraging and supporting the generation of creative products and evaluating the creative product. Simonton (1988) assesses creativity as a social phenomenon which should be studied through investigation the influences of social, political and cultural variables and which cannot be understood outside of the social context in which it occurs.

The fifth and final area of knowledge consulted refers to creativity in mathematics which we have already addressed in the beginning of this introduction. In addition to these points raised, we can mention, for example, Hashimoto (1997) which highlights the importance of to foment the creativity in mathematics in school spaces through activities that give opportunity for students have different ways of thinking about a problem to be solved.

As previously mentioned, were not found correspondence which concerned to the studies related climate to creativity in mathematics classes. In this logic, looking up theoretical contributions in the contributions discussed earlier to advance in the definitions about climate for creativity in mathematics classes and for the preparation and validation of an appropriate instrument for studies on the subject. For this purpose, it is necessary a articulation retaking key information previously addressed.

First, one can assume the climate for creativity in mathematics classes submerged in emotional-affective structure, starting from the conception of which the school is a meeting place for kids with knowledge. In the case of mathematics, inspired by Krutetskii (1976), the lessons are the moments of meeting the child with school mathematics and with creativity in mathematics, a meeting that takes place in deep interaction between student-student, student-teacher and student-knowledge (in the plural because comes up scholastic abilities and creative abilities in mathematics).

Starting from the contributions discussed above, it is assumed that in the climate for creativity in mathematics, the physical involvement and the structure (like the way which the teacher organizes the space, time and school materials and objects of knowledge to be developed in the planning of the lessons) indicate the resources that contribute to the creation of the enabling environment for creativity. The objectives and the organizational process relate to mode how the mathematics teacher organizes the educational process. The characteristics of the teachers and students, i.e., the behavioral variables relate to the interrelationships that occur in the environment of classroom and ways of behaving before knowledge. Are variables that will determine the way in which the climate of the classroom will enhance the development of creative abilities of students.

The constituent contributions of our study allows us to conclude further that the creation of a climate for creativity in mathematics classes, the perceptions of students about mathematical knowledge are constituted by factors of a social nature in which it give personal relationships, of affective nature wherein the student is related to mathematical knowledge and constitute representations about the degree of importance of the school as environment creativity, of instrumental nature in which the student builds expectations as to such future knowledge, and ultimately of academic nature in which the teacher as an organizer of school space, becomes primarily responsible for managing lessons.

When in the present study is presented the term "Climate for Creativity in Mathematics Lessons", it refers to the confluence of several factors of psychological, social, environmental and structural order that determine the perceptions of the students about the value that is attributed to creative activity in mathematics classrooms and therefore interfere in the itself creative activity of the mathematical subject , considering that these perceptions are converted into bases for the action of the individual perceiver.

These contributions substantiated and resulted in a scale that attempts to assess the perception of students in the 5th grade of elementary school about the climate for creativity in mathematics classes, focusing, therefore, on the environmental factors that influence the development of the creative potential of subject respondents to the instrument. Lubart emphasizes that "the environment evaluates creativity through social judgment" (2007, p.18). Pasquali (2010) reminds us that "assess seems to be a fatality of the human being in relation to its environment, including here, the physical environment and the social" (p.11). Therefore, among the constant human need to evaluate the facts around and considering the importance of social judgments in the constitution of individual perceptions, this scale is based as a useful tool in finding possible negative influences on the incorporation process the perception of the student as the institutionalized medium in which it develops its creative potential.

METHODS

The investigations were guided by an empirical-analytical study preceded by consulting the literature described above, the procedure needed to account to develop and validate a reliable and valid instrument. This sense 53 items were developed initially trying to reflect the aspects mentioned above, structured in a Likert 4-point scale ranging from 1 value, corresponding to the never option, to value 4, related to the always option. The language of the items was constructed by means of affirmatives phrases to ensure comprehension of the respondents seeking also maintain a standardized wording in order to facilitate the reading of sentences and emphasize the fact that participants should evaluate what occurs only in classes mathematics. Still, in order to aid the understanding of participants adapting the instrument to the age of respondents, we sought, through graphics, to represent the values assigned on the scale. Thus, the graphics capabilities represent the gradation extending a figure of a shell of ice cream relating to the value "NEVER", passing a figure of one ball of ice cream relating to the value "A FEW TIMES", another figure of two balls of ice cream concerning the value "OFTENTIMES" and reaching the figure of three balls of ice cream relating to the value "ALWAYS", as shown below:

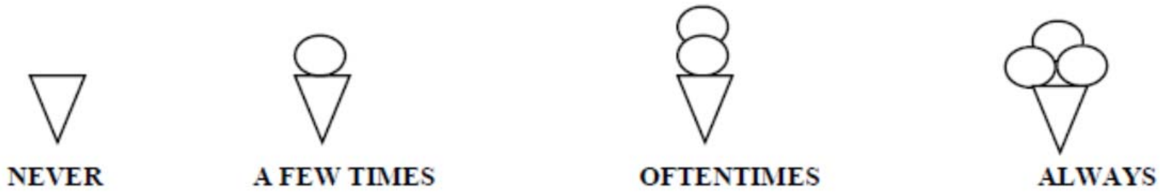

Figure 1 - Graphic Resource of the Scale of Climate for Creativity in Mathematics Lessons

The validation of this instrument took place at three different times required for the scale could actually measure what it is intended of form effective, appropriate and reliable. For that, it was initially consulted a group of experts, after a group of students and finally, we used statistical tools. We present below a brief detail of this process:

a) The initial analysis was performed by the judgment of a panel of three experts. The role of these experts was constituted in to judge the items as to their purpose of measuring students' perception regarding the climate for creativity in mathematics classes, ie, respond to the questionnaire: the items are able to measure this perception? Items that were considered adequate (although they have been suggested amendments) by at least two experts were included in the version that was subsequently submitted to analysis of the students. After this analysis, changes of terms and suggestions for new items were suggested, getting the version for semantic analysis comprised 55 items in total.
b) After the evaluation of experts, we proceeded to the semantic analysis, when five collaborators, students in the 5th grade of elementary school to a public school, provided elements for assessing the adequacy vocabulary items to the corresponding age group. According to Pasquali (1999), the items must be formulated with an appropriate language (criterion of clarity) so that they are understood by all members of the population (criterion of credibility). In this analysis step, students showed understanding of vocabulary and no change was realized.
c) And finally, after the semantic validation, the instrument was administered to a sample of 324 students following the recommendation of Gorsuch (1983) that indicates the application in a sample which represents a proportion of 5 students for each item constant on the scale or a total of at least 200 individuals. Of these students, 200 were enrolled in public schools and 124 in private schools. The reliability of the instrument constituted by factor analysis, at which time it was found their internal structure and extraction of factors was performed. Using the statistical package SPSS version 20.0, conducted an exploratory analysis of data collected in the application of the preliminary version of the scale, proceeding then to the statistical analysis of these data. With the principal components exploratory analysis, we sought to describe and explore the main features of the results and we investigate the presence, in the data collected, of statistical assumptions to demonstrate the possibility of factorability of the instrument.

RESULTS AND FINDINGS

Then we discuss the main results of this empirical research so that, later, we analyze the implications of these results for mathematics education. When performed the extraction of principal components we observed the factorability of the matrix and the possibility of existence of factors. Were pointed favorable index indicative of factorability of the matrix. First, it was pointed the index of sampling adequacy KMO OF 0.801 indicating factorable matrix and optimal adjustment of the sample size given that the literature shows that values above 0.80 are considered great. The analysis of the correlation matrix Anti-image showed diagonal values greater than 0.5 and low values in the rest of matrix which suggests its factorability. The Test of Bartlett's Sphericity ruled out the possibility that the correlation matrix represents an identity matrix (a situation in which the diagonal elements are equal to 1 and the remaining coefficients of the array equal to zero) indicating significant values and a significance level small. Were not found extreme values (0 and 1) in the table of values commonalities, a fact that rules out the existence of problems in factorability matrix.

Darting of the Principal Component Analysis, we estimated the initial number of 19 factors with reference to the Kaiser criterion where the eigenvalue of each factor must be equal to or greater than 1. Taking into account the large number of factors extracted by this criterion, we started to analyze the variance explained by the factor must be at least 3%, which suggested the extraction of 6 factors. Inspection of the Scree Plot graph also suggested the existence of six factors. However, the sixth factor was eliminated by having low reliability index (Cronbach's alpha) and contain only 3 items that did not have a factor loading greater than 0.30 on the other factors. Three items belonging to the other five factors were eliminated for not presenting a theoretical sense to justify the presence of that item in the factor to which it was allocated. This way, after the analyzes, the matrix gave birth to the scale consisted of 45 items arranged in five factors that explain 33.07% of total variance. The scale called Scale Climate for Creativity in Mathematic's Lessons was constituted as follows:

Compounding Factor 1, we have 11 items that relate to the relationship of the student with mathematics developed in the classroom, where he can express representation that makes this area of knowledge, demonstrating the level of pleasure and performance in this discipline as well as assess their level of creativity in mathematics. In this sense, Gnedenko (1982) shows that students will be creative in mathematics if he likes to math, something that rarely happens in the classroom. So, Factor 1 was named Student's Relationship with Mathematics, with Cronbach alpha index of 0.862. As an example, we mention the items: "The math classes are among my favorite classes" and "I find it easy to learn mathematics."

Factor 2 consists of 16 items and was titled Pedagogical Organization and Creativity in Mathematics. Showed a Cronbach alpha of 0.762 and concerns the perception of students as how the teacher organizes, plans and develops their math classes and how he inserts the development of mathematical creativity of the student in this educational organization. So, covers items that look for evaluate the availability of materials and physical spaces in the development of lessons and variability of pedagogical actions that can stimulate the development of creative strategies for solving mathematical problems. The way the teacher organizes her classes also reflect on how students perceive the usefulness of the knowledge constructed in school will have in your life. Exemplifying this factor we have the items: "The mathematic's lessons take place at various locations of the school (library, gymnasium, garden, patio, etc.)" and "In mathematics classrooms I am encouraged to invent problems."

Factor 3 was named Relationship with Mathematics by to embrace 7 items that relate to the student's perception about the image that colleagues pass of the mathematics and the level of creativity developed in this discipline. then, items seek to evaluate the perception of students about what their peers think about the taste of discipline and the way they evaluate their levels of creativity. The Cronbach alpha index was 0, 731. Items "My colleagues like of mathematics classes" and "My colleagues are creative in Mathematics classes" exemplify this factor.

Factor 4 was comprised of 7 items related to the level of support that the teacher dispenses the production and communication of ideas by the student. The factor was named Teacher's Support at the Production and Communication of Ideas. In this factor, it discusses the evaluation of the student regarding the perception that has on how the teacher plays its role of stimulating production and communication of ideas during math classes, teacher's action that can stimulate the development of the creative potential of students, insofar as these find space to enhance the quantitative and qualitative development of ideas. The index Cronbach alpha was 0.664. The following items are included in this factor: "In mathematics lessons the teacher allows me to ask questions when I have doubts" and "In mathematics lessons the teacher gives me time enough to think about a problem that I have to answer."

The last factor, titled Interaction of Students in Search of Mathematics Strategies, consists of 4 items that look for evaluate the way in which interactions among students in the classroom during the resolution of mathematical activities. As well evidenced by Schoenfeld (2013) learning environments are highly interactive, and ideas that individuals construct are often built and refined in collaboration with others (p.20). This form, this factor is concerned with how to measure how the interactions between students favor the establishment and communication of mathematical strategies, since the joint actions of the students may favor the emergence of creative strategies. The index Cronbach alpha was 0.507. Exemplifying this factor we have the following items: "My colleagues like to do math activities with me" and "My colleagues ask me to help them with math activities."

CONCLUSION

The results suggest that the full development of math abilities in the classroom pass compulsorily by the confluence of several factors if the aim is to educate students proficient in math. Of course this is not a purely mathematical logic, but mainly a mathematical which enables the individual to the full development of their potential, including here the ability to be able to understand their processes of mathematical thinking and problem solving abilities that require more than simple algorithmic procedures.

Based on this concept, the development of the scale grounded in the literature that supports such a view of mathematics education and validated by a rigorous statistical process scale allows us to have at hand a valuable tool with regard to the assessment of the climate of the classroom. Teachers, administrators, researchers, and students themselves can assess the strengths and weaknesses that support for the constitution of the atmosphere that can promote or inhibit the development of the creative potential that each student carries.

RECOMMENDATIONS

The full version of the Scale of Climate for Creativity in Mathematics is designed to be preferentially applied to students enrolled in the 5th grade of elementary school in public and private, educational grade in which students components of the sample of validation instrument schools were enrolled. However, studies can be oriented so as to extend the range for use in other elementary grades. Furthermore, it is recommended further studies in order to improve the scale, both increasing the sample as conducting studies in which the instrument may be tested.

The scale in its full version has the potential to serve as an instrument to measure the perceptions that students make about how creativity is treated in math classes, serving as a means for the teacher to assess their pedagogical action seeking promote the creative potential of their students.

Çukurova Üniversitesi
apinar@cu.edu.tr

ÖZET: Bu çalışma, sınıf öğretmeni adaylarının verilen farklı temsil biçimlerini grafiksel temsil biçimlerine dönüştürebilme becerilerini ortaya çıkarmaya yönelik tarama modelinde betimsel bir araştırmadır. Araştırmanın çalışma grubunu 2012-2013 eğitim öğretim yılında sınıf öğretmenliği bölümü birinci sınıfına devam eden toplam 119 öğrenci oluşturmaktadır. Veri toplama aracı olarak ilgili literatürden yararlanılarak "Temsil Dönüşüm Testi (TDT)" hazırlanmıştır. Temsil Dönüşüm Testi (TDT) dört bölümden ve on üç sorudan oluşmaktadır. Buna göre ilk bölümde tablo biçiminde üç soru, ikinci bölümde cebirsel denklem biçiminde üç soru, üçüncü bölümünde sözel ifade biçiminde üç soru, son bölümünde ise şekil biçiminde dört soru yer almaktadır. Araştırmanın analizinde betimsel istatistik teknikleri uygulanmıştır. Araştırmanın sonucunda cebirsel denklem ve tablodan grafiğe geçiş, adayların en başarılı oldukları alan olarak ortaya çıkarken; şekil biçiminde verilen temsillerin grafiğe dönüştürülmesinde ise öğretmen adaylarının büyük sorun yaşadıkları bulgusuna ulaşılmıştır. Bu sonuçlardan yola çıkarak, yaşanan sorunların neden kaynaklandığının belirlenmesine yönelik nitel bir araştırma yapılması, lisans derslerinde özellikle grafiksel temsillerle ilgili sorunların giderilmesine yönelik farklı yöntem ve tekniklerin geliştirilmesi önerilebilir.

Anahtar sözcükler: öğretmen adayı, çoklu temsiller, temsiller arası geçiş, İlköğretim matematik öğretim programı

ABSTRACT: The research is a qualitative study and designed according to survey model in order to figure out primary school teachers' transformation skills about the different representation forms into the graphical representations. The population of this study was 119 pre-service teachers studying in Primary School Education Department in 2012-2013 academic falls. A literature supported "Representation Transformation Test" (RTT) test was formed by the researcher as a data collection tool. The achievement test has fourth parts and thirteen questions. Hereunder, in the first part there are three questions in table form, in the second part there are three questions in algebraic equation form, in the third part there are three questions in verbal expression form, and in the last part there are four questions in modal form. The study was analyzed through descriptive statistics. According to results while passing from algebraic equation and table form to graphics is the most achieved area, the prospective teachers had some difficulties in terms of transforming modal forms into graphical representations. In line with these results, carrying out a qualitative research related to these challenges and developing different method and techniques in undergraduate courses for eliminating difficulties about graphical representations can be suggested.

Key words: pre-service teachers, multiple representations, visualization and graphical representations, primary school mathematics curriculum,

GİRİŞ

Matematiksel bir kavramın oluşturulması, biçimlendirilmesi sürecinde temsiller büyük önem taşımaktadır (Cai, 2005).Öğretim süreçlerinde, uygun matematiksel temsillerin seçilebilmesi, transfer edilebilmesi ve seçilen temsillerin sosyal ve fiziksel olaylar çerçevesinde öğrenciler tarafından uygulanıp yorumlanabilmesi ve bunlar arasında ilişkilerin kullanılması büyük önem taşımaktadır. Temsiller matematiğin öğrenilmesi ve öğretilmesinde önemli yapılardan biridir. (Cobb, Yackel, & Wood, 1992; Goldin, 1998; Janvier, 1987; Cai,2005). Stylianou (2010) da öğrencilerin matematik öğretiminde yer alan kavramlar ve problem çözümlerinde temsillerin kullanımları ve bunlar arasındaki geçişlerde etkin olmaları gerektiğini belirtmektedir Temsiller, öğrencilerin matematiksel anlamalarını desteklemeleri için birer araç (Hjalmarson, 2007) olup onların düşüncelerini organize etmelerine yardımcı olur (Cathcart, Pothier, Vance & Bezuk, 2006). Öte yandan, Amerikan Ulusal Matematik Öğretmenleri Konseyi'nin (NCTM (National Council of Teachers of Mathematics, 2000) öğretim standartları arasında yer alan temsil kavramı diyagram, manipulatif, grafik, tablo ve sembollerin kullanımına vurgu yapar.

İlgili literatürde genellikle ilköğretim düzeyine odaklanan çalışmalar öğrencilerin çoklu temsil dönüşümleri konusunda genelde yetersiz bilgilere sahip olduklarını göstermektedir (Cai, 2004; Gagatsis & Elia, 2004; Neria & Amit, 2004; Sert, 2007; Kılıç, 2009; Ahmad, Tarmizi, & Nawawi (2010). Yine, lisans düzeyinde göze çarpan sınırlı sayıda araştırmalar da benzer sonuçlara işaret etmektedir (Çelik & Sağlam-Aslan, 2012; Delice & Sevimli, 2010; Even, 1998; İpek & Okumuş, 2012). Bu bağlamda, Gagatsis ve Elia (2004) ilköğretim öğrencilerinin temsil ve temsiller arası geçiş becerileri ile ilgili derinlemesine bir araştırma yürütmüşlerdir. Araştırmanın sonucunda, öğrencilerin protatip biçiminde verilen grafiksel formu tablo haline kolayca dönüştürebildikleri; ancak, sembolik ve sözel temsiller arası dönüşümlerde ise oldukça zorlandıkları sonucuna ulaşılmıştır. Neria & Amit (2004) de öğrencilerinin problem çözme örüntüleri ve doğrulama sürecinde tercih ettikleri temsil modelleri ve bunun akademik başarıya olan etkisini inceledikleri araştırmalarında, öğrencilerin büyük çoğunluğunun sözel temsilleri tercih ettiklerini; ayrıca, cebirsel temsilleri kullanan öğrencilerin başarı düzeylerinin diğer temsilleri kullanan öğrencilere göre daha yüksek olduğunu ortaya çıkarmışlardır. Cai (2004) ise Çinli ve Amerikalı ilköğretim öğrencilerinin kullandıkları stratejileri ve temsilleri incelenmiştir. Araştırmada her iki grupta bulunan öğrencilerin problem çözme sırasında görsel temsillerden yararlandıkları ortaya çıkmıştır. Öte yandan, Even (1998) çalışmasında 152 matematik öğretmen adayının fonksiyonlar konusundaki bilgisini ve bir temsilden diğerine nasıl geçiş yaptığını incelemiştir. Araştırmanın sonucunda Even, öğretmen adaylarının çoklu gösterimler arasında esnek ilişkilendirmeler yapmaları gereken durumlarda çok başarılı olamadıkları sonucuna ulaşmıştır. Benzer şeklide Delice ve Sevimli (2010) de araştırmalarında öğretmen adaylarının temsil bilgileri ve farklı temsil kullanma becerileri yönünden yeterli bilgiye sahip olmadıklarını belirlemişlerdir. Öte yandan, İpek ve Okumuş (2012) ilköğretim matematik öğretmen adaylarının problem çözme süreçlerinde kullandıkları temsil türlerini ve bu temsillerle ilgili yaşadıkları sorunları araştırdıkları çalışmalarının sonucunda öğretmen adaylarının özellikle sözel temsilleri daha yoğun kullandıkları sonucuna ulaşmışlardır. Başka bir araştırmada ise Çelik ve Sağlam-Arslan (2012) sınıf öğretmeni adaylarının sözel, tablo, şekilsel gösterimler ve grafikler arası geçiş yapabilme becerilerini incelemişlerdir. Çalışma sonucunda, sözel ifadelerden grafiğe geçiş, adayların en başarılı oldukları alan olarak ortaya çıkarken şekilsel gösterimden grafiği geçiş ise en az başarılı oldukları alan olarak dikkat çekmektedir.

Yukarıdaki bilgiler ışığında, çoklu temsil dönüşümleri konusunda özellikle öğretmen adayları ile yürütülen çalışmaların sınırlı sayıda olduğu görülmektedir (Çelik & Sağlam-Aslan, 2012; Delice & Sevimli, 2010; Even, 1998; İpek & Okumuş, 2012). Bu düşünceden yola çıkarak bu çalışma ile sınıf öğretmen adaylarının tablo, cebir, sözel, şekilsel gösterimler ve grafikler arasında geçiş yapabilme becerileri ortaya çıkarılarak alandaki bir eksiklik giderilmeye çalışılmıştır. Bu genel amaç doğrultusunda araştırmanın alt amaçları şöyledir:

1) Öğretmen adayları tablo biçiminde verilen soruların ne kadarını grafiksel temsil biçiminde ifade etmektedir?
2) Öğretmen adayları cebirsel temsil biçiminde verilen soruların ne kadarını grafiksel temsil biçiminde ifade etmektedir?
3) Öğretmen adayları sözel temsil biçiminde verilen soruların ne kadarını grafiksel temsil biçiminde ifade etmektedir?
4) Öğretmen adayları şekilsel biçiminde verilen soruların ne kadarını grafiksel temsil biçiminde ifade etmektedir?

YÖNTEM

Bu çalışma sınıf öğretmeni adaylarının verilen farklı temsil biçimlerini grafiksel temsil biçimlerine dönüştürebilme becerilerini ortaya çıkarmaya yönelik tarama modelinde betimsel bir araştırmadır.

Çalışma Grubu

Araştırma 2012-2013 bahar döneminde sınıf öğretmenliği bölümünde birinci sınıfa devam eden 119 (kız:81; erkek: 31) öğrenciyle yürütülmüştür. Çalışma grubu belirlenirken amaçlı örnekleme yöntemlerinden ölçüt örneklemesi kullanılmıştır. Buna göre çalışma grubu sınıf öğretmenliği lisans programı kapsamında yer alan Temel Matematik I ve Temel Matematik II dersini alan öğrenciler oluşturmaktadır. Temel matematik I ve II derslerinin içeriğinde matematiksel kavramlar, grafik çizimleri, veri toplama, verilerin özetlenmesi, grafikle gösterme, oran-orantı konuları yer almaktadır.

Veri Toplama Aracı

Veri toplama aracı olarak ilgili literatürden (Çelik ve Sağlam-Aslan, 2012; Even, 1998; Lesh, Behr ve Post, 1987, Sert, 2007) yararlanılarak "Temsil Dönüşüm Testi (TDT)" hazırlanmıştır. Temsil Dönüşüm Testi (TDT) dört bölümden ve on üç sorudan oluşmaktadır. Buna göre ilk bölümde tablo biçiminde üç soru, ikinci bölümde cebirsel denklem biçiminde üç soru, üçüncü bölümünde sözel ifade biçiminde üç soru, son bölümünde ise şekil biçiminde dört soru yer almaktadır. TDT'nin geçerliğini sınamak üzere, matematik eğitimi alanında iki uzman tarafından testin ölçmeyi hedeflediği davranışlar yönüyle, kapsam ve görünüş geçerliğine sahip olduğu belirlenmiştir. Daha sonra temel matematik derslerini başarıyla tamamlayan ve ikinci sınıfta öğrenim gören dört öğrenciye pilot uygulama yapılmıştır. Uygulama aşamasında öğrencilere araştırmanın amacı hakkında bilgi verilmiş ve ölçme aracında anlamadıkları her hangi bir soru olup olmadığı konusunda dönüt alınmıştır. Uygulama sürecinde ise testin anlaşılması ve süre açısından herhangi bir zorlukla karşılaşılmamıştır.

Veri Analizi

Verilerin analizi aşamasında "Temsil Dönüşüm Testi (TDT)" ölçme aracından yer alan soruların grafiksel biçime dönüşümleri incelenmiş ve temsiller arasındaki geçişler doğru ise "1", yanlış ise "0" olarak kodlanmıştır. Temsil Dönüşüm Testi'nin güvenirliğini belirlemek için bu testi cevaplayan öğrencilerden rastgele seçilen 20 öğrencinin cevap kâğıtları seçilmiş matematik eğitimi alanında bir uzman tarafından da analiz edilmiş ve Miles ve Huberman (1994) tarafından önerilen *Görüş birliği/(Görüş birliği+Görüş ayrılığı) X 100* formülü kullanılarak yapılan hesaplama sonucu kodlayıcılar arasındaki uyuşma oranı .93 olarak hesaplanmıştır. Daha sonra kodlayıcılar ve araştırmacı arasında yapılan görüşmede farklılık görülen ifadelerde fikir birliğine varılmıştır. Yapılan bu sınıflandırmalardan elde edilen bulguların sunulmasında betimsel istatistik tekniklerinden yararlanılmıştır.

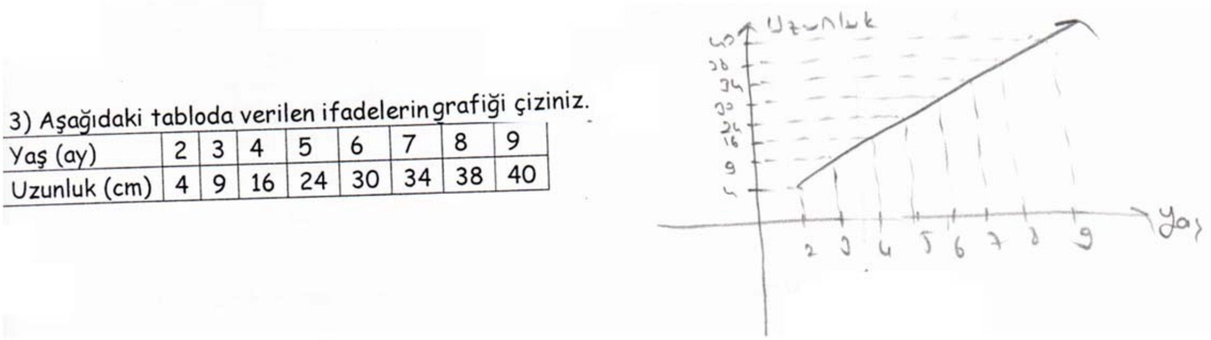
BULGULAR

Öğretmen adaylarının verilen farklı temsilleri grafiğe dönüştürebilme becerilerine yönelik yapılan analiz sonucunda elde edilen bulgular araştırmanın alt amaçlarıyla paralel olarak sunulmuştur. Öncelikle tablo biçimde verilen sorunun grafiğe dönüştürülmesine ilişkin elde edilen veriler Tablo 1'de yer almaktadır.

Tablo 1. Tablo Biçiminde Verilen Soruların Grafiksel Temsil Biçimine Dönüştürülmesine İlişkin Frekans ve Yüzde Dağılımı

Soru No	Grafiksel Temsil					
	Doğru		Yanlış		Boş	
	f	%	f	%	f	%
S1	98	82.4	20	16.8	1	.8
S2	81	68.1	38	31.9	-	-
S3	79	66.4	40	33.6	-	-

Tablo 1 incelendiğinde araştırmaya katılan öğretmen adaylarının en az %66'sı tablo biçiminde verilen soruları grafiksel biçime dönüştürebildikleri görülmektedir. Bunun yanında birinci soru birinci dereceden bir bilinmeyenli denklemle ilgili olup doğrusal bir grafiği temsil ettiğinden dolayı araştırmaya katılan öğretmen adaylarının büyük çoğunluğu (%84) grafiği doğru olarak oluşturmuştur. Ancak ikinci ve üçüncü sorular doğrusal olmayan grafik çizimleriyle ilgili olduğundan araştırmaya katılan öğretmen adaylarının yaklaşık %30'nun grafiği yanlış oluşturduğu Tablo 1'de açıkça görülmektedir. Örneğin, 3. soruda $Ö_{31}$ kodlu öğretmen adayının oluşturduğu grafik Şekil 1'de yer almaktadır.



Şekil 1. $Ö_{31}$ Kodlu Adayın 3. Soruda Oluşturduğu Grafiksel Temsil

$Ö_{31}$ kodlu öğretmen adayının 3. soruda oluşturduğu grafiksel temsilin yanlış olduğu görülmektedir. Şekil 1'de incelendiğinde öğretmen adayının soruyu doğrusal bir fonksiyon olarak düşündüğü ve buna uygun bir grafik çizdiği anlaşılmaktadır.

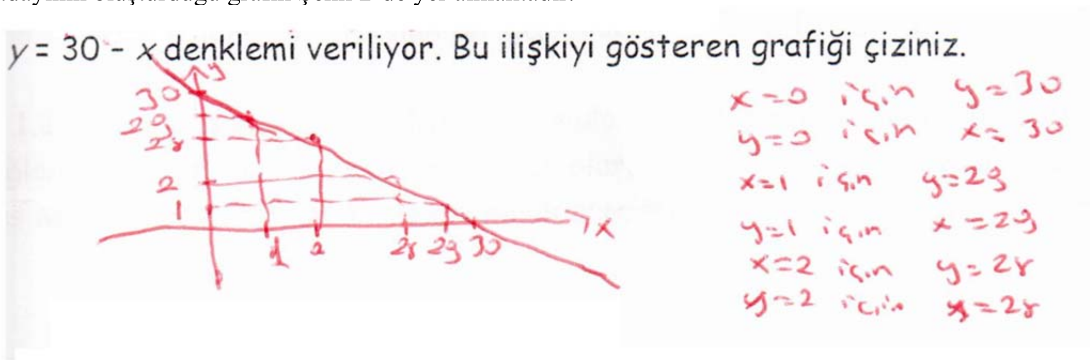
Araştırmanın ikinci alt amacı olarak cebirsel denklem olarak verilen soruların grafiksel temsil biçimine dönüştürülmesiyle ilgilidir. Buna ilişkin elde edilen bulgular Tablo 2'de yer almaktadır.

Tablo 2. Cebirsel Denklem Biçiminde Verilen Soruların Grafiksel Temsil Biçimine Dönüştürülmesine İlişkin Frekans ve Yüzde Dağılımı

Soru No	Grafiksel Temsil					
	Doğru		Yanlış		Boş	
	f	%	f	%	f	%
S4	73	61.3	46	38.7	-	-
S5	84	70.6	37	29.4	-	-

S6	67	56.3	49	41.2	3	2.5

Tablo 2 incelendiğinde öğretmen adayların büyük bir çoğunluğunun cebirsel formda verilen soruları grafiksel biçime dönüştürebildikleri sonucuna görülmektedir. Bu bağlamda, örneğin, 4. soruda Ö$_{59}$ kodlu öğretmen adayının oluşturduğu grafik Şekil 2'de yer almaktadır.



Şekil 2. Ö$_{59}$ Kodlu Adayın 4.Soruda Oluşturduğu Grafiksel Temsil

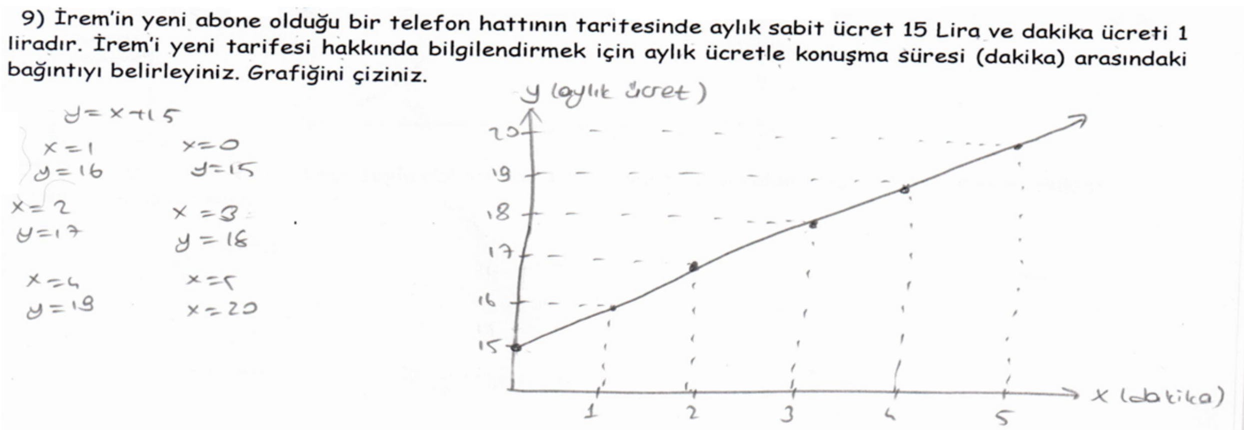
Şekil 2 incelendiğinde Ö$_{59}$ kodlu öğretmen adayının 4. soruda kendi oluşturduğu grafiksel temsili kullandığı görülmektedir.

Araştırmanın üçüncü alt amacı sözel olarak verilen soruların grafiksel temsil biçiminde dönüştürülmesiyle ilgilidir. Buna ilişkin elde edilen bulgular Tablo 3'te yer almaktadır.

Tablo 3. Sözel Temsil Biçiminde Verilen Soruların Grafiksel Temsil Biçimine Dönüştürülmesine İlişkin Frekans ve Yüzde Dağılımı

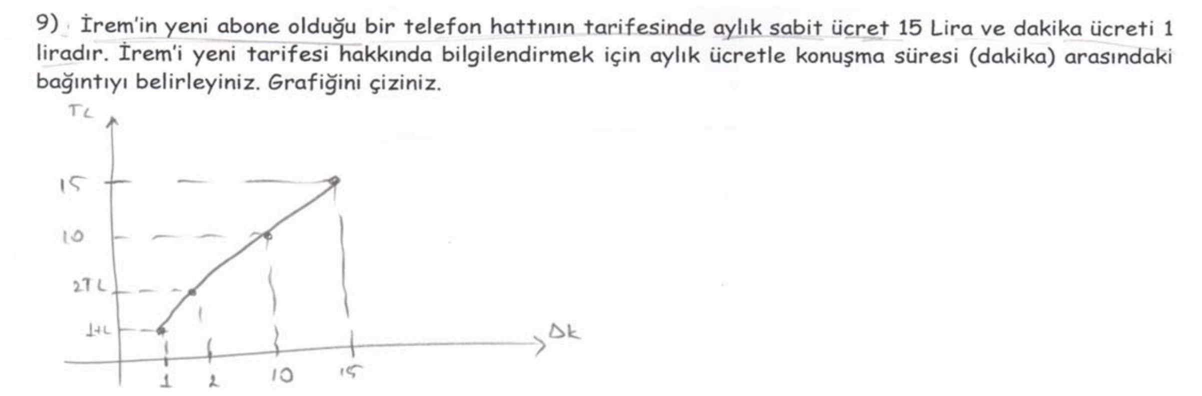
Soru No	Grafiksel Temsil					
	Doğru		**Yanlış**		**Boş**	
	f	**%**	**f**	**%**	**f**	**%**
S7	43	36.1	71	59.7	5	4.2
S8	49	41.2	62	52.1	8	6.7
S9	41	34.5	74	62.2	4	3.4

Tablo 3 incelendiğinde yedinci, sekizinci ve dokuzuncu sorularla ilgili olarak araştırmaya katılan öğretmen adaylarının yaklaşık üçte birinin (%36, %41 ve %35) doğru cevaplar verdikleri görülmektedir. Örneğin, 9. soruyla ilgili olarak da Ö$_{13}$ kodlu öğretmen adayının oluşturduğu grafik Şekil 3'te yer almaktadır.



Şekil 3. Ö$_{13}$ Kodlu Adayın 9.Soruda Oluşturduğu Grafiksel Temsil

Şekil 3'te görüldüğü gibi, Ö$_{13}$ kodlu öğretmen adayının verilen soruya uygun birinci dereceden artan bir grafik çizdiği görülmektedir. Ancak aynı soru kapsamında Ö$_{1}$ kodlu öğretmen adayının oluşturduğu yanlış grafik Şekil 4'te yer almaktadır.



Şekil 4. Ö$_1$ Kodlu Adayın 9. Soruda Oluşturduğu Grafiksel Temsil

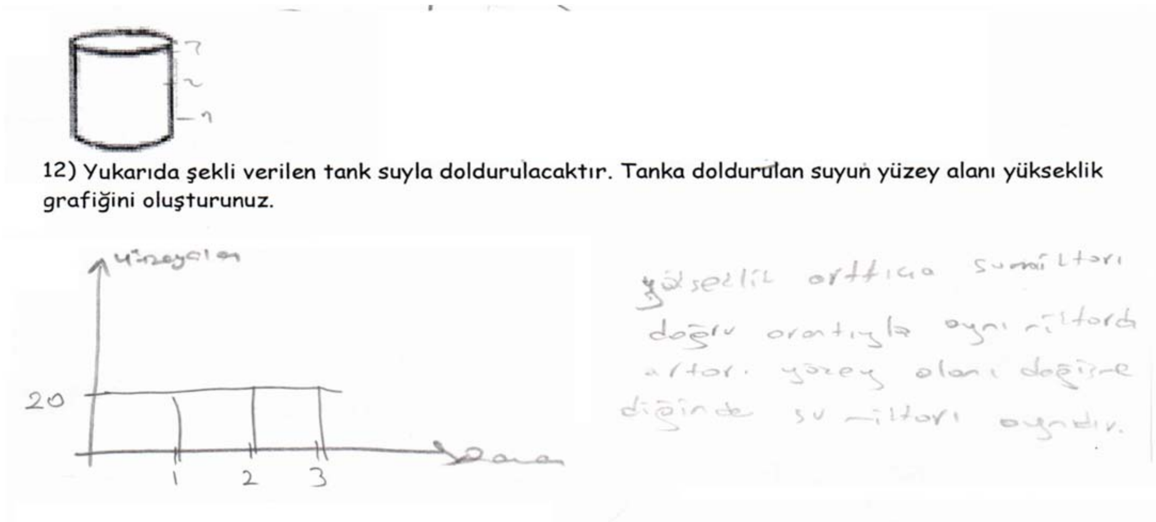
Şekil 4 incelendiğinde Ö$_1$ kodlu öğretmen adayının 9.soruyla ilgili olarak uygun bir grafik çizemediği artan bir fonksiyon olduğunu fark ettiği ama buna rağmen sabit ücreti dikkate almadan grafiği çizdiği görülmektedir.

Araştırmanın dördüncü ve son alt amacı şekil olarak verilen soruların grafiksel temsil biçimine dönüştürülmesiyle ilgilidir. Buna ilişkin elde edilen bulgular Tablo 4'te yer almaktadır.

Tablo 4. Şekilsel Verilen Soruların Grafiksel Temsil Biçimine Dönüştürülmesine İlişkin Frekans ve Yüzde Dağılımı

Soru No	Grafiksel Temsil					
	Doğru		Yanlış		Boş	
	f	%	f	%	f	%
S10	22	18.5	93	78.2	4	3.4
S11	23	19.3	92	77.3	4	3.4
S12	49	41.2	65	54.6	5	4.2
S13	15	12.6	99	83.3	5	4.2

Tablo 4 incelendiğinde şekille ilgili olarak verilen sorulardan onuncu ve on birinci soruların %19'u, on ikinci sorunun %41'i ve on üçüncü sorunun da%13'ü doğru olarak cevaplandırılmıştır. Bu kapsamda, 12. soruyla ilgili olarak da Ö$_{28}$ kodlu öğretmen adayının oluşturduğu yanlış grafik Şekil 5'te yer almaktadır.



Şekil 5. Ö$_{28}$ Kodlu Adayın 12. Soruda Oluşturduğu Grafiksel Temsil

Şekil 5 incelendiğinde Ö$_{28}$ kodlu adayın 12.soruyla ilgili yükseklik ile yüzey alanı arasındaki çizdiği yanlış bir grafik çizdiği görülmektedir.

SONUÇ ve ÖNERİLER

Bu çalışma ile sınıf öğretmeni adaylarının verilen farklı temsil biçimlerini grafiksel temsil biçimlerine dönüştürebilme becerileri irdelenmeye çalışılmıştır. Araştırmanın sonucunda cebirsel denklem ve tablodan grafiğe geçiş, adayların en başarılı oldukları alan olarak ortaya çıkarken; şekil biçiminde verilen temsillerin grafiğe dönüştürülmesinde ise öğretmen adaylarının büyük sorun yaşadıkları bulgusuna ulaşılmıştır. Bu sonuçlardan yola çıkarak, yaşanan sorunların neden kaynaklandığının belirlenmesine yönelik nitel bir araştırma yapılması, lisans derslerinde özellikle grafiksel temsillerle ilgili sorunların giderilmesine yönelik farklı yöntem ve tekniklerin geliştirilmesi önerilebilir.

MÜHENDİSLİK ÖĞRENCİLERİNİN İRRASYONEL SAYI BİLGİLERİ

Necdet GÜNER

Bu çalışma, Pamukkale Üniversitesi mühendislik fakültesinde, ayrık matematiksel yapılar dersini alan bilgisayar mühendisliği birinci sınıf öğrencileri üzerinde yapılmıştır. Öğrencilere verilen ara sınavlarda ve dönem sonu sınavında ayrık matematiksel yapılar dersi ile ilgili bazı sorularda, öğrencilerin irrasyonel sayı bilgilerinden de yararlanmalarını gerekecek sorular sorulmuştur. Bunun dışında, bir kısa sınavda öğrencilerin irrasyonel sayılar hakkındaki bilgilerinin belirlenmesi amacı ile sorular sorulmuştur.

İrrasyonel sayılarla ilgili sınav sayfaları araştırmacı tarafından notlandırlmadan ikişer fotokopisi alınmıştır. Araştırmacı bir matematik alan uzmanı ile birlikte notlandırma metodu üzerinde konuşmuş ve her iki uzman tüm soruları bağımsız olarak notlandırmıştır. Notlandırma sonrası sonuçlar karşılaştırılmış ve %20 den büyük bir fark olan sorular beraberce değerlendirilerek ortak bir görüşe varılmıştır.

Yapılan araştırmanın sonuçlarına göre, öğrencilerin büyük çoğunluğunun irrasyonel sayıların bir küme olarak sayılar sistemindeki yerini bilmedikleri görülmüştür. Ayrıca, irrasyonel sayıların toplama ve çarpma işlemlerine göre kapalı olup olmadıklarının açık olarak bilinmediği, belirlenen bir aralıkta irrasyonel sayı örneği verilmesi istenen bazı öğrencilerin ise rasyonel veya karmaşık sayıları örnek verdikleri tespit edilmiştir. Bunun dışında, öğrencilerin büyük çoğunluğunun irrasyonel sayıların sonsuz basamaklı sayılar oldukları hakkında bilgi sahibi olmadıklarıda görülmüştür.

Ülkemizde okutulmakta olan lise matematik ders kitapları incelendiğinde, irrasyonel sayılarla ilgili bölümün soruları ile birlikte beş sayfadan az olduğu görülmektedir. Bu durum öğrencilerin irrasyonel sayılar hakkında yeterince bilgi sahibi olmasına ve irrasyonel sayılarla ilgili özellikleri içselleştirmeleri için yeterli olmadığı düşünülmektedir.

Anahtar Kelimeler: İrrasyonel sayılar, mühendislik öğrencileri

ÖZET: Matematiğin semboller ve şekillerden oluşan soyut yapısından dolayı terimlerin, kavramı temsil gücü her zaman yeterli olmamaktadır. Kavramların sözel ve matematiksel temsillerinin birbirine çağrışım yapabilmeleri öğretimde kolaylık ve kalıcılık açısından önemlidir. Matematik terminolojisi ile öğrenme arasındaki ilişkiyi ele alan uluslararası çalışmalarda, terimlere anlam yüklemeyi etkileyen çeşitli faktörler belirlenmiş ve kavram öğretiminde terimler üzerinden özel öğretim yöntemlerine ihtiyaç olduğu vurgulanmıştır. Çalışmamızda, öncelikle matematik terimlerini anlamayı etkileyen dilsel faktörler tespit edilerek, bu faktörler bazında ortaokul 8. sınıf öğrencilerinin terimlere yüklediği anlam ve matematiksel örnek verme becerilerinin ne düzeyde olduğunu belirlemek amaçlanmaktadır. Bu amaçla geliştirilen matematik terimleri ölçeği öğrenciler tarafından doldurulduktan sonra elde edilen veriler içerik analizi tekniği ile nitel olarak incelenmiştir. Bulgular, öğrencilerin matematik terimlerini sözel açıklama becerilerinin, matematiksel temsil becerilerine göre oldukça zayıf olduğunu ve anlam yüklemeye olumsuz yönde etki eden en önemli faktörlerin yabancı kökenli terimler ile matematiksel anlamı ile günlük dildeki anlamı farklı olan terimler olduğunu ortaya koymaktadır.

Anahtar kelimeler: matematik terimleri, ortaokul matematik öğretimi, matematik öğretiminde temsiller

ABSTRACT: As mathematics consists of abstract symbols and shapes, the terms are inefficient to represent the concept and mathematical representations. From the point of view of easiness and sustainabilıty of the teaching, it is important that verbal and mathematical representations of concepts associate with each other. International studies that treat the relationship between mathematical terminology and learning have identified various factors attributing terminology its meaning and in the concept teaching of terms, and have emphasised the need of special teaching techniques. In our study, first, the linguistic factors affecting the understanding of mathematical terms in our language have been identified and on the view of these, it is aimed to find out the level of skills of 8th grade students of secondary school in giving mathematical examples and in attributing meanings to the terms. After the mathematical terms scale developed for this aim has been filled in by the students, the results have been evaluated in a qualified way by the content analysis technique. Findings reveal that students are weak in verbal explanation skills of mathematical terms when compared with their mathematical representation skills. Foreign-origined terms and the terms having different meaning in daily language and mathematical usage, are among the most important factors affecting negatively in attributing meanings to mathematical terms.

Key words: mathematical terms, mathematic teaching in the secondary school, representations in teaching mathematics.

GİRİŞ

Matematik diğer bilimlerde olduğu gibi kendine özgü terminolojisi olan bir bilimdir. Matematiksel bir terim yalnızca kavrama verilen bir isimdir ve bu sayede kavramı sözel olarak temsil eder. Matematiğin semboller ve şekillerden oluşan soyut yapısından dolayı terimlerin, kavramı temsil gücü her zaman yeterli olmamaktadır ve matematiksel temsiller kaçınılmazdır. Bir konuya ait farklı temsillerin oluşturulması konunun özümsenmesi açısından önemlidir. Tanım, resim, grafik, şekil, sembol, modelleme ve benzeri farklı temsiller kavramı zenginleştirdiği gibi öğrenme stillerindeki farklılığı da dikkate almayı sağlar. Çoklu temsiller sayesinde öğrenci zihninde kavramların gerçek anlamlarına yakın kavram görüntüleri oluşmaktadır (Ainsworth, 2006; Akkoç, 2006; Tall ve Vinner, 1981). Kavramların farklı şekilde temsil edilmesi ve bu temsiller arasında ilişki kurularak matematiksel düşüncenin ifade edilmesi, bu süreçte matematiksel terminoloji ve dilin doğru kullanılabilmesi ortaokul matematik öğretiminin genel amaçları arasında yer almaktadır (Milli Eğitim Bakanlığı [MEB], 2013). Böylece kavramların tanımları ve kuralların öğretilmesi esnasında farklı temsiller verilerek öğrencilerin kavramlar arasındaki ilişkiyi kendilerinin kurmaları hedeflenmektedir. Ortaokul Matematik Dersi Öğretim Programı'nda ayrıca, matematiksel süreç becerilerinden iletişim ve ilişkilendirme becerilerinin gelişiminde matematik dilinin etkili kullanımı, günlük dil ve diğer alanlarla ilişkilendirilmesi, çoklu temsiller üzerine vurgu yapılmaktadır (MEB, 2013).

Kavramların sözel ve matematiksel temsillerinin birbirine çağrışım yapabilmeleri öğretimde kolaylık ve kalıcılık açısından önemlidir. Öğretimde en önemli başlangıç, çocukların önceden bildikleriyle, yeni terim ve ifadeler arasında bağlantı kurmaktır (Rubenstein ve Thompson, 2002). Adams'a (2003) göre sayı, sembol ve terimleri okumak matematiği başarmak için bilinmesi gereken birçok şeyin gizli anahtarıdır. Öğrencilerin matematik problemlerini çözme zorluğu ve doğru sonuca ulaşamamalarının altında çoğunlukla terimleri anlama güçlüğü yatmaktadır (Larson, 2007). Matematik terminolojisi ile öğrenme arasındaki ilişkiyi ele alan uluslararası çalışmalarda, terimlere anlam yüklemeyi etkileyen çeşitli faktörler belirlenmiş ve kavram öğretiminde terimler üzerinden özel öğretim yöntemlerine ihtiyaç olduğu vurgulanmıştır (Adams, 2003; Kovarik, 2010; Larson, 2007; Rubenstein ve Thompson, 2002).
Uluslararası çalışmalara paralel olarak, çalışmamızda, öncelikle matematik terimlerini olumlu veya olumsuz yönde anlamayı etkileyen dilsel faktörler tespit edilmiş; bu faktörler bazında, ortaokul 8. sınıf öğrencilerinin terimlere yüklediği anlam ve matematiksel örnek verme becerilerini ortaya koymak amaçlanmıştır.

YÖNTEM

Araştırmada nitel araştırma yöntemlerinden fenomonoloji yöntemi kullanılmıştır. Fenomonoloji yöntemi, bireylerin kişisel tecrübeleri ile ilgilenerek, olaylara yükledikleri anlamları belirlemeyi sağlar (Baş ve Akturan, 2008). Çalışma, 2013-2014 eğitim-öğretim yılında, bir devlet ortaokulunun bireyselleştirilmiş eğitim programına tabi iki öğrenci dışında yirmi sekiz 8. sınıf öğrencisi ile gerçekleştirilmiştir. Örneklem grubu genel olarak orta düzey akademik başarıya sahiptir.

Veri Toplama Araçları ve Süreci

Veri toplama aracı olarak, ortaokul matematik terimleri listelenip alan eğitimi ışığında matematik terimleri ölçeği oluşturulmuştur. Ölçekte yer alan matematik terimleri, İlköğretim ve Ortaokul Matematik Dersi Öğretim Programları (MEB, 2009; MEB 2013) ve Matematik Sözlüğü (Large, 2011) taranarak belirlenmiştir. Veri toplama sürecinin öğrenciler için sıkıcı ve uzun sürmemesi, dolayısıyla araştırmanın güvenirliğini olumsuz yönde etkilememesi amacıyla çok temel kavramları (basamak, bölük gibi) ve genel ifadeleri (uzunluk ölçüleri, zaman ölçme gibi) içeren terimler elenerek beş öğrenme alanından 152 terim korunmuştur.
Alan eğitimi araştırmaları, lise ve lisans öğrencilerinin tanımları doğru bir şekilde ifade etme ve problem çözme ya da ispat sürecinde tanımların rolünü anlama zorluklarını vurgulamaktadır (Dahlberg ve Housman, 1997; Edwards ve Ward, 2004; Zaslaysky ve Shir, 2005). McConnel (2008) öğrencilerin matematik konularını anlamada kelime öğretiminin etkisini incelediği çalışmada, on terimin listelendiği ve her terim için dört bölmelik (terim-tanım-cümle içinde kullanım-temsil eden resim veya diyagram) çalışma alanı oluşturulan terim quizleri hazırlamıştır. Bu şekilde bir terimin öğrenci için ne ifade ettiği hakkında daha zengin bilgi elde edilebilir. Ölçeğin hazırlanmasında, öğrenciler tarafından terimlere tanım vermenin kolay olmayacağı düşüncesinden hareketle, terimlerin ne anlama geldiğini kendi cümleleriyle yazmaları tercih edilmiştir. Bunun yanında öğrencilerin, sözel temsile ek olarak, terimlere matematiksel temsili oluşturan örnekler de vermeleri istenmiştir. Böylece sözel olarak doğru bir şekilde ifade edilemese de, matematiksel olarak durumu belirlemenin mümkün olması sağlanmıştır. Sonuç olarak ölçek bir ortaokul terimler listesi olarak tasarlanmış ve her terim için iki bölmenin yazılı olarak doldurulması hedeflenmiştir: terimlerin öğrenci için taşıdığı anlam ve terimlere ilişkin matematiksel örnekler. Matematik terimleri, matematik dersi öğrenme alanlarına göre gruplandırılarak farklı zaman dilimlerinde uygulanabilirliği sağlanmıştır.

Verilerin Analizi

Ölçekte yer alan matematik terimleri ve öğrenci görüşlerinden oluşan yazılı veriler doküman analizine tabi tutulmuştur. Öğrencilerin, terimleri matematiksel ve sözel temsil becerilerini yorumlamada araç olarak kullanmak üzere, her bir terim için çağrışıma etki eden olası faktörler belirlenmiştir. Bu işlemde Thompson ve Rubenstein'ın (2000) tespit ettiği faktörler çalışmamıza yön vermiştir. Öğrencilerin öğretim ve ana dilinin

Türkçe olması göz önünde bulundurularak, çeşitli sözlükler yardımıyla matematik terimleri için, kavram çağrışımını etkileyen başlıca yedi durum belirlenmiştir:

- Günlük dil ve bilim dilinde sesteş kelimeler: Öğrencilerin matematik dersinde karşılaştıkları terimlere daha önceki okul veya okul dışı yaşantılarında edindikleri farklı anlamları yüklemeleri ile öğrenmede çeşitli zorluklar ortaya çıkabilmektedir (Bingölbali, 2009). Günlük dil ve bilim dilinde, aynı disiplin içerisinde veya farklı disiplinlerde ortak olarak kullanılan sesteş kelimeler çağrışıma etki edebilir. Türkçe sözlüklerden terimlerin değişik alanlardaki tanımı incelenerek (matematik, günlük dil…) sesteş kelimelerin olası etkisi araştırılmıştır: etkisiz eleman, ardışık sayı, imkânsız olay, bir sayının kuvveti, kesirlerde genişletme, üslü sayılarda taban/üçgenin tabanı…
- Ses benzerliği ve Kelime kökleri: Terimler ses benzerliğinden dolayı farklı çağrışımlara yol açabilir: koni-huni, asal sayı-asil …
- İlişkili fakat anlamları farklı matematik terimleri: denklem-özdeşlik, çarpan-kat…
- Kombine matematik terimleri: Terimlerin yan yana gelmesi ile oluşan yeni terimlerde kelimelerden herhangi birinin çağrıştırdığı anlam kelime öbeğine genellenebilir veya yeni bir anlam oluşmasını sağlayabilir: üçgen eşitsizliği, örnek uzay, karesel sayı…
- Yabancı kökenli terimler: Türkçeye yabancı dilden geçen kelimelerin matematikte kullanılması çağrışıma engel olabilir: permütasyon, hipotenüs…
- Vurgu yapılan kelimeler: Türkçede sıfatlar ve sıfatların önüne getirilen “en, pek, daha” gibi kelimeler o sıfatın derecesini artırarak vurguya dayalı bir anlam oluşmasına sebep olabilir. Matematik terimleri içerisinde benzer yapılar vardır: en büyük ortak bölen, en küçük ortak kat, eşkenar üçgen…
- Sadece matematikte kullanılan terimler: Bir bilim dalına özgü kelimelerle öğrenciler günlük yaşantılarında karşılaşmadıklarında terimlerin anlaşılması daha zor olabilir: prizma, ondalık gösterim, medyan…

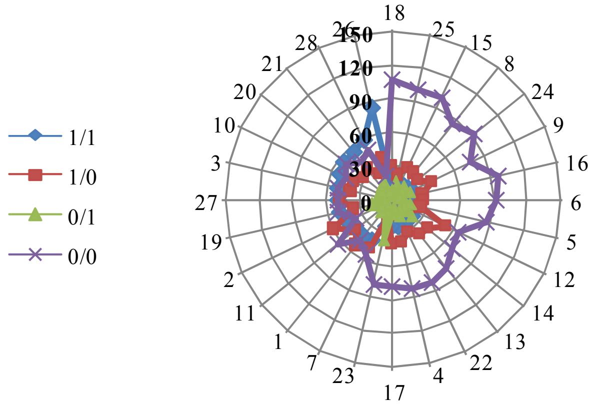
Bir terimin çağrışımına birden çok faktör etki edebilir. Örneğin “prizma” teriminin anlaşılmasındaki zorluk, sadece matematik alanına özgü bir terim olması ile birlikte yabancı kökenli olmasından da kaynaklanabilir. Faktörlerin belirlenmesi sürecinde, analizin güvenirliğini sağlamak için türkçe ve yabancı dil bilgisi iyi derecede olan kişilerden görüş alınarak sonuçlar teyit edilmiştir. Matematik terimleri ölçeği sayesinde, terimlerle ilgili her bir öğrencinin sözel ve matematiksel temsilleri kavramla ilişki bakımından doğruluk değerleri tespit edilerek kodlanmış ve MS Excel tablolama yazılımına kaydedilmiştir:

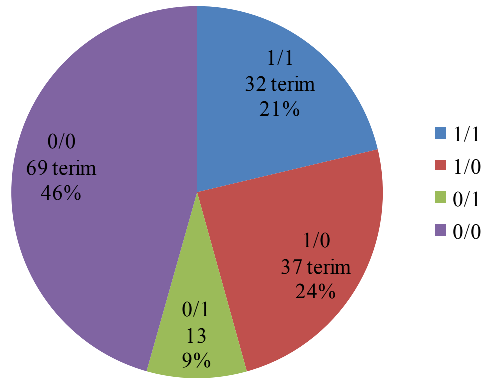
- Matematiksel ve sözel ifadesi doğru olanlar: 1/1
- Matematiksel ifadesi doğru iken sözel ifadesi yanlış olanlar: 1/0
- Matematiksel ifadesi yanlış iken sözel ifadesi doğru olanlar: 0/1
- Matematiksel ve sözel ifadesi yanlış olanlar: 0/0

Sözel ifadelerin doğruluk değeri tespit edilirken, matematiksel olarak doğru bir açıklama veya tanımdan ziyade, terimin çağrışıma olumlu (doğru olarak kodlanmış) veya olumsuz (yanlış olarak kodlanmış) etkisi göz önüne alınmıştır. Her bir terim için doğruluk değerlerine karşılık gelen frekanslar (öğrenci sayısı) not edilmiştir ve maksimum frekans değerine göre terimler gruplandırılmıştır. Daha sonra verilerden merkezi bir noktaya göre değerlerdeki değişimi gösteren radar grafikler oluşturulmuştur. Bu grafik türü ile, böylece doğruluk değerlerinin baskın olduğu durumlarla ilgili bir resim ortaya konmuştur. Öğrencilerin terimlere yükledikleri anlam incelenerek, sahip oldukları çağrışımlar ortaya çıkarılmış ve çağrışımlara etki eden faktörler bazında veriler içerik ve betimsel analiz teknikleriyle analiz edilmiştir.

BULGULAR

Bulgular, öğrencilerin matematik terimlerini sözel ve matematiksel temsillerinin kavramla ilişki bakımından doğruluk değerleri dikkate alınarak dört alt başlıkta özetlenmiştir.
Her öğrencinin (öğrenci kodları 1/1 değerlerine göre sıralanmış halde grafiğin eksenlerine yerleştirilmiştir) terimleri matematiksel ve sözel temsil becerilerini gösteren sonuçlar Şekil 1; terimlerin matematiksel ve sözel öğrenci temsillerinin doğruluk değerleri bazında yaklaşık olarak frekans ve yüzde dağılımı ise Şekil 2’de özetlenmiştir.





Şekil 6. Terimlerin Öğrenci Bazında Temsil Doğruluk Değerleri

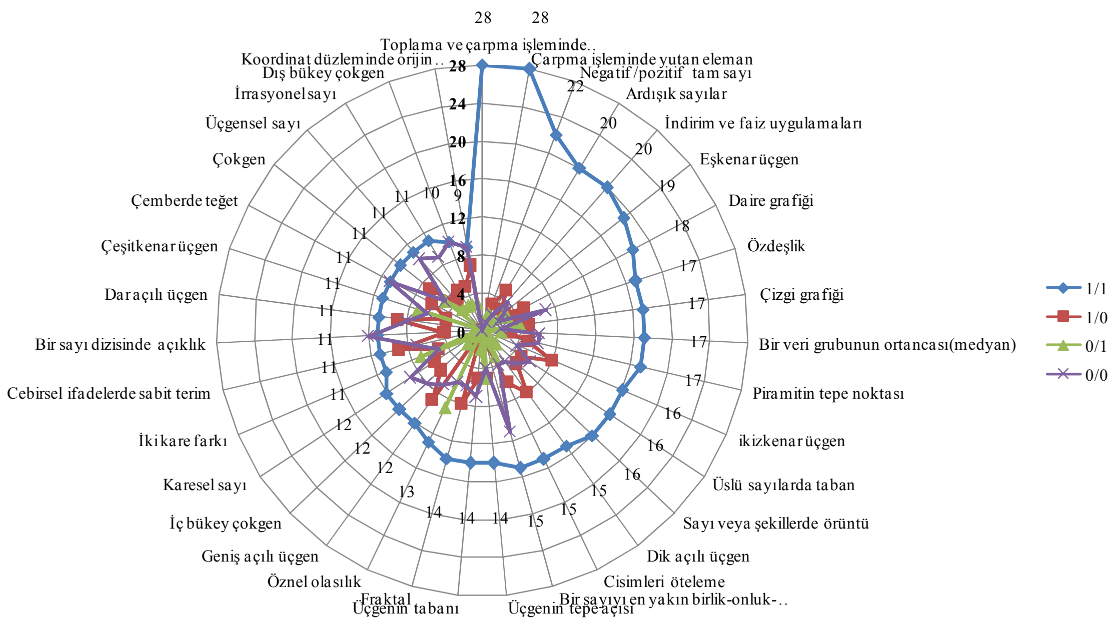
Şekil 7. Terimlerin Temsil Doğruluk Değerleri Bazında Dağılımı

Şekil 1 incelendiğinde, öğrencilerin yaklaşık yarısının (grafiğin sağ tarafındaki uç değerlere bakınız) terimlerin yarısından fazlası için ne sözel ne matematiksel olarak doğru temsiller üretemedikleri; hem sözel hem matematiksel temsilleri doğru olan öğrencilerin ise genel olarak terimlerin üçte birini pek fazla geçemedikleri anlaşılmaktadır (grafiğin sol tarafındaki uç değerlere bakınız).

Terimlere verilen matematiksel ve sözel temsiller ayrı ayrı değerlendirildiğinde, terimlerin %70 inin sözel olarak, %55 inin ise matematiksel olarak doğru bir şekilde ifade edilemediği gözlemlenmektedir.

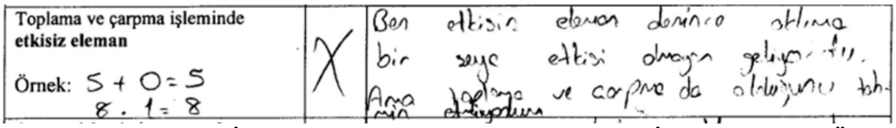
Matematiksel ve Sözel Temsil Doğruluk Değeri Çoğunlukla "1/1" Olan Terimler

Öğrencilerin çoğunun matematiksel ve sözel temsillerin her ikisini de kavramla doğru bir şekilde ilişkilendirdiği terimler Şekil 3'de sunulmuştur.



Şekil 8. Matematiksel ve Sözel Temsil Doğruluk Değeri Çoğunlukla "1/1" Olan Terimler

Öğrenciler 35 terimin matematiksel ve sözel temsillerini çoğunlukla doğru ifade etmişlerdir. Bu terimlerin sırasıyla, 16 tanesi (%46'sı) geometri ve ölçme, 11 tanesi (%31'i) sayılar ve işlemler, 4 tanesi (%11'i) cebir, 3 tanesi (%9'u) veri işleme ve 1 tanesi (%3'ü) olasılık öğrenme alanına aittir. Bulgular, grafikte yer alan çoğu terimin günlük dil ve bilim dilinde ortak kullanılan sesteş kelimeler olması durumu ile açıklanabilir: toplama ve çarpma işleminde *etkisiz eleman*, çarpma işleminde *yutan eleman*, negatif/pozitif tam sayı, ardışık sayılar, *özdeşlik, çizgi* grafiği*, öznel* olasılık*, eşkenar* üçgen*,* üçgenin *tabanı*... Sesteş olmanın yanında, bu terimlerin matematiksel anlamı günlük dildeki anlamına eş veya benzer olabilmektedir. Örneğin; toplama ve çarpma işleminde *etkisiz eleman* için 1 kodlu öğrencinin matematiksel ve sözel temsili Şekil 4'deki gibidir:

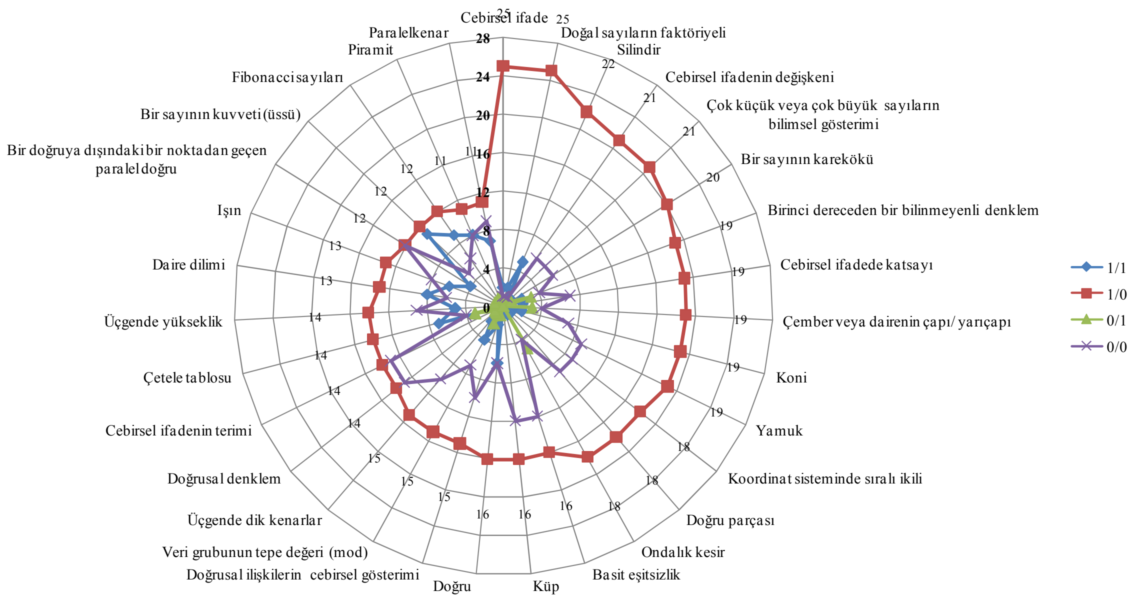


Şekil 9. "Toplama ve Çarpma İşleminde Etkisiz Eleman" Terimine İlişkin 1 Kodlu Öğrenci Temsili

Terimin matematiksel ve sözel temsilini doğru bir şekilde ifade edebilen öğrencinin zihninde "etkisiz" sözcüğü günlük dildeki "etkisi olmayan, tesirsiz" (TDK, 2014) anlamı ile örtüşmekte ve bunun sonucunda terim 'işleme etki etmeyen bir eleman olarak' çağrışım yapabilmektedir. Böylece öğrencinin terimi öğrenmesi kolay ve kalıcı olmaktadır. Öğrencilerin matematiksel ve sözel temsilleri doğru bir şekilde ifade edebilmelerinde sesteş veya vurgu yapılan kelimeler de olumlu yönde etki etmiştir. Örneğin, öğrencilerin üçte ikisinin "eşkenar üçgen" terimi için doğru temsiller üretebilmeleri, "eşkenar" sözcüğünün, sesteş olmakla birlikte (eş, kenar), üçgen terimini niteleyen bir sıfat olması ve dolayısıyla üçgenin kenarlarının eşliğine vurgu yapması ile açıklanabilir. "Öznel olasılık" gibi bazı terimler, öğrencilerin matematik derslerinde ve farklı disiplinlerde karşılaştığı sesteş ve anlamı benzer kelimelerdir. Öznel sözcüğü türkçe derslerinde "kişiye özgü düşünce, şahsi fikir" olarak öğrencilerin karşısına çıkmakta ve bu anlamı matematik dersindeki anlam ile benzerlik göstermektedir.

Matematiksel ve Sözel Temsil Doğruluk Değeri Çoğunlukla "1/0" Olduğu Terimler

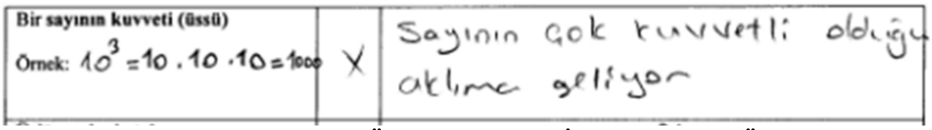
Öğrencilerin çoğunun matematiksel temsili doğru, sözel temsili ise yanlış bir şekilde kavramla ilişkilendirdiği terimler Şekil 5 'de sunulmuştur.



Şekil 10. Matematiksel ve Sözel Temsil Doğruluk Değeri Çoğunlukla "1/0" Olan Terimler

Öğrenciler 31 terimin matematiksel temsillerini çoğunlukla doğru ve sözel temsillerini yanlış ifade etmişlerdir. Bu terimlerin sırasıyla, 14 tanesi (%45'i) geometri ve ölçme, 9 tanesi (%29'u) cebir, 6 tanesi (%19'u) sayılar ve işlemler, 2 tanesi (%7'si) ise veri işleme öğrenme alanına aittir. Öğrencilerin çoğunlukla matematiksel temsili doğru, fakat sözel temsili yanlış olarak ifade ettikleri terimlere farklı öğrenme alanlarından örnek verecek olursak: doğal sayıların *faktöriyel*i, bir sayının kuvveti (üssü), ondalık kesir, cebirsel ifade, cebirsel ifadenin değişkeni, çetele tablosu, tepe değeri (mod)... Bulguları, terimlerin çağrışımına etki eden tek bir faktörle ilişkilendirmek oldukça güç gözükmektedir.

Öğrencilerin terimleri sözel olarak ifade zorlukları, bazı terimlerin kavramı çağrışım güçlerinin zayıf olması ile açıklanabilir. Örneğin "doğal sayıların *faktöriyeli*", "*Fibonacci* sayıları" yabancı kökenli kelimelerden oluştuğundan öğrenci zihninde herhangi bir olumlu çağrışım yapması zordur. *"Piramit", "silindir"* gibi terimler hem yabancı kökenli hem de günlük dil-matematik terminolojisinin ortaklaşa kullandığı kelimeler olmasına rağmen sözel temsillere olumlu olarak yansımamıştır. "Bir sayının *kuvveti (üssü)*", "*yamuk*" gibi terimler, günlük dil ve matematik terminolojisinde ortak kullanılan fakat günlük dildeki anlamları matematiksel anlamını karşılamayan, hatta yanıltıcı terimlerdir. Örneğin, 9 kodlu öğrencinin "bir sayının *kuvveti (üssü)*" için vermiş olduğu temsiller Şekil 6'deki gibidir:

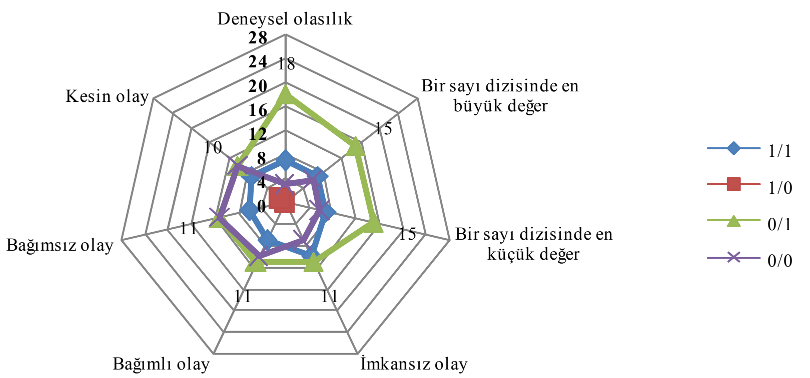


Şekil 11. "Bir Sayının Kuvveti (Üssü)" Terimine İlişkin 9 Kodlu Öğrenci Temsili

"Bir sayının kuvveti (üssü)" teriminde "kuvvet" kelimesinden dolayı, öğrenciler terimi "güçlü, yüksek, üstün, kuvvetli" gibi anlamlarda düşünmektedirler. Oysa ki negatif veya rasyonel sayıların kuvveti alındığında, duruma göre değerce daha küçük bir sayı elde edilebilmektedir. Öğrencilerin matematiksel temsilleri de, sözel temsillere paralel olarak, bir sayının kuvveti alındığında değerce büyük bir sayı vermesi ile alakalıdır, sınırlı örnekler olmasına karşın doğru olarak kabul edilmiştir. Öğrenciler sözel olarak günlük dilin etkisinde kalıp yanlış açıklamalar yapsalar da matematiksel görüntüsünü doğru kullanabilmektedir. Benzer şekilde "bir veri grubunun *tepe değeri* (modu)" teriminde de öğrenciler "tepe" sözcüğünün etkisinde kalarak veri grubundaki en büyük sayı değeri şeklinde sözel ifadede bulunmuşlarsa da, matematiksel temsilleri genel olarak doğrudur. "Cebirsel ifade" terimi matematiğe özgü terim olması dolayısıyla sözel temsiller doğru bir şekilde verilememiştir. Fakat matematiksel temsilinin çoğunlukla doğru olması, konunun 6. sınıftan itibaren her yıl kazanımlar arasında olması ile ilişkili olabilir. Cebir denilince öğrenci zihninde ilk olarak "x" canlanmaktadır ve çoğu öğrenci de örneklerinde "x" harfini kullanmıştır.

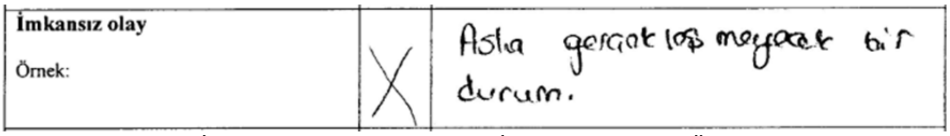
Matematiksel ve Sözel Temsil Doğruluk Değeri Çoğunlukla "0/1" Olan Terimler

Öğrencilerin çoğunun matematiksel temsili yanlış, sözel temsili ise doğru bir şekilde kavramla ilişkilendirdiği terimler Şekil 7'de sunulmuştur.



Şekil 12. Matematiksel ve Sözel Temsil Doğruluk Değeri Çoğunlukla "01" Olan Terimler

Öğrenciler 7 terimin matematiksel temsillerini çoğunlukla yanlış, sözel temsillerini ise doğru ifade etmişlerdir. Bu terimlerin 5 tanesi (%71'i) olasılık, 2 tanesi (%29'u) veri işleme öğrenme alanına aittir. Bu gruba giren terim sayısı oldukça azdır. Aslında öğrencinin bir terimi sözel olarak doğru temsil edebilirken, matematiksel temsilinde zorlanması pek beklenen bir durum değildir. Öğrencilerin çoğunlukla matematiksel temsili yanlış, sözel temsili ise doğru olarak ifade ettikleri terimler, olasılık ve veri işleme öğrenme alanlarına aittir: deneysel olasılık, bir sayı dizisindeki en büyük değer, bir sayı dizisindeki en küçük değer, imkansız olay… Bu terimlerin sözel olarak doğru ifade edebilmesini tek bir faktörle ilişkilendirmek güç olsa da büyük oranda sesteş kelimelerden matematiksel anlamı ile günlük dildeki anlamı benzer olanların etkisi olduğu gözlenmektedir. "İmkansız olay" terimi için 13 kodlu öğrenci temsili Şekil 8'deki gibidir:

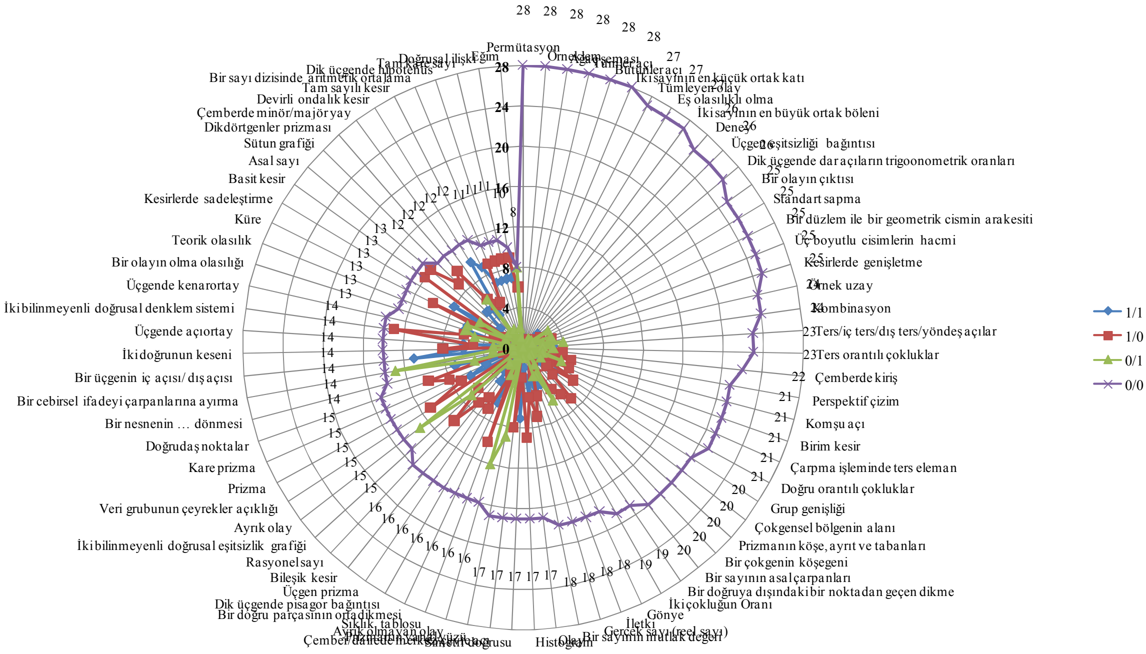


Şekil 13. "İmkansız Olay" Terimine İlişkin 13 Kodlu Öğrenci Temsili

"İmkansız" sözcüğünün günlük dilde "olanaksız" (TDK, 2014) anlamına gelmesi ve matematikte de aynı anlam ile kullanılması öğrencilerin matematiğe olumlu transfer yapmalarını sağlamaktadır. Aynı zamanda "imkansız" sözcüğü burada "olay" sözcüğünü niteleyen bir sıfat durumundadır ve olaya vurgu yapmaktadır. Öğrencilerin günlük yaşantılarında karşılaştıkları kelimelerin matematikte benzer anlamı taşıması, sözel temsili doğru bir şekilde yapmalarını sağlamıştır. Ancak, çoğu olasılık öğrenme alanına ait bu terimleri matematiksel olarak temsil etmek, sayısal veya geometrik temsiller üretmekten daha zor gelmiş olabilir.

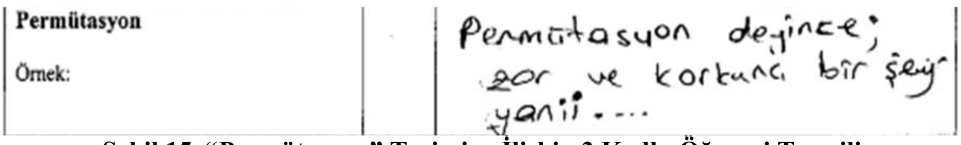
Matematiksel ve Sözel Temsil Doğruluk Değeri Çoğunlukla "0/0" Olan Terimler

Öğrencilerin çoğunun matematiksel ve sözel temsillerin her ikisini de kavramla yanlış bir şekilde ilişkilendirdiği terimler Şekil 9'da sunulmuştur.



Şekil 14. Matematiksel ve Sözel Temsil Doğruluk Değeri Çoğunlukla "0/0" Olan Terimler

Öğrenciler 79 terimin matematiksel ve sözel temsillerini çoğunlukla yanlış ifade etmişlerdir. Bu terimlerin sırasıyla, 33 tanesi (%42'si) geometri ve ölçme, 19 tanesi (%24'ü) sayılar ve işlemler, 13 tanesi (%17'si) olasılık, 9 tanesi (%11'i) veri işleme ve 5 tanesi (%6'sı) cebir öğrenme alanına aittir. Bulgular, grafikte yer alan çoğu terimin tek bir durumun etkisinde olmadığını göstermektedir: permütasyon, örneklem, ağaç şeması, tümler açı, bütünler açı, iki sayının en küçük ortak kat… *"Prizma", "permütasyon", "histogram"* gibi matematik terimlerinin yabancı kökenli olması sebebiyle öğrenci zihninde hiçbir doğru çağrışım yapılamamakta ve zor bir konu imajı çizilmektedir. "Permütasyon" terimi için 3 kodlu öğrenciye ait temsiller Şekil 10'daki gibidir:



Şekil 15. "Permütasyon" Terimine İlişkin 3 Kodlu Öğrenci Temsili

Terimin yabancı kökenli olmasından dolayı, öğrenciler ne matematiksel ne de sözel temsili doğru olarak verememiştir. "Permütasyon" teriminin etimolojik yapısı incelendiğinde Fransızca dilinde (*permutation)* "karşılıklı veya sıralı olarak yer değiştirme, matematikte bir işlem" olarak görülmektedir ve bu sözcük Latince *permutari* "sırayla değişmek" fiilinden türetilmiştir. "Permutari" kelimesinin kökeni ise "mutasyon" kelimesine dayanmaktadır. Bu terim matematikte sıranın önemli olduğu listeleme veya seçmelerde kullanılmaktadır. “Kesirlerde genişletme” teriminde *“genişletme”* kelimesinin günlük dildeki kullanımının matematiğe aktarılması olumsuz yönde bir çağrışıma sebep olmaktadır. Genişletme “geniş duruma getirme” (TDK, 2014) şeklinde tanımlanmaktadır. Genişletirken pay ve payda aynı sayı ile çarpıldığı için ayrıca değerlerinin de büyüyeceği düşünülmektedir. Öğrenciler daha önceki öğrenimlerinde doğal sayılarda çarpma işlemi yaparken çarpımın her zaman çarpanlardan büyük olduğunu fark etmiştir. Öğrenci daha önceki deneyimlerinden yola çıkarak “kesirlerde genişletme” işleminde sonucunun daha büyük olacağı yargısına ulaşmaktadır. Burada karşılaşılan zorluk, aşırı genelleme türünden bir kavram yanılgısı ile ilişkilidir.

“En küçük ortak kat” terimi öğrencilerde sonucun çok küçük bulunacağı algısı oluşturmaktadır. Bu algının sebebi terimdeki “*en”* pekiştirme sıfatının *“küçük”* sıfatını pekiştirerek vurgunun o kelimeye yapılmasını sağlamasıdır. Öğrencilerin neredeyse tamamı bu terimin ne matematiksel ne de sözel temsilini doğru olarak verememiştir.

SONUÇ ve ÖNERİLER

Matematik terimlerini anlayabilmek öğrenmenin gerçekleşmesi için atılan ilk adımlardan biridir. Öğrenci zihninde terimlere ait olumlu veya olumsuz çağrışımlar saptanarak bu çağrışımların sebepleri ile matematiksel ve sözel temsillere etkisi tespit edilmeye çalışılmıştır. Araştırma bulguları, öğrencilerin çoğunlukla matematik terimlerini açıklamakta zorlandığını ve çoğu terimi anlayarak kullanmadığını ortaya çıkarmıştır. Bu sonuç matematik terminolojisi üzerine yapılan bazı çalışma sonuçları ile paralellik göstermektedir (Otterburn & Nicholson, 1976; Yüzerler ve Doğan, 2012).

Araştırma çerçevesinde, türkçe matematik terimleri için kavram çağrışımını etkileyen çeşitli durumlar belirlenmiştir ve öğrencilerin terimlere getirdikleri sözel ve matematiksel temsiller bu durumlar açısından yorumlanmıştır: Günlük dil ve matematik terminolojisinin ortak kullandığı sesteş kelimeler oldukça fazladır. Bu kelimelerden bazıları -“etkisiz eleman”, “eğim” vb.- çağrışımı olumlu yönde etkilerken, bazıları –“yamuk”, “kesirlerde genişletme”- ise olumsuz etkileyebilmektedir. Genel olarak, öğrenci matematik terminolojisini günlük hayatla ilişkilendirerek kullanabilirse, kendini geliştirerek başarısını artırabilir (Larson, 2007). Öğrencilerin sözel temsillerini doğru oluşturdukları terimler çoğunlukla günlük dilde kullanılan ve benzer anlamda olan sesteş kelimelerdir. Terimlerin büyük bir kısmı ise sözel ve matematiksel olarak yanlış ifade edilmiştir. Bunun sebebi olarak tek bir faktör gösterilememektedir. Yabancı kökenli terimlerin birçoğu –“histogram”, “permütasyon”, “trigonometri” vb.- çağrışımı olumsuz etkilemektedir. Bu terimlerin hangi dillerden alındığı ve orijinal anlamlarının araştırılarak öğretilmesi, kavram oluşum sürecinde etkili olabilir. Sadece matematiğe özgü olan terimlerin kullanımı genellikle okul ile sınırlı olduğundan çağrışım oluşturmuyor olabilir. Bazı kombine matematik terimleri içerisindeki bir sözcük kelime öbeğinin tamamını tesiri altına alarak çağrışımı olumsuz etkileyebilir. Örneğin; “örnek uzay” teriminde “örnek” sözcüğünden dolayı sadece birkaç örnek yazılacakmış gibi düşünülebilir. Oysaki “örnek uzay” oluşturulurken aynı durumların hepsi yazılmak zorundadır. Matematik terminolojisinde vurgu yapılan kelimeler “bir sayı dizisindeki en büyük değer”, “ikizkenar üçgen”, “imkansız olay” vb.- genel olarak çağrışımı olumlu yönde etkilerken “en küçük ortak kat” ve “en büyük ortak bölen” terimlerinde durum tersindedir. Öğretimde vurgu yapan kelimelerin etkisinin doğru bir biçimde öğrenciye sezdirilmesi önem taşımaktadır.

Öğrenciler matematiği kavramsal olarak anlamak yerine formülleri ezberleyerek işlem yapmayı öğrenmektedirler (Yenilmez ve Demirhan, 2013). Öğrencilerin, bazı terimleri sözel olarak ifade edemezken matematiksel olarak örnek verebilmeleri, matematik terimlerini tanımlama zorluğu ve daha çok işlemsel bilgilere sahip olduklarını göstermektedir.

Ortaokul matematik dersi öğretim programının genel amaçları arasında, öğrencilerin matematiksel dil ve terminolojiyi doğru kullanabilmeleri ve kavramların farklı temsillerini yapabilmeleri yer almaktadır. Araştırmanın bulguları öğrencilerin bu amaçları çoğunlukla edinemediklerini göstermektedir. Matematik derslerinde terimlerin dil ile ilişkisi gözetilerek öğretilmesine önem verilmelidir. Öğretmenler öğretim süreci boyunca terimleri öğrenme ve matematiği anlamanın birbiriyle yakından ilişkili olduğunu unutmamalıdır (Thompson ve Rubenstein, 2000). Larson’un (2007) belirttiği gibi, terimlerin öğrenilmesi küçük bir adım olsa da büyük fikirlerin gelişmesi için bu küçük adımlara ihtiyaç olduğu unutulmamalıdır. Öğretmenler, her zaman öğrencilerin öğrenmesini destekleyecek yeni ve daha iyi yöntem arayışı içinde olmalıdır (McConnel, 2008).
Sonuç olarak, öğretmenlere matematiksel terimlerin anlamlarını, kökenlerini araştırıp kavramın adıyla konunun ilişkisinin kavratılarak öğretimin gerçekleştirilmesi önem arz etmektedir. Matematik terimlerini bilmek demek, kitap (formal) tanımından ziyade terimin üstlendiği anlamı bilmektir ve öğrencileri bu şekilde düşünmeye teşvik etmek gerekir (Yüzerler ve Doğan, 2012). Terim öğretimi matematik öğretiminin bir parçası olarak düşünülmeli ve her farklı terim için uygun öğretim teknikleri geliştirilmelidir. Matematiğin sadece sayılar ve işlemlerden oluştuğu düşünülmemelidir.

ÖZET: Öğrencilerin önceki bilgileri ile yeni bilgileri arasında ilişki kurabilmeleri, ancak anlamlı öğrenmeleriyle mümkün olmaktadır. Bu nedenle öğrencilerin ön bilgilerinin tespit edilip kavram yanılgılarının belirlenmesi ve giderilmesi kavram öğretiminde önem taşımaktadır. Bu çalışmada öğretmenlerin kavram öğretimi için hangi yöntemi kullandıkları, kavram yanılgılarını nasıl saptadıkları, hangi kavram yanılgıları ile karşılaştıkları ve nasıl gidermeye çalıştıklarının belirlenmesi amaçlanmıştır. Çalışma grubunu 2013-2014 eğitim-öğretim yılında Sivas ilinde görev yapan 5 fen bilgisi ve 5 sınıf öğretmeni oluşturmaktadır. Araştırma nitel bir çalışma olup betimleyici bir araştırmadır ve veri toplama aracı olarak yapılandırılmış görüşme, gözlem ve doküman analizi yöntemleri kullanılmıştır. Elde edilen veriler içerik analizi yöntemi ile analiz edilmiştir. Elde edilen bulgulara göre öğretmenlerin özel öğretim yöntemlerinden bazılarını uyguladıkları ama sunuş yoluyla kavram öğretimini de kullanmaya devam ettikleri gözlemlenmiştir. Öğretmenlerin karşılaştıkları kavram yanılgıları ısı-sıcaklık, kütle-ağırlık, kuvvet-hareket, elektrik, ışık-ses, madde, hücre, solunum-fotosentez, kalıtım konuları ile ilgilidir. Öğretmenlerin büyük çoğunluğu yaparak yaşayarak öğrenme yolları ile kavram yanılgılarını gidermeye çalıştıklarını belirtmişlerdir.

Anahtar sözcükler: Kavram öğretimi, Kavram yanılgılarını saptama, Kavram yanılgılarını giderme, Fen bilgisi öğretmenleri, Sınıf öğretmenleri.

ABSTRACT: It can only be possible for students to relate their new knowledge with the old one through meaningful learning. Therefore, in teaching of the concepts it is important that the students' preliminary information be identified and their misconceptions be determined. It is aimed in this study to determine which methods teachers use for concept teaching, how they determine misconceptions, which misconceptions they encounter and how they try to resolve these. The study group consists of 5 science teachers and 5 primary teachers working in Sivas city during 2013-2014 academic year. The study is a qualitative one and a descriptive study and structured interview, observation and document analysis methods were used as the data gathering tool. The date obtained was analyzed by means of content analysis method. According to the obtained data, it has been observed that the teachers use some of the special teaching methods but also continue to use concept teaching through presentations. Misconceptions that teachers encounter are related to the subjects of heat-temperature, mass-weight, force-motion, electricity, light-sound, substance, cell, respiration-photosynthesis, heredity. A great majority of the teachers have stated that they try to eliminate misconceptions through learning by experience.

Key words: Concept Teaching, Determination of misconceptions, Elimination of misconceptions, Science teachers, Primary teachers.

ÖĞRETMEN ADAYLARININ YAŞAM BOYU ÖĞRENME EĞİLİMLERİNİN ÇEŞİTLİ DEĞİŞKENLER AÇISINDAN İNCELENMESİ

ÖZET: Asırlar boyunca toplumlar, kendini geliştiren ve yaşam boyu öğrenme becerilerine sahip bireylere gereksinim duymuştur. Yaşam boyu öğrenme, bireyin, beceri, ilgi ve yeterliliklerini geliştirmek amacıyla yaşamı boyunca devam eden öğrenme sürecidir. Yaşam boyu öğrenme, bireylerin bilgi toplumuna uyum sağlamaları ve yaşamın tüm evrelerine etkin bir şekilde katılmalarına da imkân sağlar. Günümüzde Öğrenme, sadece sınıf ortamında gerçekleşmeyip internet erişiminin olduğu her noktada gerçekleşebilmektedir.

Bu araştırmanın amacı, öğretmen adaylarının yaşam boyu öğrenme eğilimlerini belirlemek ve bu eğilimlerin internet kullanım süresi, cinsiyet ve öğrenim görülen ana bilim dalı değişkenleri açısından farklılık gösterip göstermediğini ortaya koymaktır. Araştırmanın çalışma grubunu Necmettin Erbakan Üniversitesi, fizik, matematik, kimya, biyoloji eğitimi anabilim dallarında öğrenim gören 411 öğretmen adayı oluşturmaktadır. Araştırma verileri, Coşkun (2009) tarafından geliştirilen "Hayat Boyu Öğrenme Eğilimlerini Belirleme Ölçeği" ile elde edilmiştir. Verilerin analizinde SPSS 18 Paket programı kullanılmıştır.

Öğretmen adaylarının "Yaşam Boyu Öğrenme Eğilimleri Ölçeğinden" aldıkları ortalama puanların, ölçek ortalama puanından düşük olduğu belirlenmiştir. Öğretmen adaylarının yaşam boyu öğrenme eğilimlerinin düşük olduğu söylenebilir. Öğretmen adaylarının yaşam boyu öğrenme eğilimleri, internet kullanım süresi, cinsiyet ve öğrenim görülen ana bilim dalı değişkenleri açısından istatistiksel olarak anlamlı bir farklılık göstermemiştir. Ancak "Yaşam Boyu Öğrenme Eğilimleri Ölçeği" nin alt boyutlarından "Öğrenmeyi Düzenlemede Yoksunluk" puan ortalamalarına göre bölümler arasında anlamlı bir farklılık bulunmuştur. Biyoloji anabilim dalı öğretmen adaylarının "Öğrenmeyi Düzenlemede Yoksunluk" puan ortalamaları, diğer anabilim dallarında öğrenim gören öğretmen adaylarına göre düşük bulunmuştur.

Anahtar Kelimeler: Yaşam Boyu Öğrenme, Öğretmen Adayı, Öğrenme Eğilimi Ölçeği, İnternet kullanımı.

INVESTIGATION OF LIFELONG LEARNING TENDENCIES OF CANDIDATE TEACHERS IN TERMS OF DIFFERENT VARIABLES

ABSTRACT: Over the centuries, societies have needed to have individuals who developed themselves and have lifelong learning skills. Lifelong learning is an ongoing learning process to develop skills, interests and competencies of individual during life. Lifelong learning enables individuals to adapting to the information society and to participating effectively in all stages of life. Nowadays, learning does not only take place in the classroom, It occurs at everypoints which have Internet Access.
The purpose of this research is to figure out the lifelong learning tendencies of candidate teachers and to figure out whether these tendencies show any difference in terms of variables of internet usage time, gender and alma mater department. The study group is composed of 411 candidate teachers studying at physics, mathematics,

chemistry and biology education departments of Necmettin Erbakan University. The research data was obtained through the “Scale of Determining Lifelong Learning Tendencies" developed by Coskun (2009). The SPSS18 package program was used to analysis of data.

It was determined that candidate teachers’ mean score of “Lifelong Learning Tendencies Scale” is lower than the mean score of the scale. It can be stated that lifelong learning tendencies of candidate teachers are low. The lifelong learning tendencies of candidate teachers has not been showed statistically any significant difference in terms of variables of internet usage time, gender and alma mater department. However, according to the average score of sub-dimension called "Learning in Regulation Deprivation" of "Lifelong Learning Tendencies Scale", a significant difference has been found between departments. The average score of sub-dimension called "Learning in Regulation Deprivation" of candidate teachers from biology education department was found lower then the other departments.

Key words: Lifelong learning, Teachers, Learning tendency survey, Internet usage.

IMPACT OF EXPLİCİT-REFLECTİVE AND HİSTORY BASED INSTRUCTİON ON PRESERVİCE SCİENCE TEACHERS' UNDERSTANDİNG OF NATURE OF SCİENCE

Volkan GÖKSU

Oktay ASLAN

Murat ÖZEL

In this study, it was investigated the impact of explicit-reflective and history based instruction on preservice science teachers' (PSTs) understanding nature of science (NOS). One-group pretest-posttest experimental design was used. In this design, differences between pre and posttests scores were assessed. The participants of this research consisted of 62 preservice science teachers who enrolled a public university in Turkey. To assess PSTs' understandings of NOS, 17 items which were purposefully selected from the Views on Science-Technology-Society (VOSTS) Questionnaire were used. In the experimental course, activities prepared based on explicit-reflective, and histories of science were taught throughout 10 weeks. After experimental instruction, the items selected from the VOSTS Questionnaire were administered as pre and posttest. Based on data analyses, it was found that explicit-reflective and history based instructions impacted positively PSTs' understandings of NOS. In particular, PSTs' views on nature of observations, nature of scientific models, hypothesis, theories, laws and epistemological status of scientific knowledge significantly changed from naive to realistic. In light of findings, implications for teaching the nature of science will be discussed.

ÖZET: Problem çözme, matematik eğitiminin en temel amaçlarından birisidir ve öğretim programının içerisinde yer alan her konu için geliştirilmesi gerekli bir beceri olarak ele alınmaktadır. Problem çözme "bir matematik sorusuna cevap vermek, kısa yoldan ve hızlı işlem yaparak sonucu bulmak" şeklinde basite indirgenemeyecek kadar önemli bir düşünme becerisidir. Matematik öğretmeni adaylarının problem çözmenin yapısı ve süreci hakkında doğru bilgilerle donatılmaları, mesleklerinde öğrencilerinin problem çözme becerilerinin geliştirilmesinde doğru yol yöntem ve yaklaşımı kullanmaları açısından önemli görülmektedir. Bu düşünceden hareketle, araştırmada, ilköğretim matematik öğretmenliğinde okuyan öğretmen adaylarının George Polya tarafından söylenen "Bir problemi beş farklı yoldan çözmek, beş problemi bir yoldan çözmekten daha iyidir" sözü hakkındaki düşüncelerini belirlemek amaçlanmıştır. Araştırma öğretmen adaylarının görüşlerini betimlemeye yönelik nitel bir çalışmadır ve 41 matematik öğretmen adayı ile gerçekleştirilmiştir. Sonuçta öğretmen adaylarının yaklaşık %75'i bir problemi farklı yollardan çözmenin birden çok problemi bir yolla çözmekten daha faydalı olduğunu söyleyerek Polya'nın sözüne katılmışlar ve farklı stratejileri öğrenmenin çok yönlü düşünme becerisini geliştirdiğini belirtmişlerdir.

Anahtar sözcükler: matematik eğitimi, problem çözme, George Polya.

ABSTRACT: Problem solving is one of the essential objectives of mathematics education and is considered as a skill to be developed in almost all subjects within mathematics curriculum. Problem solving is a significant thinking skill that can not be reduced to simply "answering a mathematics question or obtaining the result using a shorter way or via quicker processing". We think it is important to train mathematics teacher candidates with correct information on the structure and process of problem solving so that they can use the correct methods to improve students' problem solving skills in their future teaching career. Having this idea as our motivation, we aimed to determine what elementary mathematics teacher candidates think about George Polya's famous saying: "It is better to solve a problem by five different ways than to solve five different problems by one way". This research is a qualitative study realized with 41 teacher candidates. As a result, %75 of the teacher candidates agreed with Polya's saying by stating that "solving a problem by five different ways is better than solving many problems by one way" and also stated that learning different strategies improves multi-faceted thinking skill.

Key words: mathematics education, problem solving, George Polya.

GİRİŞ

Problem çözme matematik öğretiminin en temel taşlarındandır. Alanyazın incelendiğinde, matematikte başarılı olmanın yolunun problem çözme becerisinin gelişimi ile doğrudan ilişkili olduğu görülmektedir (Wilson, Fernandez & Hadaway, 1993). Öğrencilerin problem çözme becerilerini geliştirmeye yönelik çalışmalarda; (1) problemi anlama, (2) çözümü planlama, (3) planı uygulama, (4) çözümün doğruluğunu ve geçerliğini kontrol etme ve (5) çözümü genelleme ve benzer/özgün problem kurma süreçlerinin gözetilmesi gerektiği vurgulanmaktadır (Polya, 197; Schoenfeld, 1992). Bu süreçlere yönelik beklenen göstergelerden birisinin ulusal programlarda ve uluslararası matematik öğretim standartlarında "problemin farklı çözüm yollarını değerlendirme" ye önem verildiği görülmektedir (Xie, 2004).

George Polya (1957) "nasıl çözmeli" eserinde matematik öğretmenlerinin ilk görevlerinin öğrencilerinin problem çözme becerilerini geliştirmek olduğu vurgusunu yapmıştır. Polya tarafından söylenen "Bir problemi beş farklı yoldan çözmek, beş problemi bir yoldan çözmekten daha iyidir" sözü Polya'nın problem çözme konusundaki yaklaşımını ortaya koymaktadır. Dr. Polya Stanford Üniversitesi'nde (1887-1985) görev yapmış matematik bilimi ve eğitimine önemli katkılar sağlamış bir matematikçidir ve matematik eğitiminde problem çözmenin babası olarak bilinmektedir. Polya bir diğer veciz sözünde "bir problem 24 saat içerisinde çözülebiliyorsa problem değildir" demekle problem çözmede iki hususa dikkat çekmek istemektedir . Bunlardan ilki; kısa sürede çözülen problemin daha önce karşılaşılmış bir durum olması ve artık bu yönü ile güçlük özelliği taşımamasıdır. İkincisi de benzer bir çözüm yolu ile çözülmüş bir problemle karşılaşılmış olunabileceğidir. Benzer şekilde aynı yolla çözülen bir başka problemin de gerçek anlamda problem özelliği taşımayacağı değerlendirilmektedir. Bu bakış açısı ile, matematik derslerinde yer alan pek çok problem gerçek anlamda problem özelliği taşımamaktadır. Oysa ki, gerçek hayatta karşılaştığımız problemler, nasıl çözüm bulunacağı bilinmeyen, hatta çözüme nereden başlanacağının dahi kestirilemediği durumlar, güçlüklerdir. Dolayısı ile matematik eğitiminde öğrencilerin problem çözme becerisini geliştirmenin yolu öğrencileri alışılmış (rutin) olmayan problemler ile çalıştırmaktan ve problemin farklı çözüm yollarını araştırmalarını sağlamaktan geçmektedir. Bu aynı zamanda öğrencilerin muhakeme becerilerini de geliştirmekte ve öğrencilerin benzeri pek çok güçlükle baş edebilmelerini mümkün kılmaktadır. Probleme yönelik farklı çözüm yollarını, startejilerini araştırmak, öğrencilerin başarılı problem çözen bireyler olmalarına katkı sağlamaktadır (Bransford & Stein, 1984; Soylu & Soylu, 2006). Öğrencilerin problem çözmede tek yol izlemelerinin, öğrencilerin yaratıcı ve esnek düşünme kabiliyetlerini zamanla kaybetmelerine yol açtığı düşünülmektedir. Benzer şekilde, öğrenciler farklı yollar aramanın gerekliliğine inançlarını kaybetmekte ve risk alma konusunda daha çekingen olmaktadırlar. Ek olarak, tek bir yol ile problem çözme çalışmaları yapıldığında öğrenciler, işlemsel bilgi kazanım sürecinde kavramsal bilgi ve anlayışlarını yüksek bir olasılıkla kaybetmektedirler (Narode, Board & Davenport, 1993).

Bu çalışmada, öğretmenlerin matematik öğretiminde öğrencileri ile yalnız tek çözümü olan, doğru ve hızlı sonuç bulmaya dayalı bir yaklaşımla çalışmaları yerine, alternatif çözümler barındıran problemlerle çalışmaları önemli görülmüştür. Buradan hareketle, Geleceğin öğretmenlerinin bu konudaki düşüncelerini ortaya koyarak, öğretmen adaylarının tek yolla çözülen pek çok problem yerine bir problemin farklı çözüm yollarını önemseyen bireyler olarak eğitilmelerinin gerekliliğine dikkat çekilmek istenmiştir.

YÖNTEM

Araştırmada, ilköğretim matematik öğretmenliğinde okuyan öğretmen adaylarının Polya tarafından söylenen "Bir problemi beş farklı yoldan çözmek, beş problemi bir yoldan çözmekten daha iyidir" sözü hakkındaki düşüncelerini belirlemek amaçlanmıştır. Araştırma öğretmen adaylarının görüşlerini betimlemeye yönelik nitel bir çalışmadır ve seçmeli bir ders olan Problem ve Problem Çözme Öğretimi dersi kapsamında 2. ve 3. sınıfta okuyan toplam 41 matematik öğretmen adayı ile gerçekleştirilmiştir. Öğretmen adayları ile gerçekleştirilen yarı yapılandırılmış görüşmede, öğrencilerden Polya'nın görüşüne katılıp katılmadıklarını gerekçeleri ile birlikte, ayrıntılı bir biçimde, açık anlaşılır bir dil ile, sunmaları istenmiştir. Verilerin analizinde içerik analizi uygulanmıştır. İçerik analizinde üç farklı görüşe, temaya ulaşılmıştır. Bunlar " (1) Bir problemin beş farklı çözüm yolunu bilmek iyidir, (2) Beş problemin bir çözüm yolunu bilmek iyidir ve (3) Her ikisi de iyidir " biçiminde verilebilir. Bulgular bölümünde her üç temaya ait kategori ve kodlar oluşturulmuş, tablolaştırılmış ve tabloyu somutlaştırır özellikte seçilen örnek öğrenci görüşleri ile birlikte sunulmuştur. Görüşlerin hangi öğrenciye ait olduğu bilgisi, öğrencilerin sıralaması Ö-Numara biçiminde (Ö-1: Birinci öğrenci örneğinde olduğu gibi) sunulmuştur.

BULGULAR

Bulgular bölümünde ulaşılan üç farklı görüş sırası ile "Bir problemin beş farklı çözüm yolunu bilmek iyidir", "Beş problemin bir çözüm yolunu bilmek iyidir" ve "Her ikisi de iyidir" alt başlıkları ile sunulmaktadır.

Bir Problemin Beş Farklı Çözüm Yolunu Bilmek Daha İyidir

Yapılan incelemeler sonucu, 31 öğretmen adayının "bir problemin beş farklı çözüm yolunu bilmenin daha iyi olduğu" düşüncesinde George Polya'ya paralel bir düşünce sergiledikleri bulgusuna ulaşılmıştır. Bu her dört kişiden üçünün bu düşüncede olduğunu göstermektedir. Öğretmen adaylarının bir problemin beş farklı çözüm yolunu bilmenin beş problemin bir çözüm yolunu bilmekten neden daha iyi olduğu konusundaki açıklamaları incelenerek aşağıda Tablo 1'de verilen kategoriler ve kodlar oluşturulmuştur. Burada bir problemin beş farklı çözüm yolunu bilmenin beş problemin bir çözüm yolunu bilmekten daha iyi olması matematiksel bir biçimde **1P 5Ç > 5P 1Ç** kısaltması ile verilmiştir.

Tablo 1. "Bir Problemin Beş Farklı Çözüm Yolunu Bilmek Daha İyidir" Temasına Ait Kategori, Kod ve Temalar

Tema	Kategori	Kod	Frekans
		Bakış açısını zenginleştirme Çok yönlü düşünme	31

	Yaklaşıma Katkı	Alternatif üretme Ezbercilikten uzaklaştırma Tekdüzelikten çıkarma	
1 P 5Ç > 5P 1Ç	Düşünmeye Katkı	Analitik düşünme Yaratıcı düşünme	17
	Zihinsel Yeteneklere Katkı	Zihinsel yetenekler Akıl yürütme yeteneği Muhakeme yeteneği	29
	Yaşama Katkı	Anlayış kazandırma Hayatı kolaylaştırma	18
	Problem Çözmeye Katkı	Farklı problem çözümlerine yardım	16
	Özellik	Kolay hatırlanabilir Eğlenceli, zevkli	11
	Nitelik	Az problem çok kazanım	27

Tablo 1'de yer alan kodlara ilişkin örnek öğretmen adayı ifadelerinden bazılarına aşağıda yer verilmektedir.

Tamamen katılıyorum. Tek bir çözüm yolunu bilmek insana tekdüze bakış açısı kazandırır. İnsan farklı çözüm yollarını araştırdığında normal yaşantısında problemleri daha kolay çözer. Problemlerin çözümleri için farklı alternatifler kolaylıkla üretebilir. [Ö - 39]

Bir problem için farklı çözüm yolları bulabilmek beş farklı biçimde düşünmek demektir. Farklı yolları bulmaya çalışmak akıl yürütmemizi sağlar ve farklı problemlerin çözümlerine de yardımcı olur bence. [Ö - 41]

Bir problemin birden çok çözüm yolunu bilmek bizim ileride daha farklı problemlerle karşılaştığımızda daha kolay sonuca ulaşmamızda yardımcı olur. Yani olaylara sorunlara başka pencerelerden bakma imkanı tanır. Daha geniş düşünmemizi sağlar. [Ö - 38]

31 öğretmen adayı da farklı ifadelerle de olsa bir problemin beş farklı çözüm yolunu bilmenin öğrencilerin bakış açısını değiştireceği, çok yönlü düşünme sağlayacağı ve dolayısı ile bireylerin yaklaşımına katkı sağlayacağı düşüncesindedirler. Öğretmen adaylarının aşağıda örnek verilen ifadelerinden de görüldüğü gibi, problemin farklı çözüm yollarını araştırmanın, bilmenin öğrencilerin düşünme biçimlerine, zihinsel yeteneklerine ve dolayısı ile yaşamlarına katkı sağladığı bulgusuna ulaşılmıştır..

Problem çözmek doğru işlemleri kullanarak doğru sonuca ulaşmaktan ziyade kişinin muhakeme yeteneğini kullanması ve geliştirmesini amaçlamaktadır. Bir problemi çözerken farklı yollar denemek kişinin analitik düşünmesini sağlar. Analitik düşünen kişi de hayata at gözlükleri ile bakmak yerine farklı farklı pencerelerden bakar. Beş farklı yol bilmek insanın yaratıcılığını geliştirir. [Ö - 21]

Tek bir çözümün olması o çözüm yolunu bulamayan biri için zordur, çünkü soruyu çözemez. Ama alternatif çözümler olursa birey sonuca daha kolay ulaşır. [Ö - 9]

Bir problemin 5 farklı çözüm yolunu bilmek bence daha iyidir. Çünkü bazı zamanlarda tek çözümünü biliyorsan unutabilirsin ama 5 çözümünü de biliyorsan mutlaka biri hatırlanır. [Ö - 40]

Bir konu hakkında farklı ve çeşitli alternatifler türetebilmek daha sağlıklıdır. Ezbercilikten uzaklaştırır. Yaratıcı düşünmeyi sağladığı için kişisel gelişimimize önemli katkılar sağlar. Bir problemin çözüm yolu diğer problemlerde uygulanıyorsa bu bişey katmaz, ezberlendiğini gösterir. Bir problemi farklı yollarla çözmek kişiye zihinsel çok şey katar. Farklı problemlerin de üstesinden gelir. [Ö - 27]

Öğretmen adaylarının düşünceleri incelendiğinde, aynı yolla farklı problemler çözmenin kendilerine çok da katkı sağlamayacağı düşüncesindedirler. Bunun nedenini iyi puan almak, doğru sonuca en kısa yoldan ulaşmak amaçlı yetiştirilme biçimlerine bağlamaktadırlar. Aşağıda verilen ifade bu durumu ortaya koyar niteliktedir.

Ben bu söze sonuna kadar katılıyorum. Sebebi şu: Günümüzde hepimiz iyi puanlar alabilmek için sadece doğru sonuca en kısa yoldan ulaşmak için yetiştirilen bireyler olduk. Bunun için de bir problemin beş farklı çözüm yolunu bilmekten ziyade beş problemin bir çözüm yolunu bilmeyi hedef edindik. Öyle böyle bir yerlere geldik ama çoğu kişi üniversite sıralarında yorum yapmaktan aciz. Bizlerin farklı bakış açıları, farklı ufukları, farklı çözüm önerileri olmazsa bizlerin yetiştireceği öğrencilerden ne beklenir? [Ö - 11]

Beş Problemin Bir Çözüm Yolunu Bilmek Daha İyidir

4 öğretmen adayının beş problemin bir çözüm yolunu bilmenin bir problemin beş farklı çözüm yolunu bilmekten daha iyi olduğunu düşündüğü bulgusuna ulaşılmıştır. Oluşturulan kategori ve kodlar matematiksel bir biçimde **5P 1Ç > 1P 5Ç** kısaltması ile aşağıda Tablo 2 'de sunulmuştur.

Tablo 2. "Beş Problemin Bir Çözüm Yolunu Bilmek Daha İyidir" Temasına Ait Kategori, Kod ve Temalar

Tema	Kategori	Kod	Frekans
5 P 1Ç > 1P 5Ç	Deneyim	Tecrübe kazandırma Pratiklik Çok soru tipi görme Aynı yolla çözüm Kolay hatırlama	4
	Zaman	Hızlı çözüm Zaman kaybını önleme	2
	Sınav	Sınav başarısına katkı	3
	Nitelik	Çok problem çok kazanım	3

Beş problemin bir çözüm yolunu bilmek daha iyidir görüşünde olan öğrencilerin problem çözmenin daha çok sınavlar için öğrencilere gerekli olduğu, farklı çözüm yollarını araştırmanın zaman kaybı olduğu düşüncesinde oldukları belirlenmiştir. Bu durumun öğrencilerin aldıkları eğitimin bir sonucu olduğu değerlendirilmektedir (Korkmaz, Gür & Ersoy, 2004). Öğretmen adaylarının niteliğine bakılmaksızın niceliksel açıdan çok problem çözmenin daha önemli bir kazanım olduğu düşüncesinde oldukları bulgusuna ulaşılmıştır. Aşağıda örnek seçilen bazı öğrenci ifadelerine yer verilmiştir.

Aslında bu bana pratiklik gibi geliyor. Zamana karşı yarıştığımız sınavlar için aynı tip sorulardan çokça çözmeliyiz ki kazanabilelim. [Ö - 33]

Katılıyorum çünkü günlük hayatta problem çözmede esas olan problemin çözümüne ulaşmaktır. Hangi yoldan ulaşıldığı çok önem arz etmez. Ne kadar çok problem çözersek o kadar iyi, yolu önemli değil. [Ö - 21]

Amaç problem çözmek olunca beş farklı çözüm yolunu bilmek ve öğrenmek zaman kaybı olacaktır. [Ö - 23]

Bir problem yerine beş problem çözmek sadece bir çözüm yolu bilinse bile daha çok işimize yarar. Bize deneyim kazandırır. [Ö - 29]

Her İkisi de İyidir

Burada beş problemin bir çözüm yolunu bilmenin bir problemin beş farklı çözüm yolunu bilmenin her ikisinin de eşdeğer öneme sahip olması durumu 6 öğretmen adayı tarafından dile getirilmiş olup; oluşturulan kategori ve kodlar matematiksel bir biçimde **5P 1Ç = 1P 5Ç** kısaltması ile Tablo 3'de verilmiştir.

Tablo 3. "Her İkisi de İyidir" Temasına Ait Kategori, Kod ve Temalar

Tema	Kategori	Kod	Frekans
5 P 1Ç = 1P 5Ç	Birini Tercih	İhtiyaca bağlılık Keyfilik	4
	Birlikte Kullanım	Gereksinim	3

Öğretmen adayları, "beş problem bir çözüm veya bir problem beş çözüm"den tercih ve ihtiyaca bağlı olarak birinin seçilmesi veya her ikisinin birlikte kullanımının gerektiği düşüncesindedirler.

Bu söze katılıyorum çünkü bir problem her zaman aynı yolla çözülemeyebilir, birden fazla yol bilmek çözümü garantilemektir. Aynı zaman da katılmıyorum çünkü ne kadar çok problem çözersek o kadar iyi. İhtiyaca göre seçmek ve kullanmak en iyisi. [Ö - 25]

Ben bu söze kısmen katılıyorum. Bir problemin birden çok çözümünü bilmek akıl yürütme açısından gerçekten güzel. Beş problemin bir çözüm yolunu bilmek daha çok problemi çözüme ulaştırmak demektir. Her iki tür ihtiyaca bağlı olarak birlikte kullanılmalıdır. [Ö - 26]

SONUÇ VE ÖNERİLER

Yıllar önce Polya, problem çözme becerisinin gelişiminde aynı yoldan ne kadar çok problemin çözülmüş olmasından ziyade bir probleme yönelik farklı çözüm yollarının araştırılması, stratejilerin geliştirilmesinin önemini vurgulamıştır. Ancak her ne kadar vurgu bu yönde olsa da, işleyişin ölçme değerlendirme sistemlerinin yapısının, bireyleri farklı yollarla çözülen problemlerden ziyade sayıca çok problem çözmenin, doğru ve hızlı sonuç veren yolun önemli olduğu gibi bir düşünceye yönlendirdiği görülmektedir. Bu araştırma öğretmen adaylarının önemli bir çoğunluğunun bir problemi farklı yollardan çözmenin bireye katkısının pek çok açıdan daha fazla olacağını düşündüğünü göstermektedir ancak öğretmen adayları bunu nasıl gerçekleştirecekleri konusunda somut bir bilgiye sahip değillerdir (Korkmaz, Gür & Ersoy, 2004). Araştırmalarda, alışılmış olmayan problemlerle ve farklı çözüm süreçleri ile uğraşmanın karmaşık gerçek hayat problemleri ile baş edebilmeye fayda sağlayacağı değerlendirilmektedir (Verschaffel, Greer, Van Dooren & Mukhopadhyay, 2009). Bu çalışmada, öğretmen adaylarının eğitimlerinde alışılmış olmayan problemlerle çalıştırılmasının gerekliliğine vurgu yapılmak istenmektedir ve geleceğin öğretmenlerinin "bir problemin beş farklı çözüm yolunun iyi olduğu düşüncelerini" gerçek uygulamalara dönüştürmeleri amaçlı çalışmalar yapılması önerilmektedir..

f-CEBİRLERİNDE SIRALI İDEALLER

ORDER IDEALS IN f-ALGEBRAS

Serap ÖZCAN
Yıldız Teknik Üniversitesi
serapozcan87@gmail.com

ÖZET: Çeşitli kaynaklardan derlenerek oluşturulan bu çalışmada, f-cebirlerinin genel özellikleri verilerek, f-cebirlerinde ideal teoriden bahsedilmiştir.

Anahtar sözcükler: f-cebiri, Riesz uzayı, ideal teori, sıralı ideal

ABSTRACT: In this study which was formed by collected several works, general properties of f-algebras were given and ideal theory of f-algebras was mentioned.

Key words: f-algebra, Riesz space, ideal theory, order ideal

GİRİŞ

L bir Riesz uzayı (vektör latisi) olsun. Her $f \in L$ için $f^+ = f \vee 0$, $f^- = -f \vee 0$ ve $|f| = f \vee (-f)$ eşitlikleri gösterilsin. Bu durumda, $f = f^+ - f^-$ ve $|f| = f^+ + f^-$ olur. $f \perp g$ (yani $|f| \wedge |g| = 0$) ise f ve g elemanlarına ayrıktır denir. L'nin bir E alt kümesinin ayrık tümleyeni $E^d = \{f \in L: f \perp g, \forall g \in E\}$ ile gösterilir. I, L'nin bir lineer alt uzayı olsun. $f \in I$ için $|g| \leq |f|$ koşulunu sağlayan $g \in I$ elemanı için I alt uzayına sıralı ideal denir. Bir sıralı ideal, Riesz alt uzayıdır. $f \in L$ tarafından üretilen sıralı temel ideal I_f ile gösterilir. $f \in P$ veya $g \in P$ iken $f \wedge g \in P$ olduğunu ifade eden, L'deki P sıralı idealine sıralı asal ideal denir. B, L'de sıralı ideal ve $f \in B$ olsun. Her τ için $f_\tau \in B$, $f = sup f_\tau$ ise B'ye bant denir. Buna göre ayrık tümleyenlerin bant olduğu söylenebilir. L'nin Arşimedyan olması için gerek ve yeter koşul L'deki her bandın bir ayrık tümleyen olmasıdır (Luxemburg ve Zaanen, 1971).

L'de $v \geq 0$ elemanı verilsin. Her $\varepsilon > 0$ için, $n \geq N_\varepsilon$ koşulunu sağlayan $|f - f_n| \leq \varepsilon v$ olacak şekilde bir N_ε doğal sayısı varsa $\{f_n: n = 1,2,\dots\}$ dizisine v-düzgün yakınsaktır denir ve $f_n \to f(v)$ ile gösterilir. $0 \leq v \in L$ için $f_n \to f(v)$ ise $\{f_n: n = 1,2,\dots\}$ dizisi $f \in L$'ye düzgün yakınsar denir. Bu ise $f_n \to f$ ile gösterilecektir. v-düzgün Cauchy dizisi, düzgün Cauchy dizisiyle aynı şekilde tanımlanır. L Riesz uzayının Arşimedyan olması için gerek ve yeter koşul L'deki her düzgün yakınsak dizinin limitinin tek olmasıdır. Eğer $\{f_n: n = 1,2,\dots\}$ dizisi, L Arşimedyan Riesz uzayında v-düzgün Cauchy dizisi ve $f_n \to f(w)$ ise $f_n \to f(v)$ olur. L'deki her v-düzgün Cauchy dizisi tek bir limite sahipse L Riesz uzayına v-düzgün tamdır denir. Her $0 \leq v \in L$ için L v-düzgün tam olduğunda L'ye düzgün tam denir. Düzgün tamlığın bu tanımından, düzgün tam Riesz uzayının Arşimedyan olduğu söylenebilir.

$D \subset L$ olsun. Her $f \in L$ için $f_n \to f$ olmak üzere $f_n \in D$ $(n = 1,2,\dots)$ koşulunu sağlayan D'nin sözde-kapanışı D' tanımlansın. $D = D'$ olduğunda L'nin D alt kümesine düzgün kapalıdır denir. Düzgün kapalı kümeler L'deki bir topoloji için kapalı kümelerdir. Dolayısıyla bu kümelere düzgün topoloji de denir. L'nin bir D alt kümesinin bu topolojideki kapanışı, D^- ile gösterilir. Eğer I, L'de bir sıralı ideal ise I^- de bir sıralı idealdir (Luxemburg ve Zaanen, 1971).

$L = \{u\}^d + \{v\}^d$ olduğunu ifade eden $u \wedge v = 0$ ise L Riesz uzayına normaldir denir. Aşağıdaki iddialar birbirine denktir:
i) $\forall f \in L$ için $L = \{f^+\}^d + \{f^-\}^d$.
ii) $\forall 0 \leq u_1, u_2, \dots, u_n$ ve her $n \in N$ için $\{u_1 \wedge u_2 \wedge \dots \wedge u_n\}^d = \{u_1\}^d + \{u_2\}^d + \cdots + \{u_n\}^d$.
iii) Eğer $n \in N$ ve $u_1 \wedge u_2 \wedge \dots \wedge u_n = 0$ ise $L = \{u_1\}^d + \{u_2\}^d + \cdots + \{u_n\}^d$.

A bir Riesz cebiri olsun. $0 \leq w \in A$ olduğunda $u \wedge v = 0$ olduğunu belirten $(uw) \wedge v = (wu) \wedge v = 0$ sağlanıyorsa A'ya f-cebiri denir (Birkhoff ve Pierce, 1956). Her Arşimedyan f-cebiri değişmelidir. f-cebirlerinin bazı temel özelliklerini verelim.
i) Pozitif elemanların çarpımı, Riesz homomorfizmasıdır. Yani,
$0 \leq u \in A$ ve $f, g \in A$ için $u(f \wedge g) = (uf) \wedge (ug)$, $u(f \vee g) = (uf) \vee (ug)$, $(f \wedge g)u = (fu) \wedge (gu)$ ve $(f \vee g)u = (fu) \vee (gu)$.
ii) Her $f, g \in A$ için $|fg| = |f|.|g|$.
iii) $f \perp g$ ifadesi $fg = 0$ olmasını gerektirir.

iv) Her $f \in A$ için $ff^{+} \geq 0$ ve $f^2 \geq 0$ dır.

A'da bir r-ideali olan I'ya cebir ideali denir. $f_1, f_2, \dots, f_n \in A$ tarafından üretilen r-ideali $(f_1, f_2, \dots, f_n)$ şeklinde gösterilir. A'da aynı zamanda sıralı bir ideal olan r-idealine, l-ideali denir.

L, bir Arşimedyan Riesz uzayı ve π, L üzerinde sıralı sınırlı bir lineer dönüşüm olsun. L'de $f \perp g$ iken $\pi f \perp g$ oluyorsa π'ye ortomorfizma denir (L'deki her B bandı için $\pi(B) \subset B$ dir). L'deki tüm ortomorfizmaların $Orth(L)$ kümesi her $u \geq 0$ için $(\pi_1 \vee \pi_2)u = (\pi_1 u) \vee (\pi_2 u)$ ve $(\pi_1 \wedge \pi_2)u = (\pi_1 u) \wedge (\pi_2 u)$ eşitlikleri ile bir Arşimedyan Riesz uzayıdır (Luxemburg, 1979). Ayrıca $Orth(L)$ birim elemanlı Arşimedyan f-cebiridir. Her ortomorfizma sıralı süreklidir ve çekirdeği bir banttır (Luxemburg, 1979). L düzgün tam olduğunda, $Orth(L)$ de düzgün tamdır.

A bir Arşimedyan f-cebiri ve $f \in A$ olsun. Her $g \in A$ için π_f, $\pi_f g = fg$ şeklinde tanımlanan ortomorfizmayı göstersin. $f \to \pi_f$ dönüşümü, $Orth(A)$'da r-ideali ve Riesz alt uzayı olan $\hat{A} = \{\pi_f : f \in A\}$ kümesi üzerinde Riesz ve cebir homomorfizmasıdır. $f \to \pi_f$ dönüşümünün birebir olması için gerek ve yeter koşul A'nın yarı asal olmasıdır. Bu durumda A ve $\hat{A}$, izomorfik f-cebiridir (Bigard, Keimel ve Wolfenstein, 1977). Sonuç olarak A'nın birimsel olması için gerek ve yeter koşul $\hat{A} = Orth(A)$ olmasıdır.

Bundan sonraki bölümlerde verilen iddiaların Huijsmans ve Pagter (1982)'in çalışmalarında bulunduğunu belirtelim.

f-CEBİRLERİNİN TEMEL ÖZELLİKLERİ

Önerme 1: $\boldsymbol{A}$ bir Arşimedyan $\boldsymbol{f}$-cebiri olsun. Bu durumda,
i)$\forall \boldsymbol{r}, \boldsymbol{f} \in \boldsymbol{A}$ için $\boldsymbol{rf} \in \boldsymbol{I}'_{\boldsymbol{f}}$
ii) Her düzgün kapalı sıralı ideal, $\boldsymbol{l}$-idealidir.

Önerme 2: $\boldsymbol{e}$ birim elemanlı bir $\boldsymbol{A}$ Arşimedyan $\boldsymbol{f}$-cebirinde aşağıdakiler sağlanır:
i) $\forall\ \boldsymbol{0 \leq u \in A}$ için $\boldsymbol{u \wedge ne \uparrow u(u^2)}$.
ii) $\forall\ \boldsymbol{f \in A}$ için $\boldsymbol{I_f^- = I_{f^2}^-}$.
iii) $\boldsymbol{A}$ yarı asaldır.

Yardımcı Özellik 3: $\boldsymbol{A}$, $\boldsymbol{e}$ birim elemanlı bir Arşimedyan $\boldsymbol{f}$-cebiri ve $\boldsymbol{0 \leq u \in A}$ olsun. Bu takdirde her $\boldsymbol{m \geq n}$ için $\boldsymbol{0 \leq u \wedge me - u \wedge ne \leq n^{-1}(u \wedge me)(u \wedge ne)}$ dir.

İspat: $\boldsymbol{u_n = u \wedge ne\ (n = 1, 2, \dots)}$ alalım. $\boldsymbol{m \geq n}$ için $\boldsymbol{(u_m - u_n) \wedge (ne - u_n) = 0}$ dır. İkinci eleman $\boldsymbol{n^{-1}u_m}$ ile çarpılarak, $\boldsymbol{(u_n - u_m) \wedge (u_m - n^{-1}u_m u_n) = 0}$ bulunur. Böylece, $\boldsymbol{u_m = u_n \vee (n^{-1}u_m u_n)}$ olur. Buradan da $\boldsymbol{u_m - u_n = (n^{-1}u_m u_n - u_n)^+ \leq n^{-1}u_m u_n}$ elde edilir.

Henriksen ve Johnson (1961), $\boldsymbol{e}$ birim elemanlı $\boldsymbol{e}$-düzgün tam bir Arşimedyan $\boldsymbol{f}$-cebirinde, her $\boldsymbol{u \geq e}$'nin bir tersinin bulunduğunu ve her $\boldsymbol{u \geq 0}$'ın bir karekökünün var olduğunu göstermek suretiyle yukarıdaki özelliği ispatlamışlardır.

Teorem 4: $\boldsymbol{A}$, $\boldsymbol{e}$ birim elemanlı $\boldsymbol{e}$-düzgün tam bir Arşimedyan $\boldsymbol{f}$-cebiri olsun. Eğer $\boldsymbol{0 \leq v \leq u}$ ise ve $\boldsymbol{A}$'da $\boldsymbol{v^{-1}}$ mevcutsa, bu durumda $\boldsymbol{A}$'da $\boldsymbol{u^{-1}}$ de mevcuttur.

İspat: $\boldsymbol{v = e}$ olduğunu varsayalım.
1. $\boldsymbol{\alpha > 1}$ için $\boldsymbol{e \leq u \leq \alpha e}$ olduğunu düşünelim. $\boldsymbol{0 \leq e - \alpha^{-1}u \leq (1 - \alpha^{-1})e}$ olduğundan, $\boldsymbol{\sum_{n=0}^{\infty}(e - \alpha^{-1}u)^n}$ serisi $\boldsymbol{e}$-düzgün yakınsar ve toplamı $\boldsymbol{\alpha u^{-1}}$ dir. Dolayısıyla $\boldsymbol{u^{-1}}$ mevcuttur.
2. $\boldsymbol{e \leq u}$ olduğunu düşünelim ve $\boldsymbol{u_n = u \wedge ne\ (n = 1, 2, \dots)}$ alalım. 1. Durum'dan her $\boldsymbol{n}$ için $\boldsymbol{u_n^{-1}}$ mevcuttur. Yardımcı Özellik 3'den her $\boldsymbol{m \geq n}$ için
$\boldsymbol{0 \leq u_n^{-1} - u_m^{-1} = u_n^{-1}u_m^{-1}(u_m - u_n) \leq u_n^{-1}u_m^{-1}(n^{-1}u_n u_m) = n^{-1}e}$ elde edilir. Dolayısıyla, $\boldsymbol{\{u_n^{-1} : n = 1, 2, \dots\}}$ dizisi $\boldsymbol{e}$-düzgün Cauchy dizisidir. Hipotezden $\boldsymbol{u_n^{-1} \to w(e)}$ olacak şekilde $\boldsymbol{0 \leq w \in A}$ vardır. $\boldsymbol{0 \leq u_n \uparrow u(u^2)}$ olduğundan $\boldsymbol{w = u^{-1}}$ elde edilir.

Önerme 5: $\boldsymbol{A}$, $\boldsymbol{e}$ birim elemanlı $\boldsymbol{e}$-düzgün tam bir Arşimedyan $\boldsymbol{f}$-cebiri olsun. Eğer $\boldsymbol{0 \leq u \in A}$ ise bu durumda $\boldsymbol{0 \leq v \leq u}$ olacak şekilde $\boldsymbol{u = vw}$ eşitliği vardır ve $\boldsymbol{A}$'da $\boldsymbol{w^{-1}}$ mevcuttur (Gillman ve Henriksen, 1956).

İspat: Herhangi bir $\boldsymbol{f}$-cebirinde $\boldsymbol{fg = (f \wedge g)(f \vee g)}$ olduğunu göz önüne alalım. $\boldsymbol{f + g = f \vee g + f \wedge g}$ formülü kullanılarak $\boldsymbol{fg - (f \wedge g)(f \vee g) = fg - (f \wedge g)(f + g - f \wedge g) = (f - f \wedge g)(g - f \wedge g) = 0}$

elde edilir. $\boldsymbol{fg = (f \wedge g)(f \vee g)}$ eşitliği kullanılarak, $\boldsymbol{u = (u \wedge e)(u \vee e)}$elde edilir. Dolayısıyla, $\boldsymbol{v = (u \wedge e)}$, $\boldsymbol{w = (u \vee e)}$ alınabilir.

Teorem 6: $\boldsymbol{e}$ birim elemanlı bir $\boldsymbol{A}$ Arşimedyan $\boldsymbol{f}$-cebirinin düzgün tam olması için gerek ve yeter koşul $\boldsymbol{A}$'nın $\boldsymbol{e}$-düzgün tam olmasıdır (Gillman ve Henriksen, 1956).

İspat: Düzgün tamlığın, $\boldsymbol{e}$-düzgün tamlığı sağladığı açıktır. Tersinin ispatı için $\{\boldsymbol{f_n}: \boldsymbol{n = 1, 2, \dots}\}$ $\boldsymbol{A}$'da bir $\boldsymbol{u}$-düzgün Cauchy dizisi olsun. Önerme 5'den $\boldsymbol{0 \leq v \leq u}$ olacak şekilde $\boldsymbol{u = vw}$ eşitliğinin olduğunu ve $\boldsymbol{A}$'da $\boldsymbol{w^{-1}}$ in mevcut olduğunu biliyoruz. $\{\boldsymbol{g_n = w^{-1} f_n}: \boldsymbol{n = 1, 2, \dots}\}$ dizisi $\boldsymbol{A}$'da $\boldsymbol{v}$-düzgün ve dolayısıyla da $\boldsymbol{e}$-düzgün Cauchy dizisidir. Hipotezden $\boldsymbol{g_n \rightarrow g(e)}$ olacak şekilde $\boldsymbol{g \in A}$ vardır. O halde $\boldsymbol{f_n \rightarrow wg(w)}$ olur ve $\{\boldsymbol{f_n}: \boldsymbol{n = 1, 2, \dots}\}$ olduğundan $\boldsymbol{u}$-düzgün Cauchy dizisidir. Bu ise $\boldsymbol{f_n \rightarrow wg(u)}$ olduğunu gösterir.

Yardımcı Özellik 7: A bir yarı asal Arşimedyan f-cebiri olsun. Eğer $0 \leq u, v \in A$ ise $u \leq v \Leftrightarrow u^2 \leq v^2$ dir.

İspat: Önerme 5'in ispatındaki $fg = (f \wedge g)(f \vee g)$ alınarak, $uv = (u \wedge v)(u \vee v) = \{u(u \vee v)\} \wedge \{v(u \vee v)\} = (u^2 \vee uv) \wedge (uv \vee v^2) = (u^2 \wedge v^2) \vee (uv)$ elde edilir. Böylece, $0 \leq u, v \in A$ için $u^2 \wedge v^2 \leq uv$ olur. $u^2 \leq v^2$ olsun ve $u \leq v$ nin sağlanmadığını, yani $u \wedge v < u$ olduğunu varsayalım. Bu, $(u \wedge v)^2 < u^2$ olduğunu ifade eder. Dolayısıyla, $u^2 = u^2 \wedge v^2 = u^2 \wedge v^2 \wedge (uv) = (u \wedge v)^2 < u^2$ olur ki, bu ise bir çelişkidir. O halde, $u^2 \leq v^2$ ise $u \leq v$ dir. $u \leq v$ iken $u^2 \leq v^2$ olduğu ise kolayca görülür.

Teorem 8: A, e birim elemanlı düzgün tam bir f-cebiri olsun. Her $0 \leq u \in A$ için $v^2 = u$ olacak şekilde bir tek $0 \leq v \in A$ vardır $\left(v = \sqrt{u} = u^{1/2}\right)$.

Aşağıdaki Teorem Henriksen'in "(*) Özelliği"nin birimli olan her düzgün tam f-cebirinde sağlandığını gösterir.

Teorem 9: A, e birim elemanlı düzgün tam bir f-cebiri olsun. Eğer $0 \leq v \in A$ için $0 \leq u \leq v^2$ ise $0 \leq w \leq v$ ve $u = wv$ olacak şekilde bir tek $0 \leq w \in A$ vardır (Bu özellik (*) Özelliği olarak adlandırılır.).

İspat: $n = 1,2, \dots$ için $w_n = (v + n^{-1}e)^{-1}$ olsun. $\{w_n: n = 1,2, \dots\}$ bir e-düzgün Cauchy dizisidir. O halde $w_n \rightarrow w(e)$ olacak şekilde $0 \leq w \in A$ vardır. $v + n^{-1}e \rightarrow v(e)$ olduğundan $w_n(v + n^{-1}e) \rightarrow wv$ olur. Ancak her n için $w_n(v + n^{-1}e) = u$ olduğundan $u = wv$ olur. Her n için $w_n \leq v$ olduğundan, $w \leq v$ elde edilir. Şimdi w'nin tek olduğunu gösterelim. $0 \leq w' \leq v$ ve $u = w'v$ olduğunu varsayalım. A yarı asal olduğundan $w - w' \perp v$ dir. Ayrıca $w - w' \in I_v$ dır. Dolayısıyla, $w = w'$ olur.

Sonuç 10: A, e birim elemanlı düzgün tam bir f-cebiri olsun.
i) Eğer $0 \leq u \leq v$ ise $u^2 = wv$ olacak şekilde bir tek $0 \leq w \leq v$ vardır.
ii) Eğer $0 \leq v \in A$ ve $n \in N$ için $0 \leq u \leq v^{1+2^{-n}}$ ise $u = wv$ olacak şekilde $0 \leq w \in A$ vardır.
iii) Eğer $f \in A$ için $0 \leq u \leq v^2$ ise $|t| \leq |f|$ ve $u = tf$ koşullarını sağlayan bir tek $t \in A$ vardır.

Önerme 11: A, yarı asal bir Arşimedyan f-cebiri olsun. Aşağıdaki koşullar verilsin.
i) (*) Özelliği
ii) $\hat{A} = \{\pi_f: f \in A\}$, $Orth(A)$'da bir l-idealidir.
i)$\Leftrightarrow$ii) gerçeklenir. Ayrıca A aynı zamanda düzgün tam ise i)$\Leftrightarrow$ii) dir.

f-CEBİRLERİNDE İDEAL TEORİ

I ve J r-idealleri olmak üzere, $IJ = \{\sum_{k=1}^{n} r_k s_k: r_k \in I, s_k \in J, n \in N\}$, I ve J'nin üretecini göstersin.

Tanım 12: I, A f-cebirinde bir r-ideali olsun.
i) $I = \sqrt{I} = \{f \in A: n \in N \text{ için } f^n \in I\}$ ise I yarı asaldır.
ii) $I = I^2$ ise I idempotenttir.
iii) $f \in I$ veya $g \in I$ olmak üzere $fg = 0$ ise I sözde asaldır.
iv) Her $f \in I$ için $|f| = g^2$ olcak şekilde $g \in I$ varsa I karekök kapalıdır.

Aşağıdaki önerme Subramanian (1967) tarafından ispat edilmiştir.

Önerme 13: A bir Arşimedyan f-cebiri olsun.
i) Eğer I, A'da bir l-ideali ise, $\sqrt{I}$ da bir l-idealidir.
ii) Eğer P, A'da bir l-ideali ise P'nin bir asal r-ideali olması için gerek ve yeter koşul P'nin sözde asal ve yarı asal olmasıdır.

Önerme 14: A bir yarı asal Arşimedyan f-cebiri olsun.
i) Eğer I, A'da karekök kapalı r-ideali ise $I = I^2$ ve $I = \sqrt{I}$ dır.
ii) A'da her idempotent l-ideali yarı asaldır.

Teorem 15: Her yarı asal r-ideali, bir l-idealidir.

İspat: Daha önce de gösterildiği gibi $f \in \sqrt{I} \Leftrightarrow |f| \in \sqrt{I}$ olduğunu biliyoruz. $0 \leq u \leq v$ ve $v \in \sqrt{I}$ olduğunda $u \in \sqrt{I}$ olduğu gösterilmelidir. $Orth(A)$, birim elemanlı düzgün tam bir f-cebiri olduğundan, $0 \leq \pi_u \leq \pi_v$ ve Sonuç 10 i)'den, $\pi \in Orth(A)$ ve $0 \leq \pi \leq \pi_v$ için $\pi_u^2 = \pi\pi_v$ dir. Bu özellik bir kez daha uygulanarak $0 \leq \pi_1 \in Orth(A)$ olacak şekilde $\pi^2 = \pi_1\pi_v$ bulunur. Buradan, $\pi_u^4 = (\pi_1\pi_v)\pi_v^2 = \pi_{\pi_1 v}.\pi_v^2$ ve dolayısıyla $u^4 = (\pi_1 v)v^2$ elde edilir. Böylece, $u \in \sqrt{I}$ elde edilir.

Teorem 16: Düzgün tam olan bir yarı asal A f-cebirinde,
i) Her idempotent r-ideali bir l-idealidir.
ii) Her idempotent r-ideali yarı asaldır.

İspat:
i) I'nın A'da $I = I^2$ koşulunu sağlayan bir r-ideali olduğunu varsayalım. $\hat{I} = \{\pi_f : f \in I\}$ alalım. O halde $\hat{I}$, $\hat{A}$'da bir r-idealidir. İlk olarak $\hat{I}$'nın $Orth(A)$'da bir l-ideali olduğunu gösterelim. $\pi \in Orth(A)$ ve $\pi_f \in \hat{I}$ olsun. Hipotezden $f = \sum_{k=1}^{n} r_k s_k$, $r_k, s_k \in I$ $(k = 1,2,\dots,n)$ olur.
$\hat{I}$, $\hat{A}$'da bir r-ideali olduğundan $\pi\pi_f = \pi\left(\sum_{k=1}^{n} \pi_{r_k}\pi_{s_k}\right) = \sum_{k=1}^{n}\left(\pi\pi_{r_k}\right)\pi_{s_k} = \sum_{k=1}^{n} \pi_{\pi_{r_k}}\pi_{s_k} \in \hat{I}$ elde edilir. $\hat{I}$'nın $Orth(A)$'da bir l-ideali olduğu gösterilmelidir. $f \in I$, $\pi \in Orth(A)$ ve $0 \leq \pi \leq |\pi_f|$ alalım. $k = 1,2,\dots,n$ için $f = \sum_{k=1}^{n} r_k s_k$, $r_k, s_k \in I$, $I = I^2$ olduğundan, $0 \leq \pi \leq |\pi_f| = \pi_{|f|} \leq \sum_{k=1}^{n}\left|\pi_{r_k}\pi_{s_k}\right| \leq \sum_{k=1}^{n}\left(\pi_{r_k}^2 + \pi_{s_k}^2\right)$ olur. Riesz ayrıştırma özelliği kullanılarak $0 \leq \rho_k \leq \pi_{r_k}^2$ ve $0 \leq \sigma_k \leq \pi_{s_k}^2$ $(k = 1,2,\dots,n)$ koşullarını sağlayan ρ_k, $\sigma_k \in Orth(A)$ için $\pi = \sum_{k=1}^{n}(\rho_k + \sigma_k)$ bulunur. $\hat{I}$, $Orth(A)$'da bir l-ideali olduğundan, ρ_k, $\sigma_k \in \hat{I}, (k = 1,2,\dots,n)$ sonucuna varırız.
ii) i)'den ve Önerme 14'den kolayca görülür.

Teorem 17: Eğer I ve J, (*) Özelliği olan A Arşimedyan f-cebirinde l-ideali iseler, IJ de l-idealidir. Gerçekten $IJ = \{f \in A : |f| \leq uv, 0 \leq u \in I, 0 \leq v \in J\}$ dir.

İspat: $u \in IJ$ olduğunu göstermek için $f \in IJ$ olmak üzere $0 \leq u \leq |f|$ olduğunu göstermek yeterlidir. $f \in IJ$ olduğundan $0 \leq p \in I, 0 \leq q \in J$ olacak şekilde $|f| \leq pq$ vardır. Dolayısıyla, $0 \leq u \leq (p+q)^2$ olur. (*) Özelliği, $0 \leq w \in A$ için $u = w(p+q)$ olduğunu ifade eder. Eğer, $w_1 = w \wedge q$ ve $w_2 = w \wedge p$ alınırsa, $w_1 \in J, w_2 \in I$ ve $w_1 p + w_2 q = wp \wedge pq + wq \wedge pq = wp + wq = u$ elde edilir. Dolayısıyla $u \in IJ$ olur.

THE PERCEPTIONS OF THE PRE-SERVICE SCIENCE TEACHERS' PROBLEM-SOLVING SKILLS

Asiye BAHTİYA

Bilge CAN

Developments in knowledge, science and technology cause some problems for individuals to adapt to new situations. For this reason, improving problem solving skills of individuals to cope with those problems became one of the most important objectives of education. Teachers should help students not only by just giving information how to solve a problem but also by assimilating this skill. Undoubtedly, firstly they should have problem solving skills to be able to help their students. In this context, the aim of the study is to find out the perceptions of pre-service science teachers' problem-solving skills. The sample of the study was consisted of 76 freshmen, 81 sophomore, 117 junior and 69 senior in total 343 pre-service science teachers who study in Department of Science Teacher Education in 2012-2013 academic year. Problem solving inventory (PSI) which was developed by Heppner and Petersen (1982) and adapted into Turkish by Şahin, Şahin and Heppner (1993) was used as a data collection tool. Data obtained in the study was analysed with SPSS (version 16.0). In the data analysis process; beside descriptive statistical methods, One Way ANOVA was used to determine whether or not there is any significant difference among grades and their points of all the PSI and its dimensions. According to the results of analysis, a significant difference was found between sophomores and juniors and also between sophomores and seniors. Moreover, when data was examined according to "impulsive style" dimension and "avoidant style" dimension; it was also found that there was a significant difference among grades.

Keywords: Problem Solving Skills, Pre-servise Science Teacher

ÖZET: Bu araştırmada, 7. Sınıf 'İnsan ve Çevre' Ünitesine yönelik bir eğitsel oyun geliştirilmiş ve uygulamadaki etkililiğine bakılmıştır. Geliştirilen eğitsel oyunun etkililiğinin araştırılması amaçlandığı için basit deneysel desen kullanılmıştır. Çalışma Trabzon İl'ine bağlı bir köy okulunun 7. sınıf öğrencileri (N=29) ile yürütülmüştür. Çalışmada, çoktan seçmeli bir test ve yarı yapılandırılmış mülakat kullanılmıştır. Çok aşamalı olarak geliştirilen eğitsel oyun "eşleştirme, besin zinciri oluşturma, ekosistem tamamlama, riziko ve videodaki çevre sorununun belirleme" aşamaları içermektedir. Öğrencilerin testin ön ve son uygulamalarından aldıkları puanlar SPSS (16.0) programı ile analiz edilmiştir. Verilerin istatistiksel analizine göre, öğrencilerin ön ve son test puanları arasında son test lehine anlamlı bir fark bulunmuştur. Öğrencilerle yürütülen mülakatlarda ise sürecin eğlendirici ve öğretici olduğu tespit edilmiştir. Elde edilen bulgular doğrultusunda, 'İnsan ve Çevre' ünitesi için geliştirilen eğitsel oyunun uygulanabilir olduğu sonucuna varılmıştır.

Anahtar sözcükler: eğitsel oyun, çevre eğitimi, ilköğretim, öğrenci başarısı

ABSTRACT: In this study, an educational game was developed for the concepts of the" Human and Environment" unit in 7th class program and its applicability was examined. Simple experimental design was used. Study was conducted with 7th grade students (N= 29) in a village school in Trabzon province. Semi-structured interview and multiple-choice test were used to collect the data. Educational game has five stages named as "pairing, composition of food chain, completion of the ecosystem, risk and determining environmental problems in the video" stages. The data obtained from pre and post test were analyzed with SPSS (16.0) program. According to the statistical analysis of the data, a significant difference was found in favor of the post test between pre and post test scores of students. The result of the study showed tahat the educational game is applicable and effective for the "Human and Environment" Unit.

Key words: educational games, environmental education, primary education, success of students

GİRİŞ

Artan nüfus ve gelişen teknoloji ile birlikte meydana gelen çarpık kentleşme, ormansızlaşma, ozon tabakasının incelmesi, sera etkisi ve beraberinde küresel ısınma bugün sıkça adını duyduğumuz çevre sorunlarından bazılarıdır. Bu durum bize çevre sorunlarının artık küresel bir boyut kazandığını ve tedbir almazsak yaşam kalitemizi düşürecek çok büyük problemlerle karşılaşabileceğimizi göstermektedir (Tombul, 2006; Selvi ve Yıldız, 2009).

Mevcut çevre sorunlarının üstesinden gelebilecek ve oluşabilecek yeni çevre sorunlarına engel olabilecek, çevre sorunlarının oluşmasındaki temel etkenlerden biri olan yine insanoğlunun kendisidir. Çözüme götürecek ise çevreyi korumayı davranış haline dönüştürebilecek bir çevre eğitiminin kazandırılmasıdır (Ünal ve Dımışkı,1999). Fakat çevre eğitimi ile ilgili çalışmalar incelendiğinde, ilköğretimden yüksek öğretime kadar öğrencilerin çevre ile ilgili kavramları yeterince bilmedikleri, çevre eğitiminin uzak ve genel hedeflerine istenilen düzeyde ulaşılamadığı söylenebilir (örn. Şahin vd., 2004.; Pekel, Kaya ve Demir, 2007; Erdoğan, 2011, Artun, 2013). Bu duruma neden olan etkenlerden birinin, çevre ile ilgili konuların öğretilmesi için seçilen yöntem ve tekniklerin olduğu düşünülmektedir. Fen ve Teknoloji dersi kapsamında yer alan çevre konularının öğretilmesinde sıklıkla öğretmen merkezli, öğrencilerin konuya ilgisini çekemeyen ve öğrencileri ezbere yönelten tekniklerin kullanıldığı dikkat çekmektedir (Yılmaz, 2006; Erdoğan, 2011; Gerehan, 2011). İlköğretim 7. Sınıf Fen ve Teknoloji Öğrenci Ders Kitabı incelendiğinde, çevre konularına çok yüzeysel olarak değinildiği ve bu konularla ilgili öğrencileri aktif hale getirebilecek etkinliklerin yok denecek kadar az olduğu dikkat çekmektedir (Erdoğan, 2012; Artun, 2013). “Ağaç yaş iken eğilir” atasözü dikkate alındığında, ilköğretim düzeyinde verilecek çevre eğitiminin sonraki öğretim kademeleri için çok önemli olduğu unutulmamalıdır.

İlköğretim 7. sınıf öğrencileri 12 ve 14 yaş aralığında olabilmektedirler. Bu yaş aralığındaki çocuklar ya somut işlemler döneminde ya da soyut işlemler dönemine geçiş durumundadırlar (Slavin, 1991). Bu nedenle, öğretmenlerin öğretim sürecini planlarken ya da kullanacakları öğretim materyallerini seçerken soyut düşünen öğrencilerin yanı sıra hala somut işlemler dönemindeki öğrencileri de dikkate alması önem taşımaktadır. Bu bağlamda, öğrencilerin anlamakta zorlandıkları soyut fen kavramlarının ezberlenmeden öğretilebilmesi için aktif öğrenme etkinlikleri kullanılarak konuların somutlaştırılması önerilmektedir (örn; Demir, 2012; Karamustafaoğlu ve Kaya, 2013). İlköğretim düzeyinde, öğrenciyi aktif olarak derse katabilecek ve onu sıkmayacak öğretim etkinliklerinden birinin eğitsel oyunlar olduğu söylenebilir. Oyun genel anlamda, amaçlı ya da amaçsız, kurallı veya kuralsız oynanan, çocuğun her zaman isteyerek ve zevk alarak katıldığı; her yönden bireysel gelişimi temel alan, hayatımızın her döneminde olabilen ve etkili bir öğrenme süreci olarak tanımlanabilir (Dönmez, 1992, Aktaran: Kaya, 2013). Eğitsel oyunların öğretimde kullanılmasının temelinde, konunun öğrencinin bildiği ya da bilmediği oyun formatlarını kullanarak öğretilmeye çalışılması yatmaktadır (Demirel, Seferoğlu, ve Yağcı, 2003). Oyun içerisinde eğlence ve yarışma unsurları olduğu için, farklı yaş gruplarında da olsalar herhangi bir öğretim kademesindeki öğrenci oynamaktan sıkılmayacaktır (Aykaç, 2009). İlköğretim öğrencilerinin dikkat sürelerinin az olduğu dikkate alındığında, özellikle ilköğretim öğrencileri için oyun yolu ile öğretimin oldukça etkili olabileceği söylenebilir (Demir, 2012). Dersin içeriğine uygun olarak hazırlanan oyunların soyut kavramları somutlaştırarak öğrenciler için eğlenceli ve kolay anlaşılır hale getirilebildiği belirtilmektedir (Şaşmaz Ören ve Erduran Avcı, 2004).

Bütün bu bilgiler ışığında bu çalışmada, “İnsan ve Çevre” ünitesine yönelik bir eğitsel oyun geliştirilmiş ve uygulanabilirliği araştırılmıştır. Elde edilecek bulguların ışığında, öğretmenlere kullanabilecekleri bir materyal sunulması ve etkililiğinin ortaya konması açısından literatüre önemli bir katkı sağlayacağı düşünülmektedir.

YÖNTEM

Bu araştırmada, 7. Sınıf ‘İnsan ve Çevre’ Ünitesine yönelik bir eğitsel oyun geliştirilmiş ve uygulamadaki etkililiğine bakılmıştır. Geliştirilen eğitsel oyunun etkililiğinin araştırılması amaçlandığı için basit deneysel desen kullanılmıştır. Çalışma Trabzon İl’ine bağlı bir köy okulunun 7. Sınıf öğrencileri (N=29) ile yürütülmüştür. Çalışmada, çoktan seçmeli bir test ve yarı yapılandırılmış mülakat kullanılmıştır. Eğitsel oyunun etkililiğini tespit etmek için kullanılan test, literatürden faydalanılarak geliştirilmiş ve 28 adet çoktan seçmeli soru içermektedir. Başarı testinin güvenilirliği 0,74 olarak hesaplanmıştır. Test, uygulama öncesinde ve sonrasında, ön ve son test olarak iki kez kullanılmıştır. Öğrencilere testi cevaplamaları için 45 dakika süre verilmiştir. Yanlışlar doğruyu götürmeyecek şekilde değerlendirme yapılmıştır. Testin değerlendirilmesi, boş ve yanlış cevaplara 0, doğru cevaba 1 puan verilerek toplam 28 puan üzerinden yapılmıştır. Ders bitiminde üç öğrenci ile bireysel mülakatlar yürütülmüştür.

Öncelikle, “İnsan ve Çevre” ünitesinin kazanımlarından oluşan bir belirtke tablosu hazırlanmış ve hazırlanan belirtke tablosu doğrultusunda oyunun aşamaları geliştirilmiştir. Geliştirilen eğitsel oyun biyoloji alanında uzman iki öğretim üyesi ve iki Fen ve Teknoloji öğretmenine incelettirilmiştir. Alınan görüşler doğrultusunda oyun şekillendirilmiş ve kuralları netleştirilmiştir. Tasarlanan oyunun pilot çalışması, İlköğretim 8. Sınıfta öğrenim gören 20 öğrenciyle yürütülmüş ve pilot çalışma doğrultusunda gerekli düzenlemeler yapılarak oyuna son hali verilmiştir. Geliştirilen eğitsel oyunun aşamaları Tablo 1’de sunulmuştur.

Tablo 1. İnsan ve Çevre Ünitesine Yönelik Hazırlanan Oyunun Aşamaları

Aşamalar	Kuralı	Amaç	Süre	Puanlama

Eşleştirme	Her gruptan bir sözcü seçilir, panoya yerleştirilen zarflar içindeki resimli kavram kartları ile tanım kartlarını eşleştirmeye çalışır, yanlış olursa diğer gruptan sözcü kalkar, doğru ise aynı grup eşleştirmeye devam eder.	Kavramlarla tanım kartlarını doğru eşleştirmek.	Yok* *Eşleştirme işlemi panodaki kartlar bitene kadar devam eder.	Her doğru 50 puan, yanlışlar ise etkisizdir.
Besin Zinciri Oluşturma	Her gruptan bir sözcü seçilir ve her birine hayvan resimleri ile karton verilir. Belirlenen sürede kartonlar üzerine hayvan resimlerini yapıştırılıp aralarındaki ilişkiyi oklarla çizilerek besin zinciri oluşturulur.	Seçilen hayvanlar arasındaki ilişkilerin yönünü doğru çizmek.	2 dakika	Her doğru ok 50 puan her yanlış ok 50 puandır.
Ekosistem Tamamlama	Her gruba üzerinde ekosistemin adı yazan renkli karton ile canlı ve cansız öğeler verilir. Belirlenen sürede belirlenen ekosistemin öğelerini kartonun üzerine yerleştirir.	Seçilen ekosisteme uygun canlı ve cansız öğeleri seçmek.	2 dakika	Her doğru öğe 50 puan her yanlış öğe 50 puandır.
Riziko	Her gruptan bir sözcü seçilir. Her grup sırasıyla bilgisayarda hazırlanan program aracılığıyla zorluklarına göre farklı puan türlerinden oluşan soruları seçer ve sözcüler yanıtlar. Her grup her puan türünden en az 1 soru seçmelidir.	Açtırılan soruyu doğru yanıtlamak.	Her soru için 1 dakika* *sorular bitene kadar oyun devam eder.	50- 100-150-200 değerinde sorular bulunmaktadır.
Videodaki Çevre Sorununu Belirleme	4 farklı çevre sorununu içeren video her grup tarafından aynı anda izlenir. Öğrenciler grup arkadaşları ile birlikte videodaki çevre sorunlarını not eder.	Videodaki 4 çevre sorununu doğru belirlemek.	Video süresince	Bilinen her doğru çevre sorunu için 50 puan

Tablo 1'de görüldüğü gibi eğitsel oyun oynanırken sınıf 4 gruba ayrılmıştır. Oyunların bazıları gruptan bir sözcü seçilerek bireysel, bazıları ise grupça oynanmıştır. Bireysel oynanan oyunlarda sözcünün tahtaya çıkarak herkesin görebileceği şekilde oyunu oynamasına dikkat edilmiş, bu sayede tüm sınıfın kavramlar hakkında bilgi sahibi olması sağlanmıştır. Ayrıca sözcüler seçilirken farklı kişiler olmasına dikkat edilmiş ve tüm öğrenciler oyuna dahil edilmiştir. Grupların kendi içinde heterojen, sınıf içinde homojen olmasına dikkat edilmiştir. Oyun kurallarına göre puanlama yapılmış, alınan puanlar yalnızca oyun sırasında kullanılmıştır. Oyun sonunda toplam puana göre en yüksek puanı olan grup belirlenip, üyelerine hediyeleri verilmiştir. Ayrıca oyuna katılan tüm öğrencilere de teselli hediyeleri verilmiştir.

BULGULAR

"Çevre ve İnsan" ünitesine yönelik geliştirilen eğitsel oyunun etkililiğinin araştırılması için uygulanan testten elde edilen ön ve son test bulgularına ait istatistiksel analiz sonuçları Tablo 2'de sunulmuştur.

Tablo 2. Başarı Testi Öntest-Sontest Ortalama Puanlarına İlişkin Bağımlı t-testi Sonuçları

Ölçüm	N	$\bar{X}$	S	sd	t	p
Ön test	29	18,6207	,79471	28	2,946	,006
Son test	29	20,0345	,81471			

Tablo 2 incelendiğinde, öğrencilerin test uygulamalarından elde edilen ön ve son test puanları arasında anlamlı bir farklılık bulunmuştur ($p< .05$). Ortalama puanlar incelendiğinde son test puanının (20,0345) ön test puanından (18,6207) fazla olduğu görülmektedir. Bu bulgular doğrultusunda, geliştirilen eğitsel oyunun uygulanabilir ve etkili olduğu görülmektedir.

Test bulgularını daha derinlemesine incelemek amacıyla, öğrencilerin ön test ve son test ortalama puanlarında anlamlı farklılık olan sorular belirlenmiştir. Bu sorular ve içerikleri ile ilgili bulgular Tablo 3'te sunulmuştur.

Tablo 3. Testin Ön ve Sontest Ortalama Puanlarında Anlamlı Farklılık Olan Maddeler

	İçerik	Madde No	Ön Test	Son test
			%	%
Başarı testi	Tür	1	52	78
	Popülasyon	2	55	72
	Ekosistem	3	67	70
	Besin zinciri	10	62	71
	Su kirliliği	16	74	78
	Çevre kirliliği	19	82	90
	Hava kirliliği	22	66	86
	Su kirliliği	23	63	76
	Toprak kirliliği	25	71	80

Ön ve sontest ortalama puanları arasında anlamlı farklılık bulunan soruların içerikleri incelendiğinde, oyunun her bir aşamasındaki temel kavramlar dikkati çekmektedir. Örneğin, 'Videodaki Çevre Sorununu Bulma' aşamasında öğrenciler çevre kirlikleri, türleri ve sonuçlarını tartışmışlardır. Ayrıca, oyunun 'Ekosistem Tamamlama' aşaması sayesinde tür, popülasyon gibi kavramları pekiştirmişlerdir. Oyun aşamalarına ait temel kavramlar ya da oyun sırasında vurgulanan kavramların son testte daha fazla yapılması, eğitsel oyunun etkili olduğu şeklinde yorumlanabilir.

Öğrenciler, oyunlar esnasında nesne ve olayların değişebilir özelliklerini de dikkate alıp yeni durumlar tasarlayarak oyunları tamamlayabilmişlerdir. Bu durum onların bu iki beceriyi kazanmalarına olumlu etki ettiği söylenebilir. Örneğin, "Besin Zinciri Oluşturma" oyununda öğrencilere birçok canlı ve cansız öğe verilmesine rağmen, onlar doğru zinciri, belirledikleri doğru öğelerle oluşturabilmişlerdir.

Oyunun 'Ekosistem Tamamlama' aşamasında öğrencilerden farklı ekosistemleri hayal edip, verilen malzemelerle uygun şekilde bu ekosistemleri oluşturmaları beklenmiştir. Oyun süresince öğrencilerin yaratıcılıklarını kullanarak farklı ekosistemleri ortaya koyabilmeleri için teşvik edilmiş olmaları onların model oluşturma becerilerinin gelişimine olumlu etkide bulunduğu söylenebilir. Ayrıca oyunlarda görselliğe büyük önem verilmesinin de öğrencilerde bu becerinin gelişmesini olumlu yönde etkilediği düşünülebilir. Yaratıcılık duygusunu geliştirmesi, eğitsel oyun kullanımının yararlarından biri olarak belirtilmektedir (Aykaç, 2009)

Öğrencilerle yürütülen mülakatlarda, oyunların genelinde çok eğlendikleri tespit edilmiştir. Oyunların bazıları bireysel, bazıları ise grupça karar verildikten sonra bir sözcü tarafından sonucun açıklanması şeklinde tasarlanmıştır. Oyunların tamamı bütün sınıfın önünde ve tüm öğrencilerin görebilecekleri şekilde oynandığı için nerdeyse %100 katılımın sağlandığı söylenebilir. Öğrenciler sınıfta, kargaşadan uzak coşku ve keyif havasının hakim olduğunu belirtmişlerdir. Dersi yürüten fen ve teknoloji öğretmeni de başarısı düşük öğrencilerin bile katılımının iyi olduğunu ifade etmiştir.

SONUÇ

Elde edilen bulgular ışığında, geliştirilen eğitsel oyunun döngüsel olması, kavramların tekrarlanmasına olanak sağlaması açısından öğrencilerin öğrenmesi üzerinde etkili olduğu sonucuna varılabilir. Farklı çalışmalarda da benzer sonuçlar elde edilmiştir (örn. Aycan, 2002; Yurt, 2007). Öğrenciler oyun sürecinde eğlenmişlerdir. Tüm sınıfın katılımı sağlanmış, öğrencilerin ilgileri artmıştır. Bu bağlamda, geliştirilen oyunun uygulanabilir olduğu söylenebilir. İlköğretim düzeyinde özellikle soyut fen kavramlarının öğretiminde eğitsel oyun kullanımının yaygınlaştırılması ve öğretmenlerin bu konuda bilgilendirilmesi önerilmektedir.

ÖZET: Etkili ve kalıcı bir öğrenme için fen öğreniminde öğrencilerin ön bilgilerine önem veren ve onları aktif hale getiren öğrenme araçlarının kullanılması gerekmektedir. Öğrencilerin günlük yaşamdaki problemlerini çözmelerine ve derslere aktif katılımlarına yardımcı olmada kullanılabilecek görsel araçlardan biri de kavram karikatürleridir. Bu çalışmada, öğretmen adaylarının kavram karikatürlerine ilişkin görüşlerinin belirlenmesi amaçlanmıştır. Çalışmaya, bir eğitim fakültesinde öğrenim gören fizik (20), kimya (10) ve biyoloji (21) programlarında öğrenim gören toplam 51 öğretmen adayı gönüllü olarak katılmıştır. Çalışmada, veri toplama aracı olarak sekiz açık uçlu sorudan oluşan bir anket kullanılmıştır. Araştırmadan elde edilen veriler, öğretmen adaylarının kavram karikatürleri ve kavram karikatürlerinin nasıl hazırlanacağı ile ilgili yeterli bilgiye sahip olmadığını göstermiştir. Öğretmen adaylarının kavram karikatürlerinin öğretim sürecinde kullanımı ve farklı fen konularında nasıl tasarlanacağı konusunda bilgilendirilmeleri önerilmektedir. Çünkü kavram karikatürleri mesleki yaşamlarında öğrenme ortamlarını zenginleştirebilmeleri açısından faydalı olacaktır.

Anahtar sözcükler: fen eğitimi, kavram karikatürü, öğretmen adayı

ABSTRACT: Learning tools that taking into consideration students' prior knowledge and making them active must be used in science education for more effective and permanent learning. The concept cartoons are one of visual tools that could be used to help students solve their problems in everyday life and actively participate in courses. In this study, it is to aim to determine prospective teachers' views on concept cartoons. For this aim, a total of 51 prospective teachers enrolled in physics (20), chemistry (10) and biology (21) teacher-training programs a faculty of education voluntarily participated in this study. In the present study, a questionnaire which consisted of eight open-ended questions was used as a data collection tool. The data obtained from this study showed that prospective teachers have not enough information about concept cartoons and how to prepare them. It was suggested that the prospective teachers should be informed of the usage of concept cartoons in the teaching process and how to design concept cartoons in different science subjects because the concept cartoons would be useful in terms of enriching the learning environment in their professional life.

Key words: science education, concept cartoon, prospective teacher

GİRİŞ

Öğrenme ve öğretmedeki bütünleştirici görüş, öğretmenlerden öğrencilerin var olan fikirlerini incelemelerini ve kavramsal karmaşa oluşturacak eğitimsel etkinlikler geliştirmelerini istemektedir (Posner, Strike, Hewson & Gertzog, 1982; Demircioğlu, Demircioğlu & Ayas, 2004). Bu etkinlikler aynı zamanda öğrencilerin öğrenme sürecine aktif olarak katılmalarını, bu süreçte yaparak-yaşayarak öğrenmelerini ve mevcut bilgileriyle yeni bilgilerini anlamlı olarak ilişkilendirmelerini sağlamalıdır. Söz konusu etkinliklerden biri de kavram karikatürleridir.

Kavram karikatürleri öğrencilerin hem günlük yaşama ilişkin problemleri çözmelerini hem de derse aktif katılımlarını sağlamak için kullanılabilecek görsel araçlardır (Balım, İnel & Evrekli, 2008). Bu araçlar, her bir karakterin günlük yaşamdaki bir olaya ilişkin farklı bakış açılarını savunduğu, ilgi çekici ve şaşırtıcı karikatür biçimindeki çizimlerdir (Keogh & Naylor, 1999; Martinez, 2004). Kavram karikatürleri, tartışmaya yol açmak (Long & Marson, 2003), öğrencilerin katılımını ve motivasyonunu artırmak, öğrenim ve öğretimi desteklemek (Keogh, Naylor, de Boo & Feasey, 1999; Uğurel & Moralı, 2006), öğrencilerin günlük yaşamla fen arasında bağ kurmaları için bilimsel düşünceleri günlük yaşama uyarlamak (Keogh, Naylor & Wilson, 1998) amacıyla kullanılmaktadır.

Ayrıca kavram karikatürleri öğretmen ve öğrencileri meşgul ederek verimli öğretim ortamları oluşturmayı sağlayan ve kavramsal anlamayı geliştirmek için kullanılabilen bir araçtır (Akdeniz & Atasoy, 2006). Bu süreçte kavram karikatürleri, öğrencilerin fikirlerinin açığa çıkarılmasında (Stephenson & Warwick, 2002), kavramsal gelişimlerinin anlaşılmasında, öğrenmelerini sağlamada ve öğrencileri ilgili tutmada (Huang, Liu, Lin & Istanda, 2006) öğretmenlere yardımcı olmaktadır.

Peki, öğretmen adayları öğrenme ortamına katkı sağlamada bu denli etkili olan kavram karikatürleri ve onların nasıl tasarlanacağı konusunda yeterli bilgiye sahipler mi? Bir öğretmenin etkili bir öğretim gerçekleştirebilmesi için sadece konuyu iyi bilmesi yeterli olmaz. Aynı zamanda o konuyu nasıl öğretmesi gerektiğini de bilmelidir. Bunun için öğretmenin analojileri, resimleri, değişik ve hayatla irtibatlı örnekleri, açıklamaları, görsel unsurları kullanabilmesi, dersini daha anlaşılır hale getirmek için pratik formüller ve akılda kalıcı yöntemler üretebilmesi (Batur & Balcı, 2013) ve uygulayabilmesi son derece önemlidir. Öğretmen adaylarının kendi eğitimleriyle öğrencilerinin öğrenmelerine katkıda bulunacak, öğrenme ortamlarını zenginleştirmelerinde ve öğrencilerde var olan anlama güçlüklerini ortaya çıkarabilmelerinde yardımcı olacak eğlenceli ve öğretici araçlardan biri olan kavram karikatürleri hakkında yeterli kazanımlara sahip olmaları son derece önemlidir.

Bu bağlamda, bu çalışmanın amacı öğretmen adaylarının kavram karikatürlerine ilişkin görüşlerinin belirlenmesidir.

YÖNTEM

Bu araştırmada öğretmen adaylarının kavram karikatürlerine ilişkin görüşlerini belirleyebilmek için anket yöntemi kullanılmıştır. Anket yönteminin amacı, incelenen durumu etraflıca tanımlamak ve açıklamaktır (Çepni, 2009).

Örneklem

Çalışmanın örneklemi, eğitim fakültesi fizik (20), kimya (11) ve biyoloji (20) öğretmenliği programlarında öğrenim gören toplam 51 öğretmen adayından oluşmaktadır. Öğretmen adayları 5. sınıf öğrencileridir ve çalışmaya gönüllü olarak katılmışlardır.

Veri Toplama Aracı

Öğretmen adaylarının kavram karikatürlerine ilişkin görüşlerini belirlemek için 8 açık uçlu sorudan oluşan bir anket kullanılmıştır. Anket soruları İnel, Balım ve Evrekli (2009) tarafından yapılan çalışmadan yararlanılarak araştırmacılar tarafından farklı sorular da eklenerek yeniden düzenlenmiştir. Anketteki soruların geçerlik çalışması için, uzman görüşüne başvurulmuştur. Bunun yanında örneklem dışında 5 öğrenciye pilot uygulama yapılarak ankete son şekli verilmiştir.

Verilerin Analizi

Öğretmen adaylarının kavram karikatürüne ilişkin görüşlerinin belirlendiği 8 açık uçlu sorudan oluşan anket, betimsel olarak analiz edilmiştir. Ankette yer alan 6 sorudan elde edilen veriler temalar oluşturularak frekans dağılımları ve yüzde hesaplamaları şeklinde sunulmuştur. Yedinci sorudaki veriler, ortak öğrenci görüşleri derlenerek verilmiştir. Anketin son sorusu olan " Herhangi bir konu ya da kavramla ilgili kavram karikatürü çizer misiniz?" sorusuna cevap olarak çizilen karikatürler üç farklı seviyede değerlendirilmiştir. Çizilen karikatürlerin dereceleri ve bu derecelere karşılık gelen açıklamalar Tablo 1'de verilmiştir.

Tablo1. Çizilen Karikatürlerin Dereceleri ve Bu Derecelere Karşılık Gelen Açıklamalar

Derece	Açıklama
1.	Bir kişinin baloncuk içerisinde görüşünü ifade etmesi
2.	İki kişinin olay hakkında konuşması, farklı görüşler ifade edilmemiş
3.	İki ya da daha fazla kişinin olay hakkında konuşması, farklı görüşlerin ifade edilmesi

BULGULAR

Bu bölümde araştırmacılar tarafından hazırlanan açık uçlu anket sorularına öğrencilerin verdikleri cevaplar ve bu cevaplara ilişkin frekans değerlerine yer verilmiştir. Öğrencilerin bir soruya verdikleri cevap içerisinde yer alan birden fazla görüş analize dâhil edilmiştir.

Tablo 2. "Kavram Karikatürü Denilince Aklınıza Ne Geliyor?" Açık Uçlu Sorusuna İlişkin Öğretmen Adaylarının Görüşleri ve Frekans Değerleri

Katılımcı ifadeleri	Fizik	Kimya	Biyoloji
Kavramların karikatüre aktarılması	5	3	5
Konuşma diyagramları	4	2	3
Çizgi resimler	4	3	3
Konuları görselleştiren materyaller	4	2	4
Mizahi şekiller	-	2	2
Kavram yanılgılarını giderici materyaller	2	2	4
Öğretici şekiller	-	-	2
Açıklayıcı diyagramlar	2	1	-

"Kavram karikatürü denilince aklınıza ne geliyor?" sorusuna öğretmen adaylarının birçoğu "kavramların karikatürize edilmesi, karikatüre aktarılmasıdır" şeklinde cevap vermiştir. Bunun yanında verilen diğer ifadelerin de benzer olduğu görülmüştür.

Tablo 3. "Daha Önce Kavram Karikatürleri İle Herhangi Bir Yerde Hiç Karşılaştınız mı?" Açık Uçlu Sorusuna İlişkin Katılımcıların Görüşleri ve Frekans Değerleri

İfadeler	Fizik	Kimya	Biyoloji
Ders kitaplarında	3	3	3
Lisans derslerinde	4	2	3
KPSS kitaplarında	5	4	6
Gazetelerde	2	2	1
Dergilerde(mizahi)	2	-	2
İlköğretim çalışma kitaplarında	5	4	6
Hiç karşılaşmadım	1	1	-

"Daha önce kavram karikatürleri ile herhangi bir yerde hiç karşılaştınız mı?" açık uçlu sorusuna ilişkin öğretmen adayları kavram karikatürleri ile daha çok ilköğretim çalışma kitapları ve KPSS test kitaplarında karşılaştıklarını belirtmişlerdir.

Tablo 4. "Kavram Karikatürleri Hangi Özelliklere Sahip Olmalıdır?" Sorusuna İlişkin Katılımcıların Görüşleri ve Frekans Değerleri

İfadeler	Fizik	Kimya	Biyoloji
Dikkat çekici	10	7	8
Açık ve anlaşılır	6	4	6
Gerçeğe uygun	5	-	-
Konuya uygun	6	3	5
Kavram yanılgılarını giderici	4	5	4
Öğrenci düzeyine uygun	-	4	-
Renkli, eğlenceli	3	5	3
Öğretici, bilgi verici	2	4	5
Güncel	3	-	-

"Kavram karikatürleri hangi özelliklere sahip olmalıdır?" sorusuna ilişkin öğretmen adaylarının büyük çoğunluğu "dikkat çekici ve anlaşılır" olmalıdır şeklinde görüş bildirmişlerdir. Diğer yanıtlar incelendiğinde katılımcıların benzer ifadeler kullandıkları görülmüştür.

Tablo 5. "Kavram Karikatürlerinin Avantajları ve Dezavantajları Nelerdir?" Sorusuna İlişkin Katılımcıların Görüşleri ve Frekans Değerleri

Avantajlar	Fizik	Kimya	Biyoloji
Dikkat çeker	8	6	7
Dersi ilgiyi arttırır	-	3	6
Kalıcı öğrenme sağlar	9	6	7
Kavram yanılgılarını giderir	3	-	5
Dersi eğlenceli hale getirir	4	3	4
Derse katılımı arttırır	5	2	3
Yaratıcı düşünmeyi geliştirir	-	2	3
Dezavantajlar			
Kavram yanılgısı oluşturur	5	3	4
Her konuya uygulanmaz	6	5	5

Hazırlanması zor ve zaman alıcı	4	-	3
Konuları yüzeysel anlatır	5	4	4
Dikkat dağıtabilir	4	3	4

“Kavram karikatürlerinin avantajları ve dezavantajları nelerdir?” sorusuna yönelik cevaplarda öğretmen adayları; kavram karikatürlerinin “dikkat çekici ve kalıcı öğrenmeyi sağlayıcı” özelliklerinin en önemli avantaj olduğunu belirtmişlerdir. Bunun yanında “her konuya uygulanmaz ve kavram yanılgısı oluşturabilir” ifadeleri ile de dezavantajlarına değinmişlerdir.

Tablo 6. “Kavram Karikatürlerini Derslerinizde Hangi Amaçla Kullanırsınız?” Sorusuna İlişkin Katılımcıların Görüşleri ve Frekans Değerleri

İfadeler	Fizik	Kimya	Biyoloji
Dikkat çekmek	5	4	5
Öğrencileri motive etmek	4	3	3
Dersi eğlenceli hale getirmek	3	4	5
Kalıcı öğrenme sağlamak	4	3	3
Kavram yanılgılarını tespit etmek	-	2	2

“Kavram karikatürlerini derslerinizde hangi amaçla kullanırsınız?” sorusuna ilişkin cevaplarda öğretmen adayları; dersin başında “dikkat çekmek, öğrencilerde merak uyandırmak ve motivasyonlarını arttırmak” amacıyla kullanacaklarını belirtmişlerdir. Ayrıca kavram karikatürleri ile dersleri daha eğlenceli hale getireceklerini ve kalıcı öğrenme sağlayacaklarını ifade etmişlerdir.

Tablo 7. “Kavram Karikatürleri Bütün Derslerde Kullanılır mı?, Sizce Hangi Derslerde Kullanılmalıdır?” Sorusuna İlişkin Katılımcıların Görüşleri ve Frekansları

İfadeler	Fizik	Kimya	Biyoloji
Tüm derslerde	5	4	5
Fen derslerinde	8	5	7
Soyut kavramlar içeren derslerde	-	3	2
Günlük hayatla ilişkili derslerde	3	3	2
Özellikle ilköğretim derslerinde	4	-	4

“Kavram karikatürleri bütün derslerde kullanılır mı?, Sizce hangi derslerde kullanılmalıdır?” sorusuna öğretmen adayları, kavram karikatürlerinin tüm derslerde kullanılabilir olduğunu özellikle de fen bilimleri gibi soyut dersler için daha uygun olduğunu belirtmişlerdir.

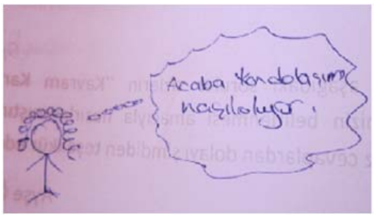
Öğretmen adaylarına 7. soruda “Kavram karikatürleri konusunda yeterli bilgi ve donanıma sahip olduğunuzu düşünüyor musunuz?” sorusu sorulmuştur. Elde edilen verilere göre; öğretmen adaylarının birçoğu bu konuda yeterli olmadıklarını, kavram karikatürünü sadece teorik olarak işlediklerini, uygulamaya yönelik bir çalışma yapmadıklarını belirtmişlerdir. Bazı öğretmen adayları “kavram karikatürü” kavramı ile ilk kez karşılaştığını, karikatürü sadece gazete ve dergilerdeki mizahi şekiller olarak düşündüklerini ifade etmişlerdir.

Tablo 8. “Herhangi Bir Konuda Kavram Karikatürü Çizer misiniz?” Sorusuna İlişkin Öğretmen Adaylarının Puanlarına Göre Dereceleri

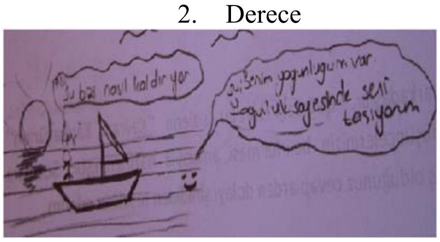
Derece	Fizik	Kimya	Biyoloji
1.	7	4	8
2.	10	4	10
3.	3	2	3

Tablo 8’de görüldüğü gibi 51 öğretmen adayından sadece 8 tanesi kavram karikatürü formatında doğru çizimler yapmışlardır. Öğretmen adaylarının yaptığı çizimlerden her dereceye ait bir örnek çizimler Şekil 1’de verilmiştir.

1. Derece



2. Derece



3. Derece

Şekil 1. Öğretmen Adaylarının Kavram Karikatürü Çizimleri

SONUÇLAR VE ÖNERİLER

Araştırmadan elde edilen sonuçlar, öğretmen adaylarının kavram karikatürleri ve kavram karikatürlerinin nasıl hazırlanacağı ile ilgili yeterli bilgiye sahip olmadığını göstermiştir. Öğretmen adayları kavram karikatürlerinin "dikkat çekici, eğlenceli, yaratıcı düşünmeyi geliştiren, kalıcı öğrenmeyi sağlayan ve kavram yanılgılarını gideren" görsel araçlar olduğunu ifade etmişlerdir. Bunun yanı sıra, doğru bir şekilde kullanılmadıklarında dikkati dağıtabileceklerini, farklı kavram yanılgılarını oluşturabileceklerini dile getirmişlerdir. Farklı kaynaklarda kavram karikatürlerine rastladıklarını ve özellikle fen bilimleri gibi soyut kavramlar içeren derslerde kullanımlarının daha uygun olduğunu söylemişlerdir. Ancak herhangi bir konu ya da kavramla ilgili bir kavram karikatürü çizmeleri istendiğinde yeterli içeriğe sahip çok fazla kavram karikatürü çizimiyle karşı karşıya kalınmamıştır. Elde edilen sayı beklenilen oldukça altında olmuştur. Bu durumun eğitimle ilgili derslerin daha ziyade teorik olarak işlenmesinden ve öğretmen adaylarının yeterince uygulamalar yapmamasından kaynaklandığı düşünülmektedir. Son sınıf öğrencileri oldukları için girecekleri KPSS sınavına fazlaca odaklanmış olmaları ve derslerde yalnızca geçmek için çaba sarf etmeleri de nedenlerden biri olabilir.

Bu sonuçlar doğrultusunda, öğretmen adaylarının kavram karikatürlerinin öğretim sürecinde kullanımı ve farklı fen konularında nasıl tasarlanacağı konusunda bilgilendirilmeleri önerilmektedir. Çünkü kavram karikatürleri mesleki yaşamlarında öğrenme ortamlarını zenginleştirebilmeleri açısından faydalı olacaktır. Eğitim derslerinde, özellikle materyal geliştirme, örnek etkinliklere yer verilmeli ve öğretmen adaylarından kendi kavram karikatürlerini hazırlamaları istenmelidir. Ayrıca öğretmen adaylarının birebir kavram karikatürlerinin etkililiğini belirlemek amacıyla çeşitli araştırmalar gerçekleştirmesi sağlanmalı ve elde etikleri sonuçları arkadaşlarıyla paylaşarak farklı durumları incelemelerine fırsat verilmelidir.

ÖZET: Bu çalışmada ilköğretim matematik öğretmenliği öğrencilerinin silindir kavramına dair kavram imajları incelenmiştir. Araştırmanın örneklemini Türkiye'nin güneyindeki bir devlet üniversitesinde 2011-2012 öğretim yılı ilköğretim matematik öğretmenliği öğrencilerinden geometri dersini alan toplam 111 öğrenci oluşturmaktadır. Veri toplama aracı olarak üç boyutlu geometrik kavramlara dair açık uçlu soruların bulunduğu bir form uygulanmıştır. Katılımcılardan, bu formda verilen kavramlarla ilgili çağrışımları yazmaları ve uygun olanların şekillerini çizmeleri istenmiştir. Bu çalışma kapsamında bu formda yer alan silindir kavramıyla ilgili veriler nitel olarak analiz edilmiştir. Analizlerden elde edilen bulgulardan katılımcıların genel olarak çağrışımdan ziyade tanım yapma eğiliminde oldukları ve şekilleri betimlemeye çalıştıkları görülmüştür. Ayrıca şekillerin yanal yüzeylerine ve tabanlarına aşırı bir vurgu göze çarpmaktadır. Öte yandan katılımcıların büyük bir çoğunluğunun silindir kavramını, dik dairesel silindir özelinde ele aldıkları görülmüştür. Bu verilere dayanarak katılımcıların büyük çoğunluğunun silindir kavramıyla ile ilgili kavram imajlarının zengin olmadığı veya yanlış kavram imajlarına sahip oldukları söylenebilir.

Anahtar sözcükler: Geometri öğretimi, kavram imajı, silindir

ABSTRACT: In this study, elementary mathematics education student's concept image about the concepts of cylinder was investigated. During this research we worked with 111 participants who are students at a state university which is located in the southern region of Turkey in the academic year 2011-2012. In order to collect data, a form including three dimensional geometrical concepts was utilized. The participants were asked to write the connotations about given concepts and draw the shapes of the appropriate ones. Within this study, the data about cylinder was analyzed qualitatively. It seems that the participants are generally inclinable to define and portrayal the shapes instead of trying to connotative them. Also there is a conspicuity that, there were an over-emphasize on the planar geometrical shapes which appears on the face of the certain concepts. On the other hand, most of the participants have a sense of the right circular cylinder as cylinder. As the result of collected data, we can say that participants' concept image about cylinder could not been enriched. In addition, they have some incorrect concept images.

Key words: Teaching geometry, concept image, cylinder

GİRİŞ

Kavramsal öğrenme matematikte ve özellikle de geometride önemli bir yer teşkil etmektedir (Altun, 2002). Kavramsal öğrenmenin gerçekleşmesi için kavramların biliniyor olması bir zorunluluktur. Ancak matematiksel kavramlara ait tanımların öğrencilerde kalıcı olup olmadığı konusu gündeme gelmektedir. Vinner (1991)'e göre tanımlar uzun vadede unutulmaktadır. Ayrıca öğrencilerin matematiksel kavramların tanımları konusunda zorluklar yaşadığına dair çalışmalara rastlamak ta mümkündür (Matos, 1994; Ubuz, 1999). Şu halde kavramların doğru anlaşılması için öğrencilerin kavramlarla ilgili doğru kavram imajları oluşturmaları bir gerekliliktir. Kavramların doğru anlaşılması matematiği anlamakta önemli olduğu kadar matematiksel konularda iletişim için de önemlidir. İletişim sırasında ilk akla gelen bilgiler ise verilen kavramla ilgili kavram imajlarıdır.

Buradan hareketle verilen kavramlara dair kavram imajları ve bu kavram imajlarının ne kadar zengin olduğunu ortaya koymak önemlidir.

Kavram İmajı

Öğrencilerin bir kavramla ilgili kendilerince oluşturulan fikirler kavram imajı olarak ifade edilmektedir (Tall ve Vinner, 1983). Başka bir ifadeyle; bir öğrencinin bir kavramla ilgili bütün zihinsel görüntüleri o öğrencinin verilen kavramla ilgili kavram imajı olarak tanımlanmıştır. Öyle ki bu zihinsel görüntüler bazen öğrencilerin o kavram söylendiğinde zihninde canlandırdığı diğer kavramlarla da ifade edilebilir. Vinner (1983) öğrencilerin bir kavramı öğrendikten uzun bir süre sonra kendisine kavram ile ilgili verilen görevlerde tanımı kullanabileceği gibi kavram imajını da kullanabileceğini belirtmiştir. Hatta öğrenmeler informal ortamlarda gerçekleşmişse, kavram tanımının hiç kullanılmayacağı kavram imajının kullanılacağı belirtilmektedir. Kavram imajları ise her zaman bilimsel görüşlerle uygun düşmeyebilir (Gutierrez ve Jaime 1999).

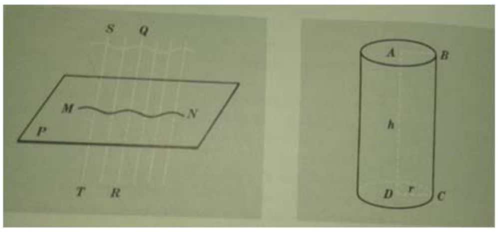
Araştırmada katılımcıların silindir kavramına dair kavram imajları incelenmiştir. Bu bağlamda silindir kavramının formal tanımını ele almak gerekir. Çünkü formal ortamlarda kavramların öğrenilmesinde tanımlar önemli bir rol oynamaktadırlar, bir kavrama ait tanımın açık, anlaşılır ve ekonomik olması önemlidir (Çakıroğlu, 2013).

Silindir

Literatürde silindirin farklı tanımlarına rastlamak mümkündür örneğin bir kaynakta: Silindir, prizmanın tabanının kenar uzunluklarının kısalmış ve kenar sayısının sonsuza gitmiş halidir (Altun, 2002). Denilmektedir bu tanımlama silindiri özel bir prizma olarak kabul etmektedir. Ayrıca aynı kaynakta, silindir dendiğinde "dik dairesel silindir" kavramının kastedildiğini, diğer silindir türlerinin özellikle belirtilmesi gerektiğinden bahsedilmektedir. Nitekim Dönmez (2002)' de silindir kavramı tanımı verilirken sadece dairesel silindiri kapsayan bir tanım verilmiştir. Tanım ifadesinde silindirin tabanlarının aynı yarıçaplı daireler olduğu söylenmiştir. Bu tanımlarda tabanların paralelliğinden, silindirin içinin dolu veya boş olacağından veya herhangi başka bir özellikten bahsedilmeden sadece tabanları aynı yarıçaplı dairelerden oluşan şekil silindir olarak kabul edilmiştir. Diğer taraftan Kruglak ve Moore (1963 ss:158,160);

> MN düzlemde bir eğri ve QR bu düzlemde olmayan bir doğrultman doğru olmak üzere(resim 1) bir ST doğrusu eğri boyunca QR doğrusuna paralel olacak şekilde hareket ettirilirse silindirik yüzey elde edilmiş olur. ST doğrusunun her konumuna ise "doğrultman" Denir. Eğer MN eğrisi kapalı bir eğriyse elde edilen yüze kapalı silindirik yüzey olarak adlandırılır. Kapalı bir silindirik yüzeyin iki paralel düzlemle kesilmesi sonucu oluşan şekle ise silindir denir.

Biçiminde tanımlamaktadır. Benzer tanım farklı kaynaklarda da yer almaktadır (Demirtaş, 1986; …). Yapılan tanımlara bakıldığında silindirin bir düzlemde bulunan bir eğri üzerinde belli bir açıyla hareket ettirilen bir doğrunun ilk düzleme paralel bir düzlemle kesilmesi sonucu oluşan üç boyutlu geometrik şekil, olduğunu söylemek mümkündür. Bu tanımlama biçimi silindiri, silindirik yüzey kavramı ile ilişkilendirerek tanımlamaktır.



Resim 1: Kruglak Ve Moore'de Verilen Silindir Resmi

Ayrıca Van De Walle (2004)' a göre silindir genel anlamda sınırsız açık bir yüzey özel anlamda ise tabanları olan ve bir yüzeyle sınırlı kapalı, içi boş cisimdir(s.423). Silindir için söz konusu kaynakta verilen görsel ise resim 1'de verilmiştir.

resim 2. Silindirler Ve Silindir Olmayan Şekiller

Söz konusu kaynakta silindir tanımı ise hiyerarşik olarak prizmaya dayandırılarak da yapılmıştır. Tanımda tabanları çokgen olan silindirler prizma olarak adlandırılır. Şeklinde bir ifadeye yer verilmiştir. (Van de Walle, Karp ve bay-Williams, 2013).

Araştırma konusu olan silindir kavramı gündelik hayatta başka alanlarda kullanılan kavramlardır ve bu kavramın informal ortamlarda öğrenilmesi beklenen bir durumdur. İnformal ortamlarda veya günlük hayatta silindir olarak adlandırılan cisimler ise matematiksel olarak bu kavramı karşılamayabilirler. Şu halde öğrencilerin bu kavramla ilgili formal ortamlarda da belli bir birikim kazandıktan sonra ve söz konusu öğrenmelerin üzerinden belli bir zaman geçtikten sonra kavram imajlarının nasıl şekilleneceği sorusu gündeme gelmektedir. Bu bağlamda bu çalışmada geometrik kavramlardan silindire dair katılımcıların kavram imajları incelenmiştir.

YÖNTEM

Bu çalışma nitel bir yöntem kullanılmıştır. Nitel araştırmalar kişi davranışlarının nedenlerini anlamaya dönük çalışmalardır. (Arlı ve Nazik, 2001:14).

Örneklem

Bu araştırmanın örneklemini 2011-2012 öğretim yılı, bahar döneminde Türkiye'nin güneyindeki bir devlet üniversitesinde Eğitim Fakültesi İlköğretim Matematik Öğretmenliği programı kapsamında GEİM 106 GEOMETRİ dersi alan, 86 bayan ve 25 erkek toplam 111 ilköğretim matematik öğretmenliği öğrencisi oluşturmaktadır.

Veri Toplama Aracı

Bu veri toplama aracı bir araştırma projesi bağlamında hazırlanmıştır. Veri toplama aracında katılımcıların üç boyutlu şekillere dair kavram imajlarının belirlenmesi planlanmıştır. Bu amaçla proje yürütücüleri tarafından bir ölçek üzerinde çalışılmış anlaşılmayan sorular düzenlenmiş ve ölçeğe son hali verilerek veri toplama aracı olarak kullanılmıştır. Bununla beraber aracın kullanılabilirliği için alanda uzman iki akademisyenin görüşlerine başvurulmuştur. Veri toplama aracında prizma, silindir, piramit, koni ve küre kavramlarının katılımcılara ne çağrıştırdığı sorulmuş ve çizimlerini yapmaları istenmiştir. Ancak araştırma kapsamında silindir kavramları ile ilgili katılımcı cevapları analiz edilmiştir.

Veri Analiz Süreci

Verilerin sayısallaştırılması işlenmesi ve karşılaştırmalı değerlendirmenin yapılabilmesi kodlama işlemidir (Bal, 2001:160). Verilerin kodlanmasında Pilkington (2001)'de verilen içerik analizi metodu kullanılmıştır. Bu doğrultuda katılımcıların verdiği cevaplar incelenerek tekrar eden cevaplar kodlanmıştır (akt: Bozkurt 2012). Ayrıca katılımcıların cevaplarında göze çarpan bazı noktalar "genel gözlemler" başlığı altında verilecektir. Araştırmaya katılan katılımcıların verdiği cevaplardan oluşturulan kategoriler Tablo 1'de gösterilmiştir.

Tablo 1: Silindir kavramı için oluşturulan kategoriler

Simge	Kategori	Örnek
S	Dik dairesel silindir çizimi yapanlar	 (#11)
AS	Silindiri, bir dikdörtgen ve iki dairenin birleşimi olarak ifade edenler	-İki daire ve bir dikdörtgenin birleşiminden oluşan geometrik şekildir.

BS	Silindiri, bir dikdörtgen ve iki çemberin birleşimi olarak ifade edenler	- İki eş çember ve eni h boyu çemberin çapının iki katı olan dikdörtgenden oluşmuş şekil.
CS	Silindiri, tabanı daire olan bir prizma şeklinde ifade edenler	-Tabanı daire olan prizmadır.
DS	Silindiri, tabanı çember olan prizma şeklinde ifade edenler	-Alt ve üst tabanı birbirine eş iki çemberden oluşan prizmadır.
ES	Silindiri, "bir dikdörtgenin herhangi bir kenarı etrafında döndürülmesiyle oluşan şekil" olarak ifade edenler	-Bir dikdörtgenin bir kenarı etrafında 360° döndürülmesi ile oluşan şekildir.
FS	Silindiri, "dikdörtgenin bükülmesi veya yuvarlanmasıyla oluşan şekil" olarak ifade edeneler.	-Bir dikdörtgenin yuvarlanıp boş kalan kısımların eşit daireler yerleştirilmesi sonucu oluşan şekil.
GS	Silindirin üç boyutlu bir cisim olduğundan bahsedenler	-Silindir üç boyutlu bir cisimdir, kalemin alt tarafı gibi.
HS	Betimleme yapanlar	-Aralarında mesafe bulunan 2 dairenin birçok çizgi ile birleştirilmesi sonucu oluşan üç boyutlu şekil.
IS	Silindir için günlük hayattan örnek verenler	-İki daireden ve bir dikdörtgenden oluşur günlük hayattan örnek vermek gerekirse borular olabilir.

Katılımcı cevaplarının çoğu birden fazla kategoride değerlendirilebilecek cevaplardır. Bu nedenle kategorilerde elde edilen cevap sayısı katılımcı sayısından fazla olmuştur. Ayrıca sayısal olarak analiz edilen bu bulguların dışında katılımcıların cevaplarında dikkat çeken bazı hususlar genel gözlemler başlığı altında verilmiştir.

BULGULAR

Katılımcıların verdiği cevaplardan oluşturulan kategoriler

Çalışmanın bu bölümünde veri toplama aracında yer alan silindir kavramlarının katılımcılardaki kavram imajlarına dair elde edilen veriler analiz edilmiştir. Tablo 2'de silindir ile ilgili bulguların frekansları gösterilmektedir.

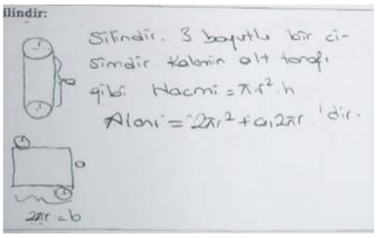
Tablo 2: Silindir Ile Ilgili Katılımcıların Kavram Imajlarına Dair Bulgular

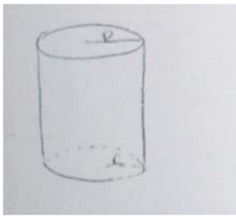
Kategori	**Frekans**
Dik dairesel silindir çizimi yapanlar	109
Silindiri, bir dikdörtgen ve iki dairenin birleşimi olarak ifade edenler	34
Betimleme yapanlar	32
Silindirin üç boyutlu bir cisim olduğundan bahsedenler	26
Silindir için günlük hayattan örnek verenler	20
Silindiri, "dikdörtgenin bükülmesi veya yuvarlanmasıyla oluşan şekil" olarak ifade edenler.	11
Silindiri, bir dikdörtgen ve iki çemberin birleşimi olarak ifade edenler	10
Silindiri, "bir dikdörtgenin herhangi bir kenarı etrafında döndürülmesiyle oluşan şekil" olarak ifade edenler	7
Silindiri, tabanı daire olan bir prizma şeklinde ifade edenler	4
Silindiri, tabanı çember olan prizma şeklinde ifade edenler	2

Tablo 2 incelendiğinde silindiri çizmeleri istenen katılımcılardan 109'u dik dairesel silindir çizimi yaptığı görülmektedir. Yine Tablo 2'den silindir kavramına dair çağrışım cevapları incelendiğinde ise 34 katılımcının bir dikdörtgen ve iki dairenin birleşimi olarak ifade ettiği,32 katılımcının betimleme yaptığı, 26 katılımcının silindirden üç boyutlu bir cisim olarak bahsettiği, 20 katılımcının ise silindirin üç boyutlu bir cisim olduğundan bahsettiği görülmektedir. Ayrıca bazı katılımcılarda silindiri, dikdörtgenin bükülmesi veya yuvarlanmasıyla oluşan şekil (11), bir dikdörtgen ve iki çemberin birleşimi (10), bir dikdörtgenin herhangi bir kenarı etrafında döndürülmesiyle oluşan şekil (7), tabanı daire olan bir prizma (4) ve tabanı çember olan prizma (2) şeklinde ifade etmişlerdir.

Silindir kavramının katılımcılarda yaptığı çağrışımlara dair genel gözlemler

Katılımcılara silindir kavramının ne çağrıştırdığı sorulmasına rağmen çoğunlukla silindirin matematiksel özelliklerini yazmaya çalıştıkları gözlenmektedir (62 katılımcı). Ayrıca katılımcıların büyük bir çoğunluğu silindir çiziminde dik dairesel silindir çizmiş (109katılımcı) ve kategorilerde de görüldüğü üzere kavram imajlarını da bu şekilde oluşturmuşlardır.



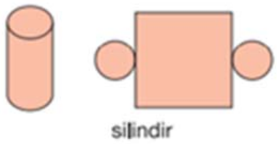


resim 3: #9 numaralı katılımcı silindir çizimi

resim 4: #11 numaralı katılımcının

TARTIŞMA

Katılımcıların hemen hemen hepsinin silindiri, dik dairesel silindir olarak algılamaları ve çizimleri buna göre yapmaları silindir kavramını dik dairesel silindire indirgediklerini düşündürmektedir. Bu durum litaratürde verilen tanımlarla örtüşmektedir.(Altun, 2002, Dönmez, 2002). Ayrıca katılımcıların önemli bir çoğunluğu (107 tanesi) silindiri tarif ederken silindirin açık halinde oluşacak şekillerden bahsetmiştir. Bu durum, katılımcıların öğretim süreçlerinde geometrik cisimlerin açık halinin fazlaca vurgulanmasının bir sonucu olarak yorumlanabilir. Nitekim ilkokul 3.sınıf matematik ders kitabında silindir kavramı "geometrik cisimlerin yüzleri ve yüzeyleri" başlığı altında verilmiştir ve silindir için ilk görsel resim 5'deki gibidir (Coşkuntürk vd., 2012). Ayrıca 6. Sınıfta Dik dairesel silindirin temel elemanlarını belirlemeye dair, 7. Sınıfta ise dik dairesel silindirin yüzey alanı ve hacmi hesaplamaları yaptırılmasının istendiği görülmektedir. Görüldüğü gibi Silindir kavramı öğrencilere ilkokul, ortaokul, lise ve lisans öğrenimi esnasında ayrı ayrı işlenmektedir. Bu aşamaların her birinde silindir kavramı için yapılan tanımlar ve verilen örnekler birbirlerinden farklıdır. (MEB, 2005) bu farklılık genellikle daha alt seviyelerde daha basit ve anlaşılır ifadeler kullanılarak tanım yapma isteğinden kaynaklanmaktadır. Ancak öğrenciler silindir başlığı altında sürekli dairesel silindir örnekleri görüp bunlarla bir kavram imajı oluşturursa bu kavram imajının dairesel silindir dışındaki silindirleri kapsamayacağı iddia edilebilir. MEB programında bu durum açıkça göze çarpmaktadır.



Resim 3. **İlköğretim 3. sınıf ders kitabında silindir için verilen görsel (MEB, 2005)**

Resim 2'de görüldüğü gibi silindir ve silindir yüzeyinin açık hali beraber verilmiştir. Vinner (1983)'te değinildiği gibi bir ders kitabında ikizkenar üçgenler için verilen bütün örneklerde taban yatay çizilmişse öğrencilerin sadece tabanı yatay olan ikizkenar üçgenleri ikizkenar kabul etmesi sürpriz olmayacaktır. Aynı şekilde ders kitaplarında silindirler bir dikdörtgen ve iki daire ile beraber verildiğinde öğrencilerin silindir ile ilgili kavram imajlarının bu şekilde oluşması da sürpriz değildir. Bu ve benzer şekil ve temsillerin silindir ile ilgili kavram imajlarını sınırlandıracağı düşünülebilir. Nitekim Vinner (1983) öğrencilere verilen spesifik örneklerin kavram imajlarını sınırlandırabileceği, hatta hatalara sebep olabileceğini belirtmiştir.

Katılımcılardan bazıları silindirin tabanını çember olarak ifade etmişlerdir. Ayrıca verilen örneklerde silindirin tabanının çember mi yoksa daire mi olacağı veya herhangi bir kapalı eğri mi olacağı konusunda katılımcıların net cevaplar vermediği görülmüştür. Bu durumda ders kitaplarında silindir için verilen tanımlarda silindirin içinin dolu olup olmayacağı veya tabanının hangi geometrik şekil olacağının net olarak vurgulanmadığını veya öğretmenlerin bu noktaya vurgu yapmadığını düşündürmektedir.

Silindir ile ilgili günlük hayattan örnek vererek açıklayan katılımcıların çoğu (20 kişiden 17'si) benzer örnekler vermiştir. (bardak, soba borusu vb.) Çevremizdeki nesnelerden verilen örneklerin her zaman silindir olmayacağı unutulmamalıdır. Örneğin günlük hayatta kullanılan her bardağın görüntüsü silindir olarak ifade edilemez.

BİR KAMPÜS AĞINDA EN KISA UZUNLUKLU HAMİLTON ÇEVRELERİN BULUNMASI

FINDING MINIMUM LENGTH HAMILTON CYCLES IN A CAMPUS NETWORK

Canan ÇİFTÇİ
Ege Üniversitesi
canan.ciftci@ege.edu.tr

Pınar DÜNDAR
Ege Üniversitesi
pinar.dundar@ege.edu.tr

ÖZET: Bir öğrenci bir duraktan başlayarak tüm duraklara tam bir kez uğrayıp başladığı durağa dönecek şekilde minimum ağırlıklı bir tur yapmak istemektedir. Burada i durağı ile j durağı arasındaki ağırlık bu iki durak arasındaki uzaklığı gösteren w_{ij} pozitif tamsayısıdır. Bir G grafının tüm tepelerinden geçen bir çevrenin olup olmadığını bulma problemi Hamilton çevre problemi olarak, minimum ağırlıklı Hamilton çevrenin bulunması ise gezgin satıcı problemi olarak bilinmektedir. Bu çalışmada, ayrıt ağırlıklandırılmış bir grafın minimum uzunluklu Hamilton çevresini bulan bir algoritma tasarlanmış ve bu algoritma kullanılarak Ege Üniversitesi kampüsünde minimum ağırlıklı Hamilton çevrelerin varlığı araştırılmıştır.

Anahtar sözcükler: Hamilton çevre, gezgin satıcı problemi, ayrıt ağırlıklandırılmış graf, ağ.

ABSTRACT: Starting from a vertex, a student is willing to visit each city once and only once and then return to the starting city with minimal weight. Let w_{ij} be the distance between the cities i and j. The problem of determining whether there exists a cycle passing through all the vertices of a graph G or not, is known as Hamilton Cycle Problem. The problem of finding the Hamilton cycle with minimum weight, is also known as Travelling Salesman Problem. In this study, an algorithm is designed for finding Hamilton cycle with minimum length of an edge-weighted graph and with this algorithm, Hamilton cycles with minimum length are examined of Ege University Campus.

Key words: Hamilton cycle, travelling salesman problem, edge-weighted graph, the network.

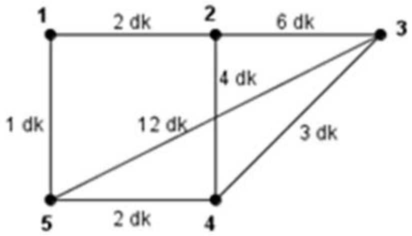
GİRİŞ

Matematiğin bir dalı olan graf teori, günlük yaşamda karşılaşılan pek çok olayın matematiksel modellerinin oluşturulmasına ve bu modellerin bilinen yöntemlerden farklı başka tekniklerle kolayca çözülmesine olanak tanır. Matematiksel olarak ifade edilirse, $V(G)$ tepeler kümesi, $E(G)$ ayrıtlar kümesi olmak üzere $V(G)$ tepeler kümesindeki ikililerin ve bu ikililer arasındaki ayrıtların oluşturduğu yapıya graf adı verilir ve $G=(V,E)$ şeklinde ya da kısaca G ile gösterilir. Bir ayrıt $e=(u,v)$ biçiminde gösterilir. Burada u ile v tepelerine bitişik tepeler denir. Ayrıca e ayrıtı da u ve v tepesi ile bitişiktir. Bitişik tepeler komşu tepeler olarak da adlandırılır. (Dündar, P. , Balcı, M. A. ve Kılıç, E., 2011)

Bir G grafının tüm tepelerini tam olarak bir kez geçen başlangıç ve bitiş noktası aynı olan çevreye Hamilton çevre denir. Hamilton çevre içeren graflara Hamiltonian ya da Hamilton graf denir. Hamilton çevrede grafın tüm ayrıtlarının kullanılması gerekmemektedir. Bir grafın Hamilton graf olup olmadığına karar vermek çok zor olabilir. Hamilton çevrelerin belirlenmesine ilişkin ifadesi karmaşık ve uygulaması zor bir kaç gerek ve bir kaç yeter şart bulunmakla birlikte hali hazırda bir grafın Hamilton graf olup olmadığını söyleyecek bir gerek ve yeter şart bilinmemektedir. (*Xu, J.*, 2003)

Temel Tanımlar

Tanım: $G=(V,E)$ grafının ayrıtlarına (tepelerine) ortak bir birim ortamında değerler yerleştirilirse böyle graflara ayrıt (tepe) ağırlıklandırılmış graf denir. (Gross, J. ve Yellen, J., 1998)
$G=(V,E)$ grafı için W matrisi ağırlık matrisi olarak kullanılmakta ve elemanları $w_{ij}>0$ ağırlıkları olup i tepesini j tepesine doğrudan birleştiren ayrıtın ağırlığı olarak tanımlanmaktadır. Eğer i tepesi j tepesine bir ayrıtla bitişik değilse $w_{ij}=\infty$ alınmaktadır ve graf loop (bir tepeyi kendisine bağlayan ayrıt) içermediğinden $w_{ii}=0$ alınmaktadır.



$$W = \begin{array}{c} \\ 1 \\ 2 \\ 3 \\ 4 \\ 5 \end{array} \begin{array}{c} \begin{array}{ccccc} 1 & 2 & 3 & 4 & 5 \end{array} \\ \begin{pmatrix} 0 & 2 & \infty & \infty & 1 \\ 2 & 0 & 6 & 4 & \infty \\ \infty & 6 & 0 & 3 & 12 \\ \infty & 4 & 3 & 0 & 12 \\ 1 & \infty & 12 & 2 & 0 \end{pmatrix} \end{array}$$

Şekil 1. Ayrıt-Ağırlıklandırılmış Graf ve Ağırlık Matrisi

Tanım: Bir G grafının bir v tepesine bağlı olan ayrıtların sayısına v tepesinin derecesi denir.

Gezgin Satıcı Problemi

Bir grafta minimum ağırlıklı Hamilton çevrenin bulunması problemi gezgin satıcı problemi olarak bilinmektedir. Bu problemde amaç, bir satıcının bulunduğu şehirden başlayıp her şehre sadece bir kez uğradıktan sonra başladığı şehre dönen en kısa turu bulmaktır.
Gezgin satıcı problemi, graf teori dilinde şehirlerin tepelerle şehirler arası yolların ayrıtlarla temsil edildiği bir graf üzerinde en kısa Hamilton turunun bulunmasıdır. Eğer graf Hamilton graf ise böyle bir kapalı yol vardır. Bu durumda gezgin satıcı probleminin çözümü Hamilton çevrenin bulunmasıyla aynıdır. Ancak graf Hamilton grafı olmayabilir. Bu durumda problem graf üzerinde Hamilton çevrenin varlığının araştırılması veya Hamilton çevrenin olması için grafa yapılacak eklemenin (ayrıt) nerelere olacağıdır. Gezgin satıcı probleminin Hamilton çevreden farkı gezinmenin en az maliyetle yapılmasıdır. (Davendra, D., 2010 ; Dündar, P. ve Dündar, S., 1998)

Gezgin Satıcı Probleminin Matematiksel Ifadesi

$V = \{1,2,\ldots,n\}$ tepeler kümesi, $E = \{(i,j) | \ (i,j) \in V, i \neq j\}$ ayrıtlar kümesi olmak üzere genel olarak n tepeli m ayrıtlı bir G grafı üzerindeki minimum ağırlıklı Hamilton çevre probleminin genel doğrusal programlama problemi aşağıdaki gibidir:

a. Graf yönlü graf ise,

$$x_{ij} = \begin{cases} 1, & (i,j) \text{ ayrıtı seçilirse} \\ 0, & \text{aksi halde} \end{cases} \tag{1}$$

$$\begin{cases} \sum\limits_{\substack{i=1 \\ i \neq j}}^{n} x_{ij} = 1, \ \ j = \overline{1,n} \\ \sum\limits_{\substack{j=1 \\ i \neq j}}^{n} x_{ij} = 1, \ \ i = \overline{1,n} \end{cases} \tag{2}$$

$$\sum_{(i,j) \in S}^{n} x_{ij} \leq |S|, \qquad 2 \leq |S| \leq n-2, \qquad S \subseteq V \tag{3}$$

$$z = \sum_{j=1}^{n} \sum_{i=1}^{n} w_{ij} x_{ij} \tag{4}$$

b. Graf yönsüz graf ise,

$$x_{ij} = \begin{cases} 1, & (i,j) \text{ ayrıtı seçilirse} \\ 0, & \text{aksi halde} \end{cases} \tag{1}$$

$$\sum_{i<k}^{n} x_{ij} + \sum_{j>k}^{n} x_{ij} = 2, \ \ k = \overline{1,n} \tag{2}$$

$$\sum_{(i,j) \in S}^{n} x_{ij} \leq |S|, \qquad 3 \leq |S| \leq n-3, \qquad S \subseteq V \tag{3}$$

$$z = \sum_{j=1}^{n} \sum_{i=1}^{n} w_{ij} x_{ij}, \qquad i < j \tag{4}$$

Amaç (4) deki fonksiyonun değerini (1), (2) ve (3) koşulları altında minimum yapmaktır. (2) koşulu her tepede bir giren ve bir çıkan ayrıtın bulunduğunu gösterir. Yani Hamilton çevrede her tepenin derecesinin 2 olduğunu gösterir. (3) koşulu ise oluşacak erken Hamilton alt turlarının yok edildiğini gösterir. (Jain, L. ve Bhanot, A., 2012)

YÖNTEM

En Kısa Uzunluklu Hamilton Çevrelerin Bulunması Algoritması

Aşağıdaki çözüm yöntemini izleyerek gezgin satıcı problemi için üç adımlık bir çözüm yolu geliştirilebilir.

(a) Grafın tüm Hamilton turlarını bul.
(b) Her turun uzunluğunu hesapla.
(c) Turlar arasından en kısasını seç.

Eğer satıcı 25 şehirli bir gezgin satıcı problemini her Hamilton turunu 10^{-9} saniye inceleme kapasitesine sahip bir bilgisayarla çözmeye kalkarsa 10 milyon yıl sonra en kısa turu bulabilir. Böylece bu çözüm yolunun uygulanması olanaksızdır.

Çok şehirli gezgin satıcı problemlerini çözmek için pratik bir yöntem, yaklaşık çözüm üreten sezgisel algoritmalar kullanmaktır. Sezgisel algoritmalar, en iyi çözümü garanti etmemelerine karşın en iyi çözüme yakın oldukça iyi bir sonucun makul bir sürede bulunmasını sağlarlar. Sezgisel algoritmalardan bir tanesi de en yakın komşu algoritmasıdır. (Nabiyev, V.V., 2013)

En Yakın Komşu Algoritması

En yakın komşu algoritması her adımda minimum ağırlığın seçimine dayalı olan bir algoritmadır. Bu algoritma oldukça hızlı ve uygulanması kolay bir algoritmadır. Fakat başlangıç tepesinin seçimine bağlı olarak gerçek çözüme yaklaşıldığı gibi uzaklaşmak ta mümkündür. (Gross, J. ve Yellen, J., 1998; Nabiyev, V.V., 2013)

Adım 1. İşlemlerin başlayacağı ve tamamlanacağı herhangi bir tepe seçilir. ($v = 1$)
Adım 2. Bu tepeden erken döngü oluşturmayacak şekilde minimum ağırlıklı komşu tepe seçilir.
Adım 3. $v = v + 1$ yap. Tüm tepeler ziyaret edilene kadar işlem tekrarlanır.
Adım 4. $|V| = n$ ise son ziyaret edilen tepeyle ilk tepe birleştirilir ve sonuç elde edilir.

BULGULAR

Ege Üniversitesi Kampüs Ağında En Kısa Uzunluklu Hamilton Çevrelerin Bulunması Problemi

Bu bölümde Ege Üniversitesinin doğu kampüsü krokisine bağlı kalınarak, duraklar arasındaki mesafeler kullanılarak en kısa uzunluklu Hamilton çevrelerin bulunması problemi için kampüsün grafı çizilmiştir.

Şekil 2' de krokisi verilen kampüs ağı bir graf olarak modellendiğinde Şekil 3' teki graf elde edilir. Bu modellemede durakların kesim noktası birer v_i tepesi ve sokaklar birer ayrıtla belirlenmiştir. Her tepe arasındaki mesafeler ise ayrıtlar üzerine yerleştirilerek Şekil 3' teki 44 tepeli ayrıt-ağırlıklandırılmış graf elde edilmiştir.

Şekil 3. Krokisi Verilen Ağın Grafı

En Yakın Komşu Algoritması Bazlı Gezgin Satıcı Problemi Algoritması

En yakın komşu algoritması bazlı bu algoritmada en yakın komşu algoritmasının çalışma mantığı esas alınarak, verilen problemin ağırlık matrisi üzerinden minimum ağırlıklı Hamilton çevreleri bulunması amaçlanmaktadır.

Adım 1. W ağırlık matrisinde işlemlerin başlayacağı ve biteceği bir v tepesi seçilir ve bu v tepesinin satırındaki sıfırdan farklı minimum ağırlıklı olan elemanın bulunduğu sütun tepesi etiketlenir. $(v = 1)$
Adım 2. v tepesinin satır ve sütun elemanları silinerek yerine sıfır yazılır.
Adım 3. $v = v + 1$ yap. Etiketlenen tepenin satırındaki en küçük elemanın sütun tepesi etiketlenir ve etiketlenen ilk tepenin satır ve sütun elemanları silinerek yerine sıfır değeri yazılır.
Adım 4. Eğer minimum ağırlık sonsuz veya sıfır ise adım 1'e git. Aksi halde adım 3'e git.
Adım 5. $|V| = n$ ve $W = [0]$ (ağırlık matrisi sıfır matris) ise son tepe ile ilk v tepesi birleştirilir ve sonuç elde edilir. Aksi halde adım 1'e git.

Verdiğimiz algoritmanın Matlab dilinde genel kodlaması yapılmış ve Şekil 3' de oluşturulan 44 tepeli grafın ağırlık matrisi oluşturulup verilen algoritma bu matrise göre çalıştırılmıştır. Sonuç olarak 21 tane minimum ağırlıklı Hamilton çevre bulunmuştur. Bulunan Hamilton çevrelerin birkaçı ve uzunlukları aşağıda verilmektedir.
v_2 tepesi ile başlayan en kısa uzunluklu Hamilton çevre:
$v_2 - v_3 - v_4 - v_5 - v_6 - v_7 - v_9 - v_8 - v_{10} - v_{11} - v_{12} - v_{31} - v_{30} - v_{13} - v_{14} - v_{15} - v_{16} - v_{17} - v_{18} - v_{19} - v_{20} - v_{21} - v_{28} - v_{29} - v_{33} - v_{32} - v_{34} - v_{35} - v_{36} - v_{37} - v_{38} - v_{39} - v_{40} - v_{41} - v_{42} - v_{43} - v_{44} - v_{26} - v_{25} - v_{24} - v_{27} - v_{22} - v_{23} - v_1 - v_2$
v_2 tepesi ile başlayan en kısa uzunluklu Hamilton çevrenin uzunluğu 5786 m 'dir.

v_3 tepesi ile başlayan en kısa uzunluklu Hamilton çevre:
$v_3 - v_4 - v_5 - v_6 - v_7 - v_9 - v_8 - v_{10} - v_{11} - v_{12} - v_{31} - v_{30} - v_{13} - v_{14} - v_{15} - v_{16} - v_{17} - v_{18} - v_{19} - v_{20} - v_{21} - v_{28} - v_{29} - v_{33} - v_{32} - v_{34} - v_{35} - v_{36} - v_{37} - v_{38} - v_{39} - v_{40} - v_{41} - v_{42} - v_{43} - v_{44} - v_{26} - v_{25} - v_{24} - v_{27} - v_{22} - v_{23} - v_1 - v_2 - v_3$
v_3 tepesi ile başlayan en kısa uzunluklu Hamilton çevrenin uzunluğu 5786 m' dir.

v_{32} tepesi ile başlayan en kısa uzunluklu Hamilton çevre:
$v_{32} - v_{34} - v_{35} - v_{36} - v_{37} - v_{38} - v_{39} - v_{40} - v_{41} - v_{42} - v_{43} - v_{33} - v_{29} - v_{30} - v_{13} - v_{14} - v_{15} - v_{16} - v_{17} - v_{18} - v_{19} - v_{20} - v_{21} - v_{28} - v_{44} - v_{26} - v_{25} - v_{24} - v_{27} - v_{22} - v_{23} - v_1 - v_2 - v_3 - v_4 - v_5 - v_6 - v_7 - v_9 - v_8 - v_{10} - v_{11} - v_{12} - v_{31} - v_{32}$
v_{32} tepesi ile başlayan en kısa uzunluklu Hamilton çevrenin uzunluğu 5834 m' dir.

Bulunan 21 Hamilton çevre içinden en kısa uzunluklu Hamilton çevrenin uzunluğu 5786 m' dir.

SONUÇ

Bu çalışmada Ege Üniversitesi kampüsünün doğu yakası krokisi ele alınarak kampüsün grafı çizilmiş ve bir öğrencinin bir duraktan başlayarak tüm duraklara tam bir kez uğrayıp başladığı durağa dönecek şekilde minimum uzunluklu bir tur yapıp yapamayacağı verilen algoritma ile incelenmiş ve Hamilton çevrelerin uzunlukları hesaplanıp bunlar içinden en kısa olanı bulunmuştur.

PSEUDOSCIENTIFIC BELIEFS OF UNIVERSITY SCIENCE EDUCATION STUDENTS

Duygu METIN

Jale CAKIROGLU

Ceren OZTEKIN

Yasemın OZDEM

Kader BILICAN,

The development of scientific literacy is fundamental goal of every country. According to Hurd (1998), distinguishing theory from dogma, understanding the ways in which scientific research is done, and distinguishing science from pseudo-science such as astrology are some skills characterizing scientific literate individual. For this reason, the existence of pseudoscientific beliefs would be stated as fundamental obstacle to developing scientific literacy. However, consistent evidence are available showing that pseudoscientific beliefs are widespread among general population, students, and even among science educators (Martin, 1994).

Although science and pseudoscience seem to have some similarities, they are absolutely different from each other in their assumptions, process, and context. Shermer (1997) explained pseudoscience as claims that they appear scientific although they lack supporting evidence and plausibility. Investigating pseudoscientific beliefs is a newly emerging research field in Turkey, and research studies held in pseudoscience are very limited.

The purpose of the present study was to investigate university science education students' pseudoscientific beliefs. Participants were 1805 university students attending science teacher education program in 16 different universities across Turkey. The methodology of the study is survey. Pseudoscientific Belief Scale and some demographic questions were used to collect data. Pseudoscientific Belief Scale includes four factors that are Superstitions, Paranormal Beliefs, Socio-cultural Beliefs Related to Religion, and Pseudoscientific Beliefs.

The results showed that university science education students believe in superstition stated in scale such as broken mirror, black cat, and unlucky numbers. They had beliefs based on religious ritual such as wearing amulet, and going to religious places before an important issue such as exam. They also had some pseudoscientific beliefs such as "the solar eclipse triggers an earthquake". The mode values of the most of the items are 5 indicating the students were absolutely agree about most of the pseudoscientific beliefs.

Keywords: pseudoscientific beliefs, science education

THE EFFECTS OF MODEL BASED TEACHING ON 8th GRADERS' METACOGNITIVE AWARENESS AND ATTITUDES TOWARDS SCIENCE AND TECHNOLOGY COURSE: EXAMPLE OF SOUND UNIT

ABSTRACT: The aim of this study is to examine the effects of model based teaching on students' metacognitive awareness and attitudes towards science and technology course. In this context, fifthy eight 8th graders attending to a state middle school in one of the districts of İzmir participated in the study. The model of the study is pre test post test with control group quasi experimental design. Students were randomly assigned to experimental and control groups. In this 4-week study, the experimental group received model based science activities related to sound unit and the control group received activities in the same unit in consistent with the present Turkish Science and Technology Curriculum which was being used since 2005. Data were gathered through "Metacognition Scale", "Attitudes towards Science and Technology Scale" and open ended questions for determining the metacognitive processes of students. Data were analyzed through statistical packet programs and content analysis. The quantitative results obtained from the research showed that the model based sound activities have no significant difference on students' metacognitive awareness and attitudes towards science and technology course. Analysis of qualitative data obtained from the research is still continuing.

Key words: Model-based teaching, Metacognitive awareness, Attitudes toward science and technology course.

STUDENTS' INTERNET AND WEB 2.0 USE: A CASE OF BURDUR'S MIDDLE SCHOOLS

ABSTRACT: This study focused on students' use of Internet and web 2.0 technologies for general and educational uses in terms of gender, technologies ownership, Internet connection, Internet and computer skills levels and years of use. 350 middle school students and two IT teachers were participated to the study. Descriptive data collected through a survey that designed by the researchers and based on these results, semi-structured interviews were conducted with their teachers. The results indicated that students with high confidence on computer and Internet use preferred to use social networking, video sharing and game sites than blogs, wikis e-mail services and cloud technologies like google drive for their general Internet and computer use. They use these technologies for homework and practice the previous content than communicating with their peers and teachers and also for educational games and educational videos. The findings obtained through teachers supports the data gathered from the students.

Key words: computer and Internet usage, web 2.0 technologies, middle school

INTRODUCTION

Technological developments providing countless opportunities for communication have allowed people to present their ideas and exchange information from different location and time zone. Both the Internet and web 2.0 technologies presents many different features for the users. Today people not only reach information from different sources but also create and share their own works, contribute others works via using blogs, forum, wikis. The growing interest on online social networks created a different platform for people to collaborate and communicate. Web 2.0 technologies provides users interactive services (Ajjan, & Hartshorne, 2008) giving user the opportunity to interact with content and other users. Wikis, blogs, instant messaging and social networking sites are widely used Web2.0 technologies to achieve those utilities. These technologies changes the way of creating using sharing and also distributing any types of documents. Users creates Wikis (What I know Is) by interacting content via adding, removing, or editing. The mostly used *Wikis* is the Wikipedia with rich sources of information in different languages. *Blogs* can be defined as the personal journals with content, and images about different content and topic open to access and interaction with the followers. Users can create their own profile and connect with other users with Social *networking* sites. Facebook, Twitter, and Instagram are the mostly known social networking sites. These sites provide users to post different kinds of documents, make organizations follow their friend.

This attractive feature of information and communication technologies (ICT) draws people attention from different ages and work areas. Education is one of these areas; and nations focus on developing literate youths in the 21 century skills. For the requirements of the information age, creativity, critical thinking, communication and collaboration, information, media and ICT literacy hold an important place (Kay, 2009). These skills are needed in order to build deep and interdisciplinary understanding of knowledge and problem related to the real world. Developing such qualifications in the early years of education where teachers and students use technology in their learning and teaching processes is so important to rise new generation to cope with the different requirements highlighted with the information age period. The researchers discussed that the use of ICT might provide practical solutions for educational needs (Pierce, 2009). In addition, the research results reveal that the positive effects of ICT related activities while developing 21 century skills including critical thinking, problem solving (Özdemir & Kılıç, 2007) higher order thinking skills (Çavaş & Çavaş, 2005; McMahon, 2009), and information searching skills (Çalışkan & Turan, 2008; Ersoy & Türkkan, 2009; Yılmaz & Aydın, 2013).

Since the use of ICT's including computers, laptops, smart phones and Internet rate is gradually growing, it was aimed to understand the views of the students and teachers regarding the Internet and Web 2.0 technologies in their daily usage and in educational platforms. This study may contribute to the literature for not only understanding the views of the students and IT teachers but also the potential of the web 2.0 technologies for informal learning opportunities.

METHODS

In this study a mixed approach was used to explore the views of the middle school students and teachers about the use of Internet and Web 2.0 technologies for general and educational purposes. Quantitative data were collected to have an understanding about the students' views and for having in depth understanding related with teachers views' qualitative data were collected (Creswell, 2011). Descriptive statistics for quantitative data and content analysis for qualitative data were selected as analysis methods for the study. The sample of the study was selected from the middle schools in Burdur province, where information technologies and software courses are given. The participants were 350 middle school students and two IT teachers from the two middle schools. All students were enrolled to Information Technologies and software course before the data collection process. While selecting the sample, two middle schools selected out of 5 as the samples of the study by using cluster sampling method. Moreover, two Information Technologies and software course teacher from the same schools were participated to the study to have deeper information about their views on Web 2.0 technologies and usage at school.

Instruments and Data analysis

The questionnaire which was developed by the researchers consisting of 27 questions and four subsections related with the views of the participants. In the first subsection, questions related with the demographics of the students, their parents' education levels, and their access to a technological device and the Internet and their use of experience with computer and Internet were asked. Other subsections were respectively; computer and Internet usage skills; Internet usage frequency, frequency of using the ICT for educational purposes. In the questionnaire, there were nineteen five scale Likert type questions from "*never*" to "*always".* In order to have in depth understanding and detailed information regarding the views of the teacher, six semi-structured interview questions were asked to the IT teachers. The descriptive data were analyzed by using SPSS 20 and qualitative data were analyzed by using content analysis technique.

RESULTS AND FINDINGS

Descriptive Statistics

The demographics of the students are depicted in Table 1. As seen from the Table 1, the participants in this study were 43.7% male and 56.3% female. The grade levels of the participants were 43.1% of them 5th grade, while 56.9% of the participants were 6th grade levels. Participants' access to the technological devices were explored and the results showed that most of the participants (%95.7) have access to the computer while 42.3% of the participants also have smart phones and 39.4% of them have a chance to use tablets at their home. Moreover, it was found that majority of the students (89.7%) have Internet access at their computers, while 34.4% of them have Internet access at their smart phones and 31.1% of them have at their tablets. Most of the participants (66.6%) declared that they were using computer more than 4 years while half of the participants (50%) expressed that they have been using Internet more than 4 years. Table 1 presents the characteristics of the students and computer and Internet experience of the students in terms of the time periods.

Table 1. Characteristic of the Students

		N	*%*
Gender			
	Female	197	56.3
	Male	153	43.7
Grade level			
	5th	151	43.1
	6th	199	56.9
Preschool education			
	Yes	308	88.0
	No	32	9.1
Accessing a technological device at home			
	Computer	335	95.7
	Tablet	138	39.4

	Smart phone	148	42.3
Connecting Internet via			
	Computer	314	89.7
	Tablet	109	31.1
	Smart phone	121	34.6
Years of Computer Use			
	0-1 year	10	2.9
	1-2 years	11	3.1
	2-3 years	25	7.1
	3-4 years	69	19.7
	More than 4 years	233	66.6
Years of Internet Use			
	0-1 year	23	6.6
	1-2 years	22	6.3
	2-3 years	47	13.4
	3-4 years	74	21.1
	More than 4 years	175	50.0

Additionally, the educational level of the participants' parents was also explored. The results showed that 30. 3% of the mothers were graduated from high schools, while 23.1% of them were graduated from university and 21.1% of them graduated from middle school. As for fathers, however, 37.2% of them were graduated from university and 31.5% of them were graduated from high schools. Table 2 presents the educational level of the participants' parents.

Table 2. Parent Education Level

Parent education level	Mother		Father	
	N	*%*	*N*	*%*
Illiterate	4	1.1	5	1.4
Literate	11	3.1	9	6.6
Primary school	50	14.3	23	6.6
Middle school	74	21.1	34	9.7
High school	106	30.3	110	31.5
University	81	23.1	130	37.2
Master	23	6.6	38	10.9

Moreover, participants' computer and Internet usage skills were examined in the study. The results showed that most of the participants (41.4%) expressed their computer usage skills as "*I know well*" while 37.1% of them responded this question as "*I know very well*". On the other hand, a reverse situation was occurred for Internet usage skills. Majority of the participants (47.1%) declared themselves for Internet usage skill as *"I know very well*" while 33.7 % of them responded this question as "*I know well*". These students' responds clarified by one of their teachers with the following quotation: "*…They [students] have a chance to use PCs at their home anymore. Moreover, they have also smartphones and tablets. That is why the utilization of the Internet is widespread – affecting up the computer and the Internet usage…"* Table 3 represents the computer and Internet usage skills of the students.

Table 3. Computer and Internet usage skills

	I don't know		I know a little		I know		I know well		I know very well	
	N	*%*	*N*	*%*	*N*	*%*	*N*	*%*	*N*	*%*
Computer	3	0.9	23	6.6	48	13.7	145	41.4	130	37.1
Internet	2	0.6	18	5.1	43	12.3	118	33.7	165	47.1

Participants were also asked about their frequency of their Internet usage for different applications. The results showed that participants expressed that they "*always*" use social media like "Facebook" and "Twitter" (54.6%) and "YouTube" (53.4%). On the other hand, according to their responses they "*never*" use wikis (60.9%) and blogs (58%) in their daily Internet activities. For this issue, one of the teachers highlighted the fact that students do not have knowledge about these tools because they will learn how to use wikis and blogs later. In table 4 the results obtained from the survey were presented related with the Internet usage frequency of the participants.

Table 4. Internet Usage Frequency

	Never	**Rarely**	**Occasionally**	**Usually**	**Always**

	N	%	N	%	N	%	N	%	N	%	M
News portal	99	28.3	98	28.0	93	26.6	39	11.1	17	4.9	2.36

Social media (Facebook/ Twitter)	34	9.7	20	5.7	43	12.3	61	17.4	191	54.6	4.02
YouTube	15	4.3	19	5.4	49	14.0	78	22.3	187	53.4	4.33

When participants' frequency of Internet and communication technologies use for educational purposes were examined, most of the participants expressed that they "*always*" use ICT for finding sources for finding sources to prepare homework (46.3%), doing their homework (46%) and drill & practice applications and solving problems (37.1%). They also declared that they "*always*" use ICT for preparing presentations (38.3%) and communicating with their friends for doing homework (23.7%). The following quotation from an interview with a teacher clarified this: "*...All teachers want students to prepare their homework via using computers. Students might communicate their friends to cope with these assignments...*" Table 5 represents participants' frequency of Internet and communication technologies use for educational purposes.

Table 5. Frequency Of Internet And Communication Technologies Use For Educational Purposes

Drill and practice/ solving questions	15	4.3	39	11.1	63	18.0	103	29.4	130	37.1	3.84

CONCLUSION

This study explored the views of the middle school students and teachers about the use of Internet and Web 2.0 technologies for general and educational purposes. The results showed that participants mostly preferred to use social media and YouTube instead of the other Internet sources. This finding supports the general idea that user-generated content is successful only if users are regularly attracted to the website to contribute (Rennie, & Mason, 2007). Students also expressed that they "*never*" use wikis (60.9%) and blogs (58%) in their daily Internet activities. The Global Information Technology Report (2014) investigated the uses of virtual social networks (e.g., Facebook, Twitter, LinkedIn) among countries (Osorio, Dutta, & Lanvin, 2014). According to the report, Turkey was ranked as 61st and accepted as social networks have been widely used country in the list (p.298). Moreover, Şener (2009) explored the profile of Facebook users in Turkey. She found that the usage of Facebook varied according to the gender, socio economic situation and age. The user group in Turkey consider Facebook as an environment which provides chance to communicate with their friends. According to Ellison, Steinfield and Lampe (2007), college students in the U.S. used Facebook for social interaction offline to communicate with their existing friends and strengthen their relationships with them. In addition, the reasons for not preferring to use wikis and blogs might be related with the one way interaction nature of them. In addition, this intensive interest to the Facebook and Youtube and contrary interest to wikis and blogs might be related with the cultural background of Turkey. As Şener (2009) indicated Turkish people using Facebook mostly for communicating possibilities. Moreover, the flexibility of Facebook regarding the communication possibilities might also be another reason for their high demands.

Moreover, participants' responses to the questions regarding frequency of using ICT technologies for educational purposes showed that they tended to use ICT technologies respectively, for finding sources for preparing homework, doing their homework and drill and practice applications or solving problems. The results showed that they use ICT for preparing presentations and communicate with the other friends while doing their homework. Yılmaz and Aydın (2013) in their qualitative study presented the middle school students positive predisposition towards technology due to its benefit to their course works, personal growth, information search and spending time for fun.

When the education levels of the parents were examined, there might be a relation between the education level and their socio-economic levels. The more educated and high income families have chance to provide more technological devices to their children. This might also affect the view of the children directly, the more they acquainted with the technology the more their views will be positive. This situation should also be investigated through the further studies to explore exact correlation between these variables. The results also point out that the students' computer and the Internet competencies differ slightly. The difference between the self-evaluation of the participants regarding their computer and the Internet skills might be related with the Internet usage by using smart phones. The demographics also showed that a non-negligible part of the students have Internet access in their smart phones. Therefore, we need new research studies on understanding how this discrepancy might be handled with regard to educational utilization of the computer and the Internet.

ÖZET: Yapılan çalışmalar öğrencilerin bir kısım cebirsel kavramları birbirleri ile karıştırdıkları; pek çok cebirsel kavram ve yöntem hakkında ortak hatalar ve temel yanılgılar taşıdıklarını göstermektedir. Bunlar arasında matematiğin temel kavramlarından olan "eşitlik, eşitsizlik, denklik, denklem ve özdeşlik" öğrenciler tarafından çoğunlukla birbirleri ile karıştırılmakta, yanlış algılanmakta ve yanlış yorumlanmaktadır. Bu kavramlar fen ve matematik öğretiminde pek çok konu ve kavrama kaynaklık etmektedir ve her biri ilk ve ortaöğretim matematik öğretim programında önemli bir yere sahiptir. Bu bağlamda, bu araştırma öğretmen adaylarının birbirleri ile ilişkili söz konusu beş kavrama ilişkin algılarını betimlemeye yönelik nitel bir çalışma olup özel durum çalışmasıdır. Araştırma genelleme amacıyla değil genele ışık tutma amaçlı yapılmıştır. Araştırmanın örneklem grubu 64 Fen Bilgisi, 60 İlköğretim Matematik olmak üzere toplam 124 öğretmen adayından oluşmaktadır. Araştırmada her bir kavrama ilişkin öğretmen adaylarının görüşleri alınmış ve verilerin analizinde içerik analizi uygulanmıştır. Elde edilen veriler kavramların doğru algılanıp algılanmadığı ve hangi kavramla karıştırıldığı yönü ile incelenmiştir. Sonuçlar öğretmen adaylarından seçilen örnek ifadelerle birlikte sunulmuştur.

Anahtar sözcükler: fen/matematik öğretmen adayları, cebirsel kavramlar.

ABSTRACT: Studies show that students confuse algebraic concepts with each other, make common mistakes and have fundamental misconceptions about many algebraic concepts and methods. The concepts of "equality, inequality, equivalence, equation and identiy" that are among the fundamental concepts of mathematics are usually confused with each other, misperceived and misinterpreted by students. These concepts form the basis of many concepts and subjects in science and mathematics education and they have an important place in primary and secondary mathematics education curriculum. In this context, this research is a qualitative study aimed to describe teacher candidates' opinions about these five interrelated concepts and is a special case study. The research was not done to make any generalization but rather was done to shed some light on the general. The research sample group consist of 64 science teacher candidates and 60 elementary mathematics teacher candidates, totalling 124 candidates. In the research, teacher candidates' opinions about each concept were taken by interview for analysis and then content analysis method was applied. The data obtained after analysis were examined according to whether the underlined concepts are perceived correctly or not and which concept was confused with which other concept. The results were presented with some selected opinions of teacher candidates.

Key words: science/mathematics teacher candidates, algebraic concepts.

THE INVESTİGATİON OF PRESERVİCE TEACHERS' MEDİA AND TECHNOLOGY USAGE AND ATTİTUDES

Ilker YAKIN

Vesile Gul BASER GULSOY

Berrin DOGUSOY TAYLAN

Advances in information and communication technologies have dramatically altered the way people do their daily tasks and the way their personal usage of technology-based activities are managed. Therefore, measuring recent technology and media behaviors has received a great amount of attention from researchers and practitioners in the area of education. This descriptive study aims to explore preservice teachers' technology and media usage and attitudes. The online questionnaire was administered to students from CEIT (Computer Education and Instructional Technology) department from a state university in Turkey. The questionnaire includes two sections; the first part consists of 42 items with 10 point frequency scale, and the second part includes 16 items with 5 point-likert type scale. The findings will be presented in the paper with eleven subheadings regarding smartphone usage, general social media usage, Internet searching, e-mailing, media sharing, text messaging, video gaming, online friendships, Facebook friendships, phone calling, and watching television in addition to four subheadings - positive attitudes, anxiety/dependence, negative attitudes, preference for task switching - with respect to attitudes towards technology. The results of the paper will be discussed with the recent research studies in the conclusion section. Lastly, some suggestions based on these findings will be also offered to conduct further studies and researches.

Keywords: Media and technology usage, Attitudes towards technology, preservice teachers

ÖZET: Bu çalışmanın amacı öğretmen ve öğretmen adaylarının, öğrencilerin kesirler konusundaki kavram yanılgılarına ilişkin mevcut bilgilerini araştırmaktır. Araştırma, nitel araştırma yöntemlerinden çoklu durum (vaka) çalışması ile gerçekleştirilmiştir. Çalışma grubu bir üniversitenin İlköğretim Matematik Öğretmenliği Bölümünde son sınıfta okuyan 2 öğretmen adayından, ortaokullarda görev yapmakta olan 4 öğretmenden ve bir ortaokulun 7.sınıfında okuyan 90 öğrenciden oluşmaktadır. Veri toplama aracı olarak araştırmacı tarafından hazırlanan kavram yanılgısı testleri kullanılmıştır. Öğretmen ve öğretmen adaylarına yarı yapılandırılmış mülakatlar uygulanmıştır. Araştırma sonucunda öğrencilerin büyük bir çoğunluğunun bir kesir ifadesindeki sayısal değerin bütüne göre değişeceğinin yeterince kavrayamadığı bulunmuştur. Öğretmenlerin bu durumu öngörmesine rağmen kendilerine ait öğrencilerin bu kavram yanılgısına düştükleri ortaya çıkmıştır. Ayrıca öğrencilerin bir kısmı kesirin ifade ettiği büyüklüğe karar verirken bütünü oluşturan parça sayısına veya parça büyüklüğüne göre karar vermiştir. Bu durum öğretmen ve öğretmen adaylarının öngöremediği bir kavram yanılgısı olmuştur.

Anahtar sözcükler: Kavram yanılgısı, Pedagojik Alan Bilgisi, Matematik Öğretmenleri, Öğretmen adayları

ABSTRACT: The purpose of this study is to explore teachers' and pre-service teachers' knowledge of students' misconception about fractions. As being a mainly qualitative research, this study has utilized multiple case study methodology. The cases consisted of 2 pre-service teachers who are in their senior year in primary mathematics education at a university, 4 in-service teachers working in a state school and 90 students. As a data collection tool misconception tests that were designed by the researcher have been utilized. Semi-structured interviews have also been conducted to collect in depth data from teachers and pre-service teachers. As result, students had misconceptions regarding the fact that the amount of 'part' indicated by a fraction is related to size of the 'whole'. An interesting finding was that the teachers had foreseen this and yet their student had such a misconception. In determining the amount of 'part' indicated by a fraction, some students decided solely on the basis of 'quantity of parts' or 'size of each part'. Neither pre-service teachers nor in-service teachers manage to foresee such a misconception.

Of a great majority of the students expressed a fraction of the numeric value will change by all has been grasped enough. Although the situation of teachers predict their own students that fall into these misconceptions have emerged. In addition, some students expressed a fraction of the numeric values in finding the number of constituent parts or parts that have been decided according to the size of teachers and student teachers did not foresee this situation has been a misconception.

Key words: Misconception, Pedagogical Content Knowledge, Mathematics Teachers, Pre-service Teachers

GİRİŞ

Kavram yanılgıları farklı alanlarda birçok araştırmacının ilgisini çekmiştir. Çok sayıda araştırmacı aslında öğrencilerin bilgileri ezberlediklerini, başarılı öğrencilerin bile konuyu derinlemesine öğrenmedikleri sonucuna varmıştır. Özellikle fen bilimleri ve matematikte öğrencilerin soruları çözerken konuya hâkim olmadan, ezberden sadece formülde yerine koyarak çözdükleri sonuca varmışlardır (Yenilmez & Yaşa, 2008).

Matematik öğretiminde sadece işlemsel ve kurala dayalı bilgiye önem verilmemeli, bu bilginin temelini oluşturan kavramsal bilgi üzerinde de durulmalıdır (Küçük & Demir, 2009). Çünkü işlemler kavramlarla gerçekleşmektedir. Anlaşılamayan veya yanlış anlaşılan bu kavramlar da işlemlerin anlaşılmaz gibi algılanmasına sebep olmaktadır.

Öğrenciler, matematik dersindeki bir konuyu eksik veya yanlış öğrendiklerinde sorun yaşamakta ve bu sorun öğrencinin ilerleyen eğitim-öğretim hayatına yansımaktadır. Dolayısıyla öğrencinin üst öğrenmelerinde olumsuzluklar meydana gelmektedir. Bu olumsuzluklar giderilmediği sürece öğrencilerdeki eksik veya yanlış öğrenmeler birer kavram yanılgısı haline dönüşmektedir (Yılmaz & Yenilmez, 2007).

Kavram yanılgısı, zihinde bir kavramın yerine oturan fakat bilimsel olarak o kavramın tanımından farklı olması anlamına gelmektedir (Eryılmaz & Sürmeli, 2002).

Kavram yanılgısı çalışmalarında en çok araştırma yapılan derslerden bir tanesi matematik dersidir. Bunda matematiğin soyut olmasından dolayı içinde birçok kavramı barındırmasının etkisi kaçınılmazdır. Matematiğin en soyut ve en zor anlaşılan konularından bir tanesi ise kesirler konusudur. Tam sayılardan farklı olarak kesirlerde çoklukların gösteriminde iki sayının birbirine göre ilişkisi ön plandadır. Kesirlerin bir başka özelliği de her bir kesir için sonsuz sayıda denk başka kesirlerin olmasıdır. Tam sayılarda ise her bir sayı tektir. Kesirler tam sayılardan farklı olarak referans aldığı bütüne göre değişik büyüklükleri gösterebilir. Kesirlerin karşılaştırılması tam sayılardaki gibi doğrudan değildir, birden fazla kavramı birlikte düşünmeyi gerektirir (Alacacı, 2010). Bu sebeple kesirler konusundaki öğrencilerin farklı şekillerde kavram yanılgılarına düştükleri görülmektedir. Öğrencilerin kesirler konusundaki kavram yanılgılarıyla ilgili çok sayıda çalışma olmasına rağmen; öğretmenlerin ve öğretmen adaylarının öğrencilerin kavram yanılgılarına ilişkin mevcut bilgisine yönelik araştırmaların yetersiz sayıda olduğu gözlemlenmiştir. Dolayısıyla öğretmenlerin ve öğretmen adaylarının, öğrencilerin kesirlerle ilgili kavram yanılgılarıyla alakalı mevcut bilgilerinin araştırılmasının bu konudaki boşluğun doldurulmasına katkıda bulunacağı sonucuna varılmıştır.

YÖNTEM

1) Araştırmanın Deseni

Öğretmen ve öğretmen adaylarının, öğrencilerin kesirler konusundaki kavram yanılgılarıyla ilgili mevcut bilgilerini incelemek amacıyla yapılan bu çalışmada nitel araştırma yöntemlerinden çoklu durum (vaka) çalışması ile gerçekleştirilmiştir.

2) Çalışma Grubu

Çalışma grubu pilot uygulama sonrası seçilen İstanbul ilindeki 4 farklı ilköğretim okulundaki 4 öğretmenden; bir üniversitenin son sınıfındaki 2 öğretmen adayından ve bir ilköğretim okulunun 7.sınıfında okuyan 90 öğrenciden oluşmaktadır. Öğretmenlerin tecrübesi 3-12 yıl arasında değişmektedir. Çalışmada öğretmen ve öğretmen adaylarının gerçek isimleri gizli tutulmuştur ve her biri için takma isimler kullanılmıştır. Öğrencilerin isimleri ise hiç kullanılmamıştır.

3) Veri Toplama Araçları

Bir kavram yanılgısı testi oluşturmak için ilgili literatür taranmış ve Alacacı'nın (2010) çalışmasında yer alan kavram yanılgısının üzerine oturtulduğu bileşenler temel alınarak test şekillendirilmiştir. Bu bileşenler şunlardır: Kesirlerde miktarın referans alınan bütüne bağlı olması; kesirlerin kısımlara ayrılması; kesirlerin karşılaştırılması; bileşik kesirlerde birimin belirlenememesi; kesrin hatalı toplanması; çarpmanın kesirlere etkisi; bölmenin kesirlere etkisi; kesrin yarısının nasıl elde edileceği. Uygulanacak test öğrencilere ve öğretmenlere -öğretmen adayları dahil- yapılan testler olmak üzere iki kısımdan oluşmaktadır. 18 sorudan oluşan kavram yanılgı testi pilot uygulamalar sonucunda öğrencilere uygulanmak üzere 9 soruya indirilmiştir. Öğretmenlere ve öğretmen adaylarına uygulanan kavram yanılgısı testi ise öğrencilere uygulanan kavram yanılgısı testleri uygun olacak şekilde değiştirilerek iki aşamalı olarak hazırlanmıştır. İlk aşamada öğrencilere sorulan soruların aynısı öğretmenlere sorulmuştur. Fakat öğretmen ve öğretmen adaylarından soruları çözmeleri değil öğrencilerde olabilecek kavram yanılgılarını tahmin etmeleri istenmiştir. İkinci aşamada ise 5 tane öğrencinin ilk aşamadaki sorulara verdiği cevaplar bulunmaktadır. Bu aşamada öğretmen ve öğretmen adaylarından öğrenci cevaplarını incelemeleri ve kavram yanılgılarını belirlemeleri istenmiştir. Kavram yanılgılı olduğunu düşündükleri cevaplar için ise sebeplerinin neler olabileceğini yazmaları istenmiştir. Bu testlerin yanı sıra öğretmen ve öğretmen adaylarına yarı yapılandırılmış mülakatlar uygulanmıştır.

4) Verilerin Analizi

Nitel çalışmalarda analiz hem veri toplama süreci hem de veri toplama süreci bittikten sonra yapılabilir. Bu tür çalışmalarda analiz yapılma nedeni şablonları, düşünceleri, açıklamaları ve anlamları keşfetmektir (Büyüköztürk, Çakmak, Akgün, Karadeniz ve Demirel, 2012). Araştırma için gerekli olan veriler, uygulana kavram yanılgı testleri ve görüşmeler yoluyla elde edilmiştir. Bu veriler için, betimsel analiz yöntemi kullanılmıştır. Betimsel analizde görüşülen ya da gözlenen bireylerin görüşlerini çarpıcı bir şekilde yansıtmak amacıyla doğrudan alıntılara çok sık yer verilir. Bu betimlerden yola çıkarak araştırmacı kendi yorumlarını yapar ve bazı çıkarımlarda bulunur (Yıldırım & Şimşek, 2011).

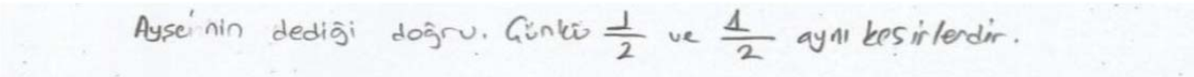
BULGULAR VE YORUMLAR

1) Jale bir pizzanın $\frac{1}{2}$ 'sini yemiştir.

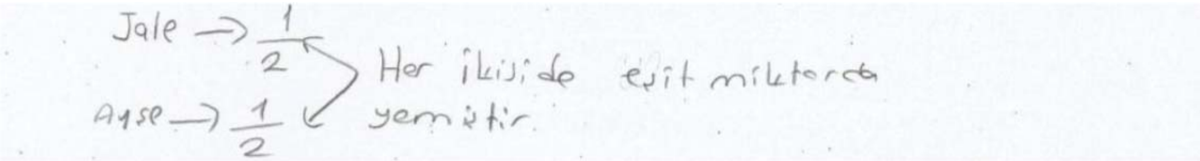
Ayşe de başka bir pizzanın $\frac{1}{2}$ 'sini yemiştir.

Jale, Ayşe'den daha fazla pizza yediğini söylüyor. Ayşe ise yediği pizzaların aynı olduğunu iddia ediyor. Kimin doğru dediği doğru olabilir? Açıklayınız.

Bu çalışma bir sorudan oluşmaktadır. Bu bölümde bu soru için verilen öğrenci cevapları ve öğretmenlerin bu cevaplara yaptıkları yorumlar incelenecektir. Öncellikle bu sorunun çözümüne bakalım. Cevap 3 olası durumdan oluşmaktadır. Pizzaların büyüklüğü eşit ise Ayşe haklıdır. Pizzalar farklı ve Jale'nin pizzası büyük ise Jale haklıdır. Eğer Jale'nin pizzası küçük ise hiçbiri haklı değildir.
Öğrencilerin %80'i $\frac{1}{2}$ kesrindeki sayısal eşitlikten yola çıkarak Jale ve Ayşe'nin eşit yediğini söylemişlerdir.



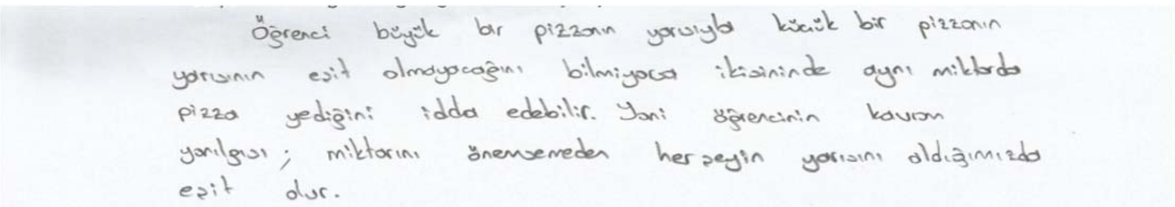
Ayşe'nin dediği doğru. Çünkü $\frac{1}{2}$ ve $\frac{1}{2}$ aynı kesirlerdir.



Jale → $\frac{1}{2}$
Ayşe → $\frac{1}{2}$
Her ikiside eşit miktarda yemiştir.

Soruda geçen $\frac{1}{2}$ kesrinin sayısal eşitliğinden yola çıkarak Jale ve Ayşe'nin eşit miktarda yediğini sanan öğrencilerin kesir ifadesindeki sayısal değerlere odaklanarak bütünü göz ardı ettikleri söylenebilir. Fakat bu durum kesir konusundaki parça-bütün ilişkisinin oluşması için engel oluşturabilir. Çünkü kesirlerle temsil edilen miktar kesrin referans alındığı bütüne bağlıdır (Kouba, Zawojewski ve Strutchens, 1997; akt: Alacacı, 2010).

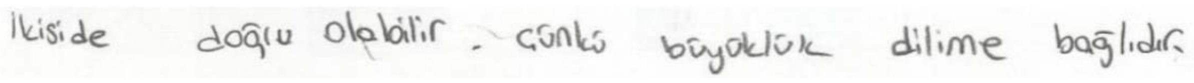
Öğretmen ve öğretmen adaylarının hepsi bu soru ile ilgili olarak öğrencilerin $\frac{1}{2}$ kesrinin sayısal eşitliğinden yola çıkarak "Jale ve Ayşe'nin eşit miktarda yediğini" söyleyeceği tahmininde bulunmuşlardır.



Öğrenci büyük bir pizzanın yarısıyla küçük bir pizzanın yarısının eşit olmayacağını bilmiyorsa ikisininde aynı miktarda pizza yediğini idda edebilir. Yani öğrencinin kavram yanılgısı; miktarını önemsemeden herşeyin yarısını aldığımızda eşit olur.

Öğretmen ve öğretmen adayları, öğrencilerin çoğunun bu soruda nasıl bir kavram yanılgısına düşeceğini kestirebilmelerine rağmen bu tip sorulara derste hiç yer vermediğini ifade etmişlerdir. Ali öğretmen, röportajlar esnasında 'bu tip sorular öğretmen kılavuz kitaplarında olsaydı derste çözerdim' şeklinde açıklama yapmıştır. Kılavuz kitaplarında olmadığı için böyle bir şey üzerinde durmadığını da eklemiştir. Ayça öğretmen ise soruyu beğenmesine rağmen derste çözmek istemediğini söylemiştir. Çünkü bu tür soruların öğrencilerin kafasını karıştırabileceğini ifade etmiştir. Mehtap öğretmen ise soruda bir eksiklik olduğunu söylemiştir. Pizzaların büyüklüğünün farklı olduğunu söylemesinin yeterli olmadığını büyük, küçük veya eşit şeklinde ifade etmesi gerektiğini söylemiştir.

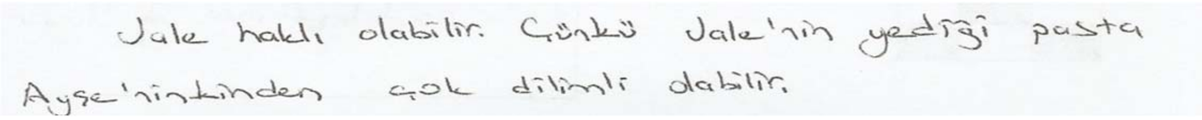
Öğrencilerin %8.8'i ise Jale ve Ayşe'nin yediği pizza büyüklüğünün "pizzanın dilim sayısına ya da pizzanın diliminin büyüklüğüne" göre değişeceğini söylemişlerdir.



İkiside doğru olabilir. Çünkü büyüklük dilime bağlıdır

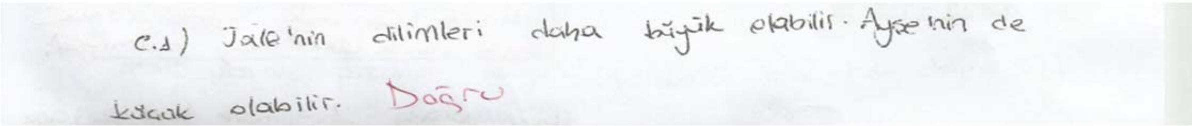
C.1) Jale'nin dilimleri daha büyük olabilir. Ayşe'nin de küçük olabilir.

Yukarıdaki cevapları veren öğrenciler yenilen pizza miktarının pizza diliminin büyüklüğüne bağlı olacağını söylemişlerdir ki bu kavram yanılgılı bir cevaptır. Çünkü aynı boyutta bir pizzayı 8 dilime bölsek de veya 16 dilime bölsek de pizzanın büyüklüğü sabittir. Öğrencilerin böyle düşünmesine yol açan faktörlerden birisi birim kesir kavramı olabilir. Örneğin $\frac{1}{2}, \frac{1}{3}, \frac{1}{4}$ vb. kesirlerin büyüklüklerinin kıyaslanması istendiğinde bölünen parça sayısı azaldıkça bir dilimin büyüklüğü de artacaktır. Birim kesirlerde tek dilim veya parça üzerine çalışıldığından öğrenciler bir dilimi veya parçası büyük olan kesir büyüktür hatalı sonucuna varmış olabilirler. Bu durum öğrencilerin aşırı genelleme türünden bir kavram yanılgısına dönüşmüş olabilir. Ya da öğretmenlerin ders anlatım şekli de öğrencilerin kavram yanılgısına ortam hazırlayabilir. Çünkü öğretmen ve öğretmen adaylarından hiçbiri, öğrencilerin pizzanın büyüklüğüne dilim sayısından veya büyüklüğünden giderek bir yanılgıya düşeceğini tahmin edememişlerdir. Öğrencilerin kavram yanılgılı cevaplarına ise Mehtap öğretmen dışındaki herkes doğru demiştir.



Yukarıdaki cevabı veren öğrencinin kavram yanılgısına kaynaklık eden durum parça-bütün ilişkisinin tam olarak anlaşılamamış olması olabilir.

Öğretmen ve öğretmen adaylarından hiçbiri, öğrencilerin pizza miktarının büyüklüğünü pizzanın dilim sayısına ya da pizzanın diliminin büyüklüğüne bağlayarak bir yanılgıya düşebileceklerini tahmin edememişlerdir. Öğrencilerin kavram yanılgılısı içeren cevaplarına ise Mehtap öğretmen dışındaki tüm öğretmen ve öğretmen adayları doğru demişlerdir.



Öğretmen ve öğretmen adaylarına röportajda dilim büyüklüğünden yola çıkarak pizzanın büyüklüğünün tahmin edilip edilemeyeceği sorulduğunda ise hepsi pizzayı iki dilim düşündükleri için öğrenci cevaplarına doğru dediklerini ifade etmişlerdir. İki dilim olduğu kanısına nasıl vardıkları sorulduğunda ise yarım alınca genelde 2'ye bölündüğünü oradan bir genelleme yaptıklarını söylemişlerdir. Öğretmen adaylarından Buse röportaj esnasında " $\frac{1}{2}$ deyince aklıma yarım geliyor. Yarım olarak düşündüğüm içinde 2'ye bölüyorum. Aslında öğrencilerin kavram yanılgıları bizim verdiğimiz örneklerden kaynaklanıyor olabilir." şeklinde bir açıklama yapmıştır. 10 yıllık tecrübeye sahip Ali öğretmen ise bu konuyu şöyle açıklamıştır (A.Ö: Ali öğretmen; A: Araştırmacı):

> A: Öğrencinin pastanın büyüklüğüne dilim büyüklüğünden gitmesi doğru bir durum mudur?
> A.Ö: Evet.
> A: Peki, neden?
> A.Ö: Çünkü pasta ikiye bölünüyor. Büyük olan pastanın dilimi daha büyük olacaktır.
> A: İkiye bölündüğünü nasıl anladınız? Böyle bir bilgi verilmemiş.
> A.Ö: Evet doğru söylüyorsunuz. Ben $\frac{1}{2}$'yi alırken zihnimde iki dilime böldüm. Doğru çok dilimlide olabilir. Öyleyse dilimden gidilmez. Kavram yanılgılı bir cevap olur bu.

Röportaj sonunda cevaplarını değiştirerek dilim sayısından bütünün büyüklüğüne gidilmeyeceğini ifade ederek bu cevaba kavram yanılgısı demişlerdir.

SONUÇ VE TARTIŞMA

Öğrencilerde kesirlerle temsil edilen miktarın referans alınan bütüne göre değişeceği (yani her şeyin ½'sinin aynı miktara karşılık gelmediği) fikrinin yeterince kavranamadığı görülmüştür. Öğrenciler aynı sembollerle gösterilen kesirlerin aynı miktarı göstereceğini düşünmüşlerdir ve referans alınan bütünü hesaba katmamışlardır. Çalışmaya katılan öğretmen adayları, fiilen öğretmenlik yapmamış olmalarına rağmen öğrencilerin bu şekilde bir kavram yanılgısına düşebileceklerini öngörebilmişlerdir. Öğretmenler de aynı şekilde öğrencilerin bu hataya düşebileceklerini ifade etmişlerdir. İlginç olan ise tecrübeli öğretmenlerin bu durumu öngörmesine rağmen kendilerine ait öğrencilerin bu kavram yanılgısına düşmeleridir. Bu durum ileride yapılacak araştırmalara öncülük edebilir.

Bu kavram yanılgısına düşmeyen ve pizzaların büyüklüğüne göre $\frac{1}{2}$ kesrinin sayısal değerlerinin değişeceğini ifade eden öğrencilerin neredeyse tamamı pizzanın büyüklüğünü 'pizzadaki dilim sayısına' (daha çok dilimli pizza daha büyük pizzadır) veya 'dilimin büyüklüğüne' (daha büyük dilimli pizza daha büyük pizzadır) bağlamışlardır. Bu öğrenciler referans alınan bütünü hesaba katmışlarıdır fakat bu bütünün büyüklüğüne karar verirken yanılgıya düşmüşlerdir. Diğer ilginç bir sonuç ise pizzaların dilim büyüklüğünü referans alarak pizzaların miktarının bulunabileceği kavram yanılgısına düşen öğrencilerin cevaplarında öğretmen ve öğretmen adayları herhangi bir kavram yanılgısı gör(e)memişler ve cevabı doğru kabul etmişlerdir. Ayrıca öğretmen ve öğretmen adayları röportajlar esnasında bu durumu fark etmiş ve fikirlerini değiştirerek öğrenci cevabının kavram yanılgılı olduğu sonucuna varmışlardır. Buradan hareketle öğretmendeki kavram yanılgılarının veya anlık hatalarının öğrencinin kavram yanılgısına kaynaklık edebileceği sonucuna varılabilir. Ayrıca, Kouba ve arkadaşları (1997) çalışmasında bu konudaki kavram yanılgısını, kesrin temsil ettiği miktarın, referans alınan bütün ile ilgili olduğu konusunda öğrencilerin yeterince deneyim yaşamamalarına bağlamıştır (Kouba, Zawojewski ve Strutchens, 1997; akt: Alacacı, 2010). İleride yapılacak çalışmalar öğretmenlerin kesirler konusunda öngörebildikleri kavram yanılgıları hakkında önleyici aktiviteler yapıp yapmadıklarını ve sebeplerini incelemeli ve ne gibi aktivitelerle kavram yanılgılarını önlemeye çalıştıkları araştırılmalıdır.

ÖZET: Problem çözme bir düşünme yolu olup öğrenilenleri muhakeme etmede ve bütün matematik aktivitelerinde kullanılmaktadır. Bu yüzden de problem çözme stratejileri, birçok matematik eğitimi çalışmasında göze çarpmaktadır. Bu çalışmada farklı olarak öğrenme stratejileri arasındaki ilişkiler veri madenciliği ile araştırılmıştır. Veri madenciliği bir veri kümesinde kalıpların veya ilişkinin bulunması için çeşitli algoritmaların uygulaması olarak ifade edilebilmektedir. Çalışmada veriler, 2013-2014 eğitim öğretim yılının 2.döneminde Manisa Kargın Ortaokulu ve İstanbul Söğütlüçeşme Ortaokulunda 7.sınıfta öğrenim gören 50 öğrenciden toplanmıştır. Öğrencilere açık uçlu sorulardan oluşan "sayılar öğrenme alanı 7. sınıf problem çözme stratejileri belirleme formu" dağıtılmıştır. Bu formlardan ve bu form doğrultusunda gereken tüm öğrenciler ile yapılan yarı yapılandırılmış görüşmelerden elde edilen veriler ile problem çözme stratejileri belirlenmiş ve bu stratejiler arasındaki ilişkiler veri madenciliği teknikleriyle irdelenmiştir.

Veri analizi devam etmekte olup, sonuçlar sempozyumda sunulacaktır.

Anahtar sözcükler: matematik, problem çözme, problem çözme stratejileri, veri madenciliği

ABSTRACT: Problem solving which is a way of thinking is used in reasoning and all mathematical activities. Therefore, problem solving strategies stand out in many mathematics education studies. In this study, unlike the others, the relationships between learning strategies were investigated with data mining. Data mining can be expressed as the application of different algorithms for determining the patterns or the relationship in a dataset. The data of the study was obtained from 50 students attending 7^{th} grade at Manisa Kargın Secondary School and İstanbul Söğütlüçeşme Secondary School in the 2^{nd} term of 2013-2014 educational year. "The form of determining 7^{th} grade problem-solving strategies in numbers learning area" consisting of open-ended questions were distributed to students. Problem solving strategies were determined with the data obtained from these forms and the semi-structured interviews conducted with all the students required in accordance with this form and the relationships between these strategies were examined with data mining techniques.

The data analysis is continuing and the results will be presented at the symposium.

Key words: mathematics, problem solving, problem solving strategies, data mining

ÖZET: Çalışmanın amacı ortaöğretim öğrencilerinin kuvvet kavramına ve kuvvet ile hareket kavramları arasındaki ilişkiye ait kavram imajlarını belirlemektir. Araştırma amaçlı örneklem tekniğine göre belirlenmiş dokuzuncu sınıfa devam eden yedi öğrenci ile gerçekleştirilmiştir. Veriler yarı yapılandırılmış görüşmelerle elde edilmiştir. Görüşmelerde beşi kuvvet kavramı diğerleri ise kuvvet ile hareket arasındaki ilişkiye ait olmak üzere toplam dokuz soru sorulmuştur. Derinlemesine bilgi edinmek için görüşmeler sırasında ara sorular sorulmuştur. Ses kayıt cihazı kullanılarak kaydedilen konuşmalar metne dönüştürülmüştür. Metinler incelenerek kategoriler belirlenmiştir. Sonuç olarak kavram imajlarının bireyden bireye farklılık göstermesine rağmen öğrencilerin kuvveti genellikle temas kuvveti olarak algıladıkları ve cisimlerin hareket durumlarında yaptıkları değişikler ile açıklamaya çalıştıkları görülmüştür. Bu durumun ortaya çıkmasında öğrencilerin aldıkları eğitimin ve günlük hayat tecrübelerinin etkili olduğu düşünülmektedir. Araştırmada öğrencilerin kuvvet ve hareket kavramları ile ilgili kavram yanılgıları da belirlenmiştir.

Anahtar sözcükler: kavram imajı, kuvvet ve hareket, dokuzuncu sınıf öğrencileri.

ABSTRACT: This study aimed to find out the concept images of high school students about the concept of force and the relation between the concepts of force and motion. The participants of the study are seven students from ninth grade students were chosen through a purposeful sampling technique. Data were obtained using semi-structured interviews. During interviews, five questions on force concept and four questions on the relationship between the concept of force and motion were asked. Search for questions were asked during the interviews to obtain in-depth knowledge. The interviews recorded by audio recording device were converted into the text. Categories were created by examining these texts. Consequently, although this varies widely person to person images of the concept, the students often perceive the concept of force as contact force and were trying to explain the changes in the case of body motion. It is thought that the education students have acquired and daily life experiences they have gained play an important role over emerge of this result. According to research data about the concept of force and motion, misconceptions of the students are also identified.

Key words: concept image, force and motion, ninth grade students.

MATEMATİK ÖĞRETMEN ADAYLARININ MATEMATİKSEL KANIT YAPMAYA YÖNELİK GÖRÜŞLERİ

PROSPECTIVE MATHEMATICS TEACHERS' VIEWS ABOUT MATHEMATICAL PROOF

Cigdem ARSLAN

ÖZET Matematik öğretiminin her kademesinde matematiksel kanıtın önemi bilinmekte olup tüm dünyada matematik öğretim programlarında ayrı bir yere sahiptir. Matematiksel kanıtı öğretecek olan öğretmen adaylarının bu konudaki görüşlerini öğrencilerine yansıtacakları gerçeği ve kanıtlamanın matematiksel düşünmenin gelişimimdeki yeri göz önünde bulundurularak bu çalışmanın amacı öğretmen adaylarının matematiksel kanıt yapmaya yönelik görüşlerinin tespiti ve öğrenim gördükleri bölüme göre farklılık gösterip göstermediğini ortaya koymak olarak belirlenmiştir. Öğretmen adaylarının matematiksel kanıta yönelik görüşlerini tespit etmek için İskenderoglu, Baki ve Palancı (2011) tarafından geliştirilen "Matematiksel Kanıt Yapmaya Yönelik Görüş Ölçeği" kullanılmıştır. Ölçek 27 maddeli 5'li likert tarzıdır. Bu bağlamda araştırmanın çalışma grubunu Eğitim Fakültesi İlköğretim Matematik Öğretmenliği Bölümü öğrencileri ile Fen Fakültesi mezunu olup öğretmenlik sertifikası almak üzere Eğitim Enstitüsüne devam eden lise matematik öğretmen adayları oluşturmuştur.
Anahtar sözcükler: matematiksel kanıt, matematik öğretmen adayı, ispata yönelik görüş

ABSTRACT: Mathematical proof has an important and distinct place at all levels of mathematics curriculum in mathematics teaching all over the world and considered crucial to the development of mathematical thinking. Prospective mathematics teachers' views on mathematical proof who will teach on this subject is of importance ,because thier views will reflect to students. The purpose of this study was to investigate and compare prospective secondary and elementary school mathematics teachers' views on proving. "Questionnaire for Constructing Mathematical Proof " developed by İskenderoglu, Baki and Palancı (2011)administrated to teacher candidates to determine their views about proof. The scale is 5-point Likert-Type and consists of 27 items. In this context, the study group of the research consisted of prospective elementary school mathematics teachers enrolled to Faculty of Education and prospective secondary mathematics teachers enrolled to pedagogical education program of Institute of Education Sciences.

Key words: mathematical proof, prospective mathematics teachers, views on mathematical proof

PRESERVICE SCIENCE TEACHERS' PERCEPTIONS OF GENETICALLY MODIFIED ORGANISMS: A METAPHOR ANALYSIS

Isil KOC

Meltem KUVAC

The purpose of this research was to determine preservice science teachers' perceptions of "genetically modified organisms" through the use of metaphors. The research was conducted with 54 preservice science teachers from Istanbul University in the Fall term of 2013-2014 academic year. The qualitative research method with phenomenology pattern was utilized in this research. For the data collection, a form that included the phrase "Genetically modified organisms(GMOs) are like ......; because ......" was given to participants and required to complete to articulate their conceptualizations of GMOs. Data were analyzed with the content analysis technique. According to results, participants produced 31 distinct and valid mental images grouped into six distinct conceptual categories that characterize GMOs. Based on findings, most frequent metaphors utilized by participants were obese people, imitation, and mystery box. Overall, the results indicate that metaphors can be utilized as a strong research tool to reveal the preservice science teachers' perceptions on the concept of GMOs.

INTERACTIVE E-LEARNING MATERIALS PRODUCTION AND SAMPLE APPLICATIONS IN THE FIELD OF MATHEMATICS

Celal Murat KANDEMİR

Today, thanks to rapid developments in the information and communication technologies (ICT), learning styles of the students have been getting more and more changes. There is a few time less than 20 minutes in order to attract attention of the new learners named as digital generation, and to keep their motivations at the same levels. Thus, the course materials are offered to the students through being prepared in small pieces instead of in one batch. After giving fundamental information intended to teach, preparing interactive e-learning materials, which enable students to learn by themselves in order to reinforce the learning, can be carried out easily by using today's information and communication technologies. To provide more benefits from information and communication technologies in education, the Act of Increasing Opportunities and Improving Technology called briefly "FATİH project" was introduced with the 52 pilot schools in 2011. Under the scope of the project, e-learning content is required in order to be used inside and outside of the classroom by the teachers and the students. These contents play an important role in the use of information and communication technologies in education, and the success of FATİH project. Using of Information and communication technologies to support learning by teachers, preparing e-learning materials by the teachers themselves, and being able to update existing materials, when it is required are important. In this study, a road map is proposed for the teachers in order to develop interactive e-learning materials, which can attract new learners' attentions, and sample applications are developed for the different subjects in the field of elementary mathematics through using this proposed road map. When developing interactive e-learning materials, some information about the selection of free or open source software and about how to use them are given in there.

SINIF ÖĞRETMENLERİNİN MATEMATİK KAYGISI

Ramazan GÜRBÜZ,

Kenan YILDIRIM

Bu çalışmanın amacı, sınıf öğretmenlerinin matematik kaygı düzeylerini çeşitli değişkenler açısından incelemektir. Araştırma, bir ilde bulunan farklı ilkokullarda görev yapan ve rastgele seçilen 559 sınıf öğretmeninin katılımıyla gerçekleştirilmiştir. Veri toplama aracı olarak, Üldaş (2005) tarafından geliştirilen Öğretmen ve Öğretmen Adaylarına Yönelik Matematik Kaygı Ölçeği (MKÖ-Ö) kullanılmıştır. Verilerin analizinde, "t" testi ve varyans analizi (ANOVA) kullanılmıştır. Yapılan analizler sonucunda, sınıf öğretmenliği mezunu öğretmenlerin matematik kaygı puanlarının, diğer anabilim dallarından mezun öğretmenlerin kaygı puanlarından daha düşük olduğu tespit edilmiştir. Öte yandan, sınıf mevcudu arttıkça öğretmenlerin matematik kaygılarının da arttığı belirlenmiştir. Bunların yanı sıra, 4. sınıf öğretmenlerinin matematik kaygılarının diğer sınıfları okutan öğretmenlerden daha fazla olduğu ve mesleğiyle ilgili yayınları takip eden öğretmenlerin matematik kaygılarının takip etmeyenlerden daha düşük olduğu saptanmıştır.

The aim of this study is to primary school teachers' math anxiety level in terms of examine of several variables. The study was carried out with 559 classroom teachers working in different primary schools in a province of Turkey. As data collection tool, Mathematics Anxiety Scale for Teachers and Teacher Candidates (MKÖ-Ö) developed by Üldaş (2005) was used. In order for analyzing the data, "t" test and analysis of variance (ANOVA) was used. According to the research results, When analyzed teachers' mathematics anxiety scores, As a result of the analysis, mathematics anxiety scores of primary school teaching graduates were lower than the scores of teachers from other departments. In addition, teachers' mathematics anxiety increased with increasing class size. Also, math anxiety of fourth-grade teachers was more than teachers of other grades. However, math anxiety of teachers who follow publications related his/her job were lower than those not follow.

ÖZET: Bu çalışmanın amacı, öğrencilerin Maddenin Tanecikli Yapısı (MTY) ünitesinde yer alan kavramlarla ilgili sahip oldukları alternatif kavramaların iki aşamalı çoktan seçmeli sorular içeren kavram testi kullanılarak belirlenmesidir. Çalışmada, araştırmacılar tarafından geliştirilen ve iki aşamalı çoktan seçmeli sorulardan oluşan "Maddenin Tanecikli Yapısı Kavram Testi (MTYKT)" Trabzon ilindeki bir ortaokulda, 6. sınıfta, iki farklı şubede öğrenim gören toplam 82 öğrenciye uygulanmıştır. Çalışma sonucunda öğrencilerin "Maddenin Tanecikli Yapısı" ünitesi ile ilgili birçok alternatif kavramaya sahip oldukları görülmüştür. Ayrıca iki aşamalı testlerin, öğrencilerin alternatif kavramalarının nedenleriyle birlikte ortaya çıkarılmasında etkili şekilde kullanılabileceği görülmüştür.

Anahtar sözcükler: Maddenin Tanecikli Yapısı, İki Aşamalı Çoktan Seçmeli Test, Alternatif Kavrama

ABSTRACT: The aim of this study it to determine students' alternative conceptions related to the particulate nature of matter subject by using a concept test which includes two-tier multiple choice questions. "The Particulate Nature of Matter Concept Test (PNMCT)", which was developed by the researchers and included two-tier multiple choice questions, was applied 82 grade 6 students in Trabzon. The results of study show that students have several alternative questions related to the particulate nature of matter concept subject. And also, it was seen that two-tier multiple choice questions could be effectively used for determining students' alternative conceptions with their possible reasons.

Key words: The Particulate Nature of Matter, Two-Tier Multiple Choice Test, Alternative Conceptions

GİRİŞ

Öğrencilerin, öğrenme ortamına gelmeden önce çeşitli deneyimleri sonucu sahip oldukları hatalı düşüncelere "kavram yanılgısı (misconceptions)", "alternatif kavrama (alternative conceptions)", ön kavrama (preconceptions) gibi birçok farklı isim verilmektedir (Özmen, 2004). Bu çalışmada hatalı öğrenci inançlarını ifade etmek üzere alternatif kavrama ifadesinin kullanılması tercih edilmiştir. Alternatif kavramalar, bilimsel olarak kabul görmese de, çocuğun bakış açısına göre mantıklı olduklarından zihinlerine iyice yerleşmiş durumdadırlar (Gilbert, Osborne & Fensham, 1982). Bu nedenle sonraki öğrenmelerini ve zihinlerinde yeni ve doğru kavramları geliştirmelerini olumsuz yönde etkilemektedir.

Literatürde alternatif kavramaların belirlenmesinde çok çeşitli araçlar kullanılmaktadır. Bu amaçla açık uçlu ve çoktan seçmeli sorular ile mülakatlar daha sık kullanılmakla birlikte, kısa cevaplı soruların, çizimlerin, doküman analizinin, kavram haritalarının ve TGA yönteminin de kullanıldığı görülmektedir. Bu veri toplama araçlarından biri veya birkaçı birlikte kullanılarak öğrencilerin MTY ve ilişkili kavramlarla ilgili anlamalarının ve alternatif kavramaların belirlendiği çalışmalara literatürde rastlanmaktadır.

Çoktan seçmeli testler, amacına uygun olarak hazırlandığında, öğrencilerin sahip oldukları alternatif kavramları belirlemede önemli bir veri toplama aracı olarak kullanılabilir. Ancak çoktan seçmeli testlerle öğrencilerin taşıdıkları alternatif kavramalar hakkında bilgi sahibi olunabilirken verilen cevapların nedenleriyle ilgili bilgi sahibi olunamaz (Ayas, 1995). Bu nedenle çoktan seçmeli testlerin olumlu yönlerini taşıyıp olumsuz yönlerini en aza indiren iki aşamalı teşhis edici testler geliştirilmiş ve fen bilimleri eğitiminde yaygın bir biçimde kullanılmıştır (Tan, Goh, Chia & Treagust, 2002; Voska & Heikkinen, 2000). Bu tip testler öğrencilerin sahip oldukları kavramaların ve bu kavramaların nedenlerinin ortaya çıkarılmasında kolaylık sağlamaktadır (Tan, Taber, Goh & Chia, 2005). Temelde iki bölümden oluşan bu tür testlerde, birinci bölüm öğrencilerin durum hakkında tahminde bulundukları, ikinci bölüm ise birinci kısımda verilen cevabın nedeninin araştırıldığı bölümdür (Tan ve diğ., 2005). İkinci kısım çoktan seçmeli seçeneklerden oluşabileceği gibi açık uçlu seçeneklerden de oluşabilir. Eğer ikinci kısım çoktan seçmeli ise kullanılan çeldiricilerde öğrencilerin doğru olduğunu düşündükleri yanlış ve ilginç bilgilere yer verilmesi önerilmektedir (Treagust, 1988).

Bu çalışmada hem fen bilimlerinin hem de kimyanın en temel konularından birisi olan maddenin tanecikli yapısı ile ilgili olarak geliştirilen iki aşamalı çoktan seçmeli sorulardan oluşan test ile öğrencilerin kavramsal anlamalarının ve alternatif kavramalarının belirlenmesi amaçlanmıştır. Literatürde maddenin tanecikli yapısı konusunda çok sayıda araştırma olsa da (Çakmak, 2009; Kenan, 2005; Yezierski, 2003), iki aşamalı çoktan seçmeli sorular içeren veri toplama araçlarına çok sık rastlanmamaktadır. Bu nedenle çalışmada öğrencilerin alternatif kavramalarının belirlenmesinde, verilen cevapların nedeninin de belirtilmesini gerektiren iki aşamalı çoktan seçmeli sorulardan oluşan bir test kullanılmıştır.

YÖNTEM

Bu çalışmada, 6. sınıf öğrencilerinin "Maddenin Tanecikli Yapısı" ünitesi ile ilgili alternatif kavramalarının belirlenmesinde, araştırmacılar tarafından geliştirilen, seçeneklerde cevabın nedeninin yer aldığı iki aşamalı çoktan seçmeli (two-tier multiple choice) sorulardan oluşan bir test (MTYKT) kullanılmıştır. MTYKT'nin geliştirilmesinde, Treagust (1988) tarafından önerilen metodolojiye göre Treagust ve Chandrasegaran (2007) tarafından ortaya konulan model kullanılmıştır. Bu model, geliştirilen içeriğin belirlenmesi, öğrencilerin alternatif kavramaları hakkında bilgi edinilmesi ve iki aşamalı teşhis testinin geliştirilmesi basamaklarından ve bu basamaklara ait alt basamaklardan oluşmaktadır.

Test, başlangıçta birinci aşaması farklı sayıda seçenek içeren çoktan seçmeli, ikinci aşaması ise öğrencilerdeki yaygın alternatif kavramaların belirlenip seçeneklere yerleştirilmesi amacıyla açık uçlu 18 soru olarak hazırlanmıştır. Uzman görüşleri dikkate alınarak birinci aşaması doğru-yanlış türü sorulara dönüştürülmüş ve soru sayısı 20'ye çıkarılmıştır. Böylece bütün soruların aynı formatta olması sağlanmıştır. Test bu haliyle ön uygulamanın yapıldığı 38 kişilik öğrenci grubuna ön test olarak uygulanmıştır. Öğrencilerden, soruların birinci aşamasında verilen yargının doğru ya da yanlış olduğunu belirtmeleri, ikinci aşamada ise düşüncelerinin sebebini yazmaları istenmiştir. Bu uygulama sonucu elde edilen cevaplar listelenerek frekanslanmıştır. Elde edilen yüksek frekansa sahip alternatif kavramalar testin ikinci aşamasının çoktan seçmeli olarak düzenlenmesinde kullanılmıştır.

Birinci kısmı doğru-yanlış ikinci kısmı dört seçenekten oluşan çoktan seçmeli 20 sorudan oluşan testin ilk hali araştırmacılar tarafından literatürden de faydalanılarak geliştirilmiştir (Kenan, 2005). Testin çoktan seçmeli ikinci aşamasında kullanılan alternatif kavrama içeren çeldiriciler, ilgili literatürden ve soruların ikinci aşamasının açık uçlu sorulardan oluşan halinin uygulanmasıyla elde edilen öğrenci cevaplarından yararlanılarak oluşturulmuştur. Bazı sorularda (19. ve 20. sorular) tanecik düzeyinde gösterimlere yer verilmiştir. Bazı soru kökleri ve seçenekleri literatürde kullanılan (Çakmak, 2009; Kenan, 2005; Yezierski, 2003) MTY ile ilgili öğrenci anlamalarının belirlenmesi amacıyla hazırlanan testlerden yararlanılarak hazırlanmıştır. 1, 4, 9, 10, 11, 12. sorular Çakmak (2009) tarafından geliştirilen testten, 20. soru ise Yezierski (2003) tarafından geliştirilen testten alınarak yeniden düzenlenmiştir. MTYKT'nin geçerliliğinin sağlanmasında uzman ve öğretmen görüşlerine başvurulmuştur. Bu amaçla test kimya eğitimi alanında uzman üç öğretim üyesi ve dört fen bilimleri öğretmeninin incelemesine sunulmuştur. Uzman görüşleri doğrultusunda gerekli değişiklik ve düzenlemeler yapılmıştır.

Yapılan düzeltmelerin ardından test, toplam 80 (40+40) öğrenciden oluşan bir gruba pilot olarak uygulanmıştır. Testin Cronbach alfa güvenirlik katsayısı 0,887 olarak hesaplanmıştır. Geliştirme süreci tamamlanan test, Trabzon ilindeki bir ortaokulda, 6. sınıfta, iki farklı şubede öğrenim gören toplam 82 (41+41) öğrenciye "Maddenin Tanecikli Yapısı" ünitesiyle ilgili alternatif kavramalarının belirlenmesi amacıyla, ünitenin öğretiminden önce uygulanmıştır.

MTYKT'deki maddelerde doğru cevap seçeneğinin yanı sıra, alternatif kavramaları içeren seçenekler (çeldiriciler) de yer almaktadır. Çeldiricilerden herhangi birini işaretleyen öğrencinin, o çeldiricide ifade edilen alternatif kavramalara sahip olduğu (Kenan, 2005; Treagust, 1988) kabul edilmiştir. Bu nedenle, her iki aşamada teste verilen cevaplar analiz edilirken, her bir test maddesindeki tüm cevap seçeneklerinin öğrenciler tarafından doğru cevap olarak işaretlenme yüzdeleri hesaplanmıştır.

BULGULAR

Öğrencilerinin alternatif kavramalarına yönelik hazırlanan iki aşamalı çoktan seçmeli bir test olan MTYKT'den elde edilen öğrencilerin cevap yüzdeleri Tablo 1'de verilmiştir.

Tablo 1. MTYKT'ye Verilen Cevaplara Ait Yüzde Dağılımları

*:Her iki aşamayı da doğru cevaplayan öğrenci yüzdeleri

Tablo 1'de görüldüğü gibi MTYKT'nin birinci sorusunda, öğrencilerin %17,1'i bütün maddelerin tanecikli yapıda olmadığı alternatif kavramasına sahipken, biri hariç, bu öğrenciler bu durumun maddeden maddeye değişeceğine inanmaktadır. Testin ikinci sorusunda, öğrencilerin % 42,6'sı katı ve sıvıların bütünsel yapıda, gazların ise tanecikli ve boşluklu yapıda olduğu alternatif kavramasına sahiptir. Öğrencilerin 19,5'i ise sadece sıvı ve gaz tanecikleri arasında boşluk olduğu alternatif kavramasına sahiptir.

Üçüncü soruda öğrencilerin %71,9'u sıkıştırılan hava taneciklerinin şeklinin değişeceği alternatif kavramasına sahiptir. Sıkıştırmanın etkisiyle öğrencilerin %19,5'i hava taneciklerinin ezileceği, %23,2'si hava taneciklerinin küçüleceği, %35,3'ü ise hava taneciklerinin birbirine yapışacağı alternatif kavramasına sahiptir. Dördüncü soruda, öğrencilerin %57,3'ü demir bir tel makasla ortadan ikiye bölündüğünde bölünen yerdeki atomların da ikiye bölüneceği alternatif kavramasına sahiptir. Bu alternatif kavramaya sahip öğrencilerin %31,7'si gerekçe olarak maddenin her türlü bölünmesinde atomların da bölüneceğini belirtmiştir.

Testin beşinci sorusunda, öğrencilerin %82,9'u genleşmenin tanecik büyüklüğünde meydana gelen değişimden kaynaklandığına inanmaktadır. Öğrencilerin %57,3'ü ise ısınma etkisiyle taneciklerin genleşeceği alternatif kavramasına sahiptir. %15,9'u ısı etkisi ile taneciklerin birbiri ile birleşip büyüyeceği, %12,2'si ise taneciklerin parçalanıp sayılarının artacağı alternatif kavramasına sahiptir. Altıncı soruda öğrencilerin %78'i tuzun su içerisinde yok olacağı alternatif kavramasına sahip iken, gerekçe olarak öğrencilerin %39'u katı maddenin taneciklerinin eriyeceğini ifade etmiştir

Yedinci soruda öğrencilerin %18,3'ü bir sıvının taneciklerinin diğerinin taneciklerini ezerek küçülteceği, %22'si taneciklerin birbirini sıkıştırmasından dolayı tanecikler arası boşlukların azalacağı alternatif kavramasına sahiptir. Testin sekizinci sorusunda, sorunun birinci aşamasında öğrencilerin %92,8'i boya taneciklerinin su taneciklerini yeşile boyayacağı alternatif kavramasına sahipken, ikinci aşamada gerekçe olarak öğrencilerin %50,1'i yeşil renkli boya taneciklerinin renksiz su taneciklerine çarparak onları da yeşile boyayacağı alternatif kavramasına sahiptir. Öğrencilerin %35,3'ü ise yeşil renkli boya taneciklerinin su tanecikleriyle birleşerek onları da yeşil yapacağı alternatif kavramasına sahiptir.

Dokuzuncu soruda öğrencilerin %70,7'si atomların ışık mikroskobuyla görülebileceğine inanırken, gerekçe olarak öğrencilerin %57,3'ü mikroskopların, atom gibi küçük nesneleri gözle görülebilir hale getirebileceğine inanmaktadır. Onuncu soruda öğrencilerin yarısı altın atomlarının sarı renkli olduğu alternatif kavramasına sahip iken, gerekçe olarak öğrencilerin %39'u atomların fiziksel özelliklerinin maddelerle aynı olmasını göstermektedir. Sorunun birinci aşamasında öğrencilerin %47,6'sı altın atomlarının sarı renkli olmayacağını belirtirken bu öğrencilerin %19,5'i gerekçe olarak ayrılan atomun rengini kaybedeceğini belirtmiştir.

On birinci sorunun birinci aşamasını doğru cevaplayan öğrencilerin oranı %85,3 iken, farklı elementlerin atomlarının birbirinden farklı özellikte olduğu gerekçesiyle demir telin atomları ile bakır telin atomlarının farklı olduğunu belirterek sorunun her iki aşamasını doğru cevaplayan öğrencilerin oranı %56,1'dir. On ikinci soruda, öğrencilerin %54,8'i ezilen teneke kutudaki atomların da ezileceği alternatif kavramasına sahiptir. Gerekçe olarak öğrencilerin %36,6'sı atomların şeklinin değişeceği, %19,5'i hacimlerinin küçüleceği ve %13,4'ü ise ezilerek fakli atomlara dönüşeceği alternatif kavramalarını belirtmiştir.

On üçüncü soruda öğrencilerin %61'i su ve karbondioksitin yapısındaki oksijen atomlarının farklı olduğu alternatif kavramasına sahiptir. Buna gerekçe olarak ise öğrencilerin %46,3'ü su ve karbondioksitin farklı bileşikler olmasını göstermiştir. On dördüncü soruda, öğrencilerin %65,8'i su moleküllerinin birbirinden farklı olabileceği alternatif kavramasına sahiptir. Gerekçe olarak öğrencilerin %36,5'i bütün su moleküllerindeki hidrojen ve oksijen atomlarının dizilişinin farklı olabileceği, %18,3'ü her bir su molekülünün farklı sayıda oksijen ve hidrojen atomlarından oluşabileceği ya da maddenin haline göre molekülleri arasında farklılık olabileceği alternatif kavramalarına sahiptir. On beşinci soruda öğrencilerin %59,8'i bileşiklerin saf madde olmadığına inanmaktadır. Bu alternatif kavramaya sahip öğrencilerin %23,2'si gerekçe olarak bileşiklerin farklı cins atomlardan oluşmasını, %17,1'i ise bileşiklerin farklı elementlerden meydana gelmesini göstermiştir.

On altıncı soruda öğrencilerin %85,3'ü sıvılar donduğunda taneciklerinin de donacağı alternatif kavramasına sahiptir. Bu öğrencilerin %40,2'si sıvıların donduğunda taneciklerinin de donacağı, %25,6'sı ise donan sıvının taneciklerinin birbirine yapışacağı ve aralarında boşluk kalmayacağı alternatif kavramalarını gerekçe olarak göstermiştir. On yedinci soruda öğrencilerin %75,6'sı atomların da öleceği alternatif kavramasına sahiptir. Bu alternatif kavramaya sahip öğrencilerin %29,3'ü gerekçe olarak atomların hareket etmesini, %35,4'ü ise canlıların da atomlardan meydana gelmesini göstermiştir.

On sekizinci soruda, öğrencilerin %71,9'u buharlaşma esnasında su moleküllerinin ağırlığının azalacağı alternatif kavramasına sahiptir. Bu alternatif kavramaya sahip öğrencilerin %34,1'i gaz halde maddelerin moleküllerinin en hafif olacağı alternatif kavramasını gerekçe göstermektedir. On dokuzuncu soruda verilen tanecik modelinin saf bir maddeye ait olmadığını belirten öğrencilerin (%56,2) gerekçe olarak %22'si modelde farklı cins atomların olmasını, %24,4'ü ise farklı iki elementin birleşmesinden oluşmasını göstermiştir.

Testin yirminci sorusunda, su buharlaştığında su molekülünü oluşturan atomların büyüdüğünü gösteren tanecik modelini seçen öğrencilerin oranı %22 iken, öğrencilerden %17,1'i bu seçeneğin gerekçesi olarak ısınan su moleküllerinin genleşerek büyüyeceğini belirtmiştir. Öğrencilerin %43,9'u ise molekülü oluşturan atomların birbirinden ayrıldığını gösteren modeli tercih etmiştir. Bu modeli tercih ederek atomların birbirinden ayrılacağı gerekçesini seçen öğrencilerin oranı ise %36,6'dır.

SONUÇLAR

Elde edilen bulgular öğrencilerin, maddelerin tanecikli ve boşluklu yapıda olduğu fikri, tanecik kavramı, taneciklerin şekli, boyutu, ağırlığı, kütlesi, rengi, canlılığı, hareketi, sayısı, aralarındaki boşluklar gibi fiziksel özellikleri ve bu özelliklerde meydana gelen değişimlerle ilgili olarak çeşitli alternatif kavramalara sahip olduklarını göstermektedir. Öğrenciler maddelerin ısıtılması, soğutulması, hal değiştirmesi, sıkıştırılması, ezilmesi ve basınca maruz kalması gibi durumlarda taneciklerin özelliklerinde değişme olacağına dair alternatif kavramalar taşımaktadır. Ayrıca, öğrencilerin genellikle maddelerin makroskobik özelliklerini ve bu özelliklerdeki değişimleri taneciklere de uygulama eğiliminde olduklarını göstermektedir. Diğer bir deyişle öğrenciler, maddelerde meydana gelen sıkışma, genleşme, büzülme, hal değişimleri gibi fiziksel değişimlerin taneciklerindeki aynı şekildeki değişimlerden kaynaklandığına inanmaktadır. Literatürde öğrencilerin maddenin makroskobik özellikleriyle, taneciklerin özelliklerinin aynı olduğuna inanma eğiliminde olduklarını ortaya koyan çalışmalar yer almaktadır (Boz, 2006). Ayrıca öğrenciler atom, molekül, element, bileşik gibi kavramlarla ilgili olarak mikroskobik düzeyde çeşitli alternatif kavramalar göstermektedir.

Belirlenen alternatif kavramaların yanı sıra, elde edilen bulgulardan, öğrencilerin iki aşamalı sorulara alışkın olmadıkları, düşüncelerini gerekçelendirmede yetersiz kaldıkları, iki aşamalı soruların her iki aşamasını da doğru cevaplayan öğrencilerin oranlarının oldukça düşük olmasından anlaşılmaktadır.

Sonuç olarak öğrencilerin, maddenin tanecikli yapısı, taneciklerin özellikleri ve meydana gelen değişimler ile tanecik, atom, molekül, element, bileşik ve saf madde kavramları ile ilgili olarak birçok alternatif kavramaya sahip oldukları söylenebilir. Bu alternatif kavramaların belirlenmesinde ve özellikle düşüncelerin gerekçelerinin ortaya çıkarılmasında iki aşamalı testler etkili bir şekilde kullanılabilir. Böylece öğretim öncesinde öğrencilerin ön bilgileri ve alternatif kavramaları ortaya çıkarılarak, gerekçeleri bilinen alternatif kavramalarla etkili bir şekilde mücadele edilebilir ve alternatif kavramaların giderilmesine yönelik uygun öğretim ortamları düzenlenebilir.

ÖZET: Bu çalışmanın amacı, öğrencilerin Maddenin Tanecikli Yapısı (MTY) ile ilgili anlamalarının belirlenmesinde Tahmin-Gözlem-Açıklama (TGA) yönteminin ve çalışma yapraklarının etkililiğini araştırmaktır. Çalışma, Trabzon ilindeki bir ortaokulun bir 6. sınıfında öğrenim gören toplam 38 öğrenci üzerinde yürütülmüştür. Veriler TGA yöntemine göre hazırlanmış ve çalışma yapraklarıyla desteklenmiş bilgisayar destekli öğretim (BDÖ) uygulamaları esnasında, öğrencilerin çalışma yapraklarına yazdıkları tahmin, gözlem ve açıklamalarından elde edilmiştir. Çalışma sonucunda, çalışma yapraklarıyla desteklenen TGA yönteminin öğrencilerin alternatif kavramalarının detaylı olarak belirlenmesinde etkili bir şekilde kullanılabileceği görülmüştür.

Anahtar sözcükler: Maddenin Tanecikli Yapısı, TGA Yöntemi, Çalışma Yaprağı, Alternatif Kavrama.

ABSTRACT: The aim of the study is to investigate the effectiveness of Prediction-Observation-Explanation (POE) method and worksheets in determining the students' conceptions on the Particulate Nature of Matter (PNM). The sample of the study consisted of 38 grade 6 students in Trabzon. The data were collected from the prediction-observation and explanations written on the worksheets during the computer assisted instruction (CAI) application which was designed according to POE and enriched with worksheets. It was seen that POE enriched with worksheets could be effectively used for determining students' alternative conceptions in detail.

Key words: The Particulate Nature of Matter, POE Method, Worksheet, Alternative Conception

GİRİŞ

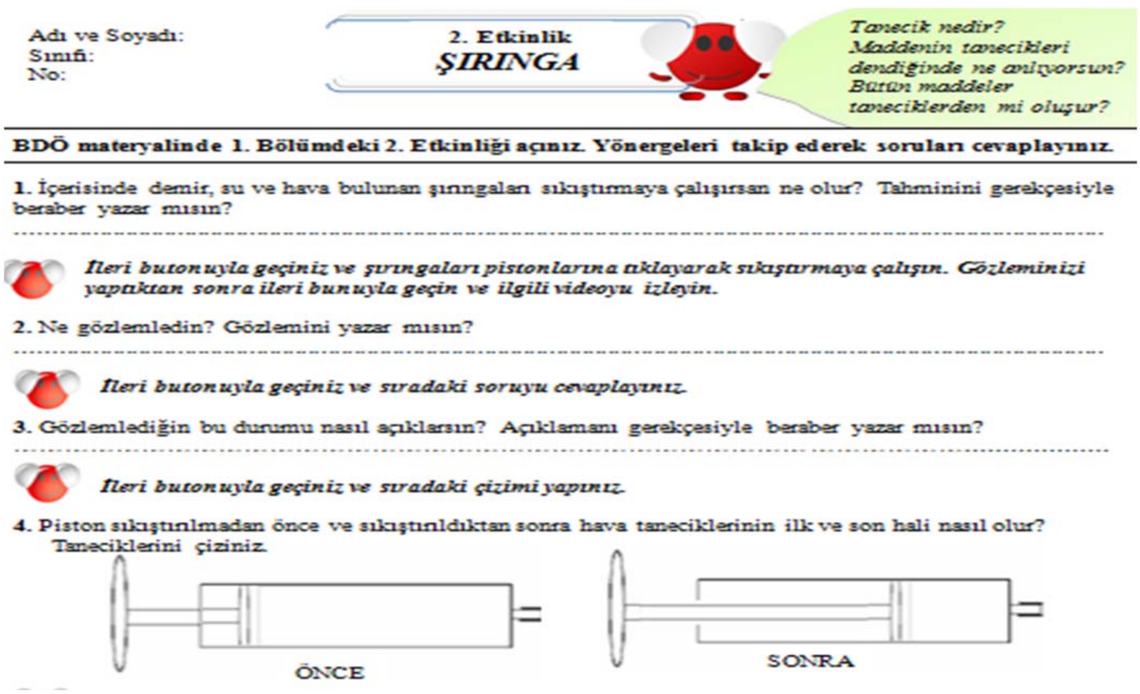
Alternatif kavramaların giderilebilmesi için öncelikle konu ile ilgili alternatif kavramalar mümkün olduğunca eksiksiz belirlenmelidir. Literatüre bakıldığında alternatif kavramaların belirlenmesinde çok çeşitli araçlar kullanılmaktadır. Bu araçlardan açık uçlu ve çoktan seçmeli sorular ile mülakatlar daha sık kullanılmakla birlikte, kısa cevaplı soruların, çizimlerin, doküman analizinin, kavram haritalarının ve TGA yönteminin de kullanıldığı görülmektedir. Bu veri toplama araçlarından biri veya birkaçı birlikte kullanılarak öğrencilerin diğer kavramlarda olduğu gibi MTY ve ilişkili kavramlarla ilgili anlamalarının ve sahip oldukları alternatif kavramaların belirlendiği literatürde görülmektedir.

Literatürde yapılan çalışmalar incelendiğinde öğrencilerin anlama düzeylerini ve alternatif kavramalarını belirlemede çoğunlukla çeldiricileri kavramla ilgili değişik alternatif kavramaları içeren çoktan seçmeli testlerin kullanıldığı görülmektedir. Fakat çoktan seçmeli testlerle öğrencilerin taşıdıkları kavram yanılgıları hakkında bilgi sahibi olunabilirken verilen cevapların nedenleriyle ilgili bilgi sahibi olunamaz. Bu nedenle yazılı cevap gerektiren testler daha detaylı bilgi edinme imkânı sağladıkları için tercih edilirler. Yazılı cevap gerektiren testler özellikle kavramların anlaşılma düzeyini tespit etmede yaygın olarak kullanılırlar (Ayas, 1995). Ayrıca çizimler öğrencilerin kavramları zihinlerinde nasıl canlandırdıklarını ortaya koyar. Zira çizimler kavramların zihinsel yapısallaşmasını ortaya çıkaran en önemli soru çeşitlerinden birisidir (Ayas ve Özmen, 2002). Çizimler, öğrencilerin zihinlerinde gizli kalmış bilgi ve inanışları ve öğrenme kalitesini kelimelerle sınırlandırmadan ortaya çıkardığı için tercih edilirler. Aynı zamanda çizimler öğrencilerin mikroskobik seviyede öğrenmelerini de ortaya çıkarır. Tanecikler düzeyindeki çizimler, anlama düzeyleri ile ilgili çalışmalarda yaygın olarak kullanılmaktadır (Kokkotas, Vlachos ve Koulaidis 1998; Singer, Tal ve Wu, 2003; Tsai, 1999).

Literatürde TGA yöntemi, MTY konusu da dahil olmak üzere, çeşitli konularla ilgili öğrencilerin alternatif kavramalarının belirlenmesinde etkili bir şekilde kullanılmaktadır (Liu ve Lesniak, 2006; Stern, Barnea ve Shauli, 2008). Çalışma yaprakları da öğretim etkinliklerinin belirlenen aşamalarda, belirli bir bütünlük içerisinde sırayla sunulmasına imkan sağladığı için diğer yöntem ve tekniklerle birlikte sıklıkla tercih edilmektedir (Şahin ve Çepni, 2012; Türk ve Çalık, 2008). Böylece öğrencilerin ilgilerinin çekilip dikkatlerinin toplanması, ön bilgilerinin belirlenmesi, içeriğin adım adım takip edilmesi, görüş ve düşüncelerinin alınması ve değerlendirme yapılmasına imkân sağlanmaktadır. Bu çalışmada, TGA yönteminin adımları takip edilerek öğrencilerin MTY ile ilgili konulardaki düşüncelerinin alınması amacıyla çalışma yapraklarının ve TGA'nın birlikte kullanılması amaçlanmıştır. Bu bağlamda çalışmanın amacı, öğrencilerin MTY ile ilgili anlamalarının belirlenmesinde TGA yönteminin ve çalışma yapraklarının etkililiğinin birlikte araştırılmasıdır.

YÖNTEM

Bu çalışma Trabzon il merkezinde bir ortaokulun 6. sınıfında öğrenin gören 38 öğrenci üzerinde yürütülmüştür. Çalışmada, 6. sınıf öğrencilerinin MTY ile ilgili anlamalarının ve alternatif kavramalarının belirlenmesinde TGA yöntemine göre hazırlanan çalışma yaprağı kullanılmıştır. Uygulama iki ders saatinde yapılmıştır. TGA yöntemine göre düzenlenen etkinlik çalışma yaprağı kullanılarak yürütülmüştür. Demir, su ve hava bulunan şırıngaların sıkıştırılmasının yer aldığı etkinlikte, öğrencilerden tahmin, gözlem ve açıklamalarını çalışma yapraklarında yer alan sorulara ait boşluklara yazmaları istenmiştir. Öğrenciler cevaplarını bireysel olarak dersin işlenişi sırasında ilgili boşluklara yazmış ve sınıf içi tartışmalar yürütülmüştür. İçerikte makroskobik ve tanecikler düzeyinde tahmin, gözlem ve açıklamalara yer verilmiştir. Açıklama basamağında kavramsal değişim metinleri kullanılmış ve metinlerin girişinde literatürde yer alan alternatif kavramalarla ilgili sorulara yer verilmiştir. Çalışmada kullanılan çalışma yaprağından bir bölüm Şekil 1'de verilmiştir.



Şekil 1. Şırınga Etkinliği Çalışma Yaprağından Bir Bölüm.

Çalışma yapraklarından elde edilen verilerin analizinde "Anlama", "Kısmen Anlama", "Alternatif Kavrama" ve "Anlamama" olmak üzere dört kategori kullanılmıştır. Literatürde anlama düzeylerine ilişkin yapılan çalışmalarda açık uçlu soruların analizinde bu ve benzeri kategoriler değişik araştırmacılar tarafından kullanılmıştır (Abraham, Williamson ve Westbrook, 1994; Ayas ve Özmen, 2002; Kenan, 2005; Kokkotas ve diğ., 1998). Testin bu bölümünde verilen öğrenci cevaplarının analizi yukarıda belirtilen kategorilere uygun olarak yapılmış ve öğrenci cevaplarının yüzdeleri sunulmuştur. Çizimle ilgili olan dördüncü sorunun analizinde literatürde de yer alan "Sürekli", "Tanecikli" ve "Tanecikli Çok Hatalı" kategorileri kullanılmıştır (Ayas ve Özmen, 2002; Kenan, 2014; Özmen, Ayas ve Coştu, 2002).

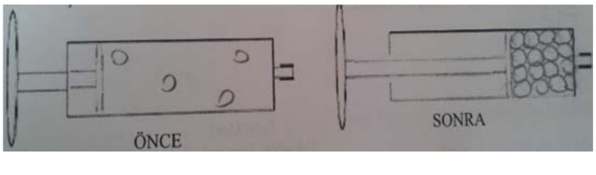
BULGULAR

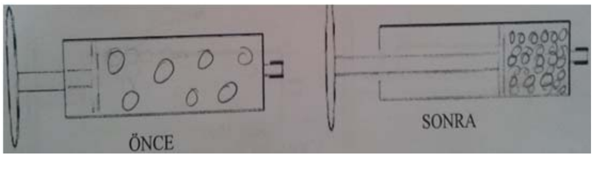
TGA'ya göre düzenlenen çalışma yapraklarının birincisinde hava, su ve demirin sıkıştırılmasına yer verilen "Şırınga" etkinliği yer almaktadır. Yapılan etkinlikle ilgili olarak öğrenciler çalışma yaprağında yer alan soruları yazılı olarak cevaplamıştır. TGA'nın tahmin aşamasında yer alan "İçerisinde demir, su ve hava bulunan şırıngaları sıkıştırmaya çalışırsan ne olur? Tahminini gerekçesiyle beraber yazar mısın?" sorusuna öğrencilerin %55,3'ü sadece havanın sıkıştırılabileceğini, su ve demirin sıkıştırılamayacağını doğru olarak belirtmiştir. Bu cevabı veren öğrencilerin %47,6'sı gerekçe belirtmezken, %19'u gazların sıkıştırılabileceğini fakat katı ve sıvıların sıkıştırılamayacağını belirtmiştir. Yalnızca üç öğrenci gaz tanecikleri arasındaki boşlukların daha fazla olduğunu belirterek doğru gerekçe belirtmiştir. Örneğin bir öğrenci "*Çünkü havayı oluşturan taneciklerin arasındaki boşluk, diğer maddelerin tanecikleri arasındaki boşluktan çok daha fazladır.*" cevabını vermiştir. Üç öğrenci ise diğer maddelerden farklı olarak havanın tanecikleri arasında boşluk olduğu şeklinde alternatif kavrama içeren gerekçe belirtmiştir. Bir öğrenci gerekçe olarak ise "*Demir ve suyun arasında boşluk azdır, ama havanın moleküllerinin arasında hava vardır.*" şeklinde alternatif kavrama içeren açıklama yapmıştır. Öğrencilerin %26,3'ü ise su ve havanın sıkıştırılabileceğini, demirin ise sıkıştırılamayacağını belirtmiştir. Bu öğrencilerden üç tanesi (%7,9) demir taneciklerinin sıkışık, birleşik ya da yapışık olduğunu belirterek demirin sıkıştırılamayacağını belirtmiştir. Öğrencilerden biri, katı olduğu için, bir öğrenci de sert olduğu için demirin sıkışmayacağını belirtmiştir. Bir öğrenci sıkıştırılınca suyun taşacağını, havanın ise boşalacağını belirtirken, bir öğrenci su ve hava tanecikleri arasında demire göre daha fazla boşluk bulunduğunu belirtmiştir. Üç öğrenci ise gerekçe belirtmemiştir. Öğrencilerin %10,5'i hiçbirinin sıkıştırılamayacağını belirtirmiştir. Bu öğrenciler gerekçe belirtmemiştir. Birer öğrenci ise sadece demirin katı olduğu için sıkışacağını belirtmiştir. Bir öğrenci de gerekçe belirtmeden demir ve suyun sıkışacağını belirtmiştir.

TGA'nın gözlem aşamasında çalışma yaprağında yer alan "Ne gözlemledin? Gözlemini yazar mısın?" sorusuna bir öğrenci tahmininde olduğu gibi su ve demirin sıkıştığını, havanın ise sıkışmadığını belirtmiştir. Diğer bütün öğrenciler ise yaptıkları gözlem sonucunda havanın sıkıştırılabildiğini, su ve demirin sıkıştırılamadığını belirtmiştir. Bu öğrencilerden sıkıştırılan havanın eski haline döndüğünü belirten bir öğrenci bu duruma su ve demirde az tanecik bulunmasını gerekçe göstermiştir. Benzer şekilde başka bir öğrenci ise "Gazın tanecikleri demirin ve suyunkine göre daha fazladır" şeklinde alternatif kavrama içeren açıklamada bulunmuştur.

TGA'nın açıklama aşamasında çalışma yaprağında yer alan "Gözlemlediğin bu durumu nasıl açıklarsın? Açıklamanı gerekçesiyle beraber yazar mısın?" sorusuna iki öğrenci haricindeki tüm öğrenciler tanecikli yapı fikrini kullanarak açıklamalarda bulunmuştur. Öğrencilerin %68,4'ü "Anlama" kategorisine dahil edilen açıklamalarda bulunmuştur. Öğrencilerin %50'si tanecikler arası boşluklarla, %18,4'ü ise taneciklerin temas halinde olup olmaması ile olayı açıklamıştır. Bir öğrencinin "*Su ve demirin tanecikleri bitişik olduğu için sıkışmadı, ama havanın molekülleri ayrı olduğu için sıkıştı.*" cevabı örnek olarak verilebilir. Öğrencilerin %23,7'si alternatif kavrama içeren açıklamalarda bulunmuştur. Bazı öğrenciler (%13,2) demir ve suyun arasında boşluk ya da hava boşluğu olmadığı, havanın arasında ise hava boşluğu olduğuna dair alternatif kavramalara sahiptir. Bazı öğrenciler (%7,9) ise hava ya da gaz taneciklerinin daha az olmasını gerekçe göstermiştir. Bir öğrencinin sadece gazların sıkıştırılabileceğini belirten açıklaması "Kısmen Anlama", iki öğrencinin boş cevapları "Anlamama" kategorisine dahil edilmiştir.

TGA'nın tanecik düzeyinde tahmin aşamasında çalışma yaprağında yer alan "Piston sıkıştırılmadan önce ve sıkıştırıldıktan sonra hava taneciklerinin ilk ve son hali nasıl olur? Taneciklerini çiziniz." sorusunda yapılan çizimlerde yalnızca iki öğrenci kabul edilebilir "Tanecikli" kategorisine dahil edilen gösterimlerde bulunmuştur. Öğrencilerin %89,5'i "Tanecikli Hatalı" kategorisine dahil edilen çizimler yapmıştır. Öğrencilerin %68,4'ü bu çizimlerinde sıkıştırma sonucu taneciklerin sayısının arttığını gösteren çizimler yapmıştır (Şekil 2). Dört öğrenci ise sıkıştırma sonucu tanecik sayısını daha az gösterimlerde bulunmuştur. Öğrencilerin %15,8'i sıkıştırma sonucu taneciklerin küçüldüğünü gösteren çizimler yapmıştır (Şekil 3). İki öğrenci ise sıkıştırılan hava taneciklerini daha büyük göstermiştir. Sıkıştırılmadan önce tanecikleri düzenli dizilmiş olarak gösteren çizim yapan öğrenci bulunmazken, öğrencilerin %57,9'u sıkıştırıldıktan sonra, katıların tanecikli gösterimine yakın düzenli dizilimde gösterimler yapmıştır (Şekil 2). Öğrencilerin %52,6'sı ise sıkıştırıldıktan sonra bütün tanecikleri birbiri ile temas halinde göstermiştir (Şekil 2). Üç öğrenci ise sıkıştırılan hava için bütünsel yapıyı çağrıştıran gösterimlerde bulunmuştur.





Şekil 2 Şekil 3

Şekil 2, 3. Alternatif Kavrama Içeren Öğrenci Çizimleri

Maddelerin tanecikli yapılarını BDÖ materyali üzerinde inceledikten sonra çalışma yaprağındaki "Bu maddelerin tanecikli yapılarını göz önünde bulundurarak bu durumu nasıl açıklarsın?" sorusuna öğrencilerin %68,4'ü tanecikli yapı fikrini kullanarak "Anlama" kategorisine dahil edilen cevaplar vermiştir. Bir öğrencinin "*Katı tanecikleri sıkışık ve düzenli, sıvı tanecikleri sıkışık ve düzensiz, hava tanecikleri sıkışık değil ve düzensiz.*" cevabı örnek olarak verilebilir. Öğrencilerin %47,4'ü tanecikler arası boşluklardan, %13,2'si taneciklerin diziliminden ve %7,9'u ise taneciklerin hareketinden bahsederek benzer açıklamalar yapmıştır. Öğrencilerin %21,1'i ise bu aşamada alternatif kavrama içeren cevaplar vermiştir. Alternatif kavramaya sahip öğrencilerin büyük çoğunluğu katı ve sıvı tanecikleri arasında boşluk olmadığı alternatif kavramasına sahiptir. Bir öğrenci "*Hava, yani gazda hava boşlukları çoktur*" ifadesini kullanmıştır. İki öğrenci ise demir ve su taneciklerinin hareketsiz olduğunu belirtmiştir. Bu öğrencilerden biri "*Su ve demir tanecikleri boşluk kalmayacak şekilde yerleştiği için hareket edemezler*" ifadelerine yer vermiştir. Dört öğrenci ise yetersiz ya da makroskobik düzeyde açıklamada bulunarak "Kısmen Anlama" kategorisinde cevap vermiştir.

Çalışma yaprağında yer alan ve TGA'nın açıklama basamağında kullanılan kavramsal değişim metni öncesinde sorulan "Bütün maddelerin tanecikleri arasında boşluk var mıdır? Neden?" sorusuna öğrencilerin %47,4'ü doğru gerekçe belirterek "Anlama" kategorisinde cevap vermiştir. Bu öğrenciler taneciklerin hareket edebilmesi için boşlukların gerekli olduğunu, boşluk olmasaydı katı taneciklerinin titreşim hareketi yapamayacaklarını belirten açıklamalarda bulunmuştur. Öğrencilerin %34,2'si "Kısmen Anlama" kategorisinde cevaplar vermiştir. Bu kategoriye tanecikler arasında boşluklar bulunduğunu gerekçesiz olarak belirten öğrenci cevapları dahil edilmiştir. Bazı öğrenciler katı tanecikleri arasındaki boşlukların yok denecek kadar az olduğunu, sıvı tanecikleri arasındaki boşlukların daha fazla ve gaz tanecikleri arasındaki boşlukların ise en fazla olduğunu belirtmiştir. Öğrencilerin %18,4'ü bu soruya "Alternatif Kavrama" kategorisine dahil edilen cevaplar vermiştir. Bütün maddelerin tanecikleri arasında boşluk bulunmadığına bazı öğrenciler katı ve sıvıların sıkıştırılamayışını gerekçe göstermiştir. Bazı öğrenciler ise sadece gaz tanecikleri arasında boşluklar bulunduğu alternatif kavramasına sahiptir.

Çalışma yaprağında yer alan ve TGA'nın açıklama basamağında kullanılan diğer bir kavramsal değişim metni öncesinde yer alan "Maddeler sıkıştırıldığında taneciklerinde ne gibi değişiklikler olur? Taneciklerin şeklinde, büyüklüğünde, sayısında bir değişme olur mu?" sorusuna öğrencilerin %50'si maddeler sıkıştırıldığında taneciklerin şeklinde, büyüklüğünde, sayısında bir değişme olmayacağını sadece tanecikler arası boşlukların değişeceğini belirterek "Anlama" kategorisine giren cevaplar vermiştir. Öğrencilerin %18,4'ü herhangi bir değişiklik olmayacağını, havanın hacminin küçüleceğini belirterek "Kısmen Anlama" kategorisine giren cevaplar vermiştir. Öğrencilerin %28,9'u ise değişim olacağını belirterek alternatif kavrama içeren cevaplar vermiştir. Öğrencilerin taneciklerin hacminin küçüleceği, taneciklerin büyüklüğünde, şeklinde, sayısında, değişme olacağı, taneciklerin ezileceği, hareketlerinin azalacağı, boşlukların artacağına dair alternatif kavramalara sahip oldukları görülmüştür. Bir öğrenci ise "Anlamama" kategorisinde cevap vermiştir.

Çalışma yaprağının son sorusunda öğrencilere "Maddeler sürekli bir yapıya mı sahiptir, yoksa taneciklerden mi meydana gelmiştir?" şeklinde bir soru yöneltilmiştir. Bu soruya öğrencilerin %73,7'si maddelerin taneciklerden meydana geldiğini belirterek "Anlama" kategorisinde cevaplar vermiştir. Geriye kalan öğrencilerin çoğunluğu soruyu boş bırakmıştır. Bir öğrenci ise "Sürekli aynı yapıdadır." şeklinde cevaplamıştır.

SONUÇLAR

TGA yönteminin tahmin aşamasında öğrencilerin ön bilgileri gerekçeleriyle birlikte, gözlem aşamasında olaylar hakkındaki makroskobik düzeydeki açıklamaları, açıklama aşamasında ise makroskobik düzeyde meydana gelen değişimleri tanecik düzeyinde meydana gelen değişimlerle açıklama düzeyleri incelenmiştir. Elde edilen bulgular öğrencilerin makroskobik düzeyde meydana gelen değişimleri tanecikli yapı fikrini kullanarak açıklamada yetersiz olduklarını ve maddelerin makroskobik özelliklerini ve bu özelliklerdeki değişimleri taneciklere de uygulama eğiliminde olduklarını göstermektedir. Diğer bir deyişle öğrenciler, maddelerde meydana gelen sıkışma gibi fiziksel değişimlerin taneciklerindeki aynı şekildeki değişimlerden kaynaklandığına inanmaktadır. Bu durum öğrencilerin çeşitli alternatif kavramalar geliştirmelerine neden olmaktadır (Kenan, 2005). Zira literatürde öğrencilerin maddenin makroskobik özellikleriyle, taneciklerin özelliklerinin aynı olduğuna inanma eğiliminde olduklarını ortaya koyan çalışmalar yer almaktadır (Boz, 2006; Kokkotas ve diğ., 1998). Ayrıca makroskobik olaylar ile moleküler düzeydeki etkileşimler arasında öğrencilerin doğru ilişkileri kuramadıkları bilinmektedir (Tsai, 1999).

Elde edilen bulgular, öğrencilerin katı, sıvı ve gaz haldeki maddelerin tanecikli yapısı, tanecikler arası boşluklar ve maddelerin sıkıştırılması esnasında bu boşluklarda meydana gelen değişimlerle ilgili olarak anlama güçlüğü çektiklerini ve alternatif kavramalara sahip olduklarını ortaya koymaktadır. Bazı öğrenciler sıvıların sıkıştırılabileceğine ve sıkıştırılma sonucu tanecikleri arasındaki uzaklığın değişeceğine dair yanılgılara sahiptir. Bazı öğrenciler ise sadece sıvı ve gaz tanecikleri arasında boşluk olduğu alternatif kavramasına sahiptir. Öğrencilerin maddenin üç hali için tanecikler arası uzaklıklar hakkında sorun yaşadıkları sonucu Periera ve Pestana (1991) tarafından yapılan çalışmada da ortaya konmuştur. Öğrencilerin, maddelerin tanecikleri (Kenan, 2005) özellikle katı tanecikleri arasında (Griffiths ve Preston, 1992; Kenan, 2005) boşluk olmadığı yönünde alternatif kavramalara sahip oldukları literatürde de ifade edilmektedir. Literatürde öğrencilerin, sıvı tanecikleri arasındaki boşlukların katılarla gazlar arasında olduğuna dair alternatif kavramalara sahip oldukları belirtilmektedir (Adadan, 2006). Ayrıca öğrenciler taneciklerin şeklinde ve büyüklüğünde değişme olacağına dair alternatif kavramalara sahiptir. Testin üçüncü sorusunda öğrenciler, sıkıştırılan hava taneciklerinin şeklinin değişeceği, ezileceği ve küçüleceği alternatif kavramalarına sahiptir. Gazların sıkıştırılabildiğini bilen öğrenciler bu sıkışmayı taneciklerin küçülmesi ile açıklamaya çalışmaktadır. Literatürde de öğrencilerin "Maddeler sıkıştırıldığında tanecikleri küçülür" alternatif kavramasına sahip olduğu belirtilmektedir (Özmen ve Kenan, 2007).

Uygulama süresince çalışma yaprakları kullanılarak, öğrencilerin bütün cevap ve açıklamalarını çalışma yaprağına yazmaları sonucu bütün öğrencilerin katılımının ve düşüncelerinin alınması sağlanmıştır. Bunun sonucunda derse katılmaya istekli olmayan ve çekinen öğrenciler bile düşüncelerini rahatlıkla yazılı olarak ifade edebilmiştir.

Sonuç olarak; öğrencilerin, anlama düzeylerinin ve alternatif kavramalarının belirlenmesinde ve özellikle düşüncelerin detaylı bir şekilde ve gerekçeleriyle ortaya çıkarılmasında TGA yöntemi ve çalışma yapraklarının etkili bir şekilde kullanılabileceği anlaşılmıştır. Böylece ön bilgileri ve alternatif kavramaları ortaya çıkarılarak öğrencilerin alternatif kavramalarının farkına varmaları ve alternatif kavramalarıyla daha etkili bir şekilde mücadele etmeleri sağlanabilir.

ÖZET: Matematik öğretmenlerinin sahip olması gereken bilgi türlerinden biri pedagojik alan bilgisidir. Pek çok araştırmacı tarafından farklı modellerle ve bileşenlerle ele alınsa da pedagojik alan bilgisi kapsamında hem fikir olunan bilgi bileşenlerinden birisi öğrencileri anlama bilgisidir. Öğrencileri anlama bilgisi; öğrencilerin ön bilgilerinin farkında olmayı, öğrencilerin kavrayışlarını ve nasıl düşündüklerini bilmeyi, öğrencilerin kavram yanılgılarını ve öğrenme güçlüklerini belirlemeyi kapsar. Bu bilgiye sahip olmak öğretmene öğretimini planlamada, uygun kararlar almada ve öğretim uygulamalarını geliştirmede yardımcı olur. Matematikte öğrencilerin en çok yanılgıya düştükleri kavramlardan biri de fonksiyon kavramıdır. Temel bir matematiksel kavram olan fonksiyon kavramı trigonometri, limit, süreklilik, türev ve integral gibi pek çok kavram için temel nitelik taşıması nedeniyle oldukça önemlidir. Bu kavram ileri matematik ya da diğer bilim dalları için de gerekli görülmektedir. Bu bağlamda matematik öğretmenlerinin fonksiyon kavramına ilişkin öğrenci düşüncelerini bilmeleri ve öğrencilerin kavram yanılgılarını giderebilmeleri bu kavramın anlamlı öğrenilmesinin sağlanması açısından yarar sağlayacaktır.

Bu araştırmada amaç matematik öğretmenlerinin öğrencilerin fonksiyon kavramına ilişkin kavram yanılgılarına yönelik yaklaşımlarının incelenmesidir. Araştırma bir hizmet içi eğitimin katılımcıları olan sekiz matematik öğretmeni ile gerçekleştirilmiştir. Hizmet içi eğitimde katılımcı öğretmenlerin pedagojik alan bilgilerini geliştirmek hedeflenmiştir. Araştırmada belirli bir grup hakkında konu ile ilgili derinlemesine bilgi edinilmesi amaçlandığından nitel araştırma yöntemlerinden biri olan özel durum çalışması kullanılmıştır. Veriler araştırmacılar tarafından, literatürde belirlenen kavram yanılgılarından yararlanılarak geliştirilen 4 senaryo durumu aracılığıyla toplanmıştır. Öğretmenler senaryo durumlarındaki açık uçlu soruların her birine yazılı olarak yanıt vermişlerdir. Veriler içerik analizi kullanılarak analiz edilmiştir. Araştırmanın bulguları katılımcı matematik öğretmenlerinin öğrencilerin kavram yanılgılarını gidermede çözüm yolu olarak sorularla yönlendirme, karşıt örnekler verme, ön bilgileri hatırlatma ve farklı gösterim şekillerinden yararlanmaya başvurduklarını göstermiştir. Elde edilen sonuçlar matematik öğretmenlerinin öğrencilerin fonksiyon kavramına ilişkin yanılgılarını belirleme ve gidermede olumlu yaklaşımlar sergilediğini göstermiştir.

Anahtar sözcükler: matematik öğretmeni, kavram yanılgısı, fonksiyon kavramı

ABSTRACT: One type of knowledge that teachers need to have is pedagogical content knowledge. However it is dealt by many researchers with different models and components, knowledge of students' thinking is one of the components that is agreed on. Knowledge of students' thinking include to be aware of students' prior knowledge, to know students' conceptions and how students think, to determine students' misconceptions and learning difficulties. To have this knowledge helps a teacher for planning her/his instruction, aprropriate decision making and improving her/his teaching practices. A concept in mathematics which students usually have misconception is function concept. A basic mathematical concept, function concept, is so important because of being a basic for many concepts like trigonometry, limits, continuity, derivatives and integrals. This concept is seen critical for advanced mathematics or other sciences. In this context, when the teachers know students' thinking about function concept and remove their misconceptions, it will contribute a lot to ensure a meaningful learning.

The purpose of this research is examining the mathematics teachers' approaches to students' misconceptions aboout function concept. The research was realized with eight mathematics teachers that were the participants of an in-service training. The aim of the training was developing participant teachers' pedagogical content knowledge. Case study, one of the qualitative research methods, was used in the study because of aiming to get in-depth knowledge about the group regarding the subject. Data were collected via 4 scenarios that were developed by the researchers on benefitting the misconceptions reported in the literature. The teachers gave responses to each of the open-ended questions in scenarios. The data were analyzed by using content analysis. Findings of the research showed that the participant mathematics teachers apply routing with questions, giving opposite examples, reminding prior knowledge and drawing on different representations for removing students' misconceptions. The obtained results showed that the mathematics teachers exhibited positive approaches for determining and removing students' misconceptions about function concept.

Key words: mathematics teacher, misconception, function concept

ÖZET:Doğayı anlama çabasının bir sonucu olan ve yapısı gereği soyut prensip ve kuralları içeren matematikte, bu soyut prensiplerin ve kavramların keşfedilmesi, ancak bir takım somut deneyimler yoluyla gerçekleşebilir. Bu nedenle matematikte öğrencinin aktif durumda olduğu drama temelli öğretim yöntemi ile daha anlamlı ve kalıcı öğrenmenin gerçekleşeceği bir öğrenme ortamı yakalama fırsatı öğrencilere sunulabilir. Drama temelli öğretimin ilkokul birinci sınıf öğrencilerinin toplama işlemi ile ilgili öğrenme süreçlerini nasıl etkilediğini ortaya çıkarmayı amaçlayan bu çalışma 2013-2014 eğitim öğretim yılı bahar döneminde yapılmıştır. Bu bağlamda ilkokul birinci sınıf öğrencilerine toplama işlemi ile ilgili altı farklı drama uygulanmış, uygulama esnasında gözlemler yapılmış ve veri kaybı yaşanmaması için kamera kayıt cihazı ile kayıt yapılmış, uygulama sonunda ise öğrencilerle yarı yapılandırılmış mülakatlar yürütülmüştür. Elde edilen verilerden, öğrencilerin drama etkinliklerine katılmada istekli oldukları, toplama işlemini kavramsal olarak anlayabildikleri, toplama işleminin günlük hayatta kullanımının önemli olduğunun farkında oldukları, drama etkinlikleri içinde yer almaktan mutlu oldukları tespit edilmiştir.

Anahtar sözcükler: Drama temelli öğretim, toplama işlemi, ilkokul 1. sınıf, drama

ABSTRACT: In mathematics, which is a result of the efforts to understand nature and which includes abstract principles and rules by nature, discovery of these abstract principals and concepts can be ensured only through some tangible experiences. This is why, with drama based education method, in which student is active in mathematics, it is possible to present a learning environment which ensures more meaningful and permanent learning to students. This study aims at revealing the effect on drama based teaching on primary education 1st grade students' learning processes about addition in mathematics; the study is carried out in 2013-2014 academic year, spring semester. In this context, six different dramas about addition are applied on 1st grade students, observations are done and in order to prevent any loss of information, the process is recorded with camera; after the application, semi-structured interviews with students are carried out. On the basis of these data, it is determined that students are willing to participate in drama activities, they can understand addition conceptually, they are aware of the importance of using addition in daily life and they are happy to participate in drama activities.

MATEMATİKTE ÜSTÜN ZEKÂ VE ÜSTÜN YETENEK KAVRAMLARI ÜZERİNE ALAN YAZIN İNCELEMESİ

Şule GÜÇYETER

Üstün zeka ve üstün yetenek kavramlarına yönelik ilginin artmasıyla birlikte, üstün zekalı ve yetenekli bireylere yönelik sunulacak eğitim-öğretim seçenekleri, eğitim öğretim hizmetlerinin neler olabileceği, en etkili yöntemlere nasıl başvurulacağı da önem kazanmaktadır. Genel alanlarda üstün zekalı ve yetenekli olarak tanı almanın yanında, üstün zeka ve yeteneğin spesifik bir alanda kendini göstermesi ile birlikte farklı disiplinlerde üstün zekalı ve yetenekli olma kavramı da ön plana çıkmaktadır. Üstün zeka ve yeteneğin spesifik olarak kendini gösterdiği en temel alanlardan biri de matematiktir. Matematikte üstün zekalı ve yetenekli bireylerin tanılanmaması, dolayısıyla uygun eğitim fırsatlarıyla karşılaştırılmaması neticesinde bu öğrencilerin yetenek gelişimleri bu durumdan olumsuz etkilenerek hem öğrenci hem toplum için kayıplara neden olabilmektedir. Bu çalışmada, matematik alanında üstün zeka ve yetenek kavramlarıyla ilgili alan yazında yer alan tanımlar ve bu kavramlara yönelik alan uzmanlarının bakış açıları incelenecektir. Bu noktadan hareketle matematik alanında üstün zeka ve yetenekle ilgili alan uzmanlarının önemli gördüğü özellikler ile bu öğrencilerle etkileşimde olan öğretmenler, eğitimciler, akademisyenler vb. ilgililerin bakış açılarını inceleyen araştırmalardan derlenen önemli bulgular da paylaşılacaktır.

Çalışma matematikte üstün zekâlı ve yetenekli bireylere yönelik farkındalık oluşturması; bu alanda yetenekli bireylerin doğru tanılanması; matematikte yetenekli bireylerin yeteneklerini geliştirecek uygun eğitim fırsatlarıyla buluşturulması, öğretmen eğitim programlarında bu alanda yetenekli bireyler için yapılması gerekenler üzerine yeni araştırmaları teşvik etmesi açılarından önem arz etmektedir. Alan yazın incelemesi neticesinde ulaşılan sonuçlar kongre katılımcılarıyla paylaşılarak tartışılacaktır.

7. SINIF ÖĞRENCİLERİNİN KESİRLERDE SIRALAMA KONUSUNDAKİ KAVRAM YANILGILARI

İbrahim ÇETİN

Fatih KALECİ

Ortaokul öğrencilerinin matematik dersinde karşılaştıkları soyut kavramlardan bir tanesi de kesir kavramıdır. Konunun soyut olması, bu konunun öğretiminde birçok güçlükle karşılaşılmasına neden olmuştur. Literatüre bakıldığında öğrencilerin kesirlerle ilgili sahip oldukları birçok yanılgıyı görmek mümkündür. Kesir öğretiminin özensiz bir yaklaşımla verilmesi bu kavram yanılgılarının ortaya çıkmasında en önemli nedenlerden biri olduğu gözlenmiştir (Van de Walle,, 2004). Maalesef bir an önce işlem yaptırma telaşıyla, özensizce ve kavramsal alt yapısı verilmeden öğretilen kesir kavramı üzerinde en fazla yanılgının görüldüğü matematiksel kavramlardan bir tanesidir.

Programa bakıldığında 1. ve 2. Sınıflarda çeyrek ve yarım kavramlarının verilmesiyle başlayan kesir eğitimi, 3. Sınıftan 4. Sınıfa doğru sayı doğrusu üzerinde kesirlerin gösterilip, sıralanması ile devam eder. Kesirlerde sıralama konusu ile ilk defa öğrenciler 3. Sınıfta karşılaşmakta ve daha sonrasında ise sıralama konusu gerek sayı doğrusunda gerekse de şekillerin üzerinde somutlaştırılarak öğrenilmesiyle sonraki sınıflarda da öğretimi yapılarak programdaki yerini almaktadır. Kesirlerin karşılaştırılması ile ilgili olarak birçok öğrencinin verilen iki kesirden rakamları büyük olanın diğerine göre daha büyük olacağı (Hart ve ark., 1980) ve paya bakmaksınız paydanın büyümesi ile kesrin küçüleceği bilgisi ile sadece paydaya bakarak kesirlerin karşılaştırılması (Haser ve Ubuz, 2000) şeklinde kavram yanılgılarına sahip oldukları belirlenmiştir.

Bu çalışmada kesirlerin karşılaştırılmasında görülen kavram yanılgılarına yeni biri daha eklenecektir. 2013-2014 yılının ilk döneminde Konya İli Karatay İlçesinde 32 tane 7. Sınıf öğrencisinin katılımı ile gerçekleşen çalışmada nitel araştırma tekniklerinden görüşme tekniği ve doküman incelemesi tekniği kullanılmıştır. Öğrencilere günlük hayatla ilgili bir problem, araba benzin göstergesi, üzerinde verilmeyen noktaların kesir değerinin ne olduğu sorulmuştur. Bu soruyu yanlış cevaplayan 27 öğrencinin verdiği farklı cevaplar ve sahip oldukları kavram yanılgılarına konferanstaki sunumda ayrıntılı değinilecektir.

THE IMPORTANCE OF LIFELONG LEARNING FOR TURKEY AND EU RELATIONSHIP IN THE GLOBAL AND CHANGING WORLD

Sahire DOGRU

Sirnak Universitesi/
University of Birmingham

sahire.dogru@gmail.com

ABSTRACT: The relationships between Turkey and European Union has a longer process of crucial discussion to become a member of European Union for Turkey over two decades. There is not enough and satisfied improvement of progress during years. However, Turkey's hope to entering the EU has not been ended with help of globalizing networks of communication tools, social media, technologic improvements that helps lifelong learning. Turkey needs a lots projects for the EU Acquis throughout the adaptation process to represent Turkey's performance. Also, social awareness and adaptation is required by Turkish citizenship towards full membership of EU. Lifelong learning, technology and social media has substantial contribution to develop projects concerned with the public and civil society for introducing EU to more masses in Turkey, increasing efficiency of project and allowing better understanding and awareness of EU progress and objectives.This paper emphasizes that the importance of lifelong learning programs, projects and initiatives for Turkey to attend the EU. Because lifelong learning provide achievement in field like personal fulfillment, active citizenship, social inclusion, employability and adaptability.

Keywords : Lifelong Learning, EU and Turkey, active citizenship, democracy and human rights, technology

INTRODUCTION

Lifelong Learning is described as by European Commission as :

All learning activities undertaken throughout life with the aim of improving knowledge, skills and competence within a personal, civic, social and employment-related perspective.

Lifelong learning has a crucial impact on personal development for learning societies. In the modern world that is becoming a global village, economies and societies support and encourage people to continue learning activities throughout all their life because of required skills and qualifications they will need in this century. Lifelong learning is quite related to the globalization, the rise of new information with technologies and the aging societies. Knowledge and information are a global power in the modern age. Over more than five hundred years, nation's and country's success and failure or destiny depend on technical skill, acquire knowledge, technology, science, management of knowledge and their economy. Therefore, societies and economies need to become a knowledge based structure. Furthermore, the knowledge given in the years of compulsory schooling is enough for this age. The role of lifelong learning is to provide opportunities for adults to be educated as active citizenship, self-realizations in liberal democracy.

EUROPE AND LIFELONG LEARNING

UNESCO with international congress has emphasized importance of relationship of lifelong learning and adult education in 1997. Also, lifelong learning has a great concern with social cohesion, community building, individual development. Moreover, the development of projects according to the UK government's Green Paper on lifelong learning mentions the importance of lifelong learning (Field, J., & Leicester, M., 2000, p. 2). In addition, there has been increasing interest in the development of lifelong learning opportunities by policy formers and makers in industrialized countries.

Lifelong learning is a popular field in EU educational policy. There has been lots of meeting and discourses about lifelong learning since the 1970s. Also, it has become a important topic in international debates from the early to mid-1970s. Most of the lifelong learning debates was related to the protection of intergovernmental organization such as the Council of Europe, the Organization for Economic Cooperation and Development (OECD) and United Nations Educational, Social and Cultural Organizations (UNESCO) before mid-1970s. Lifelong learning had humanistic origin and ideals at that time. From the 1970s to 1990s, economic perspective of lifelong learning had considered as a significant topic with the economic and petrol crisis, its consequences and increasing unemployment. However, the popularity of this area has increased with great interest in 1990s. The main strategies, concepts and objectives of lifelong learning policies in EU education and training program has described and provided essential critical thoughts on them. The main origin shift away from humanistic ideals towards economic objectives and utilitarian (Dehmel, A., 2006). Political, social, economic and technological view of lifelong learning besides educational side has become important concepts and objectives. According to EU's integrated lifelong learning programs has been separated four general section :

- Comenius (School Education)
- Erasmus (Higher Education)
- Leonardo Da Vince (Vocational and Training)
- Groundtvig (Adult Education)

Education and training programs and policy concepts are still increasing with great interest in the form of formal, informal and non-formal learning.

Each country has opportunity and freedom to follow and develop their way for lifelong learning. Turkey needs to develop and perform the policies about lifelong learning programs for EU adaptation process. Turkey is facing lots of problems of the past because of heritage of the distant past related to Ottoman's Empire time and current past associated with neighbor of Turkey and the democracy and human rights.

EUROPEAN COMMISSION AND TURKEY

Turkey 2013 progress report prepared by European Commission involves contributions of European Parliament reports, the EU Member States, the government of Turkey and international and non-governmental organization.

There are lots of cooperation area such as participation in EU programs, energy, trade, counter terrorism, political reforms, foreign policy , visas, policy, mobility and migration. Also, fundamental rights, judiciary system and progress reports have quite important concepts for the Commission. There are too much area for discussion between EU and Turkey relationship :

- *Political Criteria and Enhanced Political Dialogue*
    - ✓ Democracy and the rule of law
    - ✓ Parliament
    - ✓ Judiciary and fundamental rights
    - ✓ Government
    - ✓ Ombudsman
    - ✓ Public administration
    - ✓ Civilian oversight of the security forces
    - ✓ Civil society
    - ✓ Judicial system
    - ✓ Fight against corruption
    - ✓ Fight against organized crime
- *Human Rights and The Protection of Minorities*
    - ✓ Situation in the east and south-east
    - ✓ Refugees and internationally displaced persons
- *Regional Issues and International Obligations*
    - ✓ Cyprus
    - ✓ Peaceful settlement of border disputes
    - ✓ Regional Cooperation
- *Economic Criteria*
    - ✓ The existence of a functioning market economy
    - ✓ The capacity of cope with competitive pressure and market forces within the Union
    - ✓ Economic integration with the EU
- *Ability to take on the Obligations Of Membership*

- ✓ Free movement of goods
- ✓ Freedom of movement for workers
- ✓ Right of establishment and freedom to provide services
- ✓ Free movement of capital
- ✓ Public procurement
- ✓ Company law
- ✓ Intellectual property law
- ✓ Competition policy
- ✓ Financial services

- *Information Society and Media*

  - ✓ Electronic communication and information and communications technologies (ICT)
  - ✓ Information Society Services
  - ✓ Audiovisual policy

- *Agriculture and Rural Development*

  - ✓ Organic farming
  - ✓ Quality policy
  - ✓ Common market organization

  Fisheries

- Food safety, veterinary and phytosanitary policy

  - ✓ General food safety
  - ✓ Veterinary policy
  - ✓ Food safety rules
  - ✓ Phytosanitary policy
  - ✓ Geneticaly modified organisms

- Transport Policy

  - ✓ Road and rail transport
  - ✓ Air and Maritime transport

- Energy

  - ✓ Security and supply
  - ✓ International Energy Market
  - ✓ Renewable Energy
  - ✓ Energy Efficiency
  - ✓ Nuclear Safety and radiation protection

- *Taxation*

Economic and Monetary Policy

- *Statistics*

- *Social Policy and Employment*

- *Enterprise and Industrial Policy*

- *Transport European Networks*

- *Regional policy and Coordination of Structural Instruments*

- *Judiciary and Fundamental Rights*

- *International Human Rights Instruments*

    - ✓ Freedom of Assembly
    - ✓ Freedom of Expression
    - ✓ Prevention of torture and ill-treatment
    - ✓ Prison System
    - ✓ Freedom of Association
    - ✓ Freedom of thoughts, conscience and religion
    - ✓ Women's rights and gender equality
    - ✓ Children's rights
    - ✓ Labour and Trade Unions Rights
    - ✓ Property rights
    - ✓ Protection of Personal Data

- *Justice, Freedom and Security*
- *Science and Research*
- *Education and Culture*
- *Environment and Climate Change*
- *Consumer and Health Protection*
- *Customs Union*
- *External relation*
- *Foreign, security and Defence Policy*
- *Financial Control, Financial and Budgetary Provisions*

In many areas above list, developments and improvements are not enough for EU's standards according to EU's report for Turkey in 2013. In addition, no progress is reported in many areas. Turkey needs to take steps to become a member of European Union. There are lots of criticized issue and topic related to the list above. A number of important reforms are required to reach European Standards. Also, current law constitution is insufficient to give answer and perform new situation with EU's progress. Government should continue to reform further for democratization and take a number of steps in the human rights and the fundamental right . It is not possible real democratic system and management without the active citizenship and active civil societies. The growing and active societies in Turkey must have important role to establish Turkey's human rights mechanism and institutions. The president and government must continue to support political and democratic reforms for Turkey membership. Lifelong learning is a key word for active citizenship and to perform all reforms in real platform among people who live in Turkey. Further democratization and political reforms are should be maintained to reach the democratic standards of European Union. The coordination and cooperation among civil societies, business and government are really important issue for good progress in terms of establishing to real life all reforms.

After complication of all reforms, laws, rules, reform judicial and democratization package which are required to become a member of EU for Turkey, the main role depend on civil societies, universities, media, educationist and trainer to perform rules in level of public area. First thing for this process, all rules and reforms should be taught all people and encourage them to reform in their life. For these reasons, the lifelong learning has a quite important role in the process of membership of EU for Turkey. To become membership of EU for Turkey is significant adaptation process and the life learning has a great impact on public and adult understanding of this process to perform all required forms for EU.

All the developed countries in Europe and the United States are trying to become a society of lifelong learner as soon as possible (Lundmark, 2002). If Turkey gets achieve to become a society of lifelong learners with the help of the lifelong learning principle, technology and media in the changing and global world, the major important part of the adaptation process must be completed. Turkey must be a place for lifelong learner.

Information and knowledge related to EU should be available in all major learning setting such as schools, universities, workplace, free choice venues with helping of technology to make all information and EU's concept more accessible. Projects, working throughout public based organizations, gets civil societies involved in lifelong learning organization will give really successful results for the relationship between EU and Turkey.

To involve EU's project, as well as establishing rules reforms and law towards EU' membership will essential steps towards real success in the process.

CONCLUSION

The major part of population in Turkey is living in the rural area, only real access to people living in rural area is possible with media support, technological tools, volunteer organizations, videos, computers. Societies in Turkey needs to better support efforts for lifelong learning any time, anywhere during the life span for the adaptation process between the EU and Turkey. In addition, a better cooperation among politicians, economists, sociologist, educationists, ministries, civil societies, municipalities, governorships, academicians will provide a huge contribution to Turkey's ongoing application for becoming a full member of the EU. Turkey's hope toward the EU's standards for the all field is still continue and Turkey might be a really good role model on the way of the democracy and the fundamental and human rights for Middle East counties and others.

9-12. SINIF BİYOLOJİ DERSLERİNDE BİLİM İNSANLARINDAN YARARLANMA

Ela Ayşe KÖKSAL

Bilim insanına yönelik algılar ve zihinsel imajlar öğrencilerin fen bilimlerine yönelik tutumları ve gelecekteki meslek seçimleri üzerinde etkilidir. Bilim ve bilim insanına yönelik imajlar çeşitli okul içi ve dışı kaynaklarca belirlenmektedir. Ders kitapları ve öğretim etkinlikleri bu imajların olumlu olmasına katkı sağlayacak özelliklere sahip olmalıdır. Bu çalışmanın amacı 9-12. sınıf biyoloji derslerinde bilim insanlarından ne şekilde yararlanıldığını incelemektir. Bu amaç için ders kitaplarında bulunan bilim insanı gösterimleri incelenecek ve bilim insanlarının biyoloji dersinde ne şekilde vurgulandığı ile ilgili olarak da biyoloji öğretmenleriyle yapılacak yarı yapılandırılmış mülakatlara başvurulacaktır. Ayrıca biyoloji derslerinde bilim insanlarına nasıl yer verildiğiyle ilgili olarak görüşme yapılan öğretmenlerin sınıflarında yapılandırılmış gözlemler yapılacaktır. Bu şekilde farklı veri toplama teknikleriyle veri çeşitlemesi yapılarak araştırma bulgularının güvenirliği artırılmaya çalışılacaktır.

Anahtar Kelimeler: Bilim tarihi, bilim insanı, lise biyoloji

ÖZET :Bu araştırmanın amacı, uyarlanmış birincil literatüre dayalı yöntemin biyoloji öğretmen adaylarının bilim insanı imajları üzerine etkisini incelemektir. Araştırmanın çalışma grubunu, 2013-2014 eğitim yılında Gazi Eğitim Fakültesi, Biyoloji Öğretmenliği programında 3. sınıfa kayıtlı 26 öğretmen adayı oluşturmuştur. Araştırma ön-son test tek gruplu deneysel desen modelinde gerçekleştirilmiştir Araştırmada, öğretmen adaylarının bilim insanı imajlarının belirleyebilmek için, Chambers (1983) tarafından geliştirilen *Bir Bilim İnsanı Çiz (DAST)* ölçeği kullanılmıştır. Deneysel uygulamada sitoloji alanında 6 tane uyarlanmış bilimsel makale kullanılmıştır. Araştırmanın sonucunda, öğrencilerin bilim insanları ile ilgili olarak laboratuvar önlüklü, gözlüklü, sadece çalışan ve kendisini işine adayan ve erkek bilim insanı gibi imajları benimsedikleri gözlenmiştir. Deneysel uygulama sonucunda, cinsiyet ve kullanılan laboratuvar araçları gibi bilim insanı imajı kategorilerinde değişiklikler gözlenmiştir.

Anahtar sözcükler: uyarlanmış birincil literatür, bilim insanı imajı, öğretmen adayı, sitoloji, DAST

ABSTRACT: The aim of this study, to investigate the effect of adapted primary literature on biology prospective teachers' images of the scientists. The sample of this study includes 26 prospective teachers from 3rd grade in Gazi Faculty of Education, Biology Education Department in the educational year of 2013-2014. The research was conducted in the pre-post test with single group design of experimental research model. In the research, to determine the prospective teachers' images of the scientists, *DAST (Draw a Scientist)* test developed by Chambers was used. Six adapted scientific articles in the cytology were used in experimental implementation. As a result of the study, it is observed that the students adopt images about scientists such as scientists with lab coats, glasses, just working and dedicating themselves to the work, and male scientists. As a result of the experimental implementation, changes were observed in categories of images of scientists, such as gender and use laboratory tools.

Key words: adapted primary literature, images of the scientists, prospective teacher, cytology, DAST

STUDENTS' OPINIONS ABOUT THE ACTIVITIES BASED ON CONCEPTUAL CHANGE STRATEGIES

Assist. Prof. Dr. Güliz AYDIN

agunay.balim@deu.edu.tr

This study has been implemented in a secondary school in Izmir, Turkey. By means of the conceptual change strategies based on constructivist approach, students were taught the unit of "Cell Division and Heredity"; from the curriculum of 8th grade Science and Technology course. Students in the control group were taught along with the activities in the Science and Technology Curriculum; and students in the experimental group were taught with activities based on the constructivist approach (such as conceptual change texts, concept maps, mind maps, concept cartoons, analogies and models). The experimental study lasted for 8 weeks. Semi-structured interviews were conducted on the experimental group to understand their opinions about the method practiced. 8 students from the experimental group were interviewed and the interviews were recorded with the permissions of the students. Later, the interviews were written down and their qualitative analysis was made. The questions asked to students, the categories formed based on their answers, percentages and frequencies regarding these categories and students' statements are presented in tables. It has been observed that students find learning the lessons with techniques based on conceptual change strategies more useful and they also think that not only the activities that they did were educative and fun but also they would like to study the other units in Science lesson through similiar activities.

Key words: student opinions, science education, conceptual change strategies

BİYOLOJİ ÖĞRETMEN ADAYLARININ ORGAN NAKLİ VE BAĞIŞI KONUSUNA BAKIŞ AÇILARININ BELİRLENMESİ VE DEĞERLENDİRİLMESİ

Banu Çiçek SEYHAN

Aysel TEMELLİ

Bu araştırma; günümüzde toplumun en çok bilinçlendirilmesi gereken konulardan birisi olan organ bağışı konusunda geleceğin nesillerine eğitim verecek öğretmen adaylarının bu konudaki düşüncelerini belirlemek amacıyla yapılmıştır. Araştırmanın çalışma grubunu Gazi Üniversitesinde ve Atatürk Üniversitesinde Biyoloji Öğretmenliği bölümlerinde okuyan 2., 3., 4. ve 5. Sınıflar oluşturmaktadır. Araştırmada veri toplama aracı olarak Sarıtaş ve Köşgeroğlu (2005) tarafından geliştirilen 5'li likert ölçeği olarak "Öğrencilerin Organ Nakli ve Bağışına Yönelik Algıları Formu" kullanılmıştır. Ayrıca öğrencilere, bazı demografik özellikleri ile organ bağışına ait bilgi sahip olma durumları, bilgilerin nereden elde edildiği ve daha önce organ naklinde bulunup bulunmadığına ve buna ait sebepleri öğrenmeye yönelik de çeşitli sorular yönlendirilmiştir. Verilerin analizinde SPSS 15.0 paket programı kullanılmıştır. Elde edilen verilere göre her iki üniversitenin Biyoloji Öğretmenliği bölümlerinde okuyan öğrencilerin büyük çoğunluğu organ nakli ve bağışı konusunda yeterli bilgiye kısmen sahip olduklarını ve bu bilgilere en çok televizyondan ve internetten ulaştıklarını belirtmişlerdir. Öğrencilerin büyük bir çoğunluğu organ bağışında bulunduklarını veya bulunmak istediklerini ve bunu istemelerindeki neden olarak da en çok bir insanın yaşamasını sağlamak olduğu belirtilmiştir. Araştırmanın 5'li likert verileri demografik özellikler de dikkate alınarak farklı değişkenlere göre sonuçlar frekans ve yüzdelikler verilerek değerlendirmeleri yapılmıştır.

AKILLI TAHTA KULLANIMININ ÖĞRENCİLERİNİN MATEMATİK VE GEOMETRİ ÖZ-YETERLİLİK DÜZEYLERİNE ETKİSİ

Fatih KALECİ

Habip Mehmet SEVGI

İbrahim ÇETİN

ÖZET*:* Bu araştırmanın amacı, akıllı tahta kullanımının öğrencilerinin matematik ve geometri derslerine yönelik sahip oldukları öz-yeterlilik inanç düzeylerine etkisini belirlemektir. Çalışmanın gerçekleşmesinde ön test-son test kontrol gruplu yarı deneysel desen modelinden yararlanılmıştır. Araştırmanın çalışma grubunu, 2013-2014 eğitim-öğretim yılında Konya ilindeki bir devlet okulunda 10. Sınıf düzeyinde eğitim gören 68 öğrenci oluşturmaktadır. Araştırma için 10. Sınıf matematik ders programında yer alan "İkinci Dereceden Denklemlerin Grafiği" konusu ve geometri ders programında yer alan "Doğrular" konusu seçilmiştir. Bu amaçla 3 hafta süren uygulamada, 34 öğrencinin yer aldığı deney grubunda akıllı tahta kullanılarak ders işlenmiş, diğer 34 öğrencinin yer aldığı kontrol grubunda ise geleneksel öğretim yöntemleri kullanılmıştır. Araştırmada verilerin toplanması aşamasında öğrencilerin matematik dersine karşı özyeterlilik düzeylerini belirlemek amacıyla, Umay (2001) tarafından geliştirilmiş olan "Matematiğe Karşı Öz-yeterlik Algısı Ölçeği" ve öğrencilerin geometriye yönelik öz yeterlik inanç düzeylerini belirlemek amacıyla da Cantürk-Günhan ve Başer'in (2007) geliştirmiş oldukları "Geometri Öz-yeterlik İnanç Ölçeği" kullanılmıştır. Verilerin analizinde betimsel istatistiklerden, t-testinden ve tek yönlü varyans analizi (ANOVA) yöntemlerinden yararlanılmıştır. Veriler, SPSS 19.0 istatistik paket programı kullanılarak analiz edilmiştir.

Araştırma sonuçlarına göre, uygulama öncesinde deney ve kontrol gruplarındaki öğrencilerin matematik dersine karşı öz-yeterlilik algıları ve geometri dersine yönelik öz-yeterlilik inanç puanları arasında anlamlı bir farklılık bulgulanmazken, yapılan uygulama sonrasında gruplardaki öğrencilerin matematik dersine karşı öz-yeterlilik algıları ve geometri dersine yönelik öz-yeterlilik inanç puanları arasında deney grubu lehine istatistiksel olarak anlamlı bir farklılık tespit edilmiştir.

Anahtar Kelimeler: Akıllı Tahta, Matematik Eğitimi, Öz-yeterlilik, Matematiğe Karşı Öz-yeterlik Algısı, Geometriye Yönelik Öz-Yeterlik.

pozdemir@hacettepe.edu.tr

ÖZET: Ülkemiz fen bilimleri ders kapsamında sorgulayan, araştıran, bilimi hayatını kolaylaştırmada kullanabilen bireyler yetiştirmek esastır. Bu nedenle araştırmada geleceğin bilim adamlarını yetiştirecek olan sınıf öğretmeni adaylarının günlük hayatlarında bilimsel bilgileri kullanma düzeyleri ve fenin günlük hayattaki yerine verdikleri önem hakkındaki görüşlerinin tespiti amaçlanmıştır. Araştırmada amaçlı örnekleme yöntemiyle tespit edilmiş Bartın Üniversitesi Eğitim Fakültesi İlköğretim Bölümü Sınıf Öğretmenliği 1. ve 2. sınıfta öğrenim görmekte olan 9 öğretmen adayı çalışma grubunu oluşturmaktadır. Araştırmada nitel yöntem kullanılmış, çalışma 'durum çalışması deseni' ile yürütülmüştür. Veriler, formu araştırmacılar tarafından geliştirilen yarı-yapılandırılmış görüşmeler kullanılarak elde edilmiştir. Toplanan veriler içerik analizi yöntemiyle analiz edilmiştir. Görüşme analizlerine göre sınıf öğretmeni adaylarının fen okuryazarlığına dair bilgi sahibi olmalarına ve fen eğitiminde model olma için fenin günlük hayatla ilişkilendirilmesi gerektiğine inanmalarına rağmen bilinçli olarak feni günlük hayatlarında kullanmadıkları tespit edilmiştir. Sınıf öğretmeni yetiştirme programının fen okuryazarlığını geliştirmede yeterli olmadığı sonucuna varılmıştır. Öğretim programının geliştirilmesi ve uygulama derslerinin artırılması gibi önerilerde bulunulmuştur.
Anahtar sözcükler: Sınıf öğretmeni adayları, Günlük hayat, Fen bilimleri

ABSTRACT: It is essential to educate individuals who can use science in daily life, investigate and research in our country's science course. Therefore, the research is intended to identify the pre-service primary teachers' who will train scientists of future, the level of scientific knowledge use in their daily lives and the importance they attach science in daily life. The sample group, which is selected through the purposive sampling method, included nine teacher candidates enrolled in Primary Teacher Program of Faculty of Education in Bartın University. In the study was used qualitative methods and carried out 'case study design'. The data, form developed by researchers was obtained using half-structured interview. The collected data were analyzed by the content analysis method. According to the analysis of interview pre-service teachers have knowledge about science literacy and believe it should be associated with daily life for being a model for science education despite it is identified they don't use the science consciously use in everyday life. Teacher training program is not sufficient in improving science literacy has been concluded. Suggestions have been made, such as development of the curriculum and increase implementation lessons.
Key words: Pre-service primary teacher, Daily life, Science

MATEMATİK ETKİNLİKLERİ OLUŞTURMAK İÇİN ÖĞRENME YÖNETİM SİSTEMİ KULLANIMINA YÖNELİK ÖNERİLER

Celal Murat KANDEMİR

Günümüzde geleneksel öğrenme ortamlarında yüz yüze eğitim, bilgi ve iletişim teknolojileri ile desteklenmekte ya da bilgi iletişim teknolojilerine dayalı eğitimle yavaş yavaş yer değiştirmektedir. Hem öğrenciler hem de öğretmenlerin öğrenme nesnelerinin sağlanması ve kullanılmasında yeni yöntemleri kullanabilme yeteneklerinin olması bu yüzden önemlidir. Bilgi ve iletişim teknolojilerine dayalı eğitimde yaygın olarak kullanılan öğrenme yönetim sistemleri ders ve etkinliklerin oluşturulduğu, ders materyallerinin paylaşıldığı, sınav notları ve diğer değerlendirilebilir etkinliklerin öğrencilere atanabildiği bir web tabanlı uygulama olarak tanımlanabilir. Ayrıca öğrencilerin forum ya da wiki aracılığıyla çevrimiçi işbirliği yapabildikleri bir ortamdır. Öğrenme yönetim sistemleri, hazırlanan ders materyallerinin öğrencilere iletilmesi, ödevlerin çevrimiçi olarak toplanması ve çoktan seçmeli sorular üzerinden değerlendirme etkinliklerinin yapılması amacıyla yaygın olarak kullanılmaktadır. Bununla birlikte görseller ile zenginleştirilmiş bir şekilde tasarlandığında öğrenme yönetim sisteminde bulunan değerlendirilebilir etkinlikler tek başlarına bir e-öğrenme içeriği olarak da kullanılabilmektedir. Bu çalışmada, birinci sınıf matematik dersi öğretim programının sayısal öğrenme alanında önerilen etkinliklerin bir öğrenme yönetim sistemi üzerinde etkileşimli olarak nasıl gerçekleştirilebileceğine yönelik öneriler sunulmuştur. Bu amaçla farklı öğrenme yönetim sistemlerinde bulunan etkinlik araçlarının ne şekilde kullanılabileceği incelenmiştir. Etkinliklerin oluşturulmasında kullanılacak olan resimlerin nasıl elde edilebileceğine ve telif hakları ile ilgili bilgilerin kontrolleri yapılırken dikkat edilmesi gerekli durumlar hakkında bilgi verilmiştir. Matematik dersi öğretim programı birinci sınıf sayısal öğrenme alanında bulunan toplam 27 etkinlik içinden seçilen etkinlikler öğrenme yönetim sistemi üzerinde değerlendirilebilir etkinlikler olarak tasarlanmıştır.

ÖĞRETMEN ADAYLARININ SABİT FONKSİYONLARIN PERİYODU İLE İLGİLİ KAVRAM İMAJLARI

PRESERVICE TEACHERS' CONCEPT IMAGES RELATED TO THE PERIOD OF CONSTANT FUNCTIONS'

Abdulkadir ÖNER
Necmettin Erbakan University
aoner@konya.edu.tr

Erhan ERTEKİN
Necmettin Erbakan University
eertekin@konya.edu.tr

Bu çalışmanın amacı, ilköğretim matematik öğretmen adaylarının sabit fonksiyonların periyoduyla ilgili kavram imajlarını belirlemektir. Çalışma, 2011-2012 eğitim-öğretim yılında bir devlet üniversitesinin İlköğretim Matematik Öğretmenliği programının 1.sınıfına kayıtlı 58 öğretmen adayı ile gerçekleştirilmiştir. Öğretmen adaylarının kavram imajları periyot özelinde detaylı incelendiğinden araştırmanın deseni nitel araştırma yöntemlerinden örnek olay çalışmasıdır. Araştırmanın amacına uygun olarak öğretmen adaylarına grafik temsili verilen sabit bir fonksiyonun periyodik olup olmadığı sorulmuştur. Gerek bu soruya verilen cevaplar gerekse maksimum çeşitlilik örneklemesi ile belirlenen katılımcılarla yapılan yarı yapılandırılmış görüşmelerden elde edilen veriler içerik analizine tabi tutulmuş ve öğretmen adaylarının sabit fonksiyonların periyoduyla ilgili imajları Tall ve Vinner'in (1981) kavram imajı–kavram tanımı teorisi çerçevesinde belirlenmiştir. Shama'ya (1998) göre sabit fonksiyon periyodik değildir. Dormolen ve Zaslavsky'ye (2003) göre sabit bir fonksiyonun değerlerinin değişmemesi ve periyodunun olmaması nedeniyle buna dayanak gösterilebilir. Bu yaklaşım kabul edildiğinde, araştırmaya katılan öğretmen adaylarının %36'sı fonksiyonun periyodik olduğunu belirtip soruyu yanlış cevaplamış, %55'i ise doğru cevaba ulaşmıştır. Öğretmen adaylarından cevabını açıklayanların %55'i fonksiyonun "sabit" olduğu ve %10'u "belirli bir aralığa sahip olmadığı" için periyodik olmadığını belirtmiştir. Öte yandan, %18'i "düzenli tekrarlara sahip olduğu" ve %15'i "sabit" olduğu için periyodik olduğunu belirtmiştir. Fonksiyonun sabit olmasının hem periyodik olmasına hem de olmamasına gerekçe olarak gösterilmesi, Dormolen ve Zaslavsky'nin (2003) sabit fonksiyon tanımının matematikte bir dejenerasyon olduğu düşüncesini desteklemektedir. Matematiksel tanımların uygun olmayan örneklere neden olmayacak şekilde kapsayıcı nitelikte olması gerektiği; aksi takdirde yanlış imajlara neden olabileceği çıkarımında bulunabilir.

Anahtar sözcükler: Kavram İmajı, Kavram Tanımı, Periyot, Sabit Fonksiyon.

ABSTRACT: This study has been conducted to investigate preservice elementary mathematics teachers' concept images related to the period of constant functions'. The sample consists of 58 freshmen preservice elementary mathematics teachers who were registered to a Turkish state university in 2011-2012 academic year. This qualitative study's design is case study. A constant function has been asked whether it is periodic or not by giving its graph. After collecting data by this question and semi-structured interviews done with some selected participants, content analysis was examined to investigate period images in the spotlight of Tall and Vinner's (1981) concept image–concept definition theory. According to Shama's (1998) approach that constant function is not periodic, 36% of participants misanswered while 55% of them answered correct. Constancy of function has been a reason for periodicity (with 55%) and also for nonperiodicity (with 15%) of it, which supports for Dormolen and Zaslavsky's (2003) assertion that a constant function is a degeneration of the period concept. Finally, mathematical definitions have to be done "well" inorder not to cause counter-examples and unsuitable concept images.

Key words: Concept Definition, Concept Image, Constant Function.

KHALİFA UNİVERSİTY OF SCİENCE, TECHNOLOGY AND RESEARCH (KUSTAR) STUDENTS' ATTİTUDES TOWARDS MATHEMATİCS İN THE LİGHT OF VARİABLES SUCH AS GENDER, NATİONALİTY, MATHEMATİCS SCORES AND THE COURSE THEY ARE ATTENDİNG

Yousef ABOSALEM
Khalifa University
Yousef.abosalem@kustar.ac.ae

ABSTRACT: This study was aimed at identifying the attitudes of the students of Khalifa University towards mathematics .The sample of this study consisted of 88(out of 216) students distributed evenly according to gender. 56.9% of the sample were Emiraties and 53.1% were expatriates. The Attitude Towards Mathematics Inventory (ATMI) was implemented in collecting the data.

The results of this study indicated that there were slight statistically significant differences between students' attitudes towards mathematics and mathematics achievement scores, age, the course they are attending, students' high school type, gender and their academic level. Additionally, the results indicated that there were statistically significant differences between self-confidence, enjoyment and value with and students' nationalities. Expatriates students showed higher positive attitudes towards mathematics than the Emirati students. Also, the results showed that there was a slight statistical relationship between enjoyment and students' academic level.

Finally, this study revealed that 62.67% of the sample have self-confidence in dealing with mathematics, 84.4% felt that mathematics has a great value to them, and 75.49% showed enjoyment in dealing with mathematics.

Keywords: Attitudes, mathematics, gender, nationality, course attending

INTRODUCTION

Researches on students' attitudes toward mathematics have acquired increasing attention. Many studies outlined that mathematics learning is influenced by several factors; such as motivation, curriculum, teacher and his way of teaching and educational teaching aids he used (Cote & Levine, 2000; Singh et al., 2002; Olatunde, 2009; Howie, 2005; Singh, et al., 2002). Hill (2004) indicated that integrating mathematics and science curriculum does improve students' attitude toward mathematics. Yet, regardless of the amount of effort spend in the improvement and development of mathematics learning process, efforts will have a slight impact in achievement unless there is a positive attitude towards mathematics. (Ma & Kishor, 1997; Ma, & Xu, 2004). However, many factors have influences on students' attitudes toward mathematics. Teachers, parents, and peers, as well as the school environment, all have influences on an individual's attitude. Wilkins and MA (2003) showed that teachers', peers', and parents' positive support will help in creating positive attitude and beliefs about mathematics and thus help restrain negative attitudes and beliefs. Whereas Ames (1992) considered student's home environment and access to instructional materials can all have an impact on his attitude and achievement.

Purpose of the Study

The general purpose of this study was to find out the attitudes of the students of Khalifa University of Science Research and Technology (KUSTAR) towards mathematics. The study is focused on the relationship of their attitudes towards mathematics with other factors such as; gender, mathematics scores, high school type, nationality, academic level, age and the mathematics course they are attending.

Research Questions

This study aimed to answer the following questions:

1. What is the prelateship between students' attitudes towards mathematics and academic achievement?
2. What is the relationship between students' attitudes towards mathematics and gender?
3. What is the relationship between students' attitudes towards mathematics and nationalities?
4. What is the relationship between attitudes towards mathematics and academic level (foundation or freshmen year)?
5. What is the relationship between attitudes towards mathematics and age?

6. What is the relationship between attitudes towards mathematics and mathematics courses they are attending?
7. What is the relationship between attitudes towards mathematics and high school type?

Definition of Terms

The following definitions are provided for terms having special applications to this study.

1. Attitude – "refers to someone's basic liking or disliking of familiar target" (Hannula, 2002; p.25)
2. High School Type: The high school type refers to either private or government school.
3. Academic Level: The academic level refers to whether the student is in foundation or freshman year.
4. Nationality: The nationality refers to whether the student is an Emirati or an Expatriate.

Literature review

Many studies have studied the students' attitudes towards mathematics and the impact of that on their achievement. Gottfried (1985) reported in his study that students who value and enjoy mathematics have a higher level of achievement. As well as, Ma and Xu (2004) showed in their study that poor achievement has been linked to a decline in mathematics attitude. Therefore, achievement in mathematics caused a positive attitude. However, a positive attitude towards mathematics does not lead to a good achievement. Other factors might affect students' achievement in mathematics such as textbooks, and teacher quality (Howie, 2005). Yet, both Tapia and Marsh II (2004) argue that students who do well in mathematics showed positive attitudes, consequently they are likely to take more mathematics courses. So, attitude and achievement affect each other in a cyclical manner (Schiefele & Csikszentmihalyi, 2004). Whereas, Ma and Kishor (1997) concluded that the relationship between attitudes towards mathematics and mathematics achievement is not a strong enough. Therfore, Phonguttha, et al. (2009) agreed with Ma and Kishor that mathematics achievement and attitude towards mathematics are not correlated. Furthermore, Casey et al. (1997) and Ma (1999) showed that the relationship between attitude and mathematics achievement exists only with respect to specific or particular mathematics content areas. Maple and Stage (1991) indicated that students' attitude towards mathematics could be used as a predictor of selecting a mathematics major but not for achievement. Along with that, Oakes (1990) argued that students with lower levels of achievement in mathematics confine students' career alternatives involving mathematical skills.

We do know that students' attitudes towards mathematics change overtime because it could be replaced by other activities. Students in the early stages of schooling are given the mathematical concepts slowly and repeatedly by using different teaching aids, resulting in positive attitudes and high achievement for the majority of students. As the mathematical subjects gets more abstract and more diverse, students' attitudes and achievement started to decline or decrease (Ma & Kishor, 1997; Hannula, 2002; Sanchez et al., 2004). The decline in students' attitude towards mathematics could be justified by the huge number of alternatives available for today's students.

Other studies outlined that students' achievement in mathematics is influenced by a variety of factors other than students' attitudes towards mathematics, such as gender, teacher's experience, parents, socioeconomic status, ethnicity, cultural background, grade level and peers (Casey et al, 1997; Ho, et al., 2000; Ma & Kishor, 1997; Ma, 1999, 1997; Carrier, 2008; Isiksal, 2008). Moreover, other researchers outlined that students' attitudes towards mathematics can be affected by teacher attitudes and beliefs (Uusimaki & Nason, 2004; Beswick, 2006; Wilkins & Brand, 2004; Swan, Bell, et al., 2000; Schoenfeld, 1985; Beswick, 2007). Along with that, teaching techniques were considered by many researchers as other factors that could affect students' attitudes toward mathematics (Anderson, 2005; Townsend et. al., 1998; Higgins, 1997; Pearce et. al., 1999; Mitchell, 1999; Kinney, 2001; Yusof & Tall, 1998; Elliott et. al., 2001; Raymond & Leinenbach, 2000; Whitin, 2007).

Furthermore, Tymms (2001) stated that the most important factors affecting students' attitudes towards mathematics were the teacher and student academic level; while gender, age and language were weakly related with students' attitudes. Koller, et al. (2001) researched gender differences in mathematics achievement, which showed that male achievement is higher than that of female one especially in advanced mathematics courses. However, other researchers (Tapia & Molavan (2007; Tapia & Marsh II, 2004; Isiksal & Cakiroglo, 2008) showed that gender had no effect on students' attitudes towards mathematics and male and female students had the same average mathematics score. Vaughan (2002) introduces another factor that has a direct impact on students' attitudes towards mathematics. He argues that using cooperative learning in our schools will increase the interaction between students and consequently produce positive attitudes towards mathematics and academic achievement.

METHODS

This study was aimed at identifying the attitudes of the students of Khalifa University of Science, Technology and Research (KUSTAR) towards mathematics in the light of variables such as gender, nationality, mathematics scores and the course they are attending

Data Collection Instrument

In this study the Attitudes Towards Mathematics Inventory (ATMI) (Appendix A) was used to collect data about students' attitudes towards mathematics. ATMI consists of 40-items, 5-points Likert scale ranging from strongly disagree to strongly agree distributed by using exploratory factor analysis into four areas or domains related to attitudes towards mathematics including self-confidence (15 items), value(10 items), enjoyment(10 items), and motivation(5 items) as shown in table-1. The instrument has a reliability coefficient alpha of 0.97 with standard error of measurement of 5.67 (Tapia, 1996). It also demonstrates content and constructs validities.

Table 1. The distribution of the ATMI scale according to the four domains

Domain	Items	Total
Self-confidence	9,10,11,12,13,14,15,16,17,18,19,20,21,22,40	15
Value	1,2,4,5,6,7,8,35,36,39	10
Enjoyment	3,24,25,26,27,29,30,31,37,38	10
Motivation	23,28,32,33,34	5
Total		40

Sample

The sample of this study consisted of 88 out of 216 undergraduate students at Khalifa University randomly selected from all students enrolled in the pre-calculus, calculus-I, and calculus-II courses whose ages ranged from 18 to 22 years old and agreed to participate in this research. As shown in table 2, forty-four students of the sample were male and the same number was female. 58(66%) students were Emiratis and 30 (34%) students were expatriates.

Table 2. The sample distribution according to gender, age, and nationality

Gender	Nationality	Age(years)					
		18	19	20	21	22	Total
Male	UAE	1	19	12	1	0	33
	Others	3	6	1	0	1	11
	Total	4	25	13	1	1	44
Female	UAE	4	14	7	0		25
	Others	2	11	4	2		19
	Total	6	25	11	2		44
Total		10	50	24	4		88

Table 3 and figure 1 show the sample distribution according to the mathematics courses they are attending and the type of the school they obtained their high school diploma from. 67 of them obtained their high school diploma from government school and 21 were from private ones. Whereas, 24 students are in Pre-calculus, 27 students are in Calculus I and 37 students are in Calculus II.

Table 3. The sample distribution according to High school type, and Course are attending

High School Type	Course			Total
	Pre-Calculus	Calculus-I	Calculus-II	
Government	19	18	30	67
Private	5	9	7	21
Total	24	27	37	88

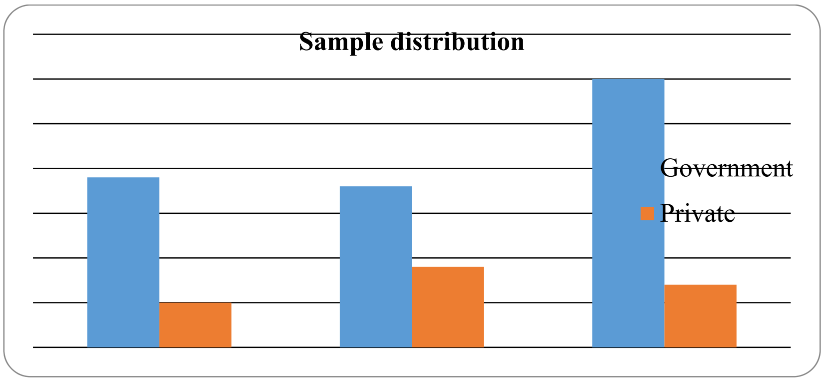

Figure 1. The sample distribution according to high school type and Course are attending

RESULTS AND FINDINGS

Research Question 1

What is the prelateship between students' attitude towards mathematics and academic achievement?

In order to the answer the first research question, and by assuming that the data is normally distributed according to Kolomogrov and Shapirotests tests with $p > 0.05$, Pearson correlations were calculated. The results shown in table 4 outlined that there is a slight significant relationship between students' attitudes towards mathematics and mathematics achievement scores. However, this relation can explain 9.24% of the variance, 90.76 % unjustified or unexplained.

Table 4. Pearson correlations between students' attitudes and academic achievement

		Attitude	Math Grade
Attitude	Pearson Correlation	1	0.304*
	Sig. (2-tailed)		0.017
	N	76	61
Math Grade	Pearson Correlation	.304*	1
	Sig. (2-tailed)	0.017	
	N	61	69

*. Correlation is significant at the 0.05 level (2-tailed).

Research Question 2

What is the relationship between students' attitude towards mathematics and gender?

In order to find out if there is statistically significant differences between students' attitudes towards mathematics and gender. By assuming the homogeneity of the two variances according to Levene's test with $p > 0.05$ as shown in table 5, and according to Kolmogorov-Smirnov and Shapiro-Wilk normality tests, we can assume that the data achieved the normality condition with $p > 0.05$ as shown in table 6. As shown in table 7 the means and standard deviations for the two groups are: 140.67, 140.70, 9.78, and 9.16 respectively. Four separate analyses of variances (ANOVA) were conducted as shown in table 8. The results indicated that no statistically significant differences between the four domains and gender with $p > 0.05$.

Table 5. The levene's test of variances homogeneity

Motivation	Between Groups	.440	1	.440	.079	.779
	Within Groups	460.383	83	5.547		
	Total	460.824	84			

Research Question 3

What is the relationship between students' attitudes towards mathematics and nationalities?

In order to find out if there is a statistically significant difference between students' attitudes toward mathematics and nationalities, the homogeneity of the two variances was assumed according to Levene's test with $p > 0.05$ as shown in table 9 and descriptive statistics shown in table-10. As shown previously in table-6, it can be assumed that the data is normally distributed. Four separate analyses of variances (ANOVA) were conducted as shown in table 11. The results indicated that there were statistically significant differences between self-confidence $F\ (1,\ 78) = 9.699$ and $p = 0.03$, enjoyment $F(1,\ 82) = 15.285$ and $p = 0.001$, and value $F\ (1,\ 83) = 6.419$ and $p = 0.013$, and students' nationalities at $\alpha = 0.05$. However, the results showed that there is no statistically significant difference between motivation $F(1,83) = 1.148$ and $p = 0.228$, and nationality at $\alpha = 0.05$. No Post Hoc comparisons were conducted because the number of values in each domain is less than three values. However, according to the descriptive statistics mentioned in table 10, we can conclude that the other nationalities with a mean value of 142.79 have higher positive attitudes towards mathematics than UAE students with a mean of 139.46.

Research Question 4

What is the relationship between attitudes towards mathematics and academic level (foundation or freshmen year)?

In order to find out if there is statistically significant differences between students' attitudes towards mathematics and their academic level. The homogeneity of the two variances and the data that was normally distributed were assumed according to Levene's test with $p > 0.05$ as shown in table 12. Based on the descriptive statistics shown in table 13 and according to Kolmogorov-Smirnov and Shapiro-Wilk normality tests, four separate analyses of variances (ANOVA) were conducted as shown in table 14. The results indicated that there were no statistically significant differences between students' attitudes towards mathematics and students' academic year at $\alpha = 0.05$. However, the analysis showed that there is a slight statistically significant difference between enjoyment and student's academic level F (1, 82) = 4.198 with $p = 0.044$ favor to freshman students ($\bar{x} = 140.88$).

Table 12. The Levene's Test Of Variances Homogeneity

	Within Groups	459.504	83	5.536		

Total	460.824	84	

Research Question 5

What is the relationship between students' attitudes towards mathematics and age?

In order to answer the fifth research question, and by assuming that the data is normally distributed according to Kolomogrov and Shapirotests with p > 0.05, Pearson correlations were calculated. The results as shown in table 15 outlined that there is no meaningful relationship between students' attitudes towards mathematics and age at $\alpha = 0.05$. However, only this relationship can explain 4.7% of the variance, 95.3 % unjustified or unexplained.

Table 15. The Correlations Between Students' Attitude Towards Mathematics And Age

		Attitude	Age
Attitude	Pearson Correlation	1	-0.217

	N	76	76
Age	Pearson Correlation	-0.217	1
	Sig. (2-tailed)	0.06	
	N	76	88

Research Question 6

What is the relationship between attitudes towards mathematics and mathematics course they are attending?

In order to find out if there is a statistically significant difference between students' attitudes towards mathematics and the course they are attending. The homogeneity of the variances according to Levene's test with $p > 0.05$ as shown in table 16, the data is normally distributed according to Kolomogrov and Shapiro tests with $p > 0.05$ were assumed. Four separate analyses of variances (ANOVA) were conducted as shown in table 18. The results indicated that there were no statistically significant difference between students' attitudes towards mathematics and the course they are attending at $\alpha = 0.05$.

Research Question 7

What is the relationship between attitude towards mathematics and high school type?

In order to find out if there is a statistically significant difference between students' attitudes towards mathematics and high school type. By assuming that the homogeneity of the two variances according to Levene's test as shown in table 18, and the data is normally distributed according to Kolomogrov and Shapiro tests with $p > 0.05$. Four separate analyses of variances (ANOVA) were conducted as shown in table 19 .The results indicated that there were no statistically significant differences between students' attitudes and students' high school type.

DISCUSSION AND CONCLUSIONS

A common understanding around the world that is students of different ages and of different studying levels are facing difficulties when they attempting to do mathematics. Many researches indicated that these difficulties might due to mathematics teachers, curricula, assessment methods or/and teaching strategies used in schools and universities.

Many researches studied the effect of students' attitudes towards mathematics (see e.g. Tapia, 1996, 2004; Tapia& Molavan, 2007) on academic achievement. Some studies outlined that there is no impact of the students' attitudes towards mathematics on their academic achievement (see e.g. Ma and Kishor, 1997; Phonguttha, et al., 2009). Other studies showed that there is a relationship between attitudes towards mathematics and achievement (see e.g. Gottfried 1985; Ma and Xu, 2004; Popham, 2005; Koller, et al. (2001).

This study aimed at identifying the attitudes of Khalifa University of Science, Technology and Research (KUSTAR) students towards mathematics in the light of some variables such as gender, nationality, mathematics scores and the course they are attending. The results of this study showed that there were no statistically differences between students' attitudes towards mathematics according to gender, academic level, high school type and nationality. The results of this study agreed with other studies (see e.g. Casey et al, 2001; Ho, et al., 2000; Ma & Kishor, 1997; Ma, 1999, 1997; Tapia & Molavan, 2007; Tapia &Marsh II ,2004) in that there were no statistical differences between students' attitudes towards mathematics and other factors such as : gender, ethnicity, mathematics scores. In addition, this study outlined that 62.67% of KUSTAR students felt self-confidence in their ability to do mathematics, 84.40% of them felt that mathematics has a great value to them, 67.13% of them are highly motivated to learn mathematics, and 75.49% of the sample reveals that KUSTAR students showed enjoyment in doing mathematics.

Many factors have influences on students' attitudes towards mathematics. Teachers, parents, teaching strategies, assessment methods, and peers, as well as the school environment all have influences on an individual's attitude.

I do agree with Tymms (2001) in that the most important factors affecting students' attitudes towards mathematics were the teacher and student academic level, so that more studies have to be conducted in the future to clarify the relationship between teachers' and teaching characteristics on students' attitudes towards mathematics. As well as, to determine how teachers can modify or change their students' attitudes towards mathematics if that is possible, and what the effect of using collaborative learning in schools and universities on changing students' attitudes towards mathematics is. Personally, I think class size, teaching methods and assessment techniques used in our schools and universities might have an impact on the students' attitudes towards mathematics and consequently on their achievements.

Appendix - A

Dear Student:

This study aims at "Finding out Students Attitudes towards Mathematics at Khalifa University of Science Technology and Research (KUSTAR)".

The information gathered by the questionnaire will be used for educational research only and is not related to your achievement or your performance in mathematics. All results will be kept strictly secret. Please read each statement carefully and write your answers in the space provided.

By filling this questionnaire, you agree to participate in this study

Thank you very much for your cooperation.

The researcher

Demographic Information

Gender	Male	Female

Attitudes Toward Mathematics Inventory (ATMI)

Directions: This inventory consists of statements about your attitude toward mathematics. There are no correct or incorrect responses. Read each item carefully. Please think about how you feel about each item. Circle the letter that most closely corresponds to how the statements best describes your feelings. Use the following response scale to respond to each item.

PLEASE USE THESE RESPONSE CODES:
A – Strongly Disagree
B – Disagree
C – Neutral
D – Agree
E – Strongly Agree

1. Mathematics is a very worthwhile and necessary subject.

A	B	C	D	E
Strongly Disagree	Disagree	Neutral	Agree	Strongly Agree

2. I want to develop my mathematical skills.

A	B	C	D	E
Strongly Disagree	Disagree	Neutral	Agree	Strongly Agree

3. I get a great deal of satisfaction out of solving a mathematics problem.

A	B	C	D	E
Strongly Disagree	Disagree	Neutral	Agree	Strongly Agree

4. Mathematics helps develop the mind and teaches a person to think.

A	B	C	D	E
Strongly Disagree	Disagree	Neutral	Agree	Strongly Agree

5. Mathematics is important in everyday life.

A	B	C	D	E
Strongly Disagree	Disagree	Neutral	Agree	Strongly Agr

6. Mathematics is one of the most important subjects for people to study.

A	B	C	D	E
Strongly Disagree	Disagree	Neutral	Agree	Strongly Agr

7. High school math courses would be very helpful no matter what I decide to stu

A	B	C	D	E
Strongly Disagree	Disagree	Neutral	Agree	Strongly Agr

8. I can think of many ways that I use math outside of school.

A	B	C	D	E
Strongly Disagree	Disagree	Neutral	Agree	Strongly Agr

9. Mathematics is one of my most dreaded subjects.

A	B	C	D	E
Strongly Disagree	Disagree	Neutral	Agree	Strongly Agr

10. My mind goes blank and I am unable to think clearly when working with mathematics.

A	B	C	D	E
Strongly Disagree	Disagree	Neutral	Agree	Strongly Agr

11. Studying mathematics makes me feel nervous.

A	B	C	D	E
Strongly Disagree	Disagree	Neutral	Agree	Strongly Agr

12. Mathematics makes me feel uncomfortable.

A	B	C	D	E
Strongly Disagree	Disagree	Neutral	Agree	Strongly Agr

13. I am always under a terrible strain in a math class.

A	B	C	D	E
Strongly Disagree	Disagree	Neutral	Agree	Strongly Agree

14. When I hear the word mathematics, I have a feeling of dislike.

A	B	C	D	E
Strongly Disagree	Disagree	Neutral	Agree	Strongly Agree

15. It makes me nervous to even think about having to do a mathematics problem.

A	B	C	D	E
Strongly Disagree	Disagree	Neutral	Agree	Strongly Agree

16. Mathematics does not scare me at all.

A	B	C	D	E
Strongly Disagree	Disagree	Neutral	Agree	Strongly Agree

17. I have a lot of self-confidence when it comes to mathematics

A	B	C	D	E
Strongly Disagree	Disagree	Neutral	Agree	Strongly Agree

18. I am able to solve mathematics problems without too much difficulty.

A	B	C	D	E
Strongly Disagree	Disagree	Neutral	Agree	Strongly Agree

19. I expect to do fairly well in any math class I take.

A	B	C	D	E
Strongly Disagree	Disagree	Neutral	Agree	Strongly Agree

20. I am always confused in my mathematics class.

A	B	C	D	E
Strongly Disagree	Disagree	Neutral	Agree	Strongly Agree

21. I feel a sense of insecurity when attempting mathematics.

A	B	C	D	E
Strongly Disagree	Disagree	Neutral	Agree	Strongly Agr

22. I learn mathematics easily.

A	B	C	D	E
Strongly Disagree	Disagree	Neutral	Agree	Strongly Agr

23. I am confident that I could learn advanced mathematics.

A	B	C	D	E
Strongly Disagree	Disagree	Neutral	Agree	Strongly Agr

24. I have usually enjoyed studying mathematics in school.

A	B	C	D	E
Strongly Disagree	Disagree	Neutral	Agree	Strongly Agr

25. Mathematics is dull and boring.

A	B	C	D	E
Strongly Disagree	Disagree	Neutral	Agree	Strongly Agr

26. I like to solve new problems in mathematics.

A	B	C	D	E
Strongly Disagree	Disagree	Neutral	Agree	Strongly Agr

27. I would prefer to do an assignment in math than to write an essay.

A	B	C	D	E
Strongly Disagree	Disagree	Neutral	Agree	Strongly Agr

28. I would like to avoid using mathematics in college.

A	B	C	D	E
Strongly Disagree	Disagree	Neutral	Agree	Strongly Agr

29. I really like mathematics.

A	B	C	D	E
Strongly Disagree	Disagree	Neutral	Agree	Strongly Agree

30. I am happier in a math class than in any other class.

A	B	C	D	E
Strongly Disagree	Disagree	Neutral	Agree	Strongly Agree

31. Mathematics is a very interesting subject.

A	B	C	D	E
Strongly Disagree	Disagree	Neutral	Agree	Strongly Agree

32. I am willing to take more than the required amount of mathematics.

A	B	C	D	E
Strongly Disagree	Disagree	Neutral	Agree	Strongly Agree

33. I plan to take as much mathematics as I can during my education.

A	B	C	D	E
Strongly Disagree	Disagree	Neutral	Agree	Strongly Agree

34. The challenge of math appeals to me.

A	B	C	D	E
Strongly Disagree	Disagree	Neutral	Agree	Strongly Agree

35. I think studying advanced mathematics is useful.

A	B	C	D	E
Strongly Disagree	Disagree	Neutral	Agree	Strongly Agree

36. I believe studying math helps me with problem solving in other areas.

A	B	C	D	E
Strongly Disagree	Disagree	Neutral	Agree	Strongly Agree

37. I am comfortable expressing my own ideas on how to look for solutions to a difficult problem in math.

A	B	C	D	E
Strongly Disagree	Disagree	Neutral	Agree	Strongly Agree

38. I am comfortable answering questions in math class.

A	B	C	D	E
Strongly Disagree	Disagree	Neutral	Agree	Strongly Agree

39. A strong math background could help me in my professional life.

A	B	C	D	E
Strongly Disagree	Disagree	Neutral	Agree	Strongly Agree

40. I believe I am good at solving math problems.

A	B	C	D	E
Strongly Disagree	Disagree	Neutral	Agree	Strongly Agree

---

ABSTRACT: Intensive and rapid development of ICT lead to popularization and necessity of its use, and changes in all spheres including education as a process.

A research was conducted in order to ensure valid and reliable assessment of the extent and nature of ICT knowledge and skills of teachers in primary schools, to identify the factors that affect the frequency of use of ICT in teaching and to identify strategies for enhancing development effectiveness future.

The research surveyed 214 teachers from 10 primary schools in the Southeast region of Macedonia. Technique Modeling of Structural Equations was used to determine the relative strength of the factors affecting the frequency of use of ICT in teaching. The results show that the highest percentage of 58.4 % of the teachers often use ICT in teaching, 33.6 % rarely use ICT, 7 % of respondents use ICT at all times, and only 0.9 % do not use ICT for teaching purposes. ICT competencies of teachers, number of training, years of computer use, possession of personal computer and having Internet at home proved as influential factors for ICT usage frequency in teaching.

The survey results were analyzed using SPSS 19, Excel and Amos Graphics 18.

Keywords: ICT knowledge and skills, ICT in teaching, modeling with structural equations.

1. INTRODUCTION

Information and communication technologies (ICT) play a proven critical role in enhancing the quality of education. They are particularly important in helping teachers and students to perform more effectively. To make the best use of ICT, teachers must be equipped with adequate ICT competencies. In the process of integrating ICT into education, both teacher's ICT competencies and how they perceive the role of ICT in their teaching/learning processes play key roles. Analysis, design, development, implementation, evaluation, and management of ICT in education require diversified competencies and knowledge (Kozma 2002, pp.1-6).

ICTs have become within a very short time, one of the basic building blocks of modern society. Many countries now regard understanding ICT and mastering the basic skills and concepts of ICT as part of the core of education, alongside reading, writing and numeracy (Daniels, 2002).

Today, improved communication technology has made time and space less complex. It could be observed that this modern age is the age of information explosion in which an average individual wants to explore the information system. Thus, the ability for timely acquisition, utilization, communication and retrieval of relevant and accurate information has become an important attribute for better teaching-learning process (Adebayo, 2008).

The new technologies have the potential to support education across curriculum and provide opportunities for effective communication between teacher and students in ways that have not been possible before. ICT in education has the potential to be influential in bringing about changes in ways of teaching (Dawes, 2001).

The field of education has been affected by ICTs, which have undoubtedly affected teaching, learning, and research (Yusuf, 2005). A great deal of research has proven the benefits to the quality of education (Al-Ansari, 2006). ICTs have the potential to innovate, accelerate, enrich, and deepen skills, to motivate and engage students, to help relate school experience to work practices, create economic viability for tomorrow's workers, as well as strengthening teaching and helping schools change (Davis and Tearle, 1999; Lemke and Coughlin, 1998; cited by Yusuf, 2005). As Jhurree (2005) states, much has been said and reported about the impact of technology, especially computers, in education The field of education has been affected by ICTs, which have undoubtedly affected teaching, learning and research (Yusuf, 2005) .ICTs have the potential to accelerate, enrich, and deepen skills, to motivate and engage students, to help relate school experience to work practices, create economic viability for tomorrow's workers, as well as strengthening teaching and helping schools change (Davis and Tearle, 1999; Lemke and Coughlin, 1998; cited by Yusuf, 2005).

Teachers contribute toward the base of the education innovation, therefore ICT competencies of teachers in primary schools should be seen as an invaluable prerequisite to facilitate teaching and learning in this modern era of information and technology. [9]

ICT is not only a means of realizing the educational goals but important factor in a complete restructuring of the educational system, introducing new interactive and participatory models of education, new educational pedagogy, continuous and lifelong learning.

Macedonian context of computerization and digitization of education intensively developed after 2002 when the country received the first Chinese donation, which allowed a certaindegree of popularization of ICT in the education. Starting in 2003 through the e-school project teacher training the use of ICT were conducted in two phases. With changes in education that occurred with the intensive introduction in education, resulted in a need to develop national educational policies and strategies that will contribute to the social and educational development. In 2005 was created the draft program for the development of ICT in education (2005-2015) which covered the process of computerization and digitization of education.

Macedonia entered the world of ICT innovation with the introduction of the program "Computer for Every Child" initiative and investment by the Government of the Republic of Macedonia to modernize Macedonian education. This project provides a computer for each child, software solutions and tools for each subject, advanced ICT skills among teachers and students, a national system of testing students and the interactive online teaching.

In the academic year 2009/2010, primary schools were equipped with portable Classmate PCs for every student from first to third grade. In 2010 teacher trainings were conducted for Edubuntu operating system, the programs for integration of mathematics and sciences, ToolKid program and SSTC of using “thin clients”. Furthermore, despite the software electronic grades were introduced. Also attached is training for class teachers for the program and Green G Compris suite-junior. [5,6,8]

Starting from the academic year 2013/14, all teachers were required to integrate at least 30% of ICT in the curriculum.

2. METHODOLOGY

In the survey every teacher had to report their ICT knowledge and skills, the ways in which they use ICT in teaching, ICT trainingthey have attended, frequency of ICT use in teaching and to evaluate motivational attitudes of the ICT use in teaching, and the attitudes of the school towards ICT. The main parts of the survey are shown in Table 1.

This research is done in order to ensure a valid and reliable assessment of the extent and nature of ICT knowledge and skills of teachers in primary schools, and to identify factors that affect the frequency ICT usage in teaching.

The survey was conducted in the academic year 2012/13, in 10 primary schools in the Southeast region of the Republic of Macedonia in the municipalities of Strumica, Vasilevo, Bosilevo and Novo Selo. The survey was conducted on 214 teachers, a representative sample in given that 610 is the total number of teachers in those municipalities.

Table 1. Structure Of The ICT Survey In Teaching For Teachers In Primary Schools.

part	Title of section	Information	Number of issues
I	General information	environment, age, experience, sex, teacher	5
II	Using the computer for personal needs	personal computer, type of computer, Internet at home, years of experience with computer	4
III	Personal and professional development	training classes at school, additional training, self-improvement	3
IV	Using computers at school	implementation of ICT programs, type of computer, hardware, use of computer	6
V	Motivation for using ICT in teaching	motivational view with scale assessment	21
VI	ICT knowledge and skills	navigation in the operating system, email, Internet, text editor, multimedia presentations, spreadsheet calculations, blogs, databases	8
VII	ICT in school	assessment scale for the application of ICT in school	3
		Total Questions	33

3. RESULTS AND DISCUSSION

The survey results were analyzed using SPSS 19 programs, Excel and Amos Graphics 18. The tables below present the demographic characteristics of the surveyed teachers.

Table 2. The location of the school.

Location

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Rural	105	49,1	49,1	49,1
	Urban	109	50,9	50,9	100,0
	Total	214	100,0	100,0	

Table 2 Shows That Almost Equal Number Of Teachers Are From Urban And Rural Areas.

Table 3. Age Structure Of The Surveyed Teachers.

Age

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	<=25	5	2,3	2,3	2,3
	>=56	24	11,2	11,2	13,6
	26-35	59	27,6	27,6	41,1

		Frequency	Percent	Valid Percent	Cumulative Percent
	36-45	55	25,7	25,7	66,8
	46-55	71	33,2	33,2	100,0
	Total	214	100,0	100,0	

Table 4. Work experience as a teacher.

Experience

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	<=5	46	21,5	21,5	21,5
	>=26	51	23,8	23,8	45,3
	11-15	29	13,6	13,6	58,9
	16-20	22	10,3	10,3	69,2
	21-25	19	8,9	8,9	78,0
	6-10	47	22,0	22,0	100,0
	Total	214	100,0	100,0	

Table 5. Gender of surveyed teachers.

Gender

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Female	177	82,7	82,7	82,7
	Male	37	17,3	17,3	100,0
	Total	214	100,0	100,0	

Table 6. Teachers from primary education.

Teacher

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Primary education teacher	85	39,7	39,7	39,7
	Subject teacher	129	60,3	60,3	100,0
	Total	214	100,0	100,0	

Figure 1 is a graphical representation of a given application of ICT in teaching. The question: Do you use ICT in teaching, teachers had to answer whether they do it all the time, rarely, never, or don't know what it is. The largest percentage of 58.4% reported that they use ICT often, 33.6% rarely use ICT, 7% of the respondents use ICT at all times, and only 0.9% do not use ICT for teaching purposes.

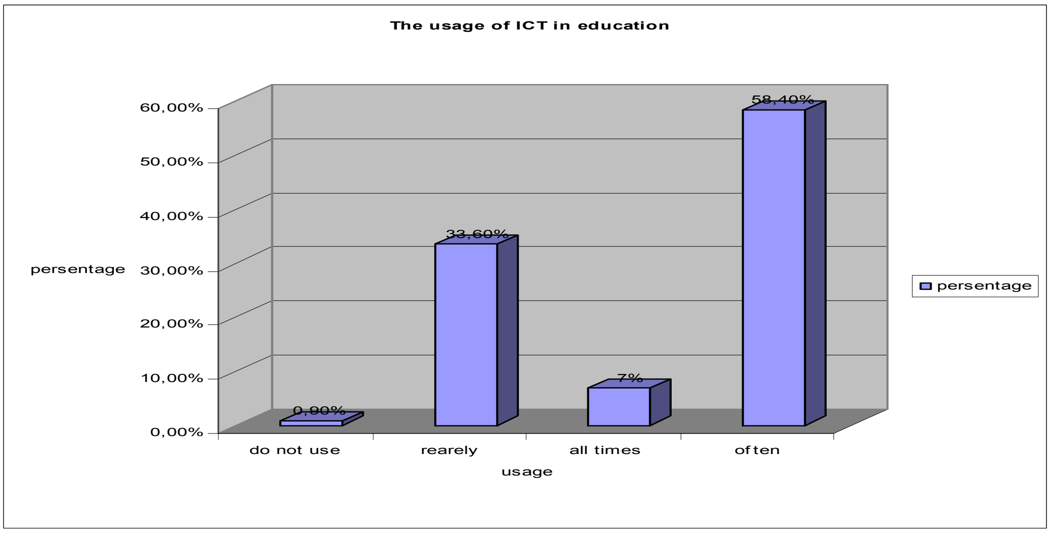

Figure 1. The usage of ICT in education.

The survey asked teachers who use ICT in teaching to also assess the frequency, i.e. if they apply it daily, weekly, monthly, or a few times a year. Figure 2 shows the frequency of ICT usage. The largest percentage of 49.10 % applied ICT weekly, 20.60 % applied ICT monthly, 17.80 % a few times a year, and the smallest percentage of 11,70 % use ICT every day. The frequency of ICT usage in teaching depends on the nature of the subject that the teacher teaches and the requirements for the application of ICT in the teacher's curriculum.

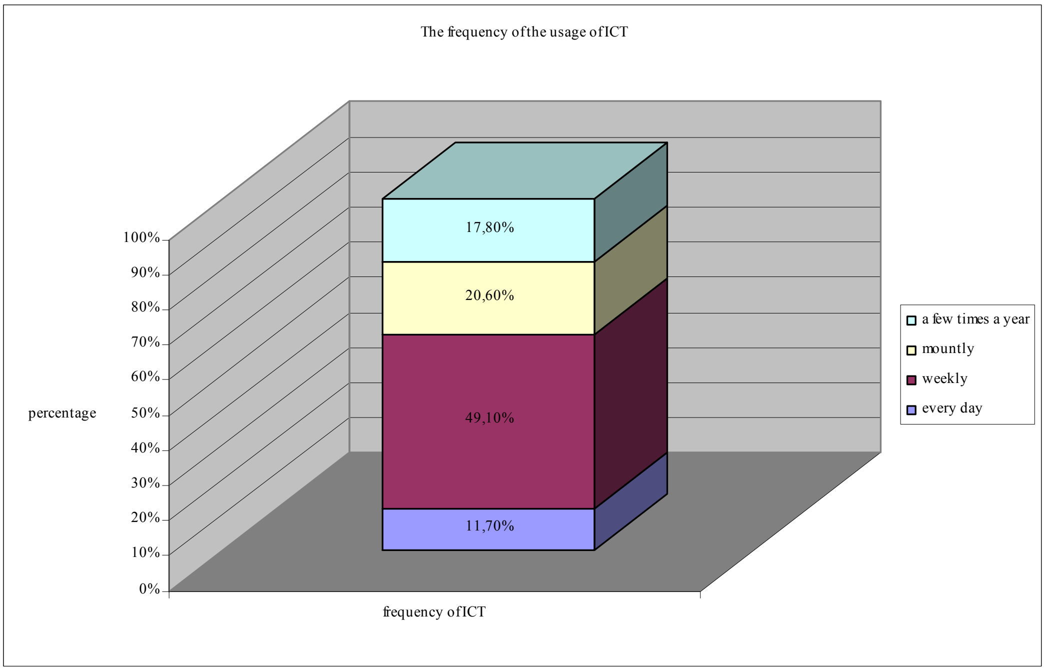

Figure 2. The frequency of the usage of ICT.

According to the frequency of ICT usage, the teachers can be classified into three categories: low, medium and high. The low category, 34.1% of the surveyed teachers, includes teachers who rarely or never use ICT and if they do use it, it is a few times a year or month. The medium category, involved the highest percentage of respondents 52.3%, includes teachers who often use ICT in teaching. The high category, involved the lowest percentage of 13.5 % respondents, includes teachers who use ICT at all times, or every day.

By analyzing all demographic factors such as gender, environment, age, seniority, years of experience, and the kind of teacher we cannot single out any demographic factor that shows statistically significant correlation with the frequency of ICT usage in teaching.

The technique of structural equation modeling was used again to analyze the relationship between the frequency of ICT usage and the other factors.

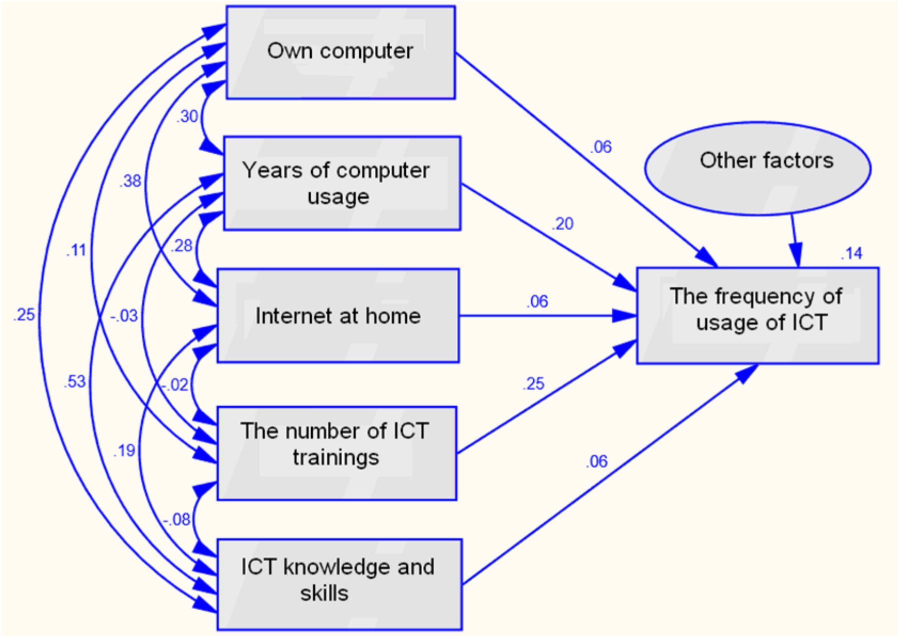

Figure 3. The relative strenght of influence on the factors on the frequency of usage of ICT.

From Figure 3 we can conclude that the number of ICT trainings is a factor with the strongest influence on the frequency of ICT usage - measured 0.25, then comes years of computer usage - measured 0.20, and the remaining three factors: own computer, have Internet at home, and have ICT knowledge and skills - measured 0.06. The impact of other factors on ICT knowledge and skills is 0.14.

When we add the results of all five factors that influence the frequency usage of ICT, we obtain value 0.63 (0 to 1). This means that all these factors are 63% of the variance in frequency of ICT usage, suggesting that these factors describe the impact on frequency of ICT usage well.

Table 7. The regressional weight of the factors for the frequency if the usage of ICT.

Regression Weights: (Group number 1 – Default model)

			Estimate	S.E.	C.R.	P	Label
The frequency of ICT usage	←-	Own computer	.266	.325	.818	.414	
The frequency of ICT usage	←-	Years of computer usage	.289	.110	2.636	.008	
The frequency of ICT usage	←-	Internet at home	.373	.464	.804	.421	
The frequency of ICT usage	←-	Number of ICT training	.238	.060	3.964	***	
The frequency of ICT usage	←-	ICT knowledge and skills	.002	.003	.758	.449	

Table 7 is a textual display of the results using AMOS Graphics. As we can see only the factor *Number of ICT training* has a significant positive effect on the frequency of ICT usage, with value of $p < 0.001$. Years of computer usage have a positive significant effect on the frequency of ICT usage, with value of $p < 0.05$. The rest of the factors have a positive insignificant effect on the frequency of ICT usage, with a value of p greater than 0.05.

Table 8. Overview of the model in SPSS.

Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	,380[a]	,144	,124	1,376

a. Predictors: (Constant), ICT knowledge and skills, Number of ICT training, Internet at home, Own computer, Years of computer usage

Table 8 gives us a summary of the model in SPSS, where we can see that the value of R Square is 0.144, indicating a good model.

Table 9. ANOVA table for the cumulative effect on SPSS.

ANOVA[b]

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	66,457	5	13,291	7,018	,000[a]
	Residual	393,917	208	1,894		
	Total	460,374	213			

a. Predictors: (Constant), ICT knowledge and skills, Number of ICT training, Internet at home, Own computer, Years of computer usage

b. Dependent Variable: The frequency of usage of ICT

As we can see from the ANOVA table, the cumulative effect is significant.

Table 10. Table of coefficients in SPSS.

Coefficients[a]

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	1,060	,479		2,213	,028
	Own computer	,266	,329	,058	,808	,420
	Years of computer usage	,289	,111	,204	2,605	,010
	Internet at home	,373	,470	,056	,795	,428
	Number of ICT training	,238	,061	,255	3,917	,000
	ICT knowledge and skills	,002	,003	,057	,749	,455

a. Dependent Variable: The frequency of usage of ICT

From Table 10 we see that the the Beta coefficients of all predictors are positive, but only Number of ICT training and years of computer use are significant, the rest of the factors are insignificant.

4. CONCLUSION

Since the ultimate goal is to achieve higher frequency of the ICT usage in teaching, then according to the factors that contribute to it, are moving a step forward.

- o Increased ICT competencies of teachers positively influence the increase of frequency ICT usage in teaching.
- o Certainly the experience of working with computer positively affects the increase of ICT competencies of teachers, and thus the frequency of ICT usage in teaching.
- o Increased number of training courses and similar improvements increase the frequency of ICT usage in teaching.
- o The use of Internet at home does not limit a teacher to work in preparation for teaching and contributes to increase of the frequency of ICT usage in teaching.
- o Having computer certainly has a positive influence on the frequency of ICT usage in teaching.

ÖZET: Bu çalışmada 11. sınıf kimya dersi kimyasal denge konusunun probleme dayalı öğrenme (PDÖ) yöntemi ile işlenmesi hakkındaki öğrenci görüşlerinin elde edilmesi amaçlanmıştır. Bu amaçla; 30 öğrencinin bulunduğu bir sınıfta kimyasal denge konusunun PDÖ yöntemi ile işlenmesinin ardından öğrencilere PDÖ değerlendirme anketi, grup çalışmalarını değerlendirme anketi ve öğrencilerin kendini değerlendirme anketi uygulanmıştır. PDÖ değerlendirme ölçeğinden elde edilen verilerin analizi sonucunda yüksek bir ortalama elde edilmiştir. Ölçeğe verilen cevaplar incelendiğinde; öğrencilerin PDÖ yöntemi ile kendilerine olan güven duygusunun arttığını, araştırma yapıp bunları derslerde kullanabilmeyi öğrendiklerini, karşılaştıkları problemlere çözümler üretebilme ve bu çözümleri analiz edebilme yeteneklerinin arttığını ifade ettikleri görülmektedir. Öğrenciler bu ölçekteki açık uçlu sorulara kimyayı bu şekilde öğrenmenin eğlenceli olduğunu düşündüklerini ve araştırma yapmayı ve konuların kitap dışında da olduğunu görmeyi olumlu buldukları cevaplarını vermişlerdir. Bununla birlikte öğrenciler araştırma imkânlarının sınırlı olduğunu, konunun uzadığını, az soru çözüldüğünü, araştırma süresinin yetersiz olduğunu belirtilmiştir. Grup çalışmalarını değerlendirme anketinden elde edilen verilerin analizi sonucunda yüksek bir ortalama elde edilmiştir. Öğrenciler ölçekteki sorulara; grup çalışmalarında karşılıklı saygı ve işbirliği geliştirdikleri, grup halinde öğrenmeyi olumlu buldukları cevaplarını vermelerinin yanında, grup içi işbirliğinin ve görev paylaşımının istenen seviyede olmadığı ve grupların öğrenciler tarafından oluşturulmasının daha iyi olacağı yönünde cevaplar da verilmiştir. Öğrencilerin kendilerini değerlendirme anketinden elde edilen verilerin analizi sonucunda öz başarı hususunda yüksek bir ortalama elde edilmiştir. Öğrenciler ölçekteki sorulara, süreç boyunca derslere ilgi gösterdikleri ve kendilerine verilen görevleri yerine getirdikleri, genel olarak kendilerini başarılı buldukları cevabını vermekle beraber birkaç öğrenci grupta sadece kendisinin çaba sarf ettiğini, bazıları ise geri planda kaldıklarını belirtmiştir. Ayrıca kimya dersini anlayamadığı için kendisinin başarısız olduğunu düşünen öğrenciler de vardır. Sonuç olarak öğrencilerin PDÖ yöntemi hakkında bazı geliştirilmesi gereken hususların olduğunu düşünmeleriyle beraber olumlu görüşlere sahip oldukları tespit edilmiştir.

Anahtar sözcükler: probleme dayalı öğrenme, grup çalışması, kimyasal denge, kimya öğretimi

DETERMINATION OF STUDENTS' REVIEWS ABOUT APLICATION OF PROBLEM BASED LEARNING

ABSTRACT: In this study it has been aimed to obtain the 11th grade students' opinion about carrying out the problem-based learning (PBL) method in chemical equilibrium topic in chemistry. For this purpose; PBL assessment questionnaire, group study assessment questionnaire and self-assessment questionnaire have been applied to 30 students after chemical equilibrium topic has been studied. Analysis results of the PBL questionnaire have shown a high average. According to the answers given to the questionnaire, students have had more self-confidence with PBL method, have learned how to search and use the findings in the class, and have had more ability to produce and analyze solutions to problems which they have faced. According to the responses to open-ended questions in this questionnaire; students think that learning chemistry with PBL is entertaining, and they take a bright view of searching for the lesson and discerning the topics not only in the book, but also in elsewhere. Nevertheless, students have pointed out that research opportunities and period were limited; PBL was taking more time and limiting problem solving activities. Analysis results of the group study assessment questionnaire have shown a high average. Students have answered to the questionnaire that they have enhanced collaboration and mutual respect, and have approved to learn with the group. Despite, they have pointed out that cooperation and task-sharing among the group member weren't at the desired level and it would be better to create the groups by themselves. Analysis results of the self-assessment questionnaire have shown a high average in self success. However, students have answered that they have shown interest in course along the process, fulfilled the tasks given to them and found themselves successful, some students have stated that only they made an effort and some others expressed that that they remained in the background. Also some students thought themselves as unsuccessful because of they couldn't understand the chemistry. As conclusion, it has been determined that students have positive opinions about PBL method while they think that PBL method has some matters must be developed.

GOLF SPORU YAPAN BİREYLERİN DİKKAT DÜZEYLERİNİN İNCELENMESİ

Ahmet TUNÇ

Mehibe AKANDERE

Gülsüm Baştuğ

Selçuk Üniversitesi Beden Eğitimi ve Spor Yüksek Okulu

Konya -Kampüs

ÖZET: Bu çalışmanın amacı, golf sporu egzersizinin 14-15 yaş grubu bireylerde dikkat düzeyini etkileyip etkilemediğinin araştırılmasıdır. Çalışmanın örneklem grubu Konya ili Selçuklu ilçesi Mehmet Halil İbrahim Hekimoğlu Ticaret Meslek Lisesinde okuyan 14-15 yaş grubu 60 öğrenci oluşturmaktadır. Araştırmaya deney gurubu olarak katılan deneklerin yaş ortalaması 14,80±1,38 yıl, kontrol gurubunun yaş ortalaması ise 14,90±1,39 yıldır. 8 haftalık sürecin öncesinde ve sonrasında hem kontrol hem denek gruplarına Bourdon (1955) dikkat testi uygulanmıştır.

Verilerin değerlendirilmesinde ve hesaplanmış değerlerin bulunmasında SPSS 16.0 istatistik paket program kullanılmıştır. Veriler yüzde ve frekans tabloları erilerek özetlenmiştir. Verilerin normal dağılım gösterip göstermediği One-Sample Kolmogorov-Smirnov testi ile test edilmiş ve verilerin normal dağılım gösterdiği tespit edilmiştir. Veriler normal dağılım gösterdiği için guruplar arasındaki farklılığın tespiti için independed sample t testi kullanılmıştır. Gurup içi ön test – son test karşılaştırmalarında ise, paired samples t testi kullanılmıştır. Bu çalışmada hata düzeyi 0.05 olarak alınmıştır.

Araştırmaya katılan deney ve kontrol grubu arasında son test bakımından istatistiksel olarak anlamlı bir farklılık olduğu tespit edilmiştir ($p<0,05$). Araştırmaya deney grubu olarak katılan deneklerin ön test – son test karşılaştırılmasında, ön test ve son test değerleri arasında istatistiksel olarak anlamlı bir farklılık olduğu tespit edilmiştir ($p<0,05$). Bu karşılaştırmalarda son test değerlerinin ön test değerlerinden yüksek olduğu bulunmuştur. Araştırmaya katılan deneklere ilişkin ön test ve son test değerlerinin aylık gelir durumu bakımından karşılaştırılmasında, aylık gelir durumları arasında deney grubu bakımından ön test ve son test sonuçları arasında istatistiksel olarak anlamlı farklılık tespit edilmiştir ($p<0,05$). Ancak kontrol gurubu bakımından aylık gelir durumlar arasında istatistiksel olarak anlamlı bir farklılık tespit edilememiştir ($p>0,05$).

Sonuç olarak, golf sporu egzersizi yapan 14-15 yaş grubu bireylerin dikkat düzeylerinin incelenmesi amacı ile yapılan araştırmada, deney grubuna uygulanan golf sporu egzersizinin çocukların dikkat düzeylerinde anlamlı farklılığa neden olduğu bulunmuştur. Bu bağlamda golf sporu egzersizinin 14-15 yaş grubu çocuklarda dikkat özelliklerini olumlu yönde etkilediğini söyleyebiliriz.

Anahtar Sözcükler: Çocuk, dikkat, egzersiz, golf sporu

THE ANALYSIS OF THE ATTENTION LEVELS OF INDIVIDUALS PLAYING GOLF

ABSTRACT: The purpose of this study is to investigate whether the golf exercises effect the attention level of the individuals in 14-15 years of age. The sample group of the study is occuring 60 students in 14-15 age group from Hekimoğlu Ticaret Meslek High School located in Selçuklu District of Konya. The mean age of the subjects participating in the study as the experimental group is 14.80 ± 1.38 years, mean age of the control group is 14.90 ± 1.39 years. Before and after the 8 weeks process Bourdon (1955) attention test is applied.

SPSS 16.0 programme is used in evaluation and using the calculated values. Datas are summarized in the percentage and frequency tables. The test of the datas distribution is normal or not made by One-sample Kolmogorov-Smirnov test method and fixed that datas have normal distribution. Because of the datas have normal distribution, to fix the differences of the groups independent sample t test is applied. For the pre-test – post test comparisons in the group paired samples t test is used. In this study the error level is set as 0.05. ıt is fixed that there is a significant difference between experimental group and control group in the final test ($p<0,05$). It is fixed that there is a statistically significant difference between pre test and post test values in the comparison of the pre test and post test of the subjects who participated to the survey. ($p<0,05$). In this comparisons it is found that the post test values are higher then pre test values. In the comparison of the monthly income status of the pre test and post test values of the participants, it is fixed that there is statistically significant difference between monthly income statusses of the participants in terms of experiment group. ($p<0,05$). However for the control group there is not any statistically significant difference between monthly income statusses. ($p>0,05$).

As a result, in the survey made for inspecting the attention levels of the individuals in 14 – 15 age group who are making golf excersises, it is fixed that the golf excersise applied to the test gruop effects the attention level of the kids significiantly. In this context, we can say that the golf excersise positively effect the attention properties of the kids in 14-15 age group.

Key words: Kid, attention, exercise, golf

FUTBOL BRANŞINA KATILAN 9-14 YAŞ GRUBU ERKEK ÇOCUKLARIN IŞIK REAKSİYON ZAMANLARININ BELİRLENMESİ

Hayrunisa BOYAR

Mehibe AKANDERE

Gülsüm BAŞTUĞ

Selçuk Üniversitesi Beden Eğitimi ve Spor Yüksek Okulu
Konya – Kampüs

ÖZET: Bu çalışmada; yaz spor okulu programına katılan, spora yeni başlayan çocukların ışık reaksiyon zamanlarının belirlenmesi amaçlanmıştır.

Bu çalışma; Konya ili merkezinde bulunan Konya Beşiktaş Spor Okulu (Kara kartallar Spor Okulu)'na katılan 9-14 yaş grubu erkek futbolcular üzerinde uygulanmıştır. Deney grubuna uygulanan çalışmada gönüllü 80 kişi katılmıştır. Herhangi bir ön seçim uygulanmamıştır. Araştırmamızda 9-14 yaş grubu çocuklara 16 haftalık, haftada üç gün ikişer saat temel futbol antrenman programı uygulanmıştır. Uygulanan 16 haftalık temel futbol antrenmanları ile çocukların reaksiyon zamanlarında herhangi bir değişme olup olmadığını incelenmiştir.

Verilerin değerlendirilmesinde ve hesaplanmış değerlerin bulunmasında SPSS 16.0 istatistik paket program kullanılmıştır. Veriler ortalama ve standart sapmalar verilerek özetlenmiştir. Verilerin normal dağılım gösterip göstermediği One-SampleKolmogorov-Smirnov testi ile test edilmiş ve verilerin normal dağılım göstermediği tespit edilmiştir. Veriler normal dağılım göstermediği için bağımsız değişkenler arasındaki farklılığın tespiti için Mann Whitney-U testi, bağımlı değişkenler arasındaki farklılığın tespiti için ise Wilcoxon testi kullanılmıştır. Bu çalışmada hata düzeyi 0.05 olarak alınmıştır.

Araştırmaya katılan deney gurubu ön test – son test değerlerinin karşılaştırılmasında, vücut ağırlığı, vücut kütle indeksi, görsel reaksiyon zamanı sol değişkenleri bakımından istatistiksel olarak anlamlı bir farklılık tespit edilmemiştir. ($P>0,05$) Buna karşın yağ%, görsel reaksiyon zamanı sağ değişkeni bakımından ön test – son test değerleri arasında istatistiksel olarak anlamlı bir farklılık tespit edilmiştir ($P<0,05$). Bu karşılaştırmada yağ%, görsel reaksiyon zamanı sağ için elde edilen ön test değerleri yağ%, görsel reaksiyon zamanı sağ için elde edilen son test değerlerinden anlamı derecede daha yüksek bulunmuştur ($P<0,05$).

Araştırmaya katılan kontrol gurubu ön test – son test değerlerinin karşılaştırılmasında, görsel reaksiyon zamanı sağ, görsel reaksiyon zamanı değişkenleri bakımından istatistiksel olarak anlamlı bir farklılık tespit edilmemiştir ($P>0,05$). Buna karşın vücut ağırlığı, vücut kütle indeksi ve yağ% değişkenleri bakımından ön test – son test değerleri arasında istatistiksel olarak anlamlı bir farklılık tespit edilmiştir ($P<0,05$). Bu karşılaştırmada vücut ağırlığı, vücut kütle indeksi ve yağ% için elde edilen ön test değerleri vücut ağırlığı, vücut kütle indeksi ve yağ% için elde edilen son test değerlerinden anlamı derecede daha düşük bulunmuştur ($P<0,05$).

Bu çalışmada; futbol branşında veya farklı branşlarda uygulanacak olan antrenmanın şiddeti ve yoğunluğunun yanında düzenli reaksiyon programının uygulanmasını gerektirdiği kanısına varılmıştır.

Anahtar Sözcükler: Reaksiyon zamanı; futbol; antropometri

DETERMINING THE TIME OF LIGHT REACTION OF THE MALE CHILDREN BETWEEN 9 AND 14 YEARS OLD WHO ATTENDED THE FOOTBALL BRANCH

Hayrunisa BOYAR

Mehibe AKANDERE

Gülsüm BAŞTUĞ

Selçuk Üniversitesi Beden Eğitimi ve Spor Yüksek Okulu
Konya – Kampüs

ABSTRACT: In this study: The aim was to determine the time of light reaction time in children who had been involved in summer sport school and had just started doing sport.

This study: It has been applied on children who had been involved in Konya Beşiktaş Sport Club(Kara Kartallar Spor Okulu) in Konya City Centrum and who were 9-14 aged male soccers.80 volunteers participated in this experiment. There was not any pre-election. In this study, Basic football training program put into practice on children who are 9-16 age range for 16 weeks which is 2 hours in a week. As a result of 16 weeks basic football training, It was observed that whether there were any changes in reaction time or not.

SPSS 16.0 Statistical packet program was used in evaluating data and finding calculated values. Data were summarized in light of average and standard deviation. One-Sample Kolmogorov-Smirnov test was used in order to test whether there were any normal distribution in data and it was ascertained that data did not show normal distribution. Because data did not show normal distribution, Man Whitney-U test was used in order to determine variety among independent variables, and Wilcoxon test was used to determine variety among dependent variable. Error was taken as 0.05 in this study.

It was not observed semantic variety statistically in terms of body weights, body mass index, visual reaction time left variables in comparing pre-final test values of experiment group involved in research($P>0,05$). Despite that fat%, in terms of visual reaction time sağ variable , was determined to be semantic differences between pre - final test values statistically ($P<0,05$). In this comparison fat% was found to be significantly higher than final test values obtained for visual reaction time right. ($P<0,05$)

It was observed semantic difference statistically in terms of visual reaction time right, visual reaction time variables in comparing pre-final test values of experiment group involved in research($P>0,05$). In spite of that, in terms of body weights, body mass index and fat% variables, it was determined to be semantic differences between pre - final test values statistically ($P<0,05$). In this comparison, body weights, body mass index and fat% pre-test values were found meaningfully lower than body weights, body mass index and fat% final-test values ($P<0,05$).

In this study; it was concluded that it is necessary to apply regular reaction program as well as severities and intensity of training in soccer or different branches.

Keywords: Reaction time; football; anthropometry

THE EFFECT OF PRACTICES IN THE LABORATORY COURSE ON THE DEVELOPMENT OF SCIENTIFIC PROCESS SKILLS OF TEACHER CANDITATES

Eylem EROĞLU DOĞAN

Yunus ÖZYURT

The purpose of science education is to train learners as science literate individuals. It is fundamental to have students gain essential knowledge about science as well as learn how to access knowledge during this process. As it is known that scientific process skills (SPS) of individuals can be developed starting from the early ages so the importance of classroom teachers having sufficient knowledge about this issue becomes more clear. The aim of this research is to examine the effect of the course designed to improve scientific process skills of classroom teacher candidates on redounding these process skills. In the study, survey and document analysis methods are used and one group pretest-posttest experimental design was adopted. The research sample is composed of 2nd year undergradute elementary teacher candidates (N=41) at Abant Izzet Baysal University . In the study, Integrated SPS Test (Geban, Aşkar & Özkan, 1992) and rubrics prepared by the researcher with the aim of assessing lab reports and experiments designed by the participants were used as data collection instruments. Teacher candidates having been done experiments designed for the development of their science process skills for seven weeks and lab reports written by them were collected and assessed. SPS test was administered as pretest-posttest before and after the experiments having been performed. After the intervention, teacher candidates were asked to design experiments that can be used in elementary school grade 3 level science lessons for developing science process skills. The use and content of the experiments designed by teacher candidates were assessed in terms of overlap with science process skills. In the analysis of data obtained, frequency distributions and paired samples t-test were used. The findings revealed that science process skills of teacher candidates in this laboratory course were improved and they could applied them into practice.

Keywords: Scientific prosess skills, laboratory practice, teacher candidate

INQUIRY-BASED LEARNING IN CHINA : LESSON LEARNED FOR SCHOOL SCIENCE PRACTICES

Prasart NUANGCHALERM

This study aims to explore inquiry-based learning in teacher preparation program in China. Data were collected by qualitative methods; classroom observation, videotape recording, photography, and interviewing were employed. The results can be explained in terms of lesson learned for school science practices. It can be understandable, simply to incorporate for general science classroom, and also be implied to instructional science practices. The findings help us to understanding what inquiry-based classroom is and how inquiry-based learning are.

Keywords: inquiry-based learning, science teaching, scientific inquiry

APPLICATION OF MATHEMATİCS TO TRANSPORT PHENOMENA

Norman LONEY

In the delivery of advanced engineering and science courses, it appears that the most common deficit in undergraduate students' preparation is the lack of exposure to the applications of mathematics. In order to succeed in graduate studies chemical engineering students must have more than an adequate understanding of the science of transport phenomena. However, transport phenomena are acutely coupled to the application of mathematics. While practitioners of advanced transport phenomena (Slattery, Bird et. al) frequently use mathematics as a tool to expose the behavior of complex systems this approach is not prevalent in undergraduate programs. Addressing this deficit in the undergraduate programs could have immediate positive impact on interdisciplinary and cross disciplinary communities as mathematics is the common language between all of the physical sciences. Material has been developed that is aimed at improving the level of understanding and the application of mathematics as a tool for chemical engineers. This material consists of brief descriptions of given mathematical methods followed by several complete examples demonstrating the previously described mathematical approach. There is an abundance of examples that can be adopted from current or recent physical science and engineering research literature to constitute teaching portfolios. As an example, a book was published by CRC Press in 2000) and was adopted in various chemical engineering programs in the USA. Applied Mathematical Methods for Chemical Engineers, has been adopted by 9 (nine) schools and is currently in its 2nd Ed. (January 2007). This one example indicates the need and strong opportunity for such mathematical applications to be produced and delivered to the various engineering and technology communities through existing undergraduate programs.

A NEW E-LEARNİNG PARADİGM: TOOLS AND TECHNİQUES

Juliet OKPO
Nigerian Defence Academy, Kaduna, Nigeria

ABSTRACT: Technology we believe can place a greater range of tools and resources at the disposal of teachers and students and one of the by-products of the speed with which things change in the era of the ICT revolution is that there is a lot of new paradigms which is explored in this work. Several of the tools and techniques available for the delivery of electronic learning are presented. Also, basic IT tools are shown to possess considerable capabilities alongside the discussions of specialized tools such as symbolic, computer algebra and graphical simulation packages and their contributions to learning. Presented in this paper also is the adaptation of hardware which was originally designed for recreation and entertainment to e-learning.

Keywords: e-learning, paradigm, hardware, tools, techniques

INTRODUCTION

Students and teachers in the world today are greatly affected by advances in the information and communication tools that they meet in the course of learning and impacting knowledge and there is sufficient interaction with these tools that we must learn to adapt to. It is therefore a necessary result that our mode of education must now take advantage of the current electronic alternatives. The reality of this fact is that there are a lot of new paradigms, which are both useful and meaningful. In the light of this it is imperative that we learn and know about these paradigms.

Technology is the system by which society provides its members with the things they need. The art of learning and impacting knowledge in itself is technology. The skilled manpower and knowledge produced by the combination of formal training, schooling and teaching are desirable products in society. Technology exists wherever man is present due to the fact that it aids man in his thriving and survival. Primitive technology is technology that is not driven by science and ICT is the present thing in human technological advancement and the driver of most other technologies in the modern world today.

Technology is increasingly being used both inside and outside the classroom. Embracing new technologies and finding optimal ways of harnessing their benefits is crucial to maximizing educational outcomes. However, in order to gain benefits from technologies it is important to have an understanding of the benefits of their usage, as well as ensuring that they are implemented in ideal ways. The main purpose of this paper is to assess the potential for using cloud computing in the field of education.

Defining Learning

The field of learning is full of many theories, with many dating back over 60 years. However, the majority of the currently popular theories are based upon studies that have been conducted during the past 20 years. On the whole, these theories can be categorized into five main types: humanist, behaviourist, cognitive, social learning, and critical reflection. Each orientation has its strengths and limitations, and there are some situations when one theory might be more applicable than another.

• Humanists hold the belief that people have unlimited potential for development, and that the objective of learning is to fulfil one's potential. Learning involves an active search for meaning, which is controlled by the learners who know their particular needs and goals. Educators should serve as facilitators of learning, by helping students learn the process of how to learn and teaching them to self-discover learning. Methods that exemplify this approach include self-directed learning, and experiential learning.

• Behaviourist's focus on skills development and behavioural change. Learning is seen as a change in overt, observable behaviour. The process of learning is seen as being controlled by stimuli in the external environment from educators and their curriculum, and not by the students themselves. The educator's role is to manage and control the learning environment by setting specific learning objectives and then monitoring the learner's progress. Behaviourism involves "Stimulus-Response" learning which is derived from Skinner's "Reinforcement Theory." Methods that exemplify the behaviourist educational methods include games and simulations, reinforcement and incentives, and instructional feedback [2].

• Cognitive and constructivist perspectives of learning emphasize the importance of understanding the mental processes involved in learning from the learner's perspective. According to these perspectives learning is seen as changes in the way in which the learner understands or organizes the elements of the environment, and changes in the behaviour of the learner are deemphasized. The purpose of learning is seen as the acquisition of knowledge, and the goal of educators is to create the optimal conditions for learning to occur. Methods include the use of metaphors, analogies and simile, chunking (presenting information in "chunks"), and concept mapping. Key figures in this field include Piaget, Bruner,and Bloom[2].

• Social learning theory integrates many of the ideas mentioned in the behavioural and cognitive views of learning. It beliefs that learning is a social process. Most of what people learn is through observations and interactions with other people in a social context. Focus is on the impact of people on people. In this theory the instructor is a model (demonstrator) or identifies and provides effective models, in addition to facilitate social interactions. Examples of educational methods: Demonstrations and trials, apprenticeships, mentoring, tutorials, peer partnerships, on-the-job training [2].

• Critical reflection theory focuses on critical reflection and capitalizing on learners' experience. In general, critical reflection involves the learner identifying and evaluating the assumptions, beliefs and values that underlie his or her thoughts, feelings or actions. This leads to a transformation in how one looks at the world. The instructor's role is that of critical analyst, stimulator of critical reflection, and challenger of assumptions. The emphasis is on learner and instructor equality. The educator is simultaneously teacher and learner. Examples of educational methods: Focus group inquiry, critical debate, imaging the future, reflective judgment, scenario building [2].

Defining e-learning

E-learning includes all forms of electronically supported learning and teaching. The information and communication systems, whether networked learning or not, serve as specific media to implement the learning process. This often involves both out-of-classroom and in-classroom educational experiences via technology, even as advances continue in regard to devices and curriculum. [12] E-learning is a fast and efficient way to spread knowledge to learners in different parts of the world. E-Learning uses the Internet or other digital content for learning and teaching activities, which takes full advantage of modern educational technology provided with a new mechanism of communication and resource rich learning environment to achieve a new way of learning". In addition, e-learning can significantly reduce the time learners spend on learning and it also allows them to access a broader spectrum of learning materials in accordance with their individual competences and situation without the limitations of time and space. . The main difference between an e-learning platform and a traditional classroom is the way in which instruction is transmitted. In an e-learning situation, the learning provider is separated from the learner by cyberspace, and has less visibility of the way the learner is interacting with the educational environment. The ability to adapt, realign, or change the environment is reduced due to this limited visibility. It also makes the educational content very important as the content is now the only differentiating factor between competing e-learning initiatives, assuming there is a level playing field in infrastructure for the provision of service over the internet [4].

E-Learning system

An e-Learning system is a popular technology for distance education. The e- Learning education system based on the web models conventional in-person education by providing equivalent virtual access to classes, contents, and other resources. It is also a social space where students and teacher can interact through threaded discussions or chat. There is a variety of benefits to use e-Learning system. Learner who has limitations of time and location can learn by themselves with the distant-learning system via Internet technology at a lower cost and higher quality in global scale. E-Learning system can be integrated with a physical learning environment which may be referred to as blended learning. It can take place synchronously or asynchronously. In synchronous systems, participants meet in "real time", and teachers conduct live classes in virtual classrooms. Students can communicate through a microphone, chat rights, or by writing on the board. In asynchronous learning, which is sometimes called "self-paced" learning, students are expected to complete lessons and assignments independently through the system. Asynchronous courses have deadlines just as synchronous courses do, but each student is learning at his own pace.

Virtual and Personal Learning Environments

Virtual Learning Environments (VLEs) are electronic platforms that can be used to provide and track e-learning courses and enhance face-to-face instruction with online components. Primarily they automate the administration of learning by facilitating and then recording learner activity. VLEs have evolved quite differently for formal education and corporate training to meet different needs. The most common systems used in education are Blackboard and Moodle. VLEs are the dominant learning environments in higher education institutions. Known also as learning management systems (LMS) and course management systems (CMS), their main function is to simplify course management aimed for numerous learners. The content within VLE is developed by teachers, which are mainly experts of a special domain. VLEs provide an easy to use system for flexibly delivering learning materials, activities, and support to students across an institution. For the administrator, a VLE provides a set of tools which allows course content and students to be managed efficiently and provide a single point of integration with student record systems. For the tutor, a simple set of integrated tools allows the creation of learning content without specialist computer skills, whilst class administration tools facilitate communication between tutor and individual learners.

One major drawback of existing VLEs is that it is content-centric. Many instructors simply move all their teaching materials to the system. The materials are presented uniformly to all learners regardless of their background, learning styles and preferences [8]. Nowadays, we are seeing the trend in education that emphasis on learner-centric learning. A learner-centric learning places learner at its heart. Learners are expected to actively engage in the learning process to construct their own learning. Thus they have more responsibility for their learning. Instructors are still responsible for learners' learning, but they play the role of "facilitator" who guides the learning process instead of being the sole information provider. A learner-centric learning will give learners a deeper and richer learning experience, as there is greater participation and involvement in the learning [13].

In the last few years a new wave of web technologies such as blogs, wikis, and social software, known as Web 2.0, has become a major technology that supports content publishing over the Internet. Web 2.0 allows people to create, publish, exchange, share, and cooperate on information in a new way of communication and collaboration. Applying Web 2.0 technologies to e-learning can enhance interactive communication and collaboration among participants and learners who either possess related learning resources, or can help to discover and obtain the resources, or are willing to exchange and share the resources with others in the Web-based learning. In Web 2.0, learners can read and write to the Web, in which learners become the consumers and producers of learning resources. Thus, Web 2.0 provides a learning environment have the potential to fundamentally change the nature of learning and teaching, through the creation of learner controlled learning web. This kind of environment is named Personal Learning Environment (PLE).

Adoption of PLEs as the platform for e-learning is motivated by several reasons. The most important is that PLEs help learners control and manage their own learning. This includes providing support for learners to set their own learning goals, manage their content and communicate with others in the process of learning, and thereby achieve their learning. A PLE also permits learners to join into groups and provides a suitable environment to practice social skills. Furthermore, PLEs can provide support for lifelong learning that is mainly informal and occurs over the life of the learner. Nevertheless, it has not been proven yet if PLEs can enable the growth of reflective skills, and thus enable the growth of self-directed learner [9].

21st Century Learners

Students today are often referred to as 21st Century learners, primarily because of the ubiquitous access they have to technology. What sets them apart from other generations is the way they process information and choose to participate in the educational experience. Dr. Sarah Elaine Eaton, an educational leader, researcher, author and professional speaker, has identified 21 Characteristics of 21st Century Learners. [13] Some interesting characteristics are considered as follows:

- Often have higher levels of digital literacy than their parents or teachers. They do not know a world without computers.
- Demand the freedom to show their wild creativity. 21st century learners balk at rote learning and memorizing. They will do it if you make them, but be prepared to let them loose to be creative, too.
- Want to connect with others in real time on their own terms. They want their social media, their phones and their mobile technology. They want to be connected. All the time. In a way that makes sense to them.
- Expect inter-disciplinarily. It is we, the older generation, who organize topics into "subjects". The 21st century learner understands that subjects are inherently interconnected.

Some educators seek out the ideals of a 21st century learning environment constantly, while others prefer that they lose the phase altogether, insisting that learning has not changed, and good learning looks the same whether it is the 12th or 21st century. In this view, Teach Thought developed 9 Characteristics Of 21st Century Learning that considers the potential of social media platforms against its apparent divergence from academic learning.

Higher education and life-long human resource development are urgent issues to support the sustainable development of a global society. However, the traditional style of face-to-face education is not able to meet the demands of the society because of the limitations in location, time and cost. An Internet-based e-Learning system should be utilized to support education activities according to the social requirements [13].

What Is Cloud Computing?

The National Institute of Standards and Technology (NIST) defines cloud computing as follows: Cloud computing is a model for enabling convenient, on-demand network access to a shared pool of configurable computing resources (e.g., networks, servers, storage, applications, and services) that can be rapidly provisioned and released with minimal management effort or service provider interaction.

There are two basic types of cloud infrastructures: internal and external. In an internal cloud, servers, software resources, and IT expertise are used inside the school system to build a scalable infrastructure that meets cloud computing requirements. In an external cloud, service providers sell on-demand, shared services to a school. IT support, services, and expertise are included in the package; the school needs to run only the provided applications and services. Cloud computing is a calculation of providing leasing services to users, the user can use a simple terminal to access powerful computing capabilities, regardless of the complexity of the background. To meet the users' needs, which the back-end cloud concerns care is the number of machines required to achieve cooperation. Now Google, Amazon and other companies have built the cloud platform to provided services for their clients, include hundreds of back-end machines at least. It is obvious that cloud platform back-end is a large distributed system, rather than a single machine which user interface displayed. Cloud computing turn the hardware resources into virtual resources with virtual machine monitor, and manage hardware resources with virtual hardware.

E-Learning paradigms:

Podcasting

Podcasting is actually the downloading of audio, video and acrobat files over the web to an ipod, MP3 player, mobile phone or computer. This is making serious impact in education because it offers public access to lectures, school events and performances. Once the hardware is in place, podcasts can deliver lessons as audio or video files for those who cannot or will not attend in the normal way. They can also deliver the basics of a lesson, background of a topic, homework assignments etc for free up to a teacher [3]. The technology also provides the details and facts that the pupils can refer back to during revision. If the class itself is producing the podcast, this instantly creates the need for teamwork, technical literacy and planning, as well as the ability to research and write up the podcast topic itself.

Simulation

Simulation can actually be used to emulate natural phenomena and recently, simulations are being used as instructional tools. Effective instructional simulations contain the following five elements: (1) one or more dynamic models, (2) interactions resulting in state changes, (3) non-linear logic (4) help structures to augment instruction

Simulation can be an extremely useful aid. You can choose what to focus on, build up complexity and control the environment. You can also introduce components that are purely virtual. The implication of this is that we are having simulations that are as close to laboratory experience as possible [3].

Open Sourcing

There are several whole libraries on the web. This helps to avoid the litigious issues of copyrights by beginning from materials that are in the public domain. The Wikipedia and the wiki system have introduced a user extensible system where users can actually add to the library while attempting to put educational materials spanning a wide variety of interests. This is “Open Sourcing” of on-line libraries and it is free and available to anyone with internet access. [3]

A New e-learning paradigm:

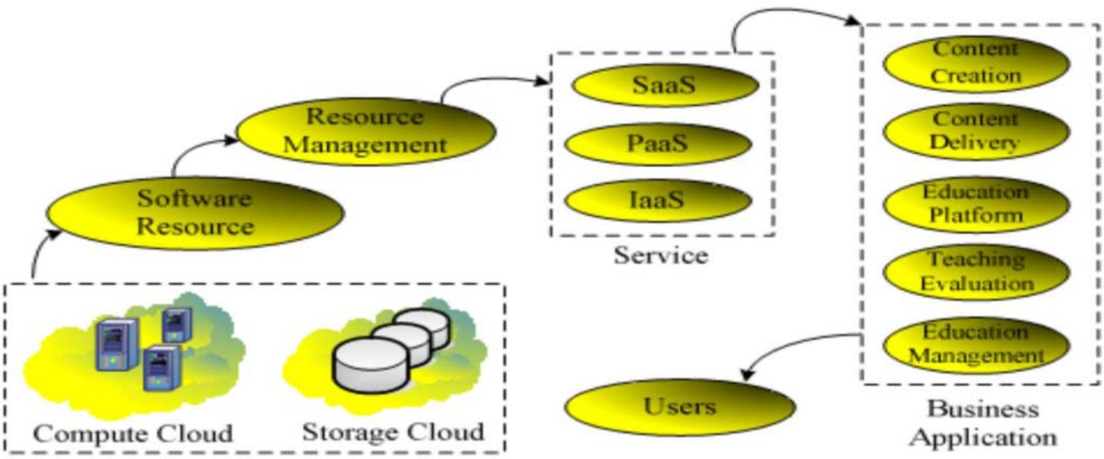
CLOUD BASED E-LEARNING

In Cloud computing technology based e-Learning system all the academic institutions of a Country or State can be connected globally and they can share the resources and e-contents for e-learning process. To connect the academic institutes for e-Learning system we can think e-Cloud model. The proposed e-Cloud provides the opportunity of flexibility and adaptability to use the computing resources on-demand without physical purchasing or installation at user site. Contrary to having only one service provider in present e-Learning models where the software has to install on each system, different providers use different interfaces to their computing resources utilizing varied architectures and implementation technologies for customers (University or Institutes) [10].

The massive proliferation of affordable computers, Internet broadband connectivity and rich education content has created a global phenomenon in which information and communication technology (ICT) is being used to transform education. Therefore, there is a need to redesign the educational system to meet the needs better. The advent of computers with sophisticated software has made it possible to solve many complex problems very fast and at a lower cost. This paper introduces the characteristics of the current E-Learning and then analyses the concept of cloud computing and describes the architecture of cloud computing platform by combining the features of E-Learning.

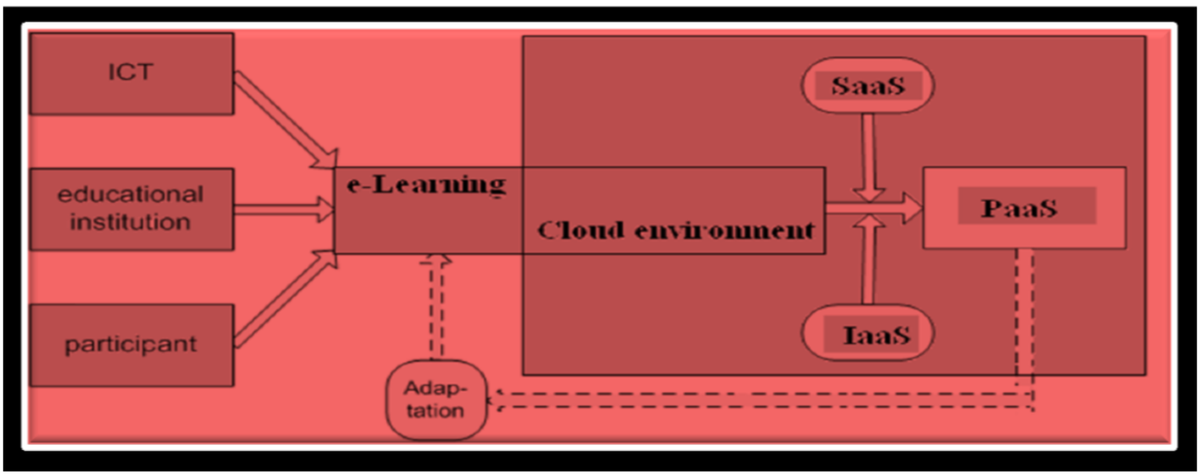
HOW IT WORKS

Cloud based e-learning is the sub division of cloud computing on educational field for e-learning systems. It is the future for e-learning technology and its infrastructure. Cloud based e-learning has all the provisions like hardware and software resources to enhance the traditional e-learning infrastructure. Once the educational materials for e-learning systems are virtualized in cloud servers these materials are available for use to students and other educational businesses in the form of rent base from cloud vendors. Cloud based e-learning architecture is explained in the following figure[9]:



Architecture of e-learning cloud

Cloud based e-learning architecture is mainly divided into five layers called hardware resource layer, software resource layer, resource management layer, server layer and business application layer. It also supports multiple client platforms both inside and outside the school infrastructure



E-Learning system with cloud

FRAMEWORK FOR CLOUD BASED E-LEARNING:

A. The base layer of e-learning cloud

The base layer of e-learning cloud shares IT infrastructure resources and connects the huge system pool together to provide services. Cloud Computing allows the hardware layer to run more like the internet, to make the hardware resources shared and accessed as data resources in secure and scalable way. Virtualization technology separates the physical hardware from operating system, which on one hand can make computing and storage capacity of the existing server into smaller size and re-integration, to improve the utilization and flexibility of IT resource; on the other hand can provide a common interface for large-scale cloud computing integration that enables the publication of calculation. The base layer can provide the basic hardware resources for the platform layer, and the users can also make use of it as the same as using a local device to use.

B. The platform layer of e-Learning cloud With the support of the powerful hardware, platform layer carries out the tasks of data storage, computing and software development, and it can even achieve the tasks of completion of the original mass data storage, business intelligence processing and so on which have been difficult to complete. Users can choose the devices and the number of devices according to the complexity of dealing with the content. Virtualization technology enables the platform to show a strong level of flexibility [1].

The more recent trend in the E-Learning sector is screen casting. There are many screen casting tools available but the latest buzz is all about the web based screen casting tools which allow the users to create screencasts directly from their browser and make the video available online so that the viewers can stream the video directly [1]. The advantage of such tools is that it gives the presenter the ability to show his ideas and flow of thoughts rather than simply explain them, which may be more confusing when delivered via simple text instructions. With the combination of video and audio, the expert can mimic the one on one experience of the classroom and deliver clear, complete instructions. From the learner's point of view this provides the ability to pause and rewind and gives the learner the advantage of moving at their own pace, something a classroom cannot always offer.

BENEFITS

Provides a flexible, scalable, cost effective model that does not force the institute or university to use out-of-date infrastructure or software application.

Offers the flexibility to meet rapidly changing software requirements for todays and tomorrow’s teachers and students.

Allows software standardization, a shared pool of applications for use in an e-learning system for school, college or university, and easier maintenance through centralized licensing and updates.

Enables rapid development and deployment of complex solutions without the need for in-house expertise

Can eliminate the upfront financial burden of deploying new technologies through a pay-as-you-go model.

CONCLUSION

The current trends in the delivery of e-learning have been presented and it is clear that we must provide facilities that will help us benefit fully from the useful materials that are freely available on the internet. We also verified that cloud computing technologies can be exploited to build the next generation of e-learning systems to provide smart formal and informal learning. This set of technologies has clear potential to distribute applications across a wider set of devices in addition to making educational services to be instant, intelligent, multi-sensory, seamless and social and greatly reducing the overall cost of computing.

POTENTIAL USE OF DIGITAL TECHNOLOGIES IN MATHEMATICAL MODELING THE FIRST STEPS OF RESEARCH

Morgana SCHELLER

IFC – Câmpus Rio do Sul/PUCRS,

morganascheller@yahoo.com.br

Maria Salett BIEMBENGUT

PUCRS,

maria.salett@pucrs.br

ABSTRACT: This article presents and analyzes one practice of scientific initiation developed from the use of modeling and digital technologies on basic research projects as a way to stimulate the art of research. The empirical study was conducted in a public agricultural institution in southern Brazil, in which high school students develop research papers at school, during one year. Data were collected through observation of the students activities, field repports, articles and the socialization material. They were analyzed using content analysis of Bardin (1979). Results points that the use of digital technologies enhances the work of mathematical modeling and, both articulated with discussions related to the reality of those involved, promote students: motivation in learning and research; autonomy; reflexion and knowledge to the expression of their own actions and even math itself.

Keywords: Modeling, digital technology, project, scientific initiation.

INTRODUCTION

School research should occupy increasingly larger space in educational institutions, in order to develop skills and abilities that enable students to aim educational goals of different levels, both conceptual, as procedural or behavioral. In mathematics teaching, the subject must extrapolate the instrumental character, posing itself as science research with characteristics of investigation, whose role is to integrate with the other sciences. Thus, in the basic education we seek to develop "strategy of learning to learn, how to think, understand the reality globally, evaluate social and productive processes, discuss and perform quality citizenship and production" (DEMO, 2009, p. 85).

Therefore the teaching of mathematics should prioritize the construction of knowledge; knowledge gained through investigative, constructive and non-instructional processes. A student, much more than mastering techniques and strategies of calculus, needs to develop the initiative and creative sense to learn to adapt it to different contexts, using them appropriately in many situations (BRAZIL, 2008). Because "we are, as bodies that adapt themselves and solve problems, motivated to respond to our environment and achieving goals and objectives." (George, 1973, p. 29).

Learning math and in parallel learning to research with the help of digital technology, software, computers, internet, makes that they acquire natural importance as resources that permit an approach of problems which data require selection and analysis skills. Accordingly, it is necessary to provide students opportunities to develop skills related to representation, understanding, communication and research, as well as the sociocultural context, regardless of the subject or context. The school can help stimulate the student to research, both within the classroom and beyond. As endorses Demo (1996) it may be an opportunity to begin the first steps in the art of research, awakening the student's curiosity, autonomy in seeking information and, finally, the expression of ideas.

In this way, teachers and students can share tasks traversing paths that culminate in the development of skills and learning of scientific concepts, through the development of research projects. As mathematical modeling has an approach related with projects, these have received significant contributions in the last years, of digital technologies as a way of support. Many practical research in this direction have already been made. We mention the research of Araujo (2002), Diniz (2007), Borba and Malheiros (2007), Franchi (2007), Malheiros (2008) and Borba and Villareal (2005), whose research involves modeling and ICT, with the objective of understand and

analyze modeling practices and digital technologies in the classroom, in the form of activities or projects developed in different levels of education for the purpose of explore mathematical content, i.e., learn math and do not necessarily develop research-related skills.
Based on recent studies involving modeling and digital technologies, and with the premise that students become more interested in learning by conducting research, the study aims to present and analyze a practice of Undergraduate Research in Secondary Agricultural School looking for potentials on the use of digital technologies in modeling. Therefore, hereafter is a theoretical outline used to contextualize the study, followed by the methodological aspects that are the guidance, the reasoning, data, the manifest and latent knowledge of the study.

THE THEORETICAL CONTRIBUTION OF THE RESEARCH: FROM MODELING TO THE DIGITAL TECHNOLOGIES

Biembengut (2004) sees modeling as a set of procedures to make a model which process may be used in any area of knowledge. For Bassanezi (2006), either as a teaching strategy or scientific method, modeling is a process that involves theory and practice, leading researchers to interact and understand the reality that is inserted in the investigation, and may have as consequence the action on it aiming transformations.

In the context of education, Biembengut (2004) defines modeling as a research method, particularly used in the Sciences. He emphasizes that modeling procedures are essentially the same presented in stages of scientific research; so, defends as a method in education. The purpose is to encourage and engage students to do research, learning math at the same time, which can be used at any stage of education. Therefore, Biembengut (2013) groups into three procedures of modeling:
- First stage: Perception and seizure - at this stage occurs the recognition and delineation of the problem; and familiarity with the subject to be modeled, consisting of a subsequently theoretical framework.
- 2nd stage: Comprehension and explanation - after performing interaction with the subject, the formulation of the problem is made, questions are elaborated and hypothesis are pointed up; subsequently takes place the formulation of the model.
- 3rd stage: Significance and expression – made the resolution of the problem from the model and interpretation of the solution found. Consists of a review of the model looking for verify whether the model is valid or not and the expression of the process and the outcome.

In recent decades, as modeling, digital technologies also came up when the objective is the pursuit of knowledge and interpretation of a phenomenon, with them there are more and better ways to learn. Lévy (1993) points out that computer media creates conditions for qualitative changes in education, quality regarding the one arises from the collective, with the formation of networks and intelligence seen as a process in which various knowledges are included. To Papert (1985, P. 2), to think about the use of computers coupled with the use of projects, just realize that this adds quality learning, if those implementing the project, is in possession of their interests and desires. Ponder that "[...] technology is not the solution, it is only one instrument." Soon, school modeling practices can have it as a tool to enhance research and education, as advocated by Brazil (2008).

For Moran, Masetto and BEhrens (2000), the *internet* facilitates students' motivation, because of the novelty and the endless research possibilities it offers. It helps to develop intuition, mental flexibility and adaptation to different rhythms. In the context of modeling, Blum and Niss (1991) argue that ICTs used in modeling work not only in facilitating problem solving as are necessary to validate the mathematical model. Borba and Penteado (2001 believe that informatics facilitates the visualization of models, enables the emergence of conjectures and may lead to discoveries. They emphasize that computers reorganize the thoughts and contributes to change the traditional teaching practices. Araújo (2002) confirms these information showing that the interaction between students and ICT enables new strands of research, well as the interaction of modeling and technology enables the exploration of problem situations in which it participates actively in the process.

METHODS AND PROCEDURES

Regarding the empirical space, the study was conducted at the Federal Institute of Santa Catarina - Campus Rio South, public institution of integrated technician course located in southern Brazil, during the development of 4 research projects in which students have initiated the art of research. Developed at school environment, seven students from 2nd and 3rd grade of Technical Education, with 16 and 17 years old, held their projects integrating the areas of agriculture, mathematics and informatics. These projects have utilized modeling as a search method for studying the phenomena / problems existing in other areas of knowledge related to daily life of their course, with digital technologies a resource for the development of research.

In this context the research is inserted, caracterized with qualitative case study (Yin, 2001). Empirical data were derived from observation, field diaries, articles and socialization material, materials produced during the project development. Unstructured observations occurred for approximately one year (2011-2013) at weekly meetings of 1.5 to 2 hours and were being recorded in a logbook. They were conducted to describe and understand what was happening in certain situations. Also, copies of written materials produced by students in the course of research activity were utilized, such as work files, the final article, *poster* and video. For the data analysis procedures of Content Analysis (Bardin, 1979) were used.

RESULTS AND FINDINGS

The collected data allowed the identification of three categories in relation to the potential of digital technologies and modeling at the first steps in the art of basic research in high school. They flow with more or less emphasis according to the characteristics of each group of students in the developed projects. These categories are seen on the speeches of the students, along with material that they have produced. In the text that follows these three categories are implied, which are identified as: the use of technical standards in the writing of research; understanding of what and how to research; cognitive development (descriptive skills, analytical, critical and creative).

About perception and apprehension

Related to agricultural area, the subjects of the research were about growing heifers for dairy purposes, study of egg production of laying hens, chicken and pigs growing and lactating Holstein cow curve. In an initial stage, students have look for realizing and getting a larger number of information about the topic in order to delimit a problem situation for each project. Biembengut (2013) points out that this phase is important, because in order to understand a problem situation, a phenomenon or a theme / topic of interest, one must understand its context and get the greatest number of information and data available in first instance, and thus recognize and become familiar with the topic / subject.

In this step, students have explored the existing knowledge in the literature, with professionals from zootechnical area, as well as part of academic material available on the worldwide web pages, all with reference to the subject. Such information obtained were arranged in the form of files, records of readings, data, videos, magazine articles, and other forms. The internet, computer and software such as *Excel and Grafhmática* resources were further explored by students. This confirms what is described by Borba and Penteado (2001), that students use technology from the beginning of their research. "- When we choose *Google* search, there are thousands of search options for us to know more about the topic. Now we need to filter and see what really matters. It is not only open the first and the search is over. ", Considered the student B.

Stands out beyond the modification of the concept of common research in basic education by students, that in the transition from the 1st to the 2nd phase of modeling, they have already opted for recording data using *Excel,* leaving aside simpler resources like calculators or non digital spreadsheets. Students have already incorporated technology into their studies, confirming the birth of information in the digital age. Biembengut (2013) highlights that the phase of perception and apprehension (recognition and familiarity of the theme) are not disjoint. As some data are perceived, they collect them, and this allows the perception of other data, other information, and so on in a cyclic process, however, increased. This modeling step may be ended with a text compiled and arranged and organized in data tables, such as Table 1.

Table 1. Chicken eggs industrial classification according to its weight (grams)

Identification	Rating
Jumbo	Greater than 66
Extra	60-65
Big	55-60
Average	50-55
Small	45-50
Industrial	Less than 45

Understanding and explanation

In the second stage of modeling, there is a dialogue between the counselor and the student C asked, which developed the project on growth of calves:
- "Does the height and chest girth of the calves have proportional growth? Are they constant? - "What this question can infer in your study?" The teacher asked. - "You mean the two do not grow proportionally, it will

have its disproportionate body and this may impair milk production" Student C. Students seek to understand a problem in every part of it, seeking a way to make it explicit. The question from the student demonstrates that they start not to accept reality anyway, questioning it. They do not consider as something perfect, correct.

In the episode above, the student makes use of mental mechanisms to take advantage and upgrade his/her perception on the considerations of the problem. This is the way people expand their cognitive ability. Vygotsky (19 89) calls inner speech the process in which the student enters the symbolic system in his psychological apparatus, with the support of the language. And a research favors this type of development to be active, interactive and constructive individual in an environment conducive to interaction.

Cognitive skills enabled students design a model that would allow not only the resolution of the particular issue, but also serve to make predictions or allow a (re) creation. They used the previous knowledge for a model. Result can translate what, in high school, can be constructed by students.

The algebraic model A (p) = p*0.55 + 32.28 was one of the obtained with the aid of Excel, when investigating the relationship between height and heart girth present in the growth of calves. In this model, like all functional model, are incorporating the particularities of the analysed phenomenon (Bassanezi, 2006). In the case of explicit algebraic model, the "A (p)" is the height (cm) and "p" the heart girth (cm) along the calves growth, obtained through what Levy (1993) calls simulation possibilities. Thus the second stage is effective to understand the data and explicitation of the model. And this requires the modeler student creativity, critical, analytical power, persistence, among others.

Of meaning and expression

The model validation, in all projects, took advantage of the use of Excel and it consists of the resumption of empirical data arising from experiments and / or literature by applying the model. It was noticed at this stage that on studying and solving a problem using the computer, the student describes the problem to be solved, the computer performs a task through software or a programming language, and allows the student to interact with the program, thinking, reflecting and making decisions about the activity. This is the constructionist paradigm defended by Valente (1993).

- "Wow, the graphical display of the model obtained by empirical data and the model designed by the company that provides the animals is very close visually. Now we need to check whether this difference is significant "? Student S on the express graphical model in Figure 1.

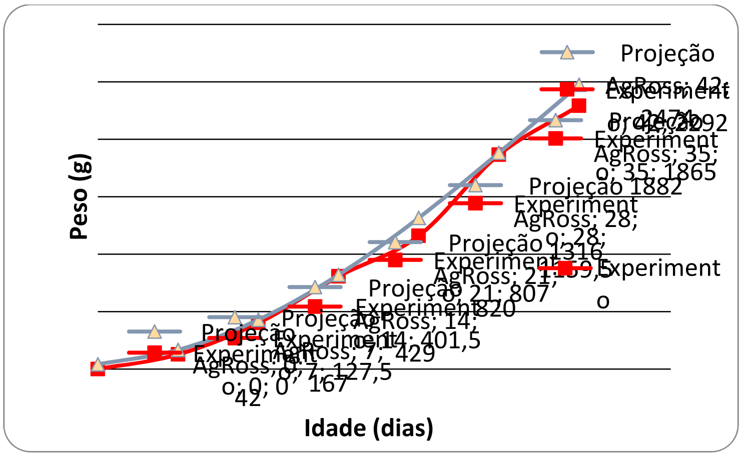

Figure 1. Comparison of representative models of the growth of broiler chickens based on empirical data and engineered for animals.

In this third stage of modeling, Biembengut (2013) discusses that it is the stage of expression and this implies to evaluate and verify the validity of the model, and thus express it. Students perform evaluation of the models taking into account aspects presented in the literature, which data were obtained empirically and projected by the model. "- Damn life, now I'm really seeing what it means to do research, it is quite cool teacher!" Student K illustrates about the phase of modeling and representing what the research means for him/her, when handling the Excel spreadsheet aiming at validating the model.

The communication of the model is one way to test it and complete the modeling process. As a final step of expression, lactation curves Project students developed na projection and control instrument of these curves in an Excel spreadsheet, preparing a video for better explanation of the project and the instrument to the general public (Figure 2). This part went beyond the initial purpose of the project and demonstrates that motivation and interest drive the student to build ways to solve his/her problems. "The ownership of a response to a stimulus or stimulus complex should depend on the motivation (George, 1973, p. 28).

Figure 2. Outline of study instrument developed by students completing the modeling process

All projects were released to the community, both orally and in writing. For that, students have developed na abstract, article and poster, explaining that socialization are crucial when doing research, when it takes the first steps in the art of research. "- It is very good to present what we have done, it gives a pride, especially when there are people who want to hear us. It is rewarding, and our public commitment to take our studies to milk producers and others in the community" student M expressing his views about the research communication. It was just possible at any level of education "because the student is given the opportunity to study the problem situations through research, developing their interest and sharpening their critical thinking" (Biembengut, 2004, p. 23).

CONCLUSION

All the navigation through this study so far allows some relevant analysis of the practice of scientific research: aim of this study. We emphasize modeling as a research method in which students extend their understanding and build knowledge. Knowledge not only conceptually, but also procedural and behavioral related to mathematical and technological domain, techniques and procedures of the research. It is important to consider the use of technology as a resource to support the modeling, present in all stages of modeling, enabling students to complete inferences about: the research theme and your interaction with it, the model in their tabular representations, graphical and algebraic, significance and the model's expression and communication project for validation.

It is emphasized in the study, three potential use of digital technologies and modeling in the first steps of research of high school students: the first refers to the use of technical indicatives on writing results of the projects of these students to develop their final articles, abstracts and posters. Stand out the tables, charts, quotes, references, among others. These are aspects that are not customarily present in works produced by students at this level of education. Another highlight is to the "new" conception of what is and how to study, since most students conceive research as a copy of what a particular author claims related to a theme, taking it as his/her. Finally, we highlight the cognitive development of students in terms of descriptive, creative, analytical and critical skills. It was noticed in describing the theme, sketch and compare the data, choose strategies for obtaining the model, analyze the feasibility of the model, modify the assumptions for model improvement, communicate their results, worrying about the social commitment to socialize their work, among others.

Digital technology and the modeling provided to students social posture while studying a theme. This occurs not only by studying, but for considering it essential to extrapolate the school boundaries with socialization and dissemination of the instrument to milk producers, broiler breeders and laying, of calves and the school community. This way, contributed to the formation of citizenship, to awaken new views, whether on the situation investigated, or on the political and social reality that surrounded them in the environment that was motivating for them. This presentation and analysis ends here highlighting the statement Papert (1985), expressing that to educate is to create situations for learners to engage in activities that will fuel constructive process to think and learn. A process in which active subjects in the construction of knowledge, authors subjects, dive in art research.

ABSTRACT: This study investigates the effect of gender related differences on Geometry Achievement and retention of senior secondary school students. A pretest-posttest experimental control group research design was used. A total of 70 SS3 students were selected from about 9,540 students of Jigawa state using stratified random sampling techniques. Both male and female group were treated using problem solving approach. The instruments used for data collection were Researchers Made Test (RMT), Geometry Achievement Test (GAT) and Geometry Retention-Test (GRT). Data collected were analyzed using t-test statistic. Finding statistically showed the existence of significant difference between male and female students 'performance in Geometry Achievement Test, while there is no significant difference in male and female performance in Geometry Retention-Test. Based on the findings, Mathematics Teachers are encouraged to use problem solving approach (polya model) in teaching Mathematics.

Key Words: Gender Related Difference, Achievement, Retention, Geometry, Secondary school

INTRODUCTION

The role of Mathematics in the scientific, technological and economic development of any nation can never be overemphasized. It is based on this notion that Adetula (1988) identified Mathematics as the key to National development. This view is also supported by Ibrahim (1998) who states that if any nation wants to achieve scientific and technological development, Mathematics should be properly taught to prepare the minds of students toward scientific and technological reasoning.

However, the perpetual global Scientific and Technological development and extraordinary world population growth rate continue to throw a challenge to Mathematics educators and researchers to come up with most effective and suitable method of teaching Mathematics at all levels of education, so that, Millennium Development Goals of Education For All (EFA) and promoting gender parity could be achieved (MDGs 1990). In Nigeria, 2006 census figures indicated that females outnumbered males in the country (NPC, 2006). As such, all concerted efforts have to be made to encourage female to acquire more knowledge as their male counterparts. It is for this view that Fennema in Adetula (1988) stresses the need to continue research that documents the status of gender differences as they exist in Mathematics education. In response to this call, attempts were made by various scholars to justify stereotype about female inferiority or otherwise in learning of Mathematics.

Literature in and outside Nigeria shows that male students performed significantly better than their female counterpart in secondary school Mathematics (Abbas, 2008 ; Batista, 1990 and Cassey, Nuttail & Pezaris, 2001). Even though, Adeleke (2007) argue that, the difference in performance occurred only in higher order knowledge. In the same course Manger (1996) investigated the relationship between gender and mathematical achievement with Norwegian 3rd graders in Numeracy, Fraction and geometry. He found that male score more than female even though the difference was small. On the other hand Mulli (1998) and Awang & Noor (nd) found that females significantly scored higher than males in the overall average achievement in Mathematics. These parallel results indicated that, the issue of gender factor on cognitive achievement in Mathematics seems inconclusive.

Lassa (1986); Kajuru (1995) and West African Chief Examiners report (WAEC, 2010) have separately claimed that the performance of students in geometry is lower than in other aspect of Mathematics. Scholars have attributed this difficulty in learning geometry to various factors. Kajuru (1995) explain that, the reason for this difficulty may be due to lack of proper link between geometry and numerous applications as it relates directly to the learners such as building, engineering and architecture. But Inekwe and Hassan (2002) related the problem to the problem of semantic use of geometric concepts. While in a meta-analysis that covers more than 100 countries Nicole, Marcia and Janet (2010) found that, the quality of instruction and curriculum affect children's Mathematics learning. They added that female is likely to perform as well as male when they are encouraged to succeed.

Records show that, in Nigeria the prevailing method of Mathematics instruction among secondary school Mathematics teachers are expository lecture method (Adetula, 1988). He further commented that, yet the method doesn't yield the desired result. Nevertheless, in search for qualitative and viable approach of Mathematics instruction, researchers advocated for the use of problem solving approach (Obodo, 1997; Bolaji, 1999 and National Council of Teachers of Mathematics, 2000). They individually argued that, the approach not only engages students in thinking, exploring and actively doing Mathematics, it also helps the learners to retain Mathematics knowledge for longer period. Due to the role of retention in learning process, Davis (1979) maintained that, if the learner cannot retain the effects of previous learning experiences, there could be no progress from one practice period to another.

Hence, it is the focus of this study to ascertain whether problem solving approach can bridge the gap between male and female mean achievement and retention of geometry concepts (assumed difficult topic). Consequently the following research questions are generated.

i. What is the nature of the difference between the mean scores of male and female achievement when taught geometry using problem solving approach?

ii. Is there any significant difference between the mean scores of male and female students in geometry retention test when taught using problem solving approach?

To answer the above questions, the following null hypotheses were formulated for testing:

HO_1: There is no significant difference in male and female students mean score in geometry Achievement test when taught using problem solving approach.

HO_2: There is no significant difference in male and female mean scores in geometry retention-test-when taught using problem solving approach.

METHODOLOGY

The research design adopted for this study was pre-test post-test experimental control group design. The population of this study was all year 3 Senior Secondary school students in Jigawa state government owned schools. Thus, the total population of this is 9,540 from 42 senior secondary schools. A sample of 70 students comprising of 35 male and 35 female were selected from one male and one female using stratified and "drawing from the hat" random sampling techniques in line with (Akuizuilo, 1993)

In this study the experimental group was taught geometry using problem solving approach (Polya, 1962) model by the researcher. While the control group was treated the same topics using traditional method by a trained colleague, whose qualification and experience are equivalent to that of the researcher, in order to control teacher factor variable. For the two groups the teaching lasted for six weeks. Three instruments were used for data collection in this study. Researcher made test (RMT) was used as pre-test to determine the entry level of the subjects. Geometry Achievement Test (GAT) was used to measure the students Geometry Achievement Test. While Geometry Retention Test (GRT) items were generated by shuffling and rotating GAT items, and were used to measure geometry retention level which was conducted two weeks after administration of post-test.

The GAT and GRT consist of 20 multiple choice geometry questions sorted and adapted from WAEC past question papers. And they cover essential geometry topics in senior secondary school Mathematics curriculum. The reliability coefficients of GAT and GRT for this study were obtained to be 0.67 and 0.66 respectively using

K-R-21 Kuder-Richardson formula. Three experienced degree- holders' secondary Mathematics teachers validated the items and their inputs were incorporated.

Scores from the instruments were collected and statistically analyzed using t-test statistic at 0.05 level of significant.

RESULTS

Table 1: Performance of the Experimental and the Control Groups in Pre-test.

GROUP	N	$\bar{X}$	Sd	Df	T_{cal}	T_{crit}	P	**Remark**
MALE	35	37	12.6					
				68	0.88	1.96	0.38	**NS**
FEMALE	35	35.4	12.6					

Not significant at $P > 0.05$

From Table 1: p-value = 0.38 which is greater than 0.05. This implies that there is no significant difference between male and female in their pretest scores. This also means that, the two groups could be assumed to have equivalent prior knowledge on geometry at the point the investigation commenced

HO_1: There is no significant difference between male and female student mean scores in Geometry Achievement Test when taught using problem solving approach.

Table 2: Comparisons between males' and females' mean scores in geometry achievement test (GAT)

Group	**N**	$\bar{X}$	**Sd**	**df**	**Tcal**	**Tcrit**	**P**	**Remarks**
Male	35	63	15					
				68	4.12	1.98	0.01	S
Female	35	49	13.2					

Significant at $P \leq 0.05$

The result from table 2 shows a p-value 0.01 which is less than p of significant level. This shows that, there was significant difference between males' and females' performance in the post-test. Moreover, the calculated t-value of 4.12 which is greater than critical value of t which is 1.98 with df = 68 at $p \leq 0.05$. Thus the null hypothesis is rejected. This implied that the approach favoured male.

HO_2: There is no significant difference between males and females mean scores in geometry retention test (post-post test) when taught using problem solving approach.

Table 3: Comparison Between Males' And Female's In Geometry Retention Test (GRT)

Group	**N**	$\bar{X}$	**Sd**	**df**	**Tcal**	**Tcrit**	**P**	**Remarks**
Male	35	57.3	12.5					
				68	1.9	1.98	0.06	NS
Female	35	51.4	13.4					

Not significant at $P > 0.05$

The result from table 3 revealed a p-value of 0.06 which is greater than p of significant level; this shows that, there is no significant difference in the performance of female and male taught geometry using problem solving approach in retention test. Moreover, the obtained t-value is 1.9 which is less than the $t_{critical}$ value 1.98 with df = 68 at $P \leq 0.05$ level of significance. Thus null hypothesis is therefore accepted.

DISCUSSION OF THE RESULT

The results in table 2 shows that, there was significant difference between the performance of male and female with respective mean scores of 63% and 49% respectively. However the mean score of 49% is appreciable in normal scores. The implication of this result is that, problem solving approach tends to promote homogeneity of male and female performances. The findings of Abbas (2008), Batista (1990) and Casey et al (2001) are consistent with the findings of this study. Possible explanation, could be due to the fact that problem solving approach makes female to participate, interact, collaborate more than when treated through traditional approach, yet the method favoured males in terms of geometry achievement.

Table 3 shows that, the difference in performance of male and female in the retention test is not significant with p-value 0.06 at $P \leq 0.05$ significant level. This shows that the method tends to bridge the wide gap that exists between male and female performances in Mathematics.

The findings agrees with that of Awang & Noor (nd) and Mulli (1998) who discovered that problem solving approach is not sensitive to gender difference. On the other hand it disagrees with the findings of Fennema & Sharma (1978) and Bolaji (1999) that confirmed the existence of gender difference in learners' cognitive performance. This will probably be as result of latent feature of problem solving approach; where the concept learnt are not allowed to be forgotten through use and over-use of the concepts in solving a given problem. Moreover, in respect of sex, students are motivated and compelled to participate fully in the process of learning. Hence, the more the female participate in learning process the better in retaining the concept learnt.

CONCLUSION

This study has shown that Problem Solving Approach (Polya model) can be used to bridge the gap between male and female performance in geometry achievement and retention.

RECOMMENDATIONS

From the findings of this study, the following recommendations were made.

1. Mathematics teachers should be trained and encourage to incorporate the use of problem solving approach in their lessons.

2. Professional bodies like Mathematics Association of Nigeria (MAN), Science Teachers Association of Nigerian (STAN) should put more effort in organizing workshops and conferences to teach Mathematics teachers on how to employ problem solving approach effectively.

3. Mathematics educators and curriculum developers should also encourage the production of text books and teachers guide; to aid and facilitate teaching and learning through the problem solving approach.

FAILURE IN MATHEMATICS

Lamin SAIDY

The learning and teaching of mathematics in our schools cannot be over emphasized. Its importance is quite enormous and so vital to our daily lives in this 21st century.

But, in my part of the World, Africa, to be specific, The Gambia, West Africa, it is a very big concern to both partners in education, that is parents, educators, teachers, donors and all those in the training of teachers, that is University of The Gambia and The Gambia College-School of Education, pupils are every year failing Mathematics at both internal and external examinations for both the Lower Basics Schools, Upper Basic Schools and Senior Secondary Schools.

At the Lower Basic Schools, pupils in grade threes and fives sit to the National Assessment Test NAT and according results given by West African Examination Council WAEC, the number of candidates failing Mathematics is on the increase at an alarming rate.

In the upper Basic School level, pupils in grade nines nationwide, the number candidates failing Mathematics is also very high each year after The Gambia Basic School Certificate Examination results are released by WAEC.

Also in the Senior Secondary School sector, it is more pathetic because this is the transition stage to University and in The Gambia, before a candidates gets admission into The University of The Gambia, you must have a credit of a minimum of six 6 grade in both English and Mathematics and i want to belief, it is the requirement if not all Universities in the entire World.Now tell me if candidates or pupils fail Mathematics at these levels, then what will happen to the future of our education sectors, because these will be the teachers and stake-holders in the education, it will be detrimental then since the World cannot go without Mathematics,its concerning.

ÖZET : Bir öğretmenin etkili bir öğretim gerçekleştirebilmesi için sahip olması gereken farklı bilgi türleri vardır. Fakat öğretmen bilgisi karmaşık bir yapıdır ve bu nedenle de pek çok araştırmacı tarafından tanımlanmaya çalışılmış ve çeşitli sınıflandırmalarla ele alınmıştır. Öğretmenin sahip olması gereken bilgileri belirlemeye yönelik yapılan çok sayıda araştırma olsa da pek çoğu için başlangıç noktası Shulman'ın (1986) çalışmaları olmuştur. Shulman (1986) "öğretmenin ne bilmesi gerekir?", "öğretmenin dersi anlatırken ne yapması gerekir?", "öğretmenin sahip olması gereken bilgiler nelerdir?" sorularına cevap aramak amacıyla pedagojik alan bilgisi kavramını ortaya koymuş ve üzerine çalışmaya başlamıştır. Ona göre pedagojik alan bilgisi, konu alan bilgisi ve pedagoji bilgisinin özel bir bileşimidir. Bir başka tanımında pedagojik alan bilgisini, konu bilgisinin pedagojik bilgi ile kesiştiği, uygulama bilgisi ile kuramsal bilginin bütünleştiği, bir konunun öğretimi bilgisi olarak tanımlamıştır (Shulman, 1987). Shulman'ın çalışmalarından sonra öğretmen bilgisi pek çok araştırmaya konu olmuş ve araştırmacılar öğretmenin sahip olması gereken bilgileri kategorilere ayırmada farklı modeller ortaya koymuşlardır. Öğretmen bilgisinin ele alındığı modellere bakıldığında, öğrenci düşüncesi bilgisini pedagojik alan bilgisinin bir bileşeni olarak ele alma konusunda araştırmacıların hem fikir oldukları söylenebilir. Modellerde bu bilginin öğrenenler ve karakteristikleri bilgisi, öğrenci anlamaları bilgisi, öğrencilerin matematiği kavrayışları bilgisi, öğrencilerin düşünceleri hakkında bilgi gibi terimlerle yer aldığı görülmektedir. Tanımlarına bakıldığında ise farklılaşan kimi noktaları olsa da çoğunlukla benzer bir kapsama işaret etmektedirler.

Bu çalışmada pedagojik alan bilgisinin bir bileşeni olan öğrenci düşüncesi bilgisine yönelik bir literatür özetinin sunulması amaçlanmıştır. İlk olarak pedagojik alan bilgisinin bileşenleri ve ortaya konulan modellerde öğrenci düşüncesi bilgisinin yeri incelenmiştir. Daha sonra öğrenci düşüncesi bilgisi kapsamlı olarak irdelenmiştir. Öğrenci düşüncesi bilgisinin alt bileşenleri incelenen literatür ışığında; öğrencilerin mevcut bilgilerini ortaya çıkarma, ön bilgi ile yeni bilgiyi ilişkilendirme, öğrenci sorularına ve düşüncelerine değer verme, öğrenci düşüncesini ön görme, öğrencilerin kavram yanılgılarını belirleme ve bireysel farklılıkları dikkate alma şeklinde sıralanmıştır.

Anahtar sözcükler: öğretmen bilgisi, pedagojik alan bilgisi, öğrenci düşüncesi bilgisi

ABSTRACT: There are different types of knowledge that a teacher need to have for making an effective teaching. But teacher knowledge is a complex structure and therefore it has been defined by many researhers and dealt with different classifications. Although there are so many studies done for determining teacher knowledge, Shulman's (1986) has been the origin of many of them. To find answers to the questions " What do teachers need to know?", "What must teachers do during her/his instruction?", " What are the knowledge that teachers need to know?", Shulman (1986) suggested the concept of pedagogical content knowledge and started to study on. According to him pedagogical content knowledge is a special amalgam of content and pedagogy. In another definition he defines pedagogical content knowledge as knowledge of teaching a subject in which content knowledge and pedagogical knowledge intersected and practical knowledge and theory integrated. After Shulman's studies, teacher knowledge became the subject of many researches and the researchers suggested different models to categorize teacher knowledge. When we look these models it can be said that knowledge of students' thinking is agreed on as a component of pedagogical content knowledge. This knowledge is seen in the models as terms like knowledge of learners and their characteristics, knowledge of students' understanding, knowledge of students' cognitions in mathematics. In the definitions although there are some different points, they generally indicate the same content.

In this study it is aimed to present a literature review on knowledge of students' thinking which is one component of pedagogical content knowledge. First, the components of pedagogical content knowledge and the place of knowledge of students thinking in the models were examined. Then, knowledge of students' thinking was examined thoroughly. In the light of the literature the subcomponents of knowledge of students' thinking were organized as: eliciting studenst' current knowledge, connecting prior knowledge to new knowledge, valuing students' questions and thinking, foreseeing students' thinking, determining students' misconceptions and considering students individual differences.

Key words: teacher knowledge, pedagogical content knowledge, knowledge of students' thinking

SERVICE LEARNING IN SCIENCE TEACHER PREPARATION PROGRAM: CONCEPTS AND PRACTICES

Prasart NUANGCHALERM

Faculty of Education, Mahasarakham University THAILAND

Corresponding author e-mail: prasart.n@msu.ac.th

ABSTRACT: Service learning is now challenging higher education in the 21st century. The concepts of service learning influenced to science teachers preparation program in terms of outcome-based education. The purpose of this paper aims to represent concepts relevant to service learning in science teacher preparation program and also practices of how service learning meet the 21st century skills. Documentary analysis and empirical study are employed for qualitative explanation. Finding revealed that service learning is an important instructional strategy in science teacher preparation program and it needs to be incorporated into curriculum for developing 21st century science teachers.

Keywords: service learning, preservice teacher, science teacher, teacher preparation

INTRODUCTION

Learning process in the 21st century is not appeared only in classroom-based activities, but also community service should be introduced in various kind of learning management to higher education level. That is, previous research (Zlotkowski, 2000; Gallego, 2001; Kaye, 2004; Butin, 2005; Butin, 2010; Coffey, 2011; Daniels *et.al.*, 2011; Cone, 2012) help us to understand how to manage learning environment that meet requirement between curriculum and nature of learning. This era, we cannot deny learning management innovation propagating academic and community hit to the goal of higher education. Coffey (2011) states that the number of higher education institutions using ways to serve students' learning with service-learning programs, it is greatly increased within the last twenty years, especially teacher education programs are using them to help teacher candidates achieve an awareness of social and community issues. That is, higher education should be take responsibilities to social relations. Due to students come from community and serve community as well. They have to do with a civic mission that addresses important issue. Service learning is a significant instructional strategy which university should incorporate into course and learning activities.

Community experiences can make preservice teachers with positive attitudes, academic, skills, and attributes that classroom maybe give them less opportunity to fulfill of what they should be prospered because of school hour is limited. That why university reason lectured-based learning is restricted by content matter and space of learning. Based on framework of higher education concerns with many sectors, learning process should be widely participated in terms of community development, students are centered-based, community-based, and practical-based needed to shape society. It is expected academic aspect and reflection which encourage our citizen autonomy and control, help them realize the link between their effort and success promote development of environmental awareness. Service learning is an educational methodology that combines community service with explicit academic learning objectives, preparation for community work, and deliberate reflection (Benneworth & Charles, 2013). It engages students within the local community through completion of a hands-on construction project which response to civic engagement (Benneworth & Humphrey, 2013; Clevenger & Ozbek, 2013; Hart & Aumann, 2013).

Service learning brings students and teachers to the open learning area. They have learning skills from real life situations and problem-solving. Meanwhile, service learning have itself responsible to shape way of learning by cooperative inquiry-based practices, students will have problem-solving skills and decision making through project work and serve learning outcomes through empirical evidences by community services. We can recognize instructional practices in the university level should not only emphasize on theory, most of study indicated that theoretical knowledge cannot be helped preservice teachers to fulfill learning skills. The educational practices in higher education should be focused on how learning reaches the model of learning and its assessment (Astin & Antonio, 2012). Thus, the assessment should response to societal impact, relevant to higher education produced knowledge and human resources to society.

The notion of service learning is not new for education, is referred by experiential learning theory (Kolb & Kolb, 2005), it is influential regarding as it provides a model of the learning process as well as model of adults' learning development. Preservice science teachers should have appropriate learning environment that institution support by various kind of theoretical-based and practical-based management. Service learning shows us socially responsible and responsive instructional practices. It also influences to authentic learning outcomes, critical reflection, and civic engagement (Galvan & Parker, 2011). Moreover, it is an approach to teaching in which links community-based service academic and critical reflection, leads them meet the goal of experiential learning theory. This approach helps higher education curriculum build preservice teachers to have assumption a leadership role in addressing widespread of social and environmental problems, and to prepare them to be a good citizenship making them to meet the needs of a rapidly social changes (Boyer, 1990). Service learning connects authentic, meaningful service to community as well as they supported, especially to community with academic and reflection in which they have learned through scientific thinking, systemic plans, and cooperating practices (Eyler & Giles, 1999).

Service learning enhances preservice teachers' abilities in many ways by allowing them to have learning opportunities, link academic and theories to work with real life situation, various kinds of pedagogical practices, 21st century learning skills, social awareness, and public mind to community. As it great for learning activities in higher education, service learning incubates them not only general courses, but also preservice teachers who is lead and shape our society. According to Cone (2009a; 2009b; 2009c) studied the effect of service learning in the role of approach to enhance self-efficacy beliefs of preservice elementary teachers. The findings indicated that service learning is significantly influenced to preservice teachers with outcome expectancy towards equitable teaching and learning. It will stimulate them to have self-efficacy, has been linked to educational outcomes (Bandura, 1997). It is directly associated with behavioral, cognitive, and motivational engagement of them on academic practices (Bandura, 1993). If they have all of above and perceived that it is importance to have higher levels of cognitive engagement and also some related to their attributes (Eccles & Wigfield, 2000).

To developing preservice teachers, service learning in science teacher preparation program should fulfill cultural, social and academic awareness as well as curriculum determined.

Service-learning in teacher education programs is now growing trend in universities level which is around the world. Preservice science teachers are particularly prospered leader and transformer of social direction. The program should be challenged 21st century skills that learning realization is overcoming in the complex society. We can say that it is an important guideline to think, imagine, plan, do, and assess for preparing quality citizen in a changing world. This study aims to present concepts and practices of service learning in science teacher preparation program. The results will be discussed and guided to curriculum development and instructional practices for science teacher preparation program.

METHODOLOGY

This study employed documentary analyses in service learning for science teacher preparation program. Document analyses are investigated through standard databases in both Thai and international sources. Thai databases can be accessed through ThaiLis, ONEC, Google Scholar, and universities' WebOPAC. International database are linked to ERIC, EBSCOHOST, Proquest, Google Scholar, Scopus, and ISI Web of Science. Information is gathered by keywords, methods, and contents related to service learning in higher education, and it is screened only related preservice science teachers and service learning documents. Concepts are drawn, reviewed, and analyzed by content analysis methods. Data are described in terms of qualitative presentation, descriptive report, and gap analysis.

The practices are reviewed research in service learning, especially for science teacher preparation program. Also, data from practices and experiences are collected through observation, participatory action, and reflection. The service learning by practical data is observed through science teacher service camp, which it have been run for 10 years in Bachelor degree of General Science program, Mahasarakham university. It can conclude to be instructional strategies. Then, researcher analyzed data and explained empirical evidences by descriptive explanation.

RESULTS

Social responsibilities are now calling for 21st century because we have too much knowledge and technology in which concerns unlimited cognitive growing, but necessary skills and attributes need to be done with high quality education, high quality citizens facing complex modern life and innovation for surviving. The process of learning in school or university should not be concentrated only subject matters because the world is change, problem is more complex, natural resources and environment are ruined. Society call for all sectors to have responsibilities and awareness to do with friendly action that is education can change. Challenging reason, hands-on and mind-on activities leads students to have contemporary skills and 21st century experiences, experiential learning (Kolb and Kolb, 2005) states in the currently educational strategies because beliefs in no one learn without think and practice. The meaningful learning by head, heart, and hand with deep responsibility to social awareness is propagated at all level. The process of service learning seems to science teacher preparation in Thai university in terms of community service or preservice science teacher camp. However, student-centered based learning is implemented as it the project assignment.

Preservice science teachers decided to conduct project or science camp by norm or university culture. It cannot be indicated that real service learning implemented or occurred in the process of learning in higher education. They have learned culture and others community dimension by starting to select target community through group discussion via possibility of project cooperation. Then, they have to teach or construct school environments as well as school administrator wants. Finally, they move back to traditional class in university to register several courses by means of project ending and restart with another community that traditional ceremony recommended. It can be concluded that paradigm of community service is still implement in terms of traditional ceremony between community and preservice science teachers (Figure 1).

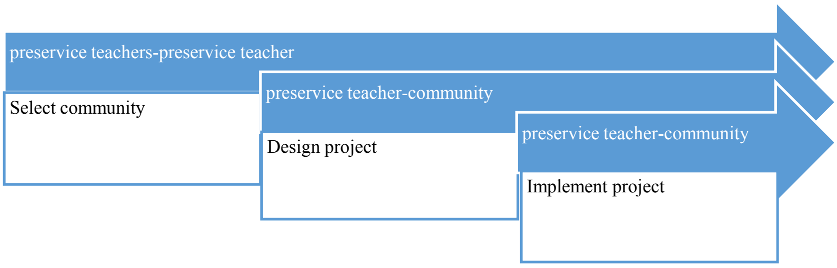

Figure 1. Community Service And Preservice Science Teachers

The instructional strategies of service learning can be generalized to preservice science teacher preparation with previous result of the study. Based on my teaching experiences and research findings (Prasertsang & Nuangchalerm, 2013; Prasertsang *et.al*., 2013; Nuangchalerm, 2014a, Nuangchalerm, 2014b), it can be described that service learning can summarize at least 3 phases of instructional practices.

Preparation: it has been known that the initial phase of learning will hit the requirement of learning objectives preparation seems to classroom conditioning as it traditional for general classes. It is the first instructional process, allow students to have concept in teachers' role and community development. They spent time for planning of what project should be done and problem should be solved. They formed group and work with others by effective communication. Leadership is begun during project planning. Community pilot study is not ignored because it will give them necessary data to making decision. They gathered some information that concerns with community-based service learning by employing scientific thinking as well as science teachers be. This phase, stimulate and inspire their attributes of how to be a good citizen based on concept of good democracy, good citizen, and serving good community. They have to spent mostly time for preparation, not only project investigating community service but also knowledge in such they have to know before group entering.

Teacher will give them goal of working by lecture-based learning and group-based discussion with how to sustain community, especially implication of theoretical knowledge in classroom into real life situation.

Teacher as a key person to inspire students producing community service and stimulate them to have scientific thinking which is not emphasize theoretical perspectives but also case studies are introduced. Students take responsibilities to work with community members by various kind of knowledge construction such as observation, talking, photography, dialogues, community record, and so on to help them make possibility of successful in community service program. They are guided in teachers' profession and way of group working, team working, and problem-solving. Walk and talk are prior knowledge that they should do with community members.

Action: everything will not be success if we deny learning by doing. The concept of any learning theory didn't ignore to stating students interact with natural world through direct experiences. Sensory organ works with brain function, it migrates perception by seeing, hearing, smelling, tasting, and touching. The second phase of service learning process let preservice teachers having experiences that looks different traditional classroom may be emphasized subject matters or theory-based learning. It allows them to work with community members and peers by conducting project as they planned, team-based learning, project-based learning, and problem-based learning. Learning activities help students to have 21st century skills during action phase i.e. scientific thinking skills, life skills, innovation skills, ICT skills, science process skills, learning skills, and so on. They have to do as they plan with community members, project is implemented with assignment then various kind of data collection method are employed by video recording, photography, journal writing, discussion and report. Each group has to record and assess the goal of project by conducting a small research, interviewing, observing, making questionnaires, and videotape recording. The outcome of this process response the project in which serve community's needs with learning together between community and university. They have to talk with others, share ideas, construct knowledge through effective communication.

This phase teachers should divide preservice science teachers to group-based community service, each group consist of 10-15 person. Teacher is facilitator by guiding concept, methods, and techniques to do with community and also giving tools for collecting data and methodology for examining community service. Time for action is no too short or too long because it influenced to project-based service. Hidden curriculum, determined presrvice science teachers pay attention to community awareness, civic engagement, social responsibility that it difficult to understand in only theoretical-based classroom. Action is important methods open the world of knowledge to them. They have to move themselves to community and response to the real needs by doing with community members. Boundary of knowledge in social, cultural, political, and economical dimension is moved, they employed educational research after had learned from university. They can think and do various kinds of cooperating learning strategies.

Reflection**:** this learning process will be conducted when they back to classroom, presentation and reflection by whole class is set. Each group presents of what they did and how the project reaches the goal of study. The classroom activity assigned all group members prepare what they had learn through project-based construction and community service. Video recording, questionnaire, report, and presentation are important evidences to indicate successful in service learning.

"...I have a chance to repair school playground. When I do, it is not easier than those I think. Moreover, community members are warmest welcome to all students during project conducted…" Sunny

"…community members take care all of us with warmest welcome, food and supplies are transferred by community members to our service camp. The deepest expression that I remembered in the last day, he ride a bicycle followed our truck and shout loudly "forget me not, please revisit us"…" Lisa

"…the service project allowed us to fulfill knowledge and skills that we cannot buy anywhere, science show invite us to learning by happily doing because all of sectors such as students, community members, and school administrator give us to learn together in cooperatively…" Lita

"...service project taught us to plan, act, observe, and reflect in what we do. We learn to talk and discuss a lot for implementing community service. I am confidently project service employed active learning to us for knowledge construction..." Punch

Participants expressed their understanding in the concept of civic education and practical knowledge in terms of community service. They employed various kind of presentation i.e., powerpoint, poster, video, and report for concluding about what they had learned by project-based activity. Reflective writing is also employed to indicated that each of them reach the concept of citizenship. Moreover, ICT skills let them to make clip video to show of what and how they implement community-problem and community-project services through social network**.** Effective communication is such incubated and challenged them to learn how perceived a successful project. Also, it develops them to have science and art to share their ideas with others in which helps them to be good teacher and transporter of knowledge, skills, and expected attributes to all students.

DISCUSSION

Teacher preparation program seems significant for shaping our society because teacher is an key person and factors that point society to of what we are. Program consists of both educational theories in which represent in classroom and also field experiences or school practicum. Educational policy promote way of effective teacher construction, as the current of teacher preparation in the world, teacher profession in the changing world must skeptic them to real life situation, solve the problem as they found, set a project, and service not only academic, but necessary skills might want to examine in the community. Field experiences in preservice science teachers declares knowledge and skills that include profession's attributes, community as a sources of learning, textbook cannot transmission of what students perceived even though they take time to work with community.

Based on individual differences, students have to adapt way of working, learn way of knowledge construction, and consume way of socio-cultural action. However, curriculum and instruction in university is limited to lecture-based learning or emphasizing theory than those practical learning. The concept if service learning is designed for 21st century skills, suitable for creative learning innovation that students will learn from of what they work as well. The field experiences, sources of knowledge construction, difficult to teach in the classroom because it needs real and solve the problem by group working. It responses of what teachers should be success as good as teacher professions defined. ICT is employed and subject matter as they have learned, it will be used for creating learning innovation and community readiness.

The teacher preparation program is now time for updating or renovate curriculum by incorporating service learning strategies into science teacher preparation program, allowing them to meet profession and match the goal of program. The activities that found in the field experiences, service learning employed project-based and problem-based learning, suitable for higher education, and practical-based than those lecture-based classroom. Due to, instructional strategies examined student-centered learning, learning by doing emphasizes, problem-based learning, and project-based learning which community is stakeholder.

Service learning can make professional teacher through project service, community and university is not far from borderline of academic or scholars, but it can make more closely by joining preservice science teachers with community members. Service learning can be summarized into 3 phases: Preparation, Action, and Reflection. Preservice science teachers and community members are planner to solve community problem (Zlotkowski, 2000). Higher-ordered thinking is key element that accelerate them to develop system thinking, academic outcomes, and skills according to Kolb (1984) states experiential learning that is process to develop abilities, experiences, and reflection (National Youth Leadership Council, 2010). Service learning initiated educators based on experiential learning (Kolb, 1984; Kolb & Kolb, 2005) theory, methods, ideas, and concepts are emerged by inner and outer classroom activities (Zins *et.al*., 2010). It constructs positive relations among teacher, learners, and communities for enhancing learning skills and necessary abilities which they should be developed (Billig & Conrad, 1997). They will have much more skills and abilities as 21st century citizens. It should have by participation, problem-solving, planning, decision making, and practices. Community's problem had been solved, students learn to work with participatory action in collaboration with effective communication, life skills, and team working (Wiegand & Strait, 2000; Ferrari III & Cather, 2002). That is, it should be incorporated into classroom that higher education defined to hands-on and mind-on learning for citizens' learning in the 21st century.

As believed in good teacher profession, preservice science teachers should fulfill learning experiences by outside activities and service communities as much as they can do. It can be considered that hidden curriculum in community service is not to help them in way of working together, but also learning the differences is required. Preservice science teachers apprentice teachers' role and responsibilities. In the way of service learning, they have to prepare community where showed clearly needs to work with. Preservice science teachers should think and act based on community needs and problem bases by service learning as shown in Figure 2 (Prasertsang & Nuangchalerm, 2013).

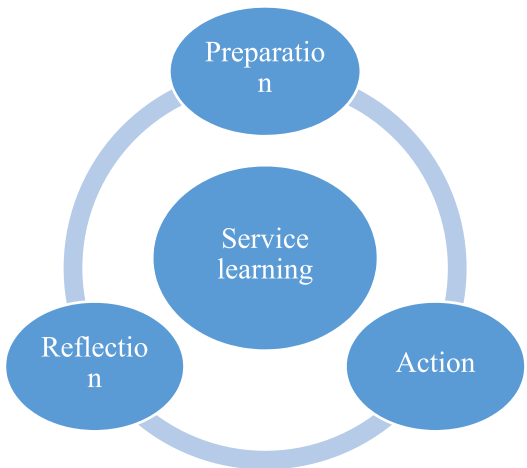

Figure 2. Service Learning Phases

They have a willing to serve community based on deep awareness to social responsibility, discuss of what they have learned from field experiences, and think about group-based learning through reflection (Clayton & Ash, 2005; Deely, 2010). Learning innovation is created as well as they have learned from university and adapted to local practices (Power, 2010). It needs them to have skills helping them to survive, learn, adapt, and contemplative practices. The outcome of service learning enhance characteristic of good citizenship (Scott, 2006; Prasertsang *et.al*., 2013). It can be concluded that service learning explain itself in the role of education for holistic view in academic, skills, and attributes that response to social needs in the current situation and future. They have cooperating in participation in community sustainable development because they are outcomes of community to do and response to a partnership in education and development as well as they have a meaningful learning (Butin, 2005; Braskamp & Engberg, 2011). Community care is a best way to let them participate in learning together with community members, happy, love, peace, awareness and social responsibility (Silcox, 1995; Galvan & Parker, 2011).

Preservice science teachers can classify community needs, share ideas together, they have to develop many skills for serving community which is not only cognitive, but psychomotor and affective sides will be developed (Kaye, 2004). It seems to them research-based active classroom and more scientific thinking (Nuangchalerm, 2009; Cartwright, 2012; Cone, 2012). Service learning and community-based experiences are effective in developing teacher preparation program (Nuangchalerm, 2014a; Nuangchalerm, 2014). They can learn much more cultural, academic, and social awareness, which is now growing trend in higher education around the world. Preservice science teachers learn a powerful way about community in which cultures of learning embedded (Boyle-Baise & Sleeter, 1998; Sleeter, 2000). It can be explained that direct experiences allow them to view, reflect, and change perspectives of how to develop their profession and attributes.

ACKNOWLEDGEMENT

I am very sincerely appreciated to Faculty of Education, Mahasarakham University for research supports.

ÖZET: Öğrencilerin matematiksel düşünmelerini geliştirmek için yapılması gerekenleri vurgulayan matematiksel düşünme odaklı öğretim uygulamasına katılan 40 ortaöğretim matematik öğretmen adayı ile gerçekleştirilen bu çalışmada, öğretmen adaylarının yapmış oldukları planlarda öğrencilerinin hatalı çözümlerini öngörme becerilerinin belirlenmesi amaçlanmıştır. Araştırmada deneysel araştırma desenlerinden tekrarlı ölçümler deseni ile nitel veri toplama yöntemlerinden doküman incelemesini içeren karma araştırma deseni kullanılmıştır. Öğretim uygulaması öncesinde, sonrasında ve bir yarıyıl sonrasında öğretmen adaylarına üst düzey düşünme süreçlerini içeren bir problem verilerek bu problem çerçevesinde planlar yapmaları istenmiştir. Planlar araştırmanın dayandığı teorik çerçeveye uygun bir araç olan ders planlama öğeleri rubriği ile incelenerek analiz edilmiştir. Yapılan analizler sonucunda öğretim uygulaması öncesindeki planlarda teorik çerçevedeki öğelerden biri olan öğrencilerin hatalı çözümlerini öngörmede öğretmen adaylarının yetersiz oldukları görülmüştür. Öğretim uygulaması sonrasında ve bir yarıyıl sonrasındaki planlarda ise öğrencilerin yapabilecekleri hatalar açıkça ifade edildiği için öğrencilerin hatalı çözümlerini öngörme öğesinde öğretmen adaylarının başarılı oldukları ortaya çıkmıştır.

Anahtar sözcükler: matematiksel düşünme, matematik öğretimi, matematik öğretimini planlama

ABSTRACT: In this study, it is aimed to determine the preservice teachers' skills in anticipating students' incorrect thinking. The study was performed with 40 preservice teachers who participated in the instruction focused on mathematical thinking and emphasized what needs to be done to improve students' mathematical thinking. Mixed methods research including repeated measures design and content analysis was used in the research. The preservice teachers were asked to plan lessons that used a task with a high level of cognitive demand before, right after and one semester after the instruction. These plans were assessed and analyzed with scoring rubric for attention to students' thinking which is a tool compatible with the theoretical framework of the research.. As a result of analysis, it was observed that the preservice teachers' skills in anticipating students' incorrect thinking, which is one of the components of the theoretical framework of the research, were inadequate before the instruction. In the plans right after and one semester after the instruction, it was emerged that the preservice teachers were successful in anticipating students' incorrect thinking because the errors that might be done by students were stated clearly.

Key words: mathematical thinking, mathematics teaching, planning of mathematics instruction.

GİRİŞ

Matematiksel düşünme, matematiksel kavramlar, teknikler ve süreçler kullanılarak gerçekleştirilen problem çözme etkinliğidir ve matematiksel düşünmenin temelinde keşfetme, mantıksal ilişkileri bulma ve matematiksel terimlerle ifade etme süreci bulunur (Henderson vd. 2001, 2002; Yıldırım, 2008; Mubark, 2005; MEB, 2005).

Matematiksel düşünme üç açıdan önemlidir: (1) matematiksel düşünme öğretimin önemli bir amacıdır; (2) matematiksel düşünme matematiği öğrenmenin bir yolu olarak önemlidir ve (3) matematiksel düşünme matematiği öğretmek için önemlidir (Stacey, 2006).

Matematik öğretiminin etkili bir şekilde uygulanması için öğretmenler, öğrencilerinin matematik içeriğini nasıl öğrendiklerinin ve bu içerik hakkında nasıl düşündüklerinin bilgisine yani öğrencilerinin matematiksel düşünmelerinin bilgisine sahip olmalıdırlar. Ayrıca, öğretmenler olası çözüm stratejilerini veya süreçlerini öğrencilerin nasıl kullandığını ve öğrencilerinin sahip olabileceği olası ön kavramalarının ve kavram yanılgılarının da bilgisine sahip olmalıdırlar. Öğretmenlerin, ders esnasında öğrencilerinin düşüncelerini anlamlandırıp değerlendirmek için yöntemleri bilmesi gerektiği ve matematiksel olarak verimli tartışmalar gerçekleştirmek için öğrencilerinin düşüncelerini kullanma hakkında kararlar vermesi gerektiği konusunda görüş birliği vardır (Hughes, 2006).

Öğrencilerin matematiksel düşünme konusunda yeterli olmadıkları çeşitli araştırmalarla ortaya konulmuştur (Umay, 1992; Lutfiyya, 1998; Cai, 2003; Mubark, 2005; Duran, 2005; Yeşildere, 2006; Ovayolu, 2010). Ayrıca öğretmenlerin veya öğretmen adaylarının matematiksel düşünme konusunda ve öğrencilerin matematiksel düşünmelerine odaklanan matematik öğretimini gerçekleştirme konusundaki eksiklikleri de araştırmalarda ortaya çıkmıştır (Weiss, Pasley, Smith, Banilower ve Heck, 2003; Alkan ve Güzel, 2005; Hughes, 2006). Türkiye'de öğretmenlerin öğretimlerinde öğrencilerinin matematiksel düşünmelerine odaklanmalarını ele alan bir araştırmaya ve Ortaöğretim Matematik Öğretimi Programının (MEB, 2013) "öğrencilerin matematiksel düşünme becerisi kazanmalarını sağlamak" şeklindeki amacını öğretmenlerin nasıl gerçekleştirecekleri konusunda Türkçe bir kaynağa rastlanamamıştır. Literatürde öğretmenlere veya öğretmen adaylarına öğrencilerinin matematiksel düşünmelerine odaklanmalarının ve öğrencilerinin matematiksel düşünmeleri hakkında bilgilerini arttırmalarının çeşitli yollarını göstermek için düzenlenmiş öğretim uygulamalarının, öğrencilerin matematiksel düşünmelerine odaklanmaları konusunda yol gösterici olduğu da görülmüştür (Fennema vd., 1996; Swafford vd., 1997; Barnett, 1998; Schifter, 1998; Vacc ve Bright, 1999; Crespo, 2000; Warfield, 2001; Masingila ve Doerr, 2002; Fernandez, Cannon ve Chokshi, 2003; Little, Gearhart, Curry ve Kafka, 2003; Kazemi ve Franke, 2004; Sherin ve Han, 2004; Fernandez, 2005; Hughes, 2006; Boston, 2006; Metz, 2007; Stein, Engle, Hughes ve Smith, 2008).

İncelenen araştırmalara ve ÖYEGM (2008, 2009) tarafından belirlenen öğretmen yeterliklerine dayanarak, matematik öğretmen adaylarının planladıkları öğretim etkinliklerinde öğrencilerinin matematiksel düşünme süreçlerine dikkat etmelerini sağlamak için lisans düzeyinde bir ders almaları gerektiği sonucu çıkarılmıştır. Bu sonuçtan hareketle gerçekleştirilen bu çalışmada, öğretmenlerin öğrencilerinin matematiksel düşünmelerine odaklanmalarını temel alan öğretim uygulamalarının karması olma özelliğine sahip bir öğretim olan matematiksel düşünme odaklı öğretim uygulaması planlanmıştır ve bu öğretim uygulamasının etkililiğinin araştırılması gerektiğine karar verilmiştir. Matematiksel düşünme odaklı öğretim uygulaması, öğretmen adaylarına öğrencilerinin matematiksel düşünmelerini dikkate alan dersler planlamalarında yol gösterici ve öğrencilerde matematiksel düşünmenin geliştirilmesi konusunda matematik eğitimi ve öğretmen eğitimine önemli katkısı olan bir öğretim uygulamasıdır. Matematiksel düşünme odaklı öğretim uygulamasının etkililiğinin araştırıldığı bu çalışmanın Türkiye'de matematik öğretimine farklı bir bakış açısı getirerek matematik eğitimi ve öğretmen yetiştirme alanında literatüre katkı sağlayacağı düşünülmektedir.

Araştırmanın problemi ve alt problemler

Bu araştırma matematiksel düşünme odaklı öğretim uygulamasına katılan öğretmen adaylarının yapmış oldukları planların incelenmesi ve öğretmen adaylarının yapmış oldukları planlarda öğrencilerinin hatalı çözümlerini öngörme becerilerinin belirlenmesi amacıyla gerçekleştirilmiştir. Buna göre araştırmanın problem ve alt problemleri şu şekilde ifade edilmiştir: Matematiksel düşünme odaklı öğretim uygulamasına katılan ortaöğretim matematik öğretmen adaylarının yapmış oldukları planlarda öğrencilerinin matematiksel düşünmelerini dikkate alan planlar yapma becerilerinin belirlenmesindeki öğelerden biri olan öğrencilerin hatalı çözümlerini öngörmede nasıl bir değişim olmuştur?

Yukarıda belirtilen araştırma problemine göre araştırmada şu sorulara yanıt aranmıştır:

1. Öğretmen adaylarının matematiksel düşünme odaklı öğretim uygulaması öncesinde ve sonrasında yapmış oldukları planlarda öğrencilerin hatalı çözümlerini öngörme puanları arasında anlamlı fark var mıdır ve öğretmen adaylarının öğrencilerinin hatalı çözümlerini öngörme becerilerinde nasıl bir değişim olmuştur?
2. Öğretmen adaylarının matematiksel düşünme odaklı öğretim uygulamasından bir yarıyıl sonrasında yapmış oldukları planlardaki öğrencilerin hatalı çözümlerini öngörme puanları ile öğretim uygulaması sonrasındaki planların öğrencilerin hatalı çözümlerini öngörme puanları arasında anlamlı fark var mıdır? Öğrencilerin hatalı çözümlerini öngörme açısından matematiksel düşünme odaklı öğretim uygulamasının kalıcılığı nasıldır?

Teorik çerçeve

Araştırmaya, Hughes (2006) tarafından belirlenen teorik çerçeve yön vermiştir. Teorik çerçeve, öğretimde öğrencilerin matematiksel düşünmelerine dikkat etmede önemli olan dört öğeye sahiptir (Hughes, 2006). Çerçevedeki öğeler (1) dersin matematiksel amacını belirleme; (2) öğrencilerin doğru çözümlerini ve olası kavram yanılgılarını veya hatalı çözümlerini öngörme; (3) öğrenciler çalışırlarken anlayışlarını değerlendirip ilerletecek sorular belirleme; (4) öğrenci düşünmesine dayandırılan ve dersteki matematiksel anlayışları belirginleştirecek tartışma düzenleme şeklindedir. Teorik çerçeve, öğretmenlere veya öğretmen adaylarına öğrenci düşünmesine nasıl odaklanılacağı konusunda fikir sunmakta ve öğrenci düşünmesine odaklı etkinliklerden öğretmenlerin neler öğrendiğini değerlendirme için yol göstermektedir (Hughes, 2006). Matematiksel düşünme odaklı öğretim uygulamasında bu teorik çerçevenin öğeleri vurgulanmış ve çalışmaya katılan öğretmen adaylarının öğrencilerinin matematiksel düşünmelerine odaklanan planlar yapma becerilerini belirlemek için bu teorik çerçeve kullanılmıştır.

YÖNTEM

Araştırmanın Modeli

Öğrencilerinin hatalı çözümlerini öngörme becerilerinin belirlenmesi amacıyla öğretmen adaylarının yapmış oldukları planlar incelenmiştir. Planların incelenmesi söz konusu olduğundan nitel veri toplama yöntemlerinden doküman incelemesi kullanılmıştır (Yıldırım ve Şimşek, 2006). Katıldıkları öğretim uygulaması öncesinde, sonrasında ve bir yarıyıl sonrasında öğretmen adaylarının yapmış oldukları planlarda öğrencilerin hatalı çözümlerini öngörme öğesinde aldıkları puanlar arasında anlamlı fark olup olmadığını belirlemek şeklindeki nicel araştırma amacını gerçekleştirmek için deneysel araştırma desenlerinden tekrarlı ölçümler deseni kullanılmıştır (Büyüköztürk, Çakmak, Akgün, Karadeniz ve Demirel, 2008). Buna göre araştırmada nicel araştırma amacıyla deneysel araştırma desenlerinden tekrarlı ölçümler deseni ve nitel veri toplama yöntemlerinden doküman incelemesi kullanıldığı için araştırman karma araştırma desenine sahiptir (Johnson ve Christensen, 2004; Johnson ve Onwuegbuzie, 2004).

Katılımcılar

Araştırmanın katılımcıları, Balıkesir Üniversitesi Necatibey Eğitim Fakültesi OFMAE Bölümü, Matematik Eğitimi Anabilim Dalı 4. sınıf öğrencilerinden oluşan bir gruptur. 2010–2011 eğitim öğretim yılı bahar yarıyılında Problem Kurma ve Çözme adlı derse devam eden 40 öğretmen adayından meydana gelen grup, "kolay ulaşılabilir durum" örneklemesi (Yıldırım ve Şimşek, 2006) ile oluşturulmuştur. Araştırmaya katılan öğretmen adaylarının 21'i kız, 19'u erkektir.

Verilerin toplanması

Bu çalışmada, 2010–2011 eğitim öğretim yılı bahar yarıyılında haftada 4 saat olmak üzere 12 haftalık bir sürede uygulanan matematiksel düşünme odaklı öğretim gerçekleştirilmiştir. Matematiksel düşünme odaklı öğretim uygulaması, öğrencilerin matematiksel düşünmelerine odaklanan öğretim uygulamalarını içeren çeşitli çalışmalar (Boston, 2006; Hughes, 2006; Metz, 2007) incelenerek oluşturulmuştur. Matematiksel düşünme odaklı öğretim uygulaması, öğretmen adaylarının matematik öğretimi ile ilgili örnek olayları, videoya çekilmiş bir matematik dersini, sınıf tartışmalarını, örnek planları incelemelerini içeren bir uygulamadır. Öğretim uygulaması esnasında öğretmen adaylarına, planlama yapmaları için düzenlenmiş bir araç olan Ders Boyunca Düşünme Protokolü (DBDP) (Hughes ve Smith, 2004; Hughes, 2006; Smith, Bill ve Hughes, 2008) tanıtılmıştır. Araştırmaya katılan öğretmen adaylarından bu aracı kullanarak matematiksel düşünme odaklı öğretim uygulamasının planında belirlenmiş matematiksel görevlere ve kendi belirledikleri matematiksel görevlere dayalı olarak bireysel ve işbirlikli planlar yapmaları istenmiştir. Öğretmen adayları farklı görevlere dayanarak hazırlanmış örnek planları inceleyerek bireysel olarak yapmış oldukları planlar üzerinde yansıtmalarda bulunmuşlar; işbirlikli olarak yaptıkları planlar için sınıflarında mikro öğretim uygulaması yapmışlardır.
Matematiksel düşünme odaklı öğretim uygulaması öncesinde ve sonrasında katılımcı öğretmen adaylarına veri toplamak amacıyla üst düzey düşünme süreçlerini içeren bir problem olan "Grafiklerden Açıklamalara [GA]" problemi (Friel, vd., 2001) (EK A) verilerek bu problem çerçevesinde planlar yapmaları istenmiştir. Öğretim uygulamasının kalıcılığını belirlemek için 2011–2012 eğitim öğretim yılının (öğretim uygulamanın gerçekleştiği öğretim yılını izleyen öğretim yılının) güz yarıyılı sonunda öğretmen adaylarının aynı problemle tekrar planlar yapmaları istenmiştir.

Verilerin analizi

Araştırmada öğretmen adaylarının yapmış oldukları planların analizi söz konusu olduğundan nitel veri analizi yöntemlerinden betimsel analiz kullanılmıştır. Betimsel analizi gerçekleştirmek için araştırmanın dayandığı teorik çerçeveye uygun olarak Hughes (2006) tarafından geliştirilmiş bir araç olan Ders Planlama Öğeleri Rubriğinde (Hughes, 2006) yer alan öğeler tema olarak kullanılmış ve katılımcıların yapmış oldukları planlar "GA" problemine özgü olacak şekilde kodlanmıştır. Analiz sonucunda elde edilen bulgular, katılımcıların planlarından alıntılar kullanılarak desteklenmiş ve yorumlanmıştır.

Ders Planlama Öğeleri Rubriğinde, ders planlama sürecinde öğrencilerin matematiksel düşünmelerine odaklanmanın dört temel öğesi; (1) dersin matematiksel amacını belirleme, (2) öğrencilerin doğru çözümlerini ve hatalı çözümlerini öngörme, (3) öğrenci düşünmesini değerlendirip ilerletecek sorular sorma ve (4) öğrencilerin düşünmelerine dayandırılan tartışma ve dersteki matematiksel fikirleri belirginleştirecek tartışma düzenleme olarak belirtilmiştir. Rubriğin amacı öğretmen adaylarının yapmış oldukların planların bu öğelere göre açık ve anlaşılır olup olmadığını belirlemek, dolayısı ile öğretmen adaylarının planladıkları derslerde öğrencilerin matematiksel düşünmelerini dikkate alma derecelerini ortaya çıkarmaktır. Bu nedenle rubrikle öğretmen adaylarının yapmış oldukları önerilerin belirgin bir şekilde ifade edilip edilmemesi değerlendirilmiştir (Hughes, 2006). Bu araştırmada Ders Planlama Öğeleri Rubriğindeki öğrencilerin hatalı çözümlerini öngörme öğesine odaklanılmıştır. Öğrencilerin hatalı çözümlerini öngörme öğesi, öğrencilerin görevi çözerken karşılaşabilecekleri zorlukların, yapabilecekleri hataların ve sahip olabilecekleri kavram yanılgılarının öngörülmesini ölçmeye yönelik bir öğedir ve dört derecelik bir ölçekle kodlanmıştır (0, 1, 2 ya da 3 puan). Öğretmen, öğrencilerin problemi çözerken karşılaşabilecekleri sorunların ve kavram yanılgılarının çoğunu tanımlamaya çalışmışsa planlar, öğrencilerin hatalı çözümlerini öngörme öğesine göre 3 puan olarak kodlanmıştır. Öğrencilerin problem üzerinde yanlış düşünebilme yollarının çoğunun tanımlanmaya çalışıldığının gösterilmemesi 2 puan olarak kodlanmıştır. Öğrencilerin problem üzerinde yanlış düşünebilme yolları belirsiz bir şekilde tanımlanması 1 puan olarak kodlanmıştır. Öğretmen öğrencilerin problem üzerinde yanlış düşünebilme yollarını öngörme konusunda herhangi bir çaba göstermemişse planlar, öğrencilerin hatalı çözümlerini öngörme öğesinde 0 puan olarak kodlanmıştır (Hughes, 2006).

Öğretmen adaylarının matematiksel düşünme odaklı öğretim uygulaması öncesinde, sonrasında ve bir yarıyıl sonrasında yapmış oldukları planların puanlarına SPSS 12.0 programı ile normallik testi yapılmış ve verilerin normal dağılım göstermediği görülmüştür Bu nedenle katıldıkları öğretim uygulaması öncesinde, sonrasında ve bir yarıyıl sonrasında öğretmen adaylarının yapmış oldukları planlarda öğrencilerin hatalı çözümlerini öngörme puanları arasında anlamlı fark olup olmadığını belirlemek için nicel veri analizi yöntemlerinden Wilcoxon işaretli sıralar testi yapılmıştır (Büyüköztürk, 2003).

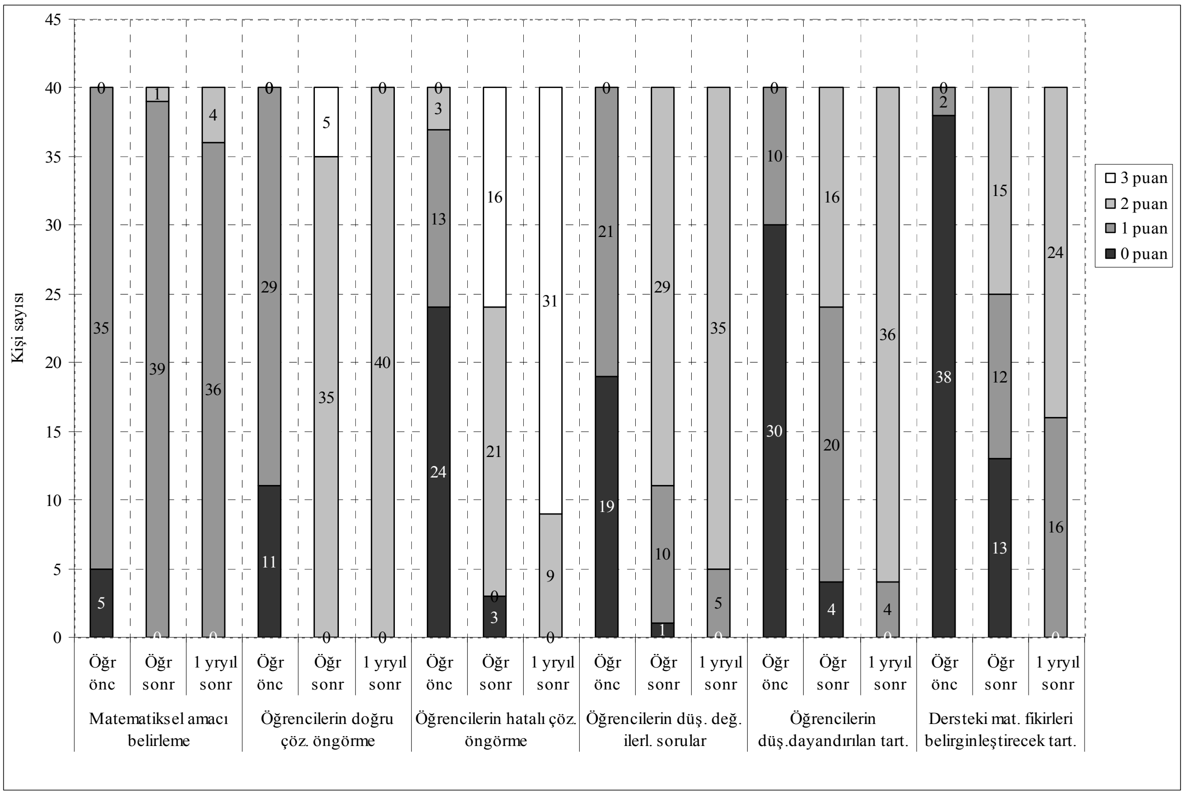
Verilerin geçerliği ve güvenirliği

Matematiksel düşünme odaklı öğretim uygulamasının öğretmen adaylarının matematik öğretimini planlama becerilerine etkisini belirlemek için öğretmen adaylarının yapmış oldukları planlar araştırmaya yön veren teorik çerçeveyle uyumlu Ders Planlama Öğeleri Rubriği ile incelenerek kodlanmıştır. Bu da verilerin anlamlı bir şekilde tanımlanmasını ve bulguların kendi içinde tutarlı olmasını sağlamıştır. Planlar analiz edilirken sadece rubrik puanı kullanılmamış ayrıca planlardan alıntılar yapılarak analizler ayrıntılandırılmıştır (iç geçerlik). Araştırmada, katılımcılar 40 kişilik bir grup olduğundan örneklemin genellemeye izin verecek ölçüde çeşitlendirilmiş olduğu ifade edilebilir. Araştırma ortam ve süreçleri ayrıntılı olarak tanımlanmış ve araştırma bulguları ile sonuçları araştırmaya yön veren teorik çerçeveye göre ayrıntılı olarak açıklanmıştır. Bu nedenle araştırma bulguları benzer ortamlarda test edilebilir (dış geçerlik) (Yıldırım ve Şimşek, 2006; Miles ve Huberman, 1994).

Güvenirlik ölçütlerinden biri olan verilerin analizinde kodlama kontrolünün yapılması ve kodlama uyuşumunun yeterli olması ölçütünü gerçekleştirmek için matematiksel düşünme odaklı öğretim uygulaması öncesinde ve sonrasında öğretmen adaylarının yapmış oldukları planlardan rasgele seçilen 10 tanesinin Ders Planlama Öğeleri Rubriği ile incelemesi ikinci araştırmacı tarafından da yapılmıştır. Kodlayıcılar arası uyuşum şu formülle (Miles ve Huberman, 1994) hesaplanmıştır: Güvenirlik=(uyuşum olan kategorilerin sayısı)/(uyuşum olan ve olmayan kategorilerin toplam sayısı). Buna göre, Güvenirlik=48/60=0,80 olarak hesaplanmıştır. İki farklı kodlayıcının uyuşumu için %70 üzerindeki değerlerin kodlayıcılar arası güvenirlik için yeterli olduğu ifade edilmiştir (Miles ve Huberman, 1994). Tüm verilerin kodlamasını gerçekleştiren araştırmacının kodlamalarının güvenirliği için, rastgele seçilen 10 öğretmen adayının planı öğretim uygulaması sonrasında yapılan planların analizinden 4 ay sonra aynı araştırmacı tarafından tekrar kodlanmış ve yukarıdaki formül ile Güvenirlik=59/60=0,98 olarak hesaplanmıştır. İç tutarlık katsayısı anlamına gelen bu oranın %90 civarında olmasının yeterli olduğu ifade edilmiştir (Miles ve Huberman, 1994).

BULGULAR

Bu bölümde matematiksel düşünme odaklı öğretim uygulaması öncesinde, sonrasında ve bir yarıyıl sonrasında “GA” problemi için öğretmen adaylarının yapmış oldukları planların Ders Planlama Öğeleri Rubriğindeki öğrencilerin hatalı çözümlerini öngörme öğesine göre verilen puanların dağılımına ve karşılaştırmalarına yer verilerek planlardan alıntılarla yorumlanmıştır.



Şekil 1. “GA” Problemi Çerçevesinde Yapılan Planların Öğelere Göre Puanları

Öğretim uygulaması öncesinde “GA” problemi için yaptıkları planlarda öğrencilerin hatalı çözümlerini öngörme öğesinde tam puan (3 puan) alan öğretmen adayı yoktur. Bu öğede 11 öğretmen adayının planı 1 puan; 3 öğretmen adayının planı 2 puan olarak kodlanmıştır (Şekil 1). Planları 1 puan olarak kodlanan öğretmen adayları “*yanlış cevaplarda ve düşüncelerde hemen dönüt verilmeli ve düzeltme yapılmalı*” (19. öğretmen adayı) örneğinde olduğu gibi öğrencilerinin yapabilecekleri hataları belirli bir şekilde ifade etmemişlerdir. Bu öğede planları 2 puan olarak kodlanan öğretmen adayları ise “*öğrenci sıfırın altında kalan bölgeyi tanımlayamaz*” (2. problem için belirtilmiştir) (17. öğretmen adayı) örneğinde olduğu gibi sadece bir hata belirtmişlerdir. Öğretim uygulaması öncesinde “GA” problemi için yapılan planlardan elde edilen bulgulara göre öğretmen adaylarının öğrencilerin hatalı çözümlerini öngörme öğesinde başarısız olduğu belirtilebilir.

Öğretim uygulaması sonrasında “GA” problemi için yapılan planlarda öğrencilerin problem üzerinde yanlış düşünebilme yolları tüm öğretmen adayları tarafından açık bir şekilde ifade edildiği için öğrencilerin hatalı çözümlerini öngörme öğesinde 1 puan alan öğretmen adayı yoktur. Bu öğede 21 öğretmen adayının planı 2 puan; 16 öğretmen adayının planı 3 puan (tam puan) almıştır (Şekil 1). Planı 2 puan olarak kodlanan öğretmen adayları her bir problem için öğrencilerinin yapabileceği birer hata öngörerek ifade etmiştir. Bu öğede planına 3 puan verilen öğretmen adayları 6 ile 9 arasında değişen sayılarda öğrenci hatası ifade etmişlerdir. Örneğin bu öğe için planı 3 puan olarak kodlanan 28. öğretmen adayı öğrencilerinin yapabilecekleri hataları, 1. problem için “*Ali’nin yarışa geç başlamasını göz ardı edebilirler. Yarışın kesişim noktasından önce bittiğini düşünebilirler. Ali’nin doğrusunun eğimini bulurken* $\frac{y}{x-3}$ *yerine* $\frac{y}{x}$ *alabilirler.*”, 2. problem için “*Doğrunun x eksenini kesmesini zarar etme* olarak *algılayabilirler. Grafikte y eksenine paralel kısmı satıcıya veya kiraya verilen para olarak düşünebilirler.*”, 3. problem için “*x eksenine paralel kısımları göz ardı edebilir.*” 4. problem için “*Ayşe ile Fatma’nın havuzda karşı kıyıya kadar gidip orada yarışı tamamladığını düşünebilirler. İlk yarıda hızlı olanın yarışı kazandığını düşünebilirler.*” şeklinde açıkça ifade etmiştir ve hataların çoğunu ifade etmek için bir çaba göstermiştir. Öğretim uygulaması sonrasında “GA” problemi için yapılan planlardan elde edilen bulgulara göre öğretmen adaylarının öğrencilerin hatalı çözümlerini öngörme öğesindeki başarılarının oldukça yüksek olduğu söylenebilir.

Öğretim uygulamasından bir yarıyıl sonra “GA” problemleri için yaptıkları planlarda öğrencilerinin hatalı çözümlerini öngörme öğesinde, öğrencilerinin problem üzerinde yanlış düşünebilme yollarını açık bir şekilde ifade ettiği için 9 öğretmen adayı 2 puan; 31 öğretmen adayı 3 puan (tam puan) almıştır (Şekil 1). 2 puan alan öğretmen adayları her bir problem için öğrencilerinin yapabileceği birer hata ifade etmişlerdir. Bu öğede 3 puan alan öğretmen adayları 6 ile 15 arasında değişen sayıda öğrencilerinin yapabileceğini öngördükleri hataları ifade etmişlerdir. Öğrencilerin hatalı çözümlerini öngörme öğesinde 3 puan verilen öğretmen adayları, 1. problem için "*grafiğin kesim noktasında Ali ile babasının yan yana geldiğini anlamayabilir. Ali yarışa geç başladığı için yarışı geç bitireceğini düşünebilir.*", 2. problem için "*Doğrunun sıfırın altında olmasının sebebinin maliyet olduğunu düşünemeyebilirler. Limon*(ata) *satmaya başlamadan limonatacının zarar ettiğini anlamayabilirler. Doğrunun x eksenini kestiği noktanın* (noktada) *kar elde etmeye başlandığını anlamayabilirler.*", 3. problem için "*bayrağın hareketini açıklayamayabilirler. Bayrağın yükselmesinin zaman içinde değişmemesini dikkate almayabilirler*" 4. problem için "*İlk 30 metreyi Ayşe daha önce bitirdiği için yarışı Ayşe'nin kazanacağını düşünebilirler.*" (24. Öğretmen adayı) örneğindeki gibi öğrencilerinin yapabilecekleri hataları açıkça ifade ederek hataların çoğunu ifade etmek için bir çaba göstermişlerdir. Öğretim uygulamasından bir yarıyıl sonra "GA" problemi için yapılan planlardan elde edilen bulgulara göre öğretmen adaylarının öğrencilerin hatalı çözümlerini öngörme öğesindeki başarılarının çok yüksek olduğu söylenebilir.

Öğretmen adaylarının öğretim uygulaması öncesinde ve sonrasında "GA" problemi çerçevesinde yaptıkları planların öğrencilerin hatalı çözümlerini öngörme öğesindeki puanlarının öğretim uygulaması öncesinden sonrasına anlamlı farklılık gösterip göstermediğine ilişkin Wilcoxon işaretli sıralar testi sonuçları Tablo 1'de verilmiştir.

Tablo 1. "GA" Planlarında Öğrencilerin Hatalı Çözümlerini Öngörme Puanlarının Wilcoxon Işaretli Sıralar Testi Sonuçları

Sontest-Öntest	n	Sıra Ortalaması	Sıra Toplamı	z	p
Negatif Sıra	0	0,00	0,00	5,34*	0,000
Pozitif Sıra	36	18,50	666,00		
Eşit	4				

* Negatif sıralar temeline dayalı

Tablo 1'de gösterilen test sonuçlarına göre araştırmaya katılan öğretmen adaylarının öğretim uygulaması öncesinde ve sonrasında yaptıkları planların öğrencilerin hatalı çözümlerini öngörme öğesinde aldıkları puanlar arasında anlamlı bir fark vardır ($z=5,34$; $p<0,05$). Fark puanların sıra toplamları dikkate alındığında, gözlenen bu fark pozitif sıralar lehindedir. Başka bir deyişle öğretim uygulamasından sonraki planların öğrencilerin hatalı çözümlerini öngörme öğesindeki puanları lehine anlamlı farklılık söz konusudur. Ayrıca öğrencilerin hatalı çözümlerini öngörme öğesinde 4 öğretmen adayının öğretim uygulaması öncesinde ve sonrasında planlarının puanları eşit iken, 36 öğretmen adayının öğretim uygulaması sonrasında öncesine göre planlarının puanları daha yüksektir (Tablo 1). Bu bulgulara dayanarak matematiksel düşünme odaklı öğretim uygulamasının öğretmen adaylarının planladıkları derste öğrencilerinin hatalı çözümlerini öngörmelerinde etkili olduğu ifade edilebilir. Öğretmen adayları öğretim uygulaması öncesinde yaptıkları planlarda öğrencilerinin problem üzerinde yanlış düşünebilme yollarını belirli bir şekilde ifade etmemişlerdir; ifade ettikleri hatalar sınırlı kalmıştır. Öğretim uygulaması sonrasındaki planlarda ise öğrencilerinin yanlış düşünebilme yolları daha ayrıntılı bir şekilde ifade edilmiştir. 36 öğretmen adayının öğretim uygulaması sonrasındaki planlarında öğrencilerin hatalı çözümlerini öngörme öğesindeki puanlarını arttırmış olmasının nedeninin, matematiksel düşünme odaklı öğretim uygulamasında, öğrencilerin yapabilecekleri hataların, düşebilecekleri kavram yanılgılarının öngörülüp planlamada dikkate alınması gerektiğinin vurgulanması ve öğrencilerin yapabilecekleri hataları, düşebilecekleri kavram yanılgılarını içeren örnek planların incelemeleri için öğretmen adaylarına sunulması olduğu söylenebilir. Hughes (2006)'in çalışmasına katılan öğretmen adayları da öğrencilerin hatalı çözümlerini öngörme öğesinde ilerleme göstermişlerdir ancak öğretim uygulaması öncesinde ve sonrasında düşük puanlar alarak en az ilerlemeyi bu öğede göstermişlerdir. Öğretmenlerin öğrencilerinin matematiksel düşünmelerine odaklanmalarını temel alan öğretim uygulamalarını ele alan başka çalışmalarda da öğretmenlerin derslerinde öğrencilerinin karşılaştıkları zorluklara, yaptıkları hatalara odaklandıkları görülmüştür (Barnett, 1998; Masingila ve Doerr, 2002; Sherin ve Han, 2004). Bunlara dayanarak bu çalışmada gerçekleştirilen matematiksel düşünme odaklı öğretim uygulamasının benzer öğretim uygulamalarında olduğu gibi öğretmen adaylarının planladıkları derste öğrencilerinin hatalı çözümlerini öngörmelerinde etkili olduğu ifade edilebilir.

Tablo 2. "GA" Planlarındaki Puanların Wilcoxon Işaretli Sıralar Testi Sonuçları

Sontest-Öntest	n	Sıra Ortalaması	Sıra Toplamı	z	p
Negatif Sıra	0	0,00	0,00	3,753*	0,000
Pozitif Sıra	16	8,50	136,00		
Eşit	24				

* Negatif sıralar temeline dayalı

Öğretim uygulaması sonrasında ve öğretim uygulamasından bir yarıyıl sonra yapılan planlarda öğrencilerin hatalı çözümlerini öngörme öğesindeki puanlar arasında anlamlı bir fark olduğu ortaya çıkmıştır ($z=3,753; p<0,05$). Fark puanlarının sıra toplamları dikkate alındığında, gözlenen fark pozitif sıralar lehindedir. Buna göre öğretmen adaylarının öğretim uygulamasından bir yarıyıl sonra yapmış oldukları planlar, öğrencilerin hatalı çözümlerini öngörme öğesinde öğretim uygulaması sonrasındaki planlardan daha fazla puan almıştır (Tablo 2). Bu bulgu çalışmaya katılan öğretmen adaylarının hatalı çözümlerini öngörme öğesindeki kalıcılık puanlarının yüksek olduğu şeklinde yorumlanabilir.

Tartışma

Bu çalışmada matematiksel düşünme odaklı öğretim uygulaması gerçekleştirilmiştir. Uygulamaya katılan öğretmen adayları matematiksel görevleri, bir matematik problemi hakkında yapılmış sınıf tartışmasını, matematik öğretimi ile ilgili örnek olayları ve bir matematik dersinin video kaydını incelemişlerdir. Ayrıca inceledikleri matematiksel görevleri, sınıf tartışmasına konu olan problemi, örnek olaylardaki problemleri, video kaydındaki problemleri çözmüşler ve öğrencilerin bu problemleri doğru ve yanlış bir şekilde çözebilme yolları hakkında tartışmışlardır.

Öğretim uygulamasına katılan öğretmen adaylarının matematiksel görevleri incelemeleri, derslerde kullanacakları görevleri sınıflandırmalarını ve görevleri dersin amacına uygun olarak seçmelerini; bir matematik problemi hakkında yapılmış sınıf tartışmasını incelemeleri, belirtilen matematiksel amaçlara yönelik olarak öğrencilere yöneltilebilecek soruları belirlemelerini ve öğretmen sorularını değerlendirmelerini sağlamıştır. Çalışmaya katılan öğretmen adayları, örnek olayları ve bir matematik dersi videosunu inceleyerek örnek olaylarla videodaki öğretmenlerin ve öğrencilerin dersteki hareketlerine odaklanmışlardır. Öğretim uygulamasında matematiksel görevleri ve problemleri çözerek bu problemler hakkında tartışan öğretmen adayları, öğrencilerin bir problemi çözmek için kullanabilecekleri stratejileri ve yaşayabilecekleri zorlukları dikkate almışlardır. Buna göre matematiksel düşünme odaklı öğretim uygulamasına katılmak öğretmen adaylarının, öğretmenlerin öğrencilerinin matematiksel düşünmelerine odaklanmasını temel alan çalışmalarda bulunan şu özellikleri geliştirmelerine olanak vermiştir: öğrencilerin bir problemi çözerken kullanabilecekleri çeşitli yolları öngörmek (Fennema vd., 1996; Barnett, 1998; Stein, 2008; Lee, 2006); öğrencilerin olası yanlış yanıtlarını veya kavram yanılgılarını öngörmek (Masingila ve Doerr, 2002; Little vd., 2003; Sherin ve Han, 2004; Hughes, 2006); öğrencilere kendi düşüncelerini anlamlandırmaları için sorular sormak (Fennema vd., 1996; Vacc ve Bright, 1999; Masingila ve Doerr, 2002; Kazemi ve Franke, 2004; Metz, 2007); öğrencilerin matematiksel düşünmelerini ilerletmek için sorular sormak (Fennema vd., 1996; Vacc ve Bright, 1999; Masingila ve Doerr, 2002; Kazemi ve Franke, 2004; Metz, 2007).

Matematiksel düşünme odaklı öğretim uygulamasına katılan öğretmen adayları kendilerinin belirledikleri matematiksel görevlere dayalı olarak işbirlikli planlar da yapmışlardır. Öğretim uygulamasının son üç haftasında yaptıkları bu planları mikro öğretim yöntemi ile sınıflarında uygulamışlardır. Bu uygulamalar, öğretmen adaylarına öğrenmiş oldukları anlayış ve planlama yöntemini kullanarak yaptıkları planların pratikte nasıl uygulandığını görme fırsatını vermiştir. Bu da matematiksel düşünme odaklı öğretim uygulamasının, öğretmen adaylarının uygulamada yer alan etkinliklere aktif olarak katılmasını gerektiren uygulama temelli bir öğretim özelliğine sahip olmasını sağlamıştır. Matematiksel düşünme odaklı öğretim uygulamasının uygulama temelli olması, uygulamanın en güçlü yönüdür. Bu nedenle matematiksel düşünme odaklı öğretim uygulaması, benzer öğretim uygulamalarında (Boston, 2006; Hughes, 2006; Metz, 2007) olduğu gibi çalışmaya katılan öğretmen adaylarının öğrencilerinin matematiksel düşünmelerini dikkate alan planlar yapma becerilerinde gelişmeye neden olmuştur. Üstelik öğretim uygulamasından bir yarıyıl sonra öğretmen adayları tarafından yapılan planlar, matematiksel düşünme odaklı öğretim uygulamasının kalıcılığının da oldukça yüksek olduğunu göstermiştir.

Sahip olduğu özellikler göz önüne alındığında matematiksel düşünme odaklı öğretim uygulaması, öğretmen adaylarına öğrencilerinin matematiksel düşünmelerini dikkate alan dersler planlamalarında yol gösterici ve öğrencilerde matematiksel düşünmenin geliştirilmesi konusunda matematik eğitimi ve öğretmen yetiştirme alanlarına önemli katkısı olan bir öğretim uygulamasıdır. Bu çalışma ortaya koymuştur ki uygulanan öğretim uygulamasına katılan öğretmen adayları, öğretmenlerin veya öğretmen adaylarının öğrencilerinin matematiksel düşünmelerine odaklanması ile ilgili çalışmalarda yer alan özelliklerden biri olan öğrencilerin hatalı çözümlerini öngörme özeliğine sahip planlar yapma konusunda başarılı olmuşlardır. Bu durum literatürde yer alan öğretmenlerin veya öğretmen adaylarının öğrencilerinin matematiksel düşünmelerine odaklanmalarını sağlamak için geliştirilmiş uygulamalardan elde edilen sonuçlarla paralellik göstermektedir (Hughes, 2006; Metz, 2007). Buna göre gerçekleştirilen öğretim uygulamasının amacına ulaştığı ifade edilebilir.

SONUÇ

Geleneksel öğretim yöntemiyle işlenen sıradan matematik dersleri, öğrencilerin sadece hesaplama, sınıflandırma ve tanımlama süreçlerinde ustalaşmalarını sağladığından öğrencilerin matematiksel düşünme becerilerini geliştirmede yetersiz kalır. Öğrencilere matematiksel akıl yürütme, iletişim kurma, tahminde bulunma, ispatlama, kavramsal düşünceleri geliştirme ve öğrendikleri yöntemler ile bu yöntemlerin neden işe yaradığını gösteren kavramlar arasında bağ kurma fırsatlarının sunulduğu dersler, öğrencilerin matematiksel düşünme becerilerinin geliştirilmesine katkıda bulunur. Bu özellikleri taşıyan derslerin planlanıp uygulanması konusunda matematik eğitimcilerine, öğretmenlere veya öğretmen adaylarına yol gösterici bir uygulama olduğu için matematiksel düşünme odaklı öğretim uygulaması öğretmen eğitimine önemli bir katkı sağlamıştır.

Matematiksel düşünme odaklı öğretim uygulamasının etkililiğinin araştırıldığı bu çalışma Türkiye'de matematik öğretimine farklı bir bakış açısı getirerek matematik eğitimi ve öğretmen yetiştirme alanında literatüre katkı sağlamıştır.

Matematiksel düşünme odaklı öğretim uygulamasında yer alan etkinlikler, vurgulanan özellikler ve incelenen örnek olaylar ile planlar, uygulamaya katılan öğretmen adaylarının, araştırmanın dayandığı teorik çerçevede ve literatürde belirtilen öğretmenlerin öğrencilerinin matematiksel düşünmelerini dikkate alan dersler planlamaları için gereken özellikleri taşıyan planlar yapmada başarılı olmalarını sağlamıştır.

Öğretmenlerin öğrencilerinin matematiksel düşünmelerini dikkate alan dersler planlamaları için gereken özellikler, öğrencilerin ders boyunca geliştireceği matematiksel kavramları anlayarak bu kavramlara yönelik olarak anlamları oluşturup bağlantıları keşfetmelerini sağlayacak amaçları belirlemek, öğrencilerin bir problemi çözerken kullanabilecekleri çeşitli yolları öngörmek; öğrencilerin olası yanlış yanıtlarını veya kavram yanılgılarını öngörmek; öğrencilere kendi düşüncelerini anlamlandırmaları için sorular sormak; öğrencilerin matematiksel düşünmelerini ilerletmek için sorular sormak şeklindedir. Buna göre matematiksel düşünme odaklı öğretim uygulamasına katılan öğretmen adaylarının öğretmen olduklarında öğrencilerinin matematiksel düşünmelerini geliştirecek dersler planlamalarında onlara yol gösterecek bir anlayış geliştirmiş oldukları sonucu çıkarılabilir.

ÖNERİLER

Öğrencilerinin matematiksel düşünmelerini geliştirmek isteyen öğretmenler veya öğretmen adayları, bilişsel gereklilik düzeyi yüksek olan problemler seçerek planlama yapmalıdırlar. Planlama yaparken öncelikle öğrencilerin ders boyunca geliştireceği matematiksel kavramları anlamalı ve öğrencilerin bu kavramlara yönelik olarak anlamları oluşturup bağlantıları keşfetmelerini sağlayacak amaçları belirlemelidirler. Bu amaçlara ulaşmak için öğrencilerin bir problemi çözerken kullanabilecekleri çeşitli yolları ve verebilecekleri olası yanlış yanıtları veya düşebilecekleri kavram yanılgılarını öngörerek planlarında ifade etmelidirler. Daha sonra öğrencilerin matematiksel düşünmelerini değerlendirip ilerletmek için soru sormayı planlamalıdırlar. Ayrıca kendi düşüncelerini anlamlandırmaları ve dersteki matematiksel fikirleri belirginleştirmeleri için öğrencilere sorular sorarak bütün sınıfın katıldığı tartışma düzenlemeyi de planlamalıdırlar.

Öğretmenlerin veya öğretmen adaylarının planladıkları öğretim etkinliklerinde öğrencilerinin matematiksel düşünme süreçlerinin gelişimine dikkat etmelerini sağlamak için bu çalışmada ele alınan matematiksel düşünme odaklı öğretim uygulamasına benzer uygulamalar yapılması gerekir. Benzer öğretim uygulamalarında öğretmenlerin veya öğretmen adaylarının öğrencilerinin matematiksel düşünmelerine odaklanmalarını sağlamak için matematiksel görevleri, matematik problemleri hakkında yapılmış sınıf tartışmalarını, matematik öğretimi ile ilgili örnek olayları ve matematik dersi uygulamalarının video kayıtlarını incelemeleri sağlanmalıdır. İncelenen matematiksel görevler ve sınıf tartışmalarındaki, örnek olaylardaki, video kayıtlarındaki problemler uygulamanın katılımcısı olan öğretmenler veya öğretmen adayları tarafından çözülmelidir. Ayrıca öğrencilerin bu problemleri doğru ve yanlış bir şekilde çözebilme yolları hakkında tartışılmalıdır.

Bu araştırmada gerçekleştirilen matematiksel düşünme odaklı öğretim daha küçük bir katılımcı grubuna (15–20 öğretmen adayı) uygulanarak ve veri toplamak için bu çalışmada kullanılan problemlerden farklı problemler kullanılarak tekrarlanabilir.

Bu araştırma başka bir öğretmen adayı grubu örneğin ilköğretim matematik öğretmenliği bölümündeki öğretmen adayları veya sınıf öğretmeni adayları ile matematiksel düşünme odaklı öğretim uygulaması gerçekleştirilerek tekrarlanabilir.

Matematiksel düşünme odaklı öğretim uygulaması görev yapan matematik öğretmenlerine hizmet içi eğitim şeklinde uygulanarak ulaşılabilecek sonuçlar araştırılabilir.

Matematiksel düşünme odaklı öğretim uygulamasına katılmış olan öğretmen adayları, gerek uygulamanın yapıldığı yarıyılda gerekse uygulamadan sonra aldıkları derslerde yüksek düzey bilişsel gerekliliklere sahip matematiksel görevler veya problemleri incelemişler ve çözmüşlerdir. Bu şekilde problem çözmüş olmaları öğretmen adaylarının matematiksel düşünmelerini geliştirmiş olabilir. Bu nedenle yapılacak benzer bir çalışmada öğretmen adaylarının matematiksel düşünme becerilerinin gelişimi de araştırılabilir.

Matematiksel düşünme odaklı öğretim uygulamasına katılan öğretmen adaylarının veya öğretmenlerin, öğrencilerinin matematiksel düşünmelerine odaklanan planlarını uyguladıkları gerçek sınıf ortamındaki öğretimleri incelenebilir. Öğretmen adaylarının veya öğretmenlerin gerçek sınıf ortamındaki öğretim uygulamalarının incelenmesi öğretimin etkililiğinin belirlenmesinde önemli bir etken olacaktır.

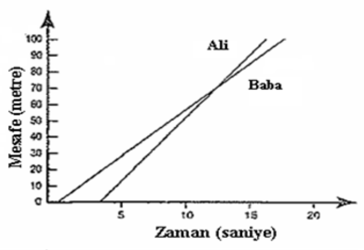
EK A. Öğretmen Adaylarının Planlama Becerilerini Belirlemek İçin Kullanılan "Grafiklerden Açıklamalara" Problemi[1]

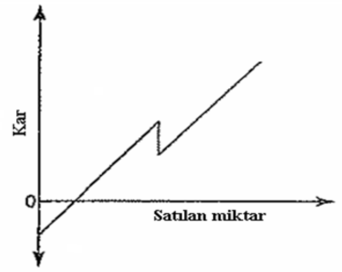
Öğrencilerinizle grafik okuma ve yorumlama konusunda çalıştığınızı düşününüz. İşleyeceğiniz derste kullanmak için Grafiklerden Açıklamalara Problemlerini seçtiniz.
Grafiklerden Açıklamalara Problemlerini temel alan bir ders planlayınız.
Lütfen planınızı mümkün olduğunca ayrıntılarıyla tanımlayınız.

Grafiklerden Açıklamalara

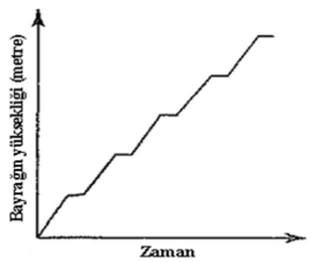
İsim: ___________________________



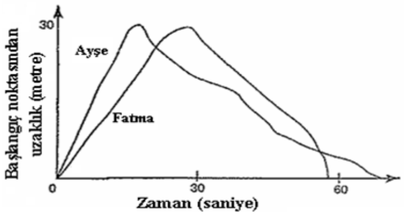
1. Ali ve babası, bir 100 metre yarışına katılmıştır. Ali, babası koşmaya başladıktan 3 saniye sonra, yarışa başladı. Grafik, Ali'nin ve babasının zaman içinde ne kadar mesafe koştuğu hakkında bilgi vermektedir. Yarışı kimin kazandığı ile ilgili bir açıklama yazınız; yarışın nasıl kazanıldığını tanımlayınız. Her birinin nasıl koştuğunu tanımlayan iki doğru paralel olsaydı, yarışı kimin kazandığı konusunda grafik size ne anlatırdı?



2. Grafik, bir limonata standında satılan limonata miktarı ve kar arasındaki ilişkiyi göstermektedir. Limonata standı karının, nasıl belirlendiği konusunda bir açıklama yazınız. Doğru sıfırın altında olduğunda ve doğru yatay ekseni kestiğinde ne gösterildiğini ifade ediniz (Bu grafik, satıcıya ücret ödenmediğini ve stant için kira ücreti verilmediğini farz etmektedir).



3. Grafik, bir göndere çekilen bir bayrağı göstermektedir. Bayrağın hareketini tanımlayan bir açıklama yazınız, gönderin yüksekliğinin (bayrağın çıktığı en yüksek nokta) hesaplaması için ne düşünüyorsunuz? Grafiğin şeklini açıklayınız.



4. Grafikler, bir yarış açıklamasını betimlemek için kullanılabilir. Burada grafik iki ortaokul öğrencisi (Ayşe ve Fatma) arasında gerçekleşen bir yüzme yarışını göstermektedir. Bu yarışta ne olduğunu tanımlayan bir açıklama yazınız.

BAYES RISK FOR SELECTION THE MEDIAN CATEGORY FROM EVEN SAMPLE SIZE

IN K-NOMIAL DISTRIBUTION

Kawther Fawzi HAMZA

University of Babylon, Iraq

Department of Mathematic, 2014

k.sultani@yahoo.com

ABSTRACT*:* Bayes risk procedure is proposed for selecting the median (middle most value) in multinomial cell when the number of observation is even .Bayesian decision –theoretic approach with linear loss function and conjunction prior Dirichlet distribution is used to construct this procedure for it we need to deriving $\underset{\pi(\underline{p}|\underline{n})}{E}[\text{þ}_{[e]}]$. Some concluding remarks and suggestions for future work are also included.

1. INTRODUCTION

During the early fifties, it was pointed out by several researchers that testing the homogeneity of population means or variances is not satis factory solution to a comparison of performance of several populations. One may wish to either rank them according to their performance or select one or more from among them for future use or future evaluation. These problems are known as ranking and selection problem.[4]

Consider a k-nomial distribution which is characterized by k events (cells) with probability vector $\underline{p} = (p_1,..p_h, p_{h+1},.., p_k)$, where p_i is the probability of the event E_i $(1 \le i \le k)$ with $\sum_{i=1}^{k} p_i = 1$. When m is even observation, the median dependent on n_h, n_{h+1} and p_h, p_{h+1} , where *h=k/2*. Let $n_1,.., n_h, n_{h+1}.., n_k$ be respective frequencies in k cells of the distribution with $\sum_{i=1}^{k} n_i = m$. Further, let $p_{[1]} \le .. \le p_{[h]}, p_{[h+1]} \le ... \le p_{[k]}$ denote the ordered values of the $p_i (1 \le i \le k)$. It is assumed that the values of p_i and of the $p_{[j]} (1 \le i, j \le k)$ is completely unknown. The goal of the experimenter is to select the median probable event, that is the event associated with $\underset{\pi(\underline{p}|\underline{n})}{E}[\text{þ}_{[e]}]$ is also called the median cell . According to this formulation we have a multinomial-decision selection problem.

Considerable efforts have been expended to the development of multinomial selection procedures using different approaches. The most popular one is the indifference zone approach (IZ)[5]. According to this approach, the selection procedure should guarantee the following probability requirements:

$$p\{CS\} \ge p^* \text{ whenever } p_{[k]} \ge \delta^* p_{[k-1]} \qquad ....(1)$$

Where $\{\delta^*, p^*\}$ with $1 < \delta^* < \infty$, $\frac{1}{k} < p^* < 1$ are specified by the experimenter prior to the start of experimentation. $P\{CS\}$ denotes the probability of a correct selection for a given certain selection rule. Using the indifference zone approach described above, the following selection procedures have been suggested in the literature. Bechhofer, et al. (1959) proposed a single-stage procedure for selecting the multinomial event associated with subset selection procedures, where the aim is to select a nonempty subset of cells which contains the best cell with a probability at least equal to a pre-assigned number p^*, are proposed by Gaupta and Nagel (1967 . Goldsman (1984) first suggested the more general use of this type of procedure to find the simulated system mostly likely to produce the "most desirable" observation on a given trial, when "most desirable" can be almost any criterion of goodness[3].

The methods described so far do not take into account any prior information before the experimentation; therefore it is worth considering Bayesian approach to the selection problem[6]. Jones and Madhi (1988) proposed some suboptimal sequential schemes for selecting the most probable event using stopping rules based on the difference between the largest and next-to-the largest posterior probabilities[7][8]. In this research we constriction approach to selection the median (middle-most value) cell from multinomial distribution where an even observation and used Bayesian procedure with prior Dirichlet distribution.

2 – REVIEW OF THE MEDIAN

2-1 History[9]

The idea of the median originated in Edward Wright's book on navigation in 1599 in a section concerning the determination of location with a compass. In 1757, Roger Boscovich developed a regression method based on the L1 norm and therefore implicitly on the median. The distribution of both the sample mean and the sample median were determined by Laplace in the early 1800s. Antoine Cournot in 1843 was the first to use the term median for the value that divides a probability distribution into two equal halves. Gustav Theodor Fechner used the median in sociological and psychological phenomena. Gustav Fechner popularized the median into the formal analysis of data, although it had been used previously by Laplace. Francis Galton used the English term median in 1881, having earlier used the terms middle-most value in 1869 and the medium in 1880.

2-2 Measure of Location[1]

The median is one of a number of ways of summarizing the typical values associated with members of a statistical population; thus, it is a possible location parameter.

In statistics and probability theory, the median is the numerical value separating the higher half of a data sample, a population, or probability distribution, from the lower half. The median of a finite list of numbers can be found by arranging all the observations from lowest value to highest value and picking the middle one. If there is an even number of observations, then there is no single middle value ; the median is then usually defined to be the mean of the two middle values, which corresponds to interpreting the median as the fully trimmed mid-range. The median is of central importance in robust statistics, as it is the most resistant statistic, having a breakdown point 50% : so long as no more than half the data is contaminated , the median will not give an arbitrarily large result. A median is only defined on ordered one-dimensional data, and is independent of any number of dimensions.

2-3 Some Related Concepts with Median and Applications[8]

The median is used primarily for skewed distributions, which it summarizes differently than the arithmetic mean , and it might be seen as a better indication of central tendency (less susceptible to the exceptionally large value in data) than the arithmetic mean .Calculation of medians is a popular technique in summary statistics and summarizing statistical data, since it is simple to understand and easy to calculate, while also giving a measure that is more robust in the presence of outlier values than is the mean.

Pseudo-median:*-For univariate distributions that are symmetric about one median, the Hodges–Lehmann estimator is a robust and highly efficient estimator of the population median; for non-symmetric distributions, the Hodges–Lehmann estimator is a robust and highly efficient estimator of the population pseudo-median, which is the median of a symmetrized distribution and which is close to the population median*

Median filter:- *In signal processing, it is often desirable to be able to perform some kind of noise reduction on an image or signal. The median filter is a nonlinear digital filtering technique, often used to remove noise.*

Cluster analysis :-*In cluster analysis, the k-medians clustering algorithm provides a way of defining clusters, in which the criterion of maximizing the distance between cluster-means that is used in k-means clustering, is replaced by maximizing the distance between cluster-medians.*

Median-Median Line:-This is a method of robust regression. The idea dates back to Wald in 1940 who suggested dividing a set of bivariate data into two halves depending on the value of the independent parameter x: a left half with values less than the median and a right half with values greater than the median.

Median graph:- *In mathematics, and more specifically graph theory, a median graph is an undirected graph in which ever y three vertices a,*

The median of three vertices in a

b, and c have a unique median: a vertex m(a,b,c) that belongs to shortest paths between each pair of a, b, and c.

Some applications are as follows.

- *the highest flood waters (useful when planning for future emergencies).*
- *In non-parametric statistics, the Theil–Sen estimator, also known as Sen's slope estimator, slope selection, the single median method is a method for robust linear regression that chooses the median slope among all lines through pairs of two-dimensional sample points.*
- *the lowest winter temperature recorded in the last 50 years.*
- *the median price of houses sold in last month.*
- *A medical research team conducts a clinical study comparing the success rates of five different drug regiments for a particular disease.*
- *A median of a triangle is a line segment that joins the vertex of a triangle to the midpoint of the opposite side.*
- *The geometric median of a discrete set of sample points in a Euclidean space is the point minimizing the sum of distances to the sample points.*
- *In object prototype learning and similar tasks, median computation is an important technique for capturing the essential information of a given set of patterns. We extend the median concept to the domain of graphs.*

2.4 Medians of Probability Distributions

For any probability distribution on the real line **R** with cumulative distribution function *F*, regardless of whether it is any kind of continuous probability distribution, in particular an absolutely continuous distribution (which has a probability density function), or a discrete probability distribution, a median is by definition any real number *m* that satisfies the inequalities

$$\mathrm{P}(X \le m) \ge \frac{1}{2} \text{ and } \mathrm{P}(X \ge m) \ge \frac{1}{2}$$

Or, equivalently, the inequalities

$$\int_{(-\infty,m]} dF(x) \ge \frac{1}{2} \text{ and } \int_{[m,\infty)} dF(x) \ge \frac{1}{2}$$

in which a Lebesgue–Stieltjes integral is used. For an absolutely continuous probability distribution with probability density function *f*, the median satisfies

$$\mathrm{P}(X \le m) = \mathrm{P}(X \ge m) = \int_{-\infty}^{m} f(x)\,dx = \frac{1}{2}.$$

Any probability distribution on **R** has at least one median, but there may be more than one median. Where exactly one median exists, statisticians speak of "the median" correctly; even when the median is not unique, some statisticians speak of "the median" informally.

3. Bayesian Procedure for Selecting the Median Multinomial Category (Cell)

3.1 Bayesian Decision- Theoretic Formulation

Before we introduce the Bayesian procedures, we introduce some standards definitions and notations which are needed to construct the procedures. Let $\Omega_k : \{\underline{p} = (p_1,..,p_h,p_{h+1},...,p_k) : \sum_{i=1}^{k} p_i = 1\ ; p_i \ge 0\}$ be the parameter space and $D = \{d_1,..,d_h,d_{h+1},...,d_k\}$ be the decision space where in the following terminal *k*-decision rule:

$d_i : p_i$ is the median cell probability $(i = 1,..,h.h+1,...,k)$ .That is, d_i denote the decision to select the event associated with the i^{th} cell as the median probable event, after the sampling is terminated.

Let $p_{[1]} \le ... \le p_{[h]} \le p_{[h+1]} \le ... \le p_{[k]}$ denote the ordered values of the , $p_i(1 \le i \le k)$ the goal of the experimenter is to select the median cell probability, that is the cell associated with $p_{[e]}$.

Suppose the loss function in making decisions d_i , defined on $\Omega_k \times D$, is given as follows.

$$L(d_i, \underline{p}^*) = \begin{Bmatrix} k^*(p_{[e]} - p_i) & \text{if } (p_{[e]} \ne p_i) \\ 0 & \text{if } (p_{[e]} = p_i) \end{Bmatrix} \qquad .... (2)$$

That is the loss if decision d_i is made when the true value of $\underline{p} = \underline{p}^*$. Where $p_{[e]}$ is the middle most value or equal to $p_{[h]} + p_{[h+1]} \big/ 2$ and k^* is the loss constant, giving losses in terms of cost.

The Bayesian approach requires that we specify a prior probability density function $\pi(\underline{p})$, expressing our beliefs about $\underline{p}$ before we obtain the data. From a mathematical point of view, it would be convenient if $\underline{p}$ is assigned a prior distribution which is a member of a family of distributions closed under multinomial sampling or as a member of the conjugate family. The conjugate family in this case is the family of Dirichlet distribution. Accordingly, let $\underline{p}$ is assigned Dirichlet prior distribution with parameters $m', n'_1, n'_h, n'_{h+1} ..., n'_k$. The normalized density function is given by

$$\pi(\underline{p}) = \frac{\Gamma\left(\sum_{i=1}^{k} n'_i\right)}{\prod_{i=1}^{k} \Gamma(n'_i)} \prod_{i=1}^{k} p_i^{n'_i - 1} \text{, where } m' = \sum_{i=1}^{k} n'_i \qquad ..... (3)$$

And the marginal distribution for p_i is Beta density

$$f(p_i) = \frac{(m'-1)!}{(n'_i - 1)!(m' - n'_i - 1)!} p_i^{n'_i - 1} (1 - p_i)^{m' - n'_i - 1}$$

Here $\underline{n'} = (n'_1,.., n'_h, n'_{h+1},.., n'_k)$, are regarded as hyperparameters specifying the prior distribution. They can be thought of “imaginary counts” from prior experience. If N_i be the number of times that category *i* is chosen in *m* independent trials, then

$\underline{N} = (N_1,..., N_k)$ has a multinomial distribution with probability mass function

$$P_r(N_1 = n_1,.., N_h = n_h, N_{h+1} = n_{h+1},.., N_k = n_k \mid p_1,..., p_k) = P(\underline{n} \mid \underline{p})$$

$$= \frac{m!}{n_1!..n_h! n_{h+1}!..n_k!} \prod_{i=1}^{k} p_i^{n_i} \text{, where } \sum_{i=1}^{k} n_i = m \text{, } \underline{n} = (n_1,.., n_h, n_{h+1}., n_k) .$$

Since

$$P(\underline{n} \mid \underline{p}) \propto p_1^{n_1} ... p_1^{n_h} p_1^{n_{h+1}} .. \ p_k^{n_k} \text{ and } \quad \pi(\underline{p}) \propto \ p_1^{n'_1 - 1} .. p_h^{n'_h - 1} p_{h+1}^{n'_{h+1} - 1} .. \ p_k^{n'_k - 1},$$

then the posterior is $\pi(\underline{p} \mid \underline{n}) \propto \ p_1^{n_1 + n'_1 - 1} ... p_1^{n_h + n'_h - 1} p_1^{n_{h+1} + n'_{h+1} - 1} ... \ p_k^{n_k + n'_k - 1}$

This is a member of the Dirichlet family with parameters

$$n_i'' = n_i' + n_i \quad \text{and} \quad m'' = m' + m \quad (i=1, \ldots, k).$$

Hence, the posterior distribution has density function

$$\pi(\underline{p} \mid \underline{n}) = \frac{(m''-1)!}{(n_1''-1)!..(n_h''-1)!(n_{h+1}''-1)!...(n_k''-1)!} p_1^{n_1''-1} ... p_h^{n_h''-1} p_{h+1}^{n_{h+1}''-1} ... p_k^{n_k''-1}$$

with posterior mean $\hat{p}_i = \dfrac{n_i''}{m''}$ (i= 1, 2, …, k), n_i'' will be termed the posterior frequency in the i^{th} cell. The marginal posterior distribution for p_i is the beta distribution with probability density function

$$f(p_i \mid n_i'') = \frac{\Gamma(m'')}{\Gamma(n_i'')\Gamma(m''-n_i'')} p_i^{n_i''-1}(1-p_i)^{m''-n_i''-1} .$$

Where Γ is gamma function.

3.2 The Stopping Risks

In this section, we derive the stopping risks (Bayes risk) of making decision d_i for linear loss function. The stopping risk (the posterior expected loss) of the terminal decision d_i when the posterior distribution for $\underline{p}$ has parameters $(n_1'',..,n_h'',n_{h+1}''...,n_k'';m'')$, that is when the sample path has reached $(n_1'',..,n_h'',n_{h+1}''...,n_k'';m'')$ from the origin $(n_1',..n_h',n_{h+1}',.,n_k';m')$, denoted by $S_h(n_1'',..,n_h'',n_{h+1}''...,n_k'';m'')$ can be found as follows.

$$S_i(n_1'',..n_h'',n_{h+1}'',..,n_k'';m'') = \underset{\pi(\underline{p}|\underline{n})}{E}[L(d_i,\underline{p}^*)]$$

$$= k^*\left[\underset{\pi(\underline{p}|\underline{n})}{E}(\text{Þ}_{[e]}) - \frac{n_i''}{m''}\right] \qquad \ldots\ldots (4)$$

Since the number of observation is even, the value of $\underset{\pi(\underline{p}|\underline{n})}{E}[\text{Þ}_{[e]}]$ is equal to $\underset{\pi(\underline{p}|\underline{n})}{E}[f(\text{Þ}_{[h]},\text{Þ}_{[h+1]})]$ and is derived as follows.

$$\underset{\pi(\underline{p}|\underline{n})}{E}[f(\text{Þ}_{[h]},\text{Þ}_{[h+1]})] = \int_0^1\int_0^1 f(\text{p}_{[h]},\text{p}_{[h+1]}).g(\text{p}_{[h]},p_{[h+1]})dp_{[h]}dp_{[h+1]} ,$$

Where $g(\text{p}_{[h]},p_{[h+1]})$ be the joint probability density function of the median order statistics $p_{[h]}$, $p_{[h+1]}$.

$$g(\text{p}_{[h]},p_{[h+1]}) = \frac{k!}{(h-1)!(k-h-1)!}\left[F(p_{[h]})\right]^{h-1}\left[1-F(p_{[h+1]})\right]^{k-h-1} f(p_{[h]})f(p_{[h+1]})$$

and

$f(\text{p}_{[h]},\text{p}_{[h+1]}) = \dfrac{p_{[h]}+p_{[h+1]}}{2}$. Let the ordered values of $n_1'',..,n_h'',n_{h+1}'',..,n_k''$ is $n_{[1]}'' \leq,.. \leq n_{[h]}'', \leq n_{[h+1]}'' \leq,..,\leq n_{[k]}''$. The marginal posterior probability density function of $p_{[h]}$ & $p_{[h+1]}$ are respectively

$$f(p_{[h]}) = \frac{(m''-1)!}{(n_{[h]}''-1)!(m''-n_{[h]}''-1)!} p_{[h]}^{n_{[h]}''-1}(1-p_{[h]})^{m''-n_{[h]}''-1} ,$$

$$f(p_{[h+1]})=\frac{(m''-1)!}{(n''_{[h+1]}-1)!(m''-n''_{[h+1]}-1)!}\,p_{[h+1]}^{n''_{[h+1]}-1}(1-p_{[h+1]})^{m''-n''_{[h+1]}-1}\;.$$

and the cumulative density function of $p_{[h]}$ & $p_{[h+1]}$ are respectively

$$F(p_{[h]})=\sum_{j=n''_{[h]}}^{m''-1}\frac{(m''-1)!}{j!(m''-1-j)!}.p_{[h]}{}^{j}(1-p_{[h]})^{m''-1-j}$$

$$F(p_{[h+1]})=\sum_{L=n''_{[h+1]}}^{m''-1}\frac{(m''-1)!}{L!(m''-1-L)!}.p_{[h+1]}{}^{L}(1-p_{[h+1]})^{m''-1-L}$$

Then,

$$g(\mathrm{p}_{[h]},p_{[h+1]})=\frac{k!}{(h-1)!(k-h-1)!}\left[\sum_{j=n''_{[h]}}^{m''-1}\frac{(m''-1)!}{j!(m''-1-j)!}.p_{[h]}{}^{j}(1-p_{[h]})^{m''-1-j}\right]^{h-1}\Bigg[1-\Bigg\langle\sum_{l=n''_{[h+1]}}^{m''-1}\frac{(m''-1)!}{l!(m''-1-l)!}$$
$$p_{[h+1]}{}^{l}(1-p_{[h+1]})^{m''-1-l}\Bigg\rangle\Bigg]^{k-h-1}\left\langle\frac{(m''-1)!}{(n''_{[h]}-1)!(m''-n''_{[h]}-1)!}\,p_{[h]}^{n''_{[h]}-1}(1-p_{[h]})^{m''-n''_{[h]}-1}\right\rangle$$
$$\left\langle\frac{(m''-1)!}{(n''_{[h+1]}-1)!(m''-n''_{[h+1]}-1)!}\,p_{[h+1]}^{n''_{[h+1]}-1}(1-p_{[h+1]})^{m''-n''_{[h+1]}-1}\right\rangle. \quad . \qquad ....(5)$$

$$\underset{\pi(\underline{p}|\underline{n})}{E}[f(\mathrm{p}_{[h]},\mathrm{p}_{[h+1]})]=\int_0^1\!\!\int_0^1\left\{\left(\frac{p_{[h]}+p_{[h+1]}}{2}\right)\left(\frac{k!}{(h-1)!(k-h-1)!}\right)\left[\sum_{j=n''_{[h]}}^{m''-1}\frac{(m''-1)!}{j!(m''-1-j)!}.p_{[h]}{}^{j}(1-p_{[h]})^{m''-1-j}\right]^{h-1}\right.$$
$$\left[1-\left\langle\sum_{l=n''_{[h+1]}}^{m''-1}\frac{(m''-1)!}{l!(m''-1-l)!}.p_{[h+1]}{}^{l}(1-p_{[h+1]})^{m''-1-l}\right\rangle\right]^{k-h-1}\left\langle\frac{(m''-1)!}{(n''_{[h]}-1)!(m''-n''_{[h]}-1)!}\,p_{[h]}^{n''_{[h]}-1}(1-p_{[h]})^{m''-n''_{[h]}-1}\right\rangle$$

Hence,

$$\left.\left\langle\frac{(m''-1)!}{(n''_{[h+1]}-1)!(m''-n''_{[h+1]}-1)!}\,p_{[h+1]}^{n''_{[h+1]}-1}(1-p_{[h+1]})^{m''-n''_{[h+1]}-1}\right\rangle\right\}dp_{[h]}dp_{[h+1]}$$

$$=\int_0^1\!\!\int_0^1\left\{\left(\frac{k!}{2(h-1)!(k-h-1)!}\right)(p_{[h]}+p_{[h+1]})\left\langle\frac{(m''-1)!}{(n''_{[h]}-1)!(m''-n''_{[h]}-1)!}\,p_{[h]}^{n''_{[h]}-1}(1-p_{[h]})^{m''-n''_{[h]}-1}\right\rangle\right.$$
$$\left\langle\frac{(m''-1)!}{(n''_{[h+1]}-1)!(m''-n''_{[h+1]}-1)!}\,p_{[h+1]}^{n''_{[h+1]}-1}(1-p_{[h+1]})^{m''-n''_{[h+1]}-1}\right\rangle\left[\sum_{j=n''_{[h]}}^{m''-1}\frac{(m''-1)!}{j!(m''-1-j)!}.p_{[h]}{}^{j}(1-p_{[h]})^{m''-1-j}\right]^{h-1}$$
$$\left.\left[1-\left\langle\sum_{l=n''_{[h+1]}}^{m''-1}\frac{(m''-1)!}{l!(m''-1-l)!}.p_{[h+1]}{}^{l}(1-p_{[h+1]})^{m''-1-l}\right\rangle\right]^{k-h-1}\right\}dp_{[h]}dp_{[h+1]}$$

$$=\int_0^1\int_0^1\left(\frac{(m''-1)!}{(n''_{[h]}-1)!(m''-n''_{[h]}-1)!}\right)\left(\frac{(m''-1)!}{(n''_{[h+1]}-1)!(m''-n''_{[h+1]}-1)!}\right)\left(\frac{k!}{2(h-1)!(k-h-1)!}\right)$$

$$\left\{\left[\sum_{j=n''_{[h]}}^{m''-1}\frac{(m''-1)!}{j!(m''-1-j)!}.p_{[h]}{}^{j}(1-p_{[h]})^{m''-1-j}\right]^{h-1}\left[1-\left\langle\sum_{l=n''_{[h+1]}}^{m''-1}\frac{(m''-1)!}{l!(m''-1-l)!}.p_{[h+1]}{}^{l}(1-p_{[h+1]})^{m''-1-l}\right\rangle\right]^{k-h-1}\right\}$$

$$\left(p_{[h]}+p_{[h+1]}\right)\left\langle p_{[h]}^{n''_{[h]}-1}(1-p_{[h]})^{m''-n''_{[h]}-1}\right\rangle\left\langle p_{[h+1]}^{n''_{[h+1]}-1}(1-p_{[h+1]})^{m''-n''_{[h+1]}-1}\right\rangle dp_{[h]}dp_{[h+1]}$$

$$=\left(\frac{(m''-1)!}{(n''_{[h]}-1)!(m''-n''_{[h]}-1)!}\right)\left(\frac{(m''-1)!}{(n''_{[h+1]}-1)!(m''-n''_{[h+1]}-1)!}\right)\left(\frac{k!}{2(h-1)!(k-h-1)!}\right)$$

$$\left\{\int_0^1\int_0^1\left[\sum_{j=n''_{[h]}}^{m''-1}\frac{(m''-1)!}{j!(m''-1-j)!}.p_{[h]}{}^{j}(1-p_{[h]})^{m''-1-j}\right]^{h-1}\left[1-\left\langle\sum_{l=n''_{[h+1]}}^{m''-1}\frac{(m''-1)!}{l!(m''-1-l)!}.p_{[h+1]}{}^{l}(1-p_{[h+1]})^{m''-1-l}\right\rangle\right]^{k-h-1}\right.$$

$$\left.\left\langle p_{[h]}^{n''_{[h]}}-p_{[h]}{}^{m''-1}\right\rangle\left\langle p_{[h+1]}^{n''_{[h+1]}-1}-p_{[h+1]})^{m''-2}\right\rangle dp_{[h]}dp_{[h+1]}\right\}+\left\{\int_0^1\int_0^1\left[\sum_{j=n''_{[h]}}^{m''-1}\frac{(m''-1)!}{j!(m''-1-j)!}.p_{[h]}{}^{j}(1-p_{[h]})^{m''-1-j}\right]^{h-1}\right.$$

$$\left.\left[1-\left\langle\sum_{l=n''_{[h+1]}}^{m''-1}\frac{(m''-1)!}{l!(m''-1-l)!}.p_{[h+1]}{}^{l}(1-p_{[h+1]})^{m''-1-l}\right\rangle\right]^{k-h-1}\left\langle p_{[h]}^{n''_{[h]-1}}-p_{[h]}{}^{m''-2}\right\rangle\left\langle p_{[h+1]}^{n''_{[+1h]}}-p_{[h+1]})^{m''-1}\right\rangle\right\}dp_{[h]}dp_{[h+1]}$$

Then,

$$\underset{\pi(\underline{p}|\underline{n})}{E}[f(\mathrm{p}_{[h]},\mathrm{p}_{[h+1]})]=\left(\frac{(m''-1)!}{(n''_{[h]}-1)!(m''-n''_{[h]}-1)!}\right)\left(\frac{(m''-1)!}{(n''_{[h+1]}-1)!(m''-n''_{[h+1]}-1)!}\right)\left(\frac{k!}{2(h-1)!(k-h-1)!}\right)$$

4. Conclusion and Directions for Future Work

4.1 Conclusions

The median is the one of a number of ways of summarizing the typical values associated with members of a statistical population; thus, it is a possible location parameter. Ranking and selection procedures provides excellent tools for selecting the middle most event when an even of observation of k competing alternatives. In this paper we attempt to apply Bayesian statistical decision theory which leads to a quite different approach to the selection problem as the concepts of loss of taking a certain decision when particular values of the parameters of interest are true, the cost of sampling and some prior information about the parameters of the underlying distributions are involved.

4.2 Directions for Future Work

Some directions for future work are given as follows:

1- Group sequential sampling can be tried where observations are taken in groups to build Bayesian sequential scheme for the selection problem.

2- The problem of selecting the any two order statistic $p_{[i]}, p_{[j]}$ probable cells can be attempted.

3- To simplify the formula (7) we can used stirling's approximation for large factorials .

4- An upper bound for risks may be found using functional analysis.

5- General loss functions may be tried, where linear loss is considered as a special case.

6- In some problems the experimenter might be interested in selecting a subset of the cells including the median cell. In this problem a correct selection is the selection of any subset including the cell with i^{th} median probability. Bayesian approach can be used to solve such as a problem.

7- we can used other measure location eg: range , mid–range,…etc.

THE IMPACT OF SOCİOCULTURAL DİALECTİCAL METHOD ON STUDENTS' BEHAVİORAL, COGNİTİVE AND EMOTİONAL ENGAGEMENT

Pinar GÖKSU

Yilmaz SAGLAM

This study aimed to determine the impact of sociocultural dialectical method (SCD) on students' behavioral, cognitive and emotional engagement. The study adopted an AB quasi-experimental model in gathering and analyzing data. The sample involved three teachers' classroom practices. The study has two main stages. In the first stage, the teachers' classroom practices were video recorded. In the second phase, the teachers were asked to use sociocultural dialectic method in their practices and those practices were also video-recorded. The practices were then analyzed according to the table, which demonstrated operational definitions for codes. The teachers' classroom practices were examined separately and each of which became a sample for analysis. The results indicated that SCD had a positive impact on students' behavioral, cognitive and emotional engagement and, compared with teachers' way of instructions, SCD caused an increase in the number of students engaged.

Keywords: Sociocultural Dialectical Method, Motivation, Behavioral Engagement, Cognitive engagement, Emotional Engagement.

EXPECTATIONS TOWARDS ADEQUACIES OF NEW IT GRADUATES BASED ON SECTOR AND EXPERIENCE OF THE EMPLOYERS

ABSTRACT: This study analyzes the employer's expectations for new IT graduates in terms of employer's sector and experience level differences. A survey has been conducted among senior professionals and managers working in the IT sector for this purpose. For the analysis, multivariate regression technique has been used. The results indicate significant differences in the adequacies of new IT graduates working in public and private sectors in terms of adapting to new methods and techniques, software development background, software development processes, ethical responsibilities and competency in communication. The experience levels also show significant difference in terms of developing solutions to problems, software development background, using time effectively, ethical responsibilities and competency in communication.

Key words: Employer expectations, multivariate regression analysis, adequacies of graduates

INTRODUCTION

The qualifications of new IT graduates do not always conform with the expectations of employers in the computer industry. Employers look for the knowledge, competence, demeanor, and commercial awareness of new graduates to contribute to the organizations' objectives right after they start their employment (Mason et al., 2009).

Various studies have been conducted on the expected skills of the new IT graduates on different levels (Dravid et al., 2011; Fernandez-Sanz, 2009) analyzing the level of technical, personal and global skills of the engineering graduates. Yet, there have been only a few studies dealing with the Turkish IT graduates in the area of employability (Turhan &Akman, 2012).

In Turkey, only around 30,000-35,000 computer engineers have graduated so far, and from 143 IT-related departments, around 4000 graduates join them every year (Sarıfakioglu, 2012). According to TÜBİSAD's "Information and Communication Technology Sector Market Data Project" report for the year 2012, the Turkish IT sector is worth 78,24 billion TL with a growth of 18% from 2011, and 153,849 people are working as IT specialists in the sector (Tübisad, 2013). According to the report, by the year 2023, marking the 100th year of the republic, 400,000 more IT specialists are expected to join the force. Therefore, a large number of new IT specialists are expected in the sector every year, which implies that the qualifications they need to possess according to the IT employers become an imperative issue.

In this research, a survey has been conducted to investigate employers' expectations for new graduates in the computer industry in terms of the private and public sector differences and experience level of the employers. Different competencies of new graduates such as adapting to the new methods and technologies, software development background, communication competencies, time management skills, etc. have been analyzed in detail, and differences based on the employer's experience level and sector have been examined.

The remainder of the paper is arranged as follows. The next section introduces the research model, followed by the research design. Then, the descriptive and test results are presented which is followed by the conclusion.

RESEARCH MODEL

The literature provides studies about graduates adequacies from different perspectives. For example in their study, Rao et al. (2008) examined different approaches for estimating the cost of adequacy. In an earlier study, Steinpreis, et al., (1999) investigated the impact of gender and experience on adequacies and reported significant impact for both factors. Kapoor and Chan (2005) stated that it is important to examine the adequacy of university undergraduate programs in preparing students to become professionals with high standards. They also pointed that an inadequate education will eventually reappear in the form of low-quality services offered by professionals. Therefore, adequacy has been included as the independent factor in this study (Figure 1).

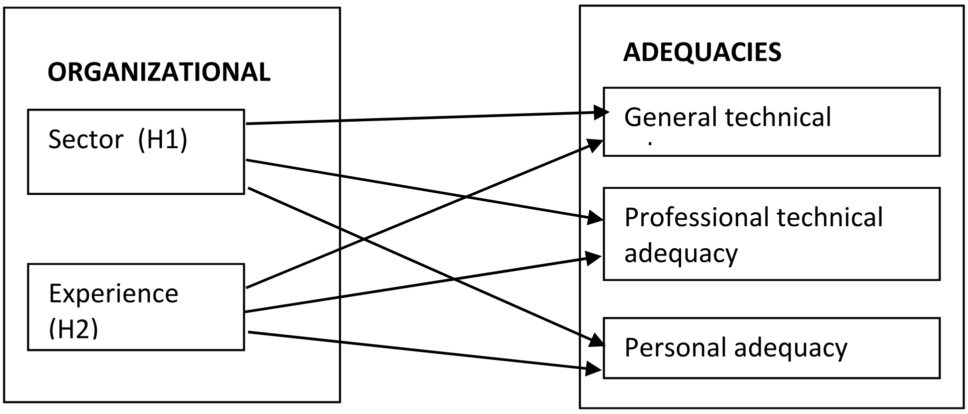

Figure 1. Research Model

The adequacies were grouped in three categories as general technical adequacies (adequacy in adapting to new methods and techniques, adequacy in developing solutions to problems); professional technical adequacies (adequacy in software development background, adequacy in software development processes); personal adequacies (adequacy in using time effectively, adequacy in ethical responsibilities, adequacy in communication). The present study performs a systematic approach to investigate the role of respondents' sector and experiences regarding their expectations in terms of mentioned adequacies of new IT graduates (Figure 1).

Various studies report the importance of organizational characteristics. For example, Jin et al. (2007) pointed that respondents' work place has significant effect in their attitude towards using IT. Additionally, Bonson and Escober (2006), and Gupta et al. (2004) have been supporters of existence of significant diversity in IT applications between public and private sector organizations. However, the existing literature does not appear to pay attention to the impact of organizational diversity in terms of organizations' expectations from new IT graduates. Therefore, the following hypotheses of the present study were constructed to compare the differences between public -and- private sector establishments in terms of expectations from new IT graduates.

Hyp.	Definition
$H1_{1i}$ (i=1, 2)	Expectations on general technical adequacy i (i=1, 2) is changing depending on the sector of organization.
$H1_{2i}$ (i=1, 2)	Expectations on professional technical adequacy i (i=1, 2) is changing depending on the sector of organization.
$H1_{3i}$ (i=1, 2, 3)	Expectations on personal adequacy i (i=1, 2, 3) is changing depending on the sector of organization.

The experience has always been one of the factors included in many of the studies regarding human behavior. Experience can be measured in several ways, including work experience and computer usage (Shore et al., 2001). Stuart (1990) used experience as years of management in business and reported its significance in relation to performance. Additionally, according to Rice (2010), employees' years of experience should be recognized as a relevant factor in human resource policies. Experience, gained over time, enhances the knowledge, skills, and productivity of workers (Rice, 2010). Therefore, present study proposes experience to be included as an independent variable and the following hypotheses are postulated.

Hyp.	Definition
$H2_{1i}$ (i=1, 2)	Expectations on general technical adequacy i (i=1, 2) is changing depending on the experience.
$H2_{2i}$ (i=1, 2)	Expectations on professional technical adequacy i (i=1, 2) is changing depending on the experience.
$H2_{3i}$ (i=1, 2, 3)	Expectations on personal adequacy i (i=1, 2, 3) is changing depending on the experience.

RESEARCH DESIGN

A survey questionnaire was developed for testing the hypotheses. Initially, a pilot version of this questionnaire was prepared and a group of IT professionals was interviewed to finalize this questionnaire. The questionnaire contains nine items, and each item reflects a discrete variable (Table 1). The variables “sector” and “experience” are the dependent variables, whereas the others constitute independent ones.

Table 1. Summary of Research Instument

Quest	Variable	Definition
1	sector	Which sector do you work at? (public, private)
2	experience	What is your management (division/project) experience level? (1-5; 6-10; 11-15; 16-20; >20)
3	$GT\_adequacy_1$	What is the level of new graduates’ adequacies in terms of adapting to new methods and techniques in your organization?
4	$GT\_adequacy_2$	What is the level of new graduates’ adequacies in terms of developing solutions to problems in your organization?
5	$PT\_adequacy_1$	What is the level of the new graduates’ adequacies in terms of software development background in your organization?
6	$PT\_adequacy_2$	What is the level of new graduates’ adequacies in terms of software development processes in your organization?
7	$Per\_adequacy_1$	What is the level of new graduates’ adequacies in terms of using time effectively in your organization?
8	$Per\_adequacy_2$	What is the level of new graduates’ adequacies in terms of ethical responsibilities?
9	$Per\_adequacy_3$	What is the level of new graduates’ adequacies in terms of competency in communication?

The respondents were either senior IT professionals or IT/Project managers from both major government and private sector establishments. The participant organizations were selected using “judgement sampling”. A total of 72 completed survey questionnaires were received. A 5-point Likert Scale was used for questions 3-9. Multivariate regression analysis technique was utilized to represent the relationships between the dependent and independent variables.

RESULTS

The results of the present survey are presented in the following sequence. Initially, the results of the survey are presented using descriptive analysis. This is followed by the results of regression analysis for each independent adequacy factor.

Descriptive Results

Most of the respondents are from private sector establishments in this research (68%) and observed to be manager (83%) (Table 2) . The percentage of IT graduate respondents is slightly higher than graduates of other fields (59%). This is not surprising since since this was the intention during the sampling procedure and this also meets the sample requirements in this survey. Of the IT graduates, 79% are working in public sector establishments. This percentage for graduates of other branches is lower (59%). This means that most of the new IT graduates prefer working in private sector organizations since the salary standards are higher in private sector. It is interesting to note that, none of the organizations are fully happy with the qualification of new IT graduates since none of the managers in the survey reported his/her organization’s full satisfaction in terms of adequacies. This may be an indication of the fact that IT departments do not consider industry demands in their curriculum designs. However, most of the managers (65%) reported their expectations regarding adequacies were met on average by new IT graduates. This may be an evidence of the fact that the curriculums are almost the same in most of the IT departments in different universities.

Table 2. Descriptive Results

Variable	**Respondents**

Table 3. Test Results

Dependent	Independent variable	Hyp.	coeff.	p-val
Sector				
	$GT\_adequacy_1$	$H1_1$	-0.251	0.042*
	$GT\_adequacy_2$	$H1_2$	-0.108	0.385
	$PT\_adequacy_1$	$H1_3$	- 0.588	0.000*
	$PT\_adequacy_2$	$H1_4$	0.216	0.046*
	$Per\_adequacy_1$	$H1_5$	- 0.051	0.700
	$Per\_adequacy_2$	$H1_6$	0.222	0.042*
	$Per\_adequacy_3$	$H1_7$	- 0.339	0.016*
Experience				
	$GT\_adequacy_1$	$H2_1$	0.371	0.172
	$GT\_adequacy_2$	$H2_2$	0.577	0.035*
	$PT\_adequacy_1$	$H2_3$	-0.449	0.054*
	$PT\_adequacy_2$	$H2_4$	0.307	0.182
	$Per\_adequacy_1$	$H2_5$	-0.503	0.070**
	$Per\_adequacy_2$	$H2_6$	0.380	0.067**
	$Per\_adequacy_3$	$H2_7$	0.569	0.039*

*significant at 5% significance level; **significant at 10% significance level.

Test results

The results of regression tests for the hypotheses are given in Table 3. The inspection of p-values in Table 3 indicated that there is sufficient evidence to accept $H1_1$, $H1_3$, $H1_4$, $H1_6$ and $H1_7$. This means the variable “sector” has significant impact on the variables “$GT\_adequacy_1$”, “$PT\_adequacy_1$”, “$PT\_adequacy_2$”, “$Per\_adequacy_2$” and “$Per\_adequacy_3$”. In other words, public and private sector managers have significantly different expectations from new IT graduates in terms of adequacies in adapting to new methods and techniques, software development background, software development processes, ethical responsibilities and communication. Similarly, the inspection of p-values in Table 3 indicated that there is sufficient evidence to accept $H2_2$, $H2_3$, $H2_5$, $H2_6$ and $H2_7$. This means the variable “experience” has significant impact on the variables “$GT\_adequacy_2$”, “$PT\_adequacy_1$”, “$Per\_adequacy_1$”, “$Per\_adequacy_2$” and “$Per\_adequacy_3$”. This means the expectations from new IT graduates regarding adequacies in developing solutions to problems, software development background, using time effectively, ethical responsibilities and communication is significantly changing depending on managers experience.

CONCLUSION

The present study has examined the existence of diversity of managers’ sector and experience in terms of selected adequacy factors of new IT graduates. Interestingly, the results revealed that, except adequacy in developing solutions to problems and adequacy in using time effectively, for all the remaining adequacy factors, the public and private sector managers have significantly different expectations. It was also found that managers’ experience level does not change their expectations in terms of adequacy in adapting to new methods and adequacy of software development process of new IT graduates.

THE USAGE OF SOCIAL MEDIA FOR LEARNING AND TEACHING PURPOSES: AN IMPLEMENTATION OF EXTENDED THEORY OF REASONED ACTION MODEL

İbrahim AKMAN
Atılım University
akman@atilim.edu.tr

Çiğdem TURHAN
Atılım University
cigdem_t@atilim.edu.tr

ABSTRACT: The growing popularity of the social networking sites has presented new options for the development of learning and teaching environments to provide informal learning. In this study, the usage of social networking sites for the purpose of learning and teaching has been analyzed using the extended Theory of Reasoned Action (TRA) model. A survey has been conducted to analyze the behavior in regard to the acceptance of social media for learning and teaching and the results were systematically analyzed with linear univariate and multivariate regression analysis techniques to apply the path analysis approach. The test results indicated that TRA has significant predictive power regarding the usage of social media for learning and teaching purposes. Among external variables, only PRB showed significant influence on the research model.

Key words: Social media, Social Networking, Informal learning, Theory of Reasoned Action

INTRODUCTION

From the early 2000's social networking sites (SNS) have emerged to establish a framework for creative expression, information sharing, interoperability and collaboration on the web such as Facebook, Twitter, Wikipedia, YouTube, etc. (Dabbagh & Kitsantas, 2012; Hong & Shaoi, 2012). According to the Global Digital Statistics, 1.8 billion people who use the Internet have social media accounts, worldwide. Whereas in Turkey, 45% of the population use the Internet, and 36 million active Facebook accounts exist (İnternet ve Sosyal Medya Kullanımı İstatistikleri, 2014). Furthermore, the report published by the Ministry of Youth and Sports states that the Internet usage rises to 76% in the 18-24 age range, and the users spend an average of 2 hours and 32 minutes on the social media (T.C.Gençlik ve Spor Bakanlığı, 2013).

This enormously popular infrastructure provides new opportunities for informal learning and teaching which can take place anywhere and anytime in the world. The users of the SNS can access learning and teaching systems in a personalized manner, voluntarily, based on their interests and are eager for the continuity of learning (Bull et al., 2008).

With the growing number of social learning environments, predicting and explaining the behavior of users regarding the adoption of SNS for their learning and teaching activities have gained importance for the acceptance, development and assessment of such systems. For this purpose, in this research, a survey was conducted to investigate user's behavior towards social learning systems, and the results were analyzed using the extended Theory of Reasoned Action (TRA) model which is a widely accepted tool to measure the user acceptance of new technology (Ajzen & Fishbein, 1980). For analysis, linear univarite and multivariate regression analyis techniques to apply the path analysis approach were utilized.

The remainder of the paper is arranged as follows. The next section introduces the research model, followed by the discussion on the external factors. Then, the research instrument and data are explained. In the next section, the descriptive and test results are presented which are followed by the conclusion.

RESEARCH MODEL

The objective of this paper is to analyse the adoption of social media for learning and teaching purposes based on the conceptual framework referred to as the Theory of Reasoned Action (TRA) (Ajzen & Fishbein, 1980). The TRA was specifically developed and used to predict and explain behavior of IT usage in the literature. The model has been proven to be successful in many of the IT studies from different perspectives (Godin et al., 2008; Marandu et al., 2010)**.** For this reason, TRA has been chosen to assess individuals' actual behavior in adopting social media for learning and teaching purposes (Figure 1). As can be seen from Figure 1, the basic TRA model contains "Attitude Towards Behavior (ATB)", "Subjective Norms (SN)", Behavioral Intention (BI)", and "Actual Behavior (AB)" as its main constructs. On the other hand, Ajzen and Fishbein (1980) proposed to include external variables to make the theory more general. Additionally, as indicated by Burton-Jones and Hubona (2006), above mentioned traditional TRA constructs fully mediate the influence of external variables on usage behaviors. For this reason, we used two external constructs in our research model such as person related beliefs and level of awareness.

The present study performs a systematic analysis approach to investigate the significance of extended TRA to predict usage of social media for learning/teaching purposes. The extensions include Person Related Beliefs (PRB) and Level of Awareness (LA). The hypotheses were categorized according to the following empirical factors:

- External factors
- TRA constructs

The justification for empirical factors and their corresponding hypotheses is provided below.

External Factors

The factor belief has been studied in the context of usage of social media. In a recent study, Al-Gahtani (2011) stated that beliefs are salient factors in conceptual models and can be used to ascertain intentions. Kiraz and Ozdemir (2006) suggested that educational ideology may affect one's decisions directly or indirectly since every individual has a belief system. They indicate in reference to O'Neill (1990) that educational ideologies are related to individuals' beliefs with regard to the overall goals of education, the objectives of the school, the nature of the curriculum and instructional methods. Furthermore, it is known that perceptions about the usefulness of technology directly or indirectly affect the frequency of use of technology (Kiraz & Ozdemir, 2006). Based on this backdrop, we used Person Related Beliefs, which considers individual's perceptions about the reliability, convenience and enjoyment in using social media to construct the following hypothesis:

H1: *PRB has significant impact on ATB.*

Awareness has been studied from different perspectives in ICT literature. For example, Hossain (2009) indicated that individuals with high awareness and skills have above-average computer experience and uses the internet more than others. This view is also supported by Aladwani (2003) that awareness regarding ICT issues such as internet security and ethics dominates the usage attitude. Humaidi and Balakrishnan (2012) also studied the influence of security awareness and concluded that this kind of awareness should be one of the significant factors in behavioural assessment of ICT usage. On the other hand, according to Taherdoost and Masrom (2009), having knowledge about a technology significantly affects the intention to adopt that technology and cause the users to enjoy its benefits. Suwannatthachote (2012), who examined the relationship between teachers' awareness and using SNS behaviors also supported this view. Finally, Taherdoost et al. (2011) studied awareness from ethical point of view and pointed out the existence of serious moral dilemmas due to lack of ethical awareness. All of these may be used as the indication of the importance of awareness for the assessment of actual behaviour towards adopting ICT. Additionally, to the best of our knowledge, none of the above literature inspected the social media usage behaviour in terms of learning and teaching purposes. Therefore, the following hypothesis is postulated.

H2: *LA has significant impact on ATB.*

The TRA is an important model for measuring user behavior as stated by Lee et al. (2006) and Wu and Liu (2007) since it provides a strong fit with the overall data (Ajzen & Fishbein, 1980). Different studies also mention the success of TRA over the other conceptual models such as Theory of Planned Behaviour (TPB) and Technology Acceptance Model (TAM) in studying general consumer information technologies and knowledge sharing (Peslak, 2012). Studies by Wu and Liu (2007) and Kwok and Gao (2006) are only two of the examples of such studies. One of the most important means of communication for many people at different ages today is social networking and Theory of Reasoned Action (TRA) has been utilized to investigate human behavior towards usage of social network sites (Peslak, et al., 2012). Based on this backdrop, we decided to use TRA for our main research model and constructed following hypotheses accordingly.

H3: *There is a significant relationship between ATB and BI.*
H4: *There is a significant relationship between SN and BI.*
H5: *There is a significant relationship between BI and AB.*

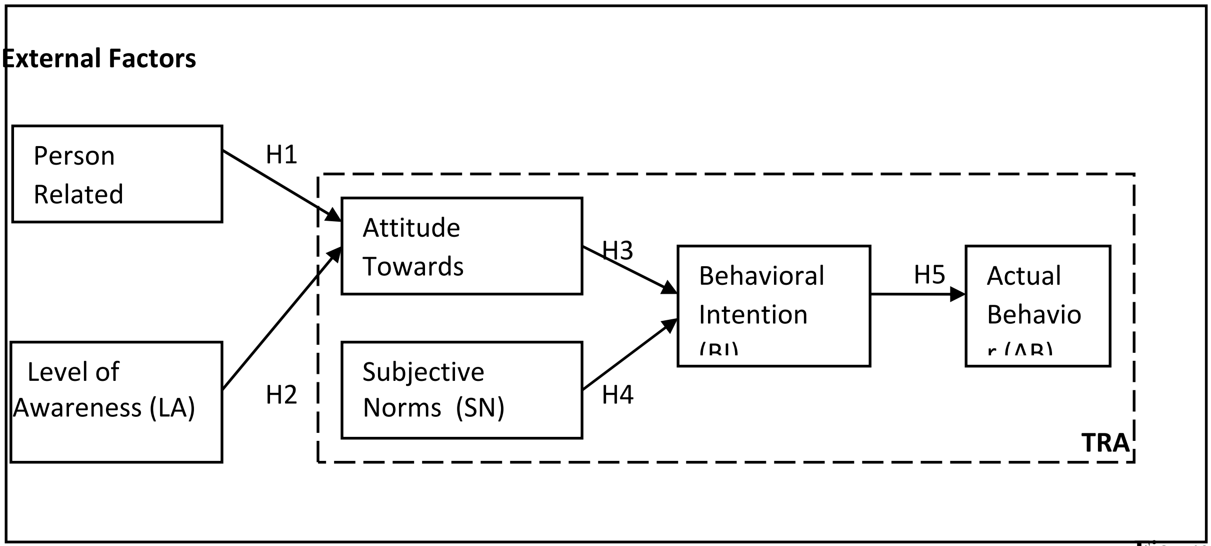

Figure 1. Research model. Boxes represent the constructs. The constructs inside dashed rectangle represents TRA, whereas others are extensions to TRA. Casual effects are given by arrows connecting boxes.

RESEARCH INSTRUMENT AND DATA

A survey was conducted to analyse the behaviour regarding adoption of Social Networking Sites (SNS) for learning and teaching (Figure 1). The data were obtained by means of a questionnaire containing 15 research questions grouped under 7 constructs according to TRA (Table 1). This questionnaire also included the variables gender (male, female) and age (<30, 31-40, 41-50 and >50) for descriptive analysis. Except for the descriptive variables, to be in parallel with the existing literature, 5-point Likert Scale (5=very much, 4=much, 3=moderate, 2=little, 1=very little) is used to collect data since this scale is the most widely used tool for survey-type studies (Table 1).

The data was collected during the 2nd International Engineering Education Conference, the 29th National Information Convention, and from various academicians and university students. A total of 142 completed survey questionnaires were obtained.

The linear univariate and multivariate regression analysis techniques were employed to apply Path analysis approach.

Table 1. List of Constructs and Corresponding Items

Construct/variable	**Item**
Gender	*What is your gender? (Male, Female)*
Age	*What is your age? (< 21; 21-30; 31-40; 41-50; >50)*
Subjective Norms (SN)	*I think that most people who are important to me expect me to use social media for learning/teaching.*
	I think that most people who are important to me use social media for learning/teaching.
Attitude Towards Behavior (ATB)	*I have favourable attitude towards using social media for learning/teaching.*
	Using social media is convenient for me in learning/teaching.
	Using social media is beneficial for me in learning/teaching.
Behavioral Intention (BI)	*I intend to use social media for learning/teaching in the future.*
	I intend to embed social media in my learning/teaching activities on a regular basis.
Actual Behavior (AB)	*I use social media for learning/teaching.*
	I use ICT (Inf. & Comm.Tech.) for learning/teaching.
Person related Beliefs (PRB)	*Social media is a convenient support for my learning/teaching activities.*

	Social media is a reliable support for my learning/teaching activities.
	I enjoy using social media for my learning/teaching activities.
Level of Awareess (LA)	*In general, I believe I have awareness of social media issues.*
	I have awareness of social media.
	I have awareness of online learning/teaching.

The cronbach's alpha (Brown, 2002) was used to assess reliability of the survey data. As a result, the overall internal reliability was found to be 0.698, which shows that the data exhibit reasonably high reliability (Yu, 2007).

RESULTS

Descriptive results

According to the descriptive results given in Table 2, of the males in the sample, 6% reported their awareness to be below average. Surprisingly, this percentage for females is only 2%. However, the test results do not indicate any significant difference for gender versus SNS awareness (Chi-Square = 2.858; DF = 3; P-Value = 0.414). Most of the respondents reported that they use SNS for learning and teaching activities at average level or higher (63%). The gender diversity for adoption of SNS for learning and teaching purposes was found to be significant (Chi-Square = 9.998; DF = 4; P-Value = 0.040). However, no significant diversity was observed for age in this regard.

The age distribution showed almost equal percentage for the male groups of below and above 30 years of age (49.49% and 50.51% resp.), whereas these percentages for females are 72.09% and 17.91% respectively. It is interesting to note that age and gender are negatively correlated (r= -0.256), meaning that female respondents are generally younger than males. Age also appears to be negatively correlated with social media usage for learning and teaching (r= -0.268). This may be used as an indication of the fact that younger respondents tend to use SNS for learning and teaching more than the older ones. Another interesting note is that the correlation between gender and using SNS for learning and teaching was found to be positive (r= 0.214) meaning that younger males use SNS more frequently for learning and teaching.

Table 2. Descriptive Statistics

Variable	Number	%
Gender	142	100

Test Results

The proposed hypotheses based on the research model were tested using path analysis approach. The univariate and multivariate least-squares regression analysis techniques were used for that purpose and the pertaining results are given in Figure 2 along with their perspective path coefficients.

The inspection of p-values given in parantheses above the arrows in Figure 2 indicate that there is sufficient evidence to accept H1 ($p<0.001$). This shows that person related beliefs have significant effect on attitude towards behaviour. This effect appears to be positive and its magnitude is 0.709. This means that increase in the personal beliefs regarding the convenience, reliability and enjoyment regarding SNS usage has an important effect on the attitude. The indirect effect of person related beliefs on behavioural intention is 0.11 (0.701*0.155). Interestingly, p-value for the relationship between level of awareness and ATB indicates that awareness does not influence the attitude and therefore we do not accept H2. This is probably because most of the respondents reported their SNS awareness to be higher than averege (73%).

The regression test results provide sufficient evidence to accept hypothesis H3 since p-value was found to be significant at 0.1% significance level. Similarly, we accept H4 since the corresponding p-value is 0.039 ($p<0.05$). These can be interpreted as attitude has positive predictive effect on behavioural intention for actual use of SNS for learning and teaching purposes since coefficient was found to be positive (coeff=0.155). On the other hand, interestingly, the regression coefficient for subjective norm was obtained to be negative (-0.170). The indirect effect of subjective norm on actual usage is -0.09 (-0.170*0.526) and significant. This may be interpreted as the other peoples opinion or behaviour increasingly effects an individual's behaviour on actual usage. Finally, inspection of p-value for the relationship between intention and actual behaviour is significant (p-value=0.000) at 0.1% significance level and therefore we accept H5. The magnitude of the predictive effect is observed to be 0.526. This shows a strong predictive power of behavioural intention on actual usage of SNS for learning and teaching purposes.

All these can be summarized as, an increase in the individuals PRB and ATB will increase their intention and actual usage of SNS for learning and teaching purposes.

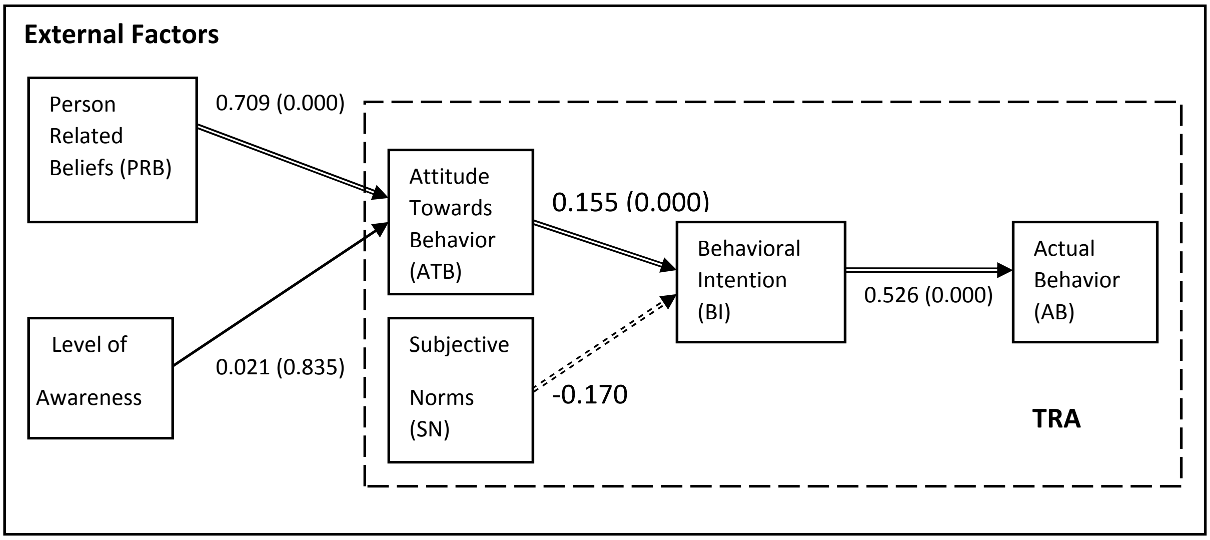

Figure 2. Test results. The path coefficients are given over the arrows. Double lines represent supported hypotheses for $p<0.001$, double dashed lines represent supported hypotheses for $p<0.05$ and single lines represent not supported.

CONCLUSION

Present study used a survey approach for the purpose of investigating the usage of SNS for learning and teaching purposes. The data was collected during the 2nd International Engineering Education Conference, the 29th National Information Convention from various academicians and university students. For the analysis, extended Theory of Reasoned action was used. Along with four traditional constructs of TRA (subjective norm, attitude towards behavior, behavioral intention and actual behavior), two external factors have been included in the analysis as extensions. The external factors are person related beliefs and level of awareness. The results supported the predicted power of TRA and external factor PRB. However, LA does not show any direct or indirect significant influence on actual use of SNS for learning and teaching purposes.

ÖZET: Bu araştırmada fen bilimleri öğretmen adaylarının sınıf düzeyi, cinsiyet, iş deneyimi ve herhangi bir dalda alınan ödül açısından girişimci özelliklerinin farklılık gösterip göstermediği incelenmiştir. Araştırma verileri beş farklı üniversitede eğitim gören 963 fen bilimleri öğretmen adaylarından elde edilmiştir. Veriler araştırmacılar tarafından geliştirilen beş faktörden oluşan (risk alma, kendine güven, fırsatları görme, duygusal zeka ve yenilikçi olma) beşli Likert tipi ölçme aracı ile toplanmış ve Kolmogorov-Simirnov Testi, U Testi ve H Testi ile analiz edilmiştir. Analiz sonuçlarına göre; cinsiyet değişkeni açısından risk alma ve yenilikçi olma özelliklerinde erkekler lehine, iş deneyimi değişkeni açısından risk alma, duygusal zeka, fırsatları görme ve yenilikçi olma özelliklerinin iş deneyimi olanlar lehine, ödül alma değişkeni açısından ise risk alma, kendine güven, fırsatları görme ve yenilikçi olma özelliklerinin ödül almış olanlar lehine anlamlı sonuçlar elde edilmiştir. Ayrıca sınıf düzeyi açısından sadece yenilikçi olma boyutunda dördüncü sınıf öğrencilerinin diğer sınıf düzeylerine göre daha yenilikçi özelliklere sahip oldukları görülmektedir.

Anahtar sözcükler: Öğretmen Eğitimi, Fen bilimleri Öğretmen Adayları, Girişimci Özellikler

ABSTRACT: The purpose of this study was to determine science teacher candidates' entrepreneurial characteristics in terms of grade levels, genders, Work Experiences and prizes in any field taken. The sample consist of 963 science teacher candidates' enrolled in science education deparment during the fall semester 2013 at five universities. Data were gathered through a entrepreneurial scale developed by the researchers that is compose of five sub-scale: risk-taking, self-confidence, see opportunities, emotional intelligence and be innovative. Findings showed that there were a significant differences among the dependent variables risk-taking and be innovative in terms of gender. According to work experience, ıt was found that there were also a significant differences among the dependent variables risk-taking, self-confidence, emotional intelligence and be innovative. Morever, according to prizes taken in any field, it was found that there were a significant differences among the dependent variables risk-taking, self-confidence, see opportunities and be innovative. Moreover, It was found that senior teacher candidates in grade level category had higher subscales scores than freshman, sophomore, junior teacher candidates' in terms of grade level.

Key words: Teacher Education, Science Teacher Candidates, Entrepreneurial Characteristics

Özet: Günümüzde bilgi ve iletişim teknolojilerinde gerçekleşen gelişmeler, eğitim alanında ki bilgi miktarlarında ve teknoloji kullanımına büyük miktarda katkı sağlamaktadır. Bu gelişime ayak uydurabilmek için, öğrencilerin öğrenmeye ihtiyaçları vardır ve ihtiyaç duydukları bilgileri öğrenebilmeleri gerekmektedir. İhtiyaç duyulan bilgiye ulaşmada önemli olan değişkenlerden birisi düşünme stiliyken bir diğeri öğrenme yaklaşımıdır. Öğrenme yaklaşımı; ihtiyaç duyulan öğrenmeyi gerçekleştirmek için gözetilen amaç ve seçilebilecek etkinliklerdeki farklılaşmadır. Öğrenme yaklaşımı öğrencilerin ders çalışırken kullandıkları stratejileri ve bu stratejileri seçme amaçlarını kapsamaktadır. Öğrenme yaklaşımının, öğrenci başarısını doğrudan etkilemesinden dolayı yaşam boyu öğrenme sürecinde de önemli ölçüde etkisi olan değişkenlerden bir tanesidir. Öğrenme yaklaşımları, "derin öğrenme" ve "yüzeysel öğrenme" olarak ifade edilebilmektedir. Bu çalışmanın amacı, ön lisans programlarındaki öğrencilerin öğrenme yaklaşımlarının belirlenmesi ve düşünme stilleri ile olan ilişkisinin incelenmesidir. Tarama modeline göre yürütülen bu araştırma, kullanılan veri toplama araçlarındaki sorulara uygun şekilde yanıtlar veren 234 ön lisans öğrencisinden elde edilen veriler ile gerçekleştirilmiştir. Verilerin toplanmasında Yılmaz ve Orhan (2011) tarafından Türkçe'ye uyarlanan ders çalışma yaklaşımı ölçeği, Sünbül (2004) tarafından Türkçe'ye uyarlanan düşünme stilleri ölçeği ve yazarlar tarafından geliştirilen kişisel bilgi formu kullanılmıştır. Elde edilen verilerin çözümlenmesinde SPSS (The Statistical Package for The Social Sciences) paket programı kullanılılmıştır. Verilerin çözümlenmesinde ise; betimsel istatistikler ve basit korelasyon kullanılmıştır.

Anahtar kelimeler: öğrenme yaklaşımı, derin yaklaşım, yüzeysel yaklaşım, düşünme stili.

Abstract: Today developments in information and communication technologies contribute to information amount and using technology very much. So as to keep in step with this development students need learn and it is need that they should learn the information they need. While one of the variables that required in reaching the information is thinking style the other one is learning approach. Learning approach is differentiation in activity and aim to realize the learning which is need. Learning approach include the strategies which are used by students while studying and their aims in choosing these strategies .Learning approach affects student's success directly so it is one of the variables which has a great effect in life-long learning process. Learning approaches are explained as ''deep learning'' and ''surface learning''. The aim of this studying is determining the learning approaches of pre-licensing students' and examining the connection with thinking styles. The research carried out according to survey model was realized with data from the 234 pre-licensing who answer the questions conveniently in data collection tools. The study process questionnaire adapted to the Turkish language by Yılmaz and Orhan (2011), thinking styles scale adapted Turkish language by Sünbül (2004), personal information form developed by writers was used in collection of data. In analyzing of data SPSS (the Statistical Package for the Social Sciences) packet program was used. In analyzing the data descriptive statistics and simple correlation was used.

Key Words: learning approach, deep approach, surface approach, thinking style.

GİRİŞ

21. yüzyıl gelişmeleri ve gereksinimleri, bilim ve teknoloji alanındaki gelişmeleri de önemli anlamda etkileyerek, birey yaşamının her alanında olduğu gibi eğitim alanının da gelişmesine yol göstermektedir. Bu etkilere paralel olarak eğitimde bu değişimden önemli ölçüde katkı görmektedir. Öğretim teknolojilerinin 21. yüzyıl gelişmelerine paralel olarak gelişmesi, bireylerin öğrenmeye olan ihtiyaçlarını etkilemiş ve ihtiyaç duydukları bilgileri öğrenebilmelerine yeni olanaklar sağlamıştır. İhtiyaç duyulan bilgiye ulaşmada önemli olan değişkenlerden birisi düşünme stiliyken bir diğeri öğrenme yaklaşımıdır.

Yılmaz ve Orhan (2011), Entwistle ve McCune (2004) ve Prosser ve Trigwell (1999) tarafından yapılan çalışmalardan yararlanarak, öğrenme yaklaşımının; belirli bir öğrenme işini gerçekleştirmek için gözetilen amaç ve seçilebilecek etkinliklerdeki farklılaşmayı ifade etmekte olduğunu ve öğrencilerin ders çalışırken kullandıkları stratejileri ve bu stratejileri seçme amaçlarını kapsadığını belirtmiştir. Ayrıca öğrencilerin öğrenme yaklaşımlarının, “derin öğrenme” ya da “yüzeysel öğrenme” şeklinde olduğunu ve alanyazında görülen “derin yaklaşım” ve “yüzeysel yaklaşım” ifadelerinin de aynı kavramı tanımladığını belirtmişlerdir.

Abraham, Vinod, Kamath, Asha ve Ramnarayan (2008) tarafından yapılan çalışmada; öğrencilerin öğrenme yaklaşımlarının belirlenmesinin; öğrencileri daha iyi öğrenenler haline getirmede yardımcı olma, kendi öğretiminin etkinliğini izlemek ve geliştirmek isteyen akademisyenlere yardımcı olma, etkisiz stratejilerden dolayı risk altındaki öğrencileri belirleme ile öğrenme deneyimi ve çıktılarını gözlemleme açısından önemli olduğu belirtilmiştir.

Alanyazın tarandığında öğrenme yaklaşımı ile ilgili yurtdışında çok fazla çalışma yapılmasına karşın, ülkemizde bu konuda yeteri kadar çalışma yapılmadığı göze çarpmaktadır.Ayrıca, ülkemizde yapılan çalışmalarda daha çok öğretmen adaylarının öğrenme yaklaşımları üzerinde durulmuştur (Çuhadar, Gündüz ve Tanyeri, 2013; Ellez ve Sezgin, 2002; Karadeniz Bayrak ve Erkoç, 2008; Ozan ve Çiftçi, 2013; Ozan, Köse ve Gündoğdu, 2012; Özgür ve Tosun, 2012; Senemoğlu, 2011; Sezgin Selçuk, Çalışkan ve Erol, 2007; Şahin Taşkın, 2012). Bu çalışmalarda öğretmen adaylarının öğrenme yaklaşımının; cinsiyete, sınıf düzeyine, anabilim dalına/bölüme ve öğretme-öğrenme ortamı algısına göre anlamlı bir farklılık gösterip göstermediği incelenmiştir. Ek olarak, öğrenme yaklaşımı ile akademik başarı, öğrenme yaklaşımı ile biliş üstü algı, öğrenme yaklaşımı ile akademik öz-yeterlilik algısı arasındaki ilişki araştırılmış ve öğrencilerin öğrenme yaklaşımlarının yordayıcısı olarak epistemolojik inançları ile ilgili çalışılmıştır. Öğrenme yaklaşımı ile ilgili daha fazla değişken hakkında bilgi sahibi olabilmek için, çeşitli değişkenlerin/bireysel farklılıkların dikkate alındığı çalışmaların yapılması da önerilmiştir (Özgür ve Tosun, 2012; Şahin Taşkın, 2012).

Olpak ve Korucu (2014) tarafından yapılan çalışmada ise; önlisans programlarındaki öğrencilerin ders çalışma yaklaşımlarının belirlenmesi ve farklı değişkenler (cinsiyet, yaş, sınıf, bölüm ve akademik genel not ortalaması) ile olan ilişkisinin incelenmesi amaçlanmıştır. Özellikle sanayinin ihtiyaç duyduğu ara eleman ihtiyacını karşılamak için belirli bir mesleğe yönelik eğitim veren meslek yüksekokullarından yetişen ön lisans öğrencilerinin, 21. yüzyıl gerksinimlerine uygun niteliklerle sahip olabilmeleri için, öğretim uygulamalarından en iyi şekilde yararlanabilmeleri gerekmektedir. Ancak kapsamlı olarak gerçekleştirilen alanyazın taramasından da görülebileceği gibi ülkemizde bu alanda yapılan çalışmalar oldukça yetersizdir. Bu bağlamda bu çalışma kapsamında öğrencilerin öğrenme yaklaşımları ile ilgili daha fazla değişken hakkında bilgi sahibi olabilmek için, öğrenme yaklaşımı ile düşünme stili arasındaki ilişki incelenmiştir.

Düşünme stilleri, bireylerin karşılaştıkları çeşitli problemlere, olaylara, olgulara ve değişkenlere karşı düşünme süreçleri sonucu göstermiş oldukları yaklaşım ve eğilimlerdir (Başol ve Türkoğlu, 2009; Emir, 2013; Mingchang, Shihuei, Hsiuhsu, Chang ve Lihua, 2013; Tortop, Çalışkan ve Dinçer, 2013). Düşünme stilleri, bireyin bilgiyi nasıl aldığı ve işlediğiyle yakından ilgilidir. Bir bireylerin her bir düşünme stilini içinde bulunduran bir düşünme stili profili vardır ancak, bireyler sadece bir düşünme stiline bağlı değillerdir. Farklı görev ve durumlara uyum sağlamak amacıyla düşünme stilleri değişiklik gösterebilir (Sünbül, 2004). Sternberg tarafından geliştirilen “zihinsel olarak kendi kendini yönetme” (mental self-government) yaklaşımında temel görüş, bireyin yaygın olan yönetim türleriyle (kuralcı, yetkili, yargısal, monarşik, hiyerarşik, oligarşik) benzer bir şekilde kendi içinde düşünme stillerini oluşturması ve kendisini yönetmesidir. Sternberg’in yaklaşımında, işlevler, biçimler, düzeyler, kapsam ve eğilimler olmak üzere 5 kategori altında toplam 13 düşünme stili vardır. Düşünme stili, bireyin yeteneklerini kullanmada seçmiş olduğu yöntemdir. Bu nedenle, çeşitli olan düşünme stilleri iyi veya kötü değil, sadece farklıdır (Sternberg, 1994). Düşünme stilleri kapsam açısından: içe dönük düşünenler ve dışa dönük düşünenler olarak ikiye ayrılmaktadır. İçe dönük düşünenler; yalnız başına çalışmayı seven, kendi içinde yoğunlaşıp, kendi kendine yetmekteyken; dışa dönük düşünenler ise, başkalarıyla çalışmayı seven, dışarı yoğunlaşıp, kişilerle ilişki kurmaktan hoşlanmaktadırlar (Sünbül, 2004). Bu bağlamda bu çalışma kapsamında, ortaya koyulmuş 13 düşünme stili içerisinden, kapsam açısından; içe dönük ve dışa dönük olarak nitelendirilmiş olan düşünme stilinin, öğrenme yaklaşımı ile ne şekilde ilişkili olduğunu ortaya koymak amaçlanmaktadır. Buradan hareketle bu çalışmanın amacı, ön lisans programlarındaki öğrencilerin öğrenme yaklaşımlarının belirlenmesi ve düşünme stilleri ile olan ilişkisinin incelenmesidir. Bu genel amaç çerçevesinde aşağıdaki sorulara cevap aranmıştır.

1. Öğrencilerin öğrenme yaklaşımı nedir?
2. Öğrencilerin düşünme stili nedir?
3. Öğrencilerin öğrenme yaklaşımları ile düşünme stilleri arasında anlamlı bir ilişki var mıdır?

YÖNTEM

Araştırmanın Modeli ve Çalışma Grubu

Tarama modeline göre yürütülen bu araştırma, 2013-2014 eğitim-öğretim yılı bahar döneminde, Ahi Evran Üniversitesi Mucur Meslek Yüksekokulu'ndaki kayıtlı 1093 öğrenciden, araştırma kapsamında kullanılan veri toplama araçlarındaki sorulara uygun şekilde yanıtlar veren 234 öğrenciden elde edilen veriler ile gerçekleştirilmiştir. Çalışma grubundaki öğrencilerin cinsiyet, bölüm ve sınıf düzeyine göre dağılımına ilişkin bilgiler Tablo 1'de verilmiştir.

Tablo 1. *Çalışma Grubundaki Öğrencilerin Cinsiyete, Okudukları Bölüme ve Sınıf Düzeyine Göre Dağılımları*

Değişkenler		N	%
Cinsiyet	Erkek	113	48.29
	Kadın	121	51.71
	Toplam	**234**	**100**
Bölüm	Bilgisayar Teknolojileri	131	55.98
	Görsel, İşitsel Teknikler ve Medya Yapımcılığı	17	7.26
	Muhasebe ve Vergi Uygulamaları	21	8.97
	Tasarım	49	20.94
	Yönetim ve Organizasyon	16	6.84
	Toplam	**234**	**100**
Sınıf	1. Sınıf	101	43.16
	2. Sınıf	133	56.84
	Toplam	**234**	**100**

Tablo 1'de de görüldüğü gibi, çalışma grubundaki 234 öğrenciden; 113'ü (%48.29) erkek, 121'i ise kadındır (%51.71). Öğrencilerin; 131'i "Bilgisayar Teknolojileri", 17'si "Görsel, İşitsel Teknikler ve Medya Yapımcılığı", 21'i "Muhasebe ve Vergi Uygulamaları", 49'u "Tasarım" ve 16'sı da "Yönetim ve Organizasyon" bölümlerinde öğrenim görmektedirler. Ayrıca, öğrencilerin 101'i 1. sınıfta, 133'ü de 2. sınıfta öğrenim görmektedirler.

Veri Toplama Araçları

Araştırma kapsamında verilerin toplanmasında Yılmaz ve Orhan (2011) tarafından Türkçe'ye uyarlanan ders çalışma yaklaşımı ölçeği, Sünbül (2004) tarafından Türkçe'ye uyarlanan düşünme stilleri ölçeği ve yazarlar tarafından geliştirilen kişisel bilgi formu kullanılmıştır.

Yılmaz ve Orhan (2011) tarafından yapılan çalışmanın amacı; Biggs, Kember ve Leung (2001) tarafından üniversite öğrencilerine yönelik geliştirilmiş olan ders çalışma yaklaşımı ölçeğinin Türkçe formunun; dilsel eşdeğerliliğinin, geçerliliğinin ve güvenilirliğinin incelenmesidir. Ölçekte toplam 20 madde ve derin ve yüzeysel yaklaşım olmak üzere de iki boyut bulunmaktadır. Ayrıca bu iki boyutun altında da ayrı ayrı olmak üzere motivasyon ve strateji alt boyutları bulunmaktadır. Maddelerin cevaplanmasında ise beşli Likert tipi derecelendirme kullanılmış ve her bir madde için; "benim için asla geçerli değil ya da nadiren geçerli (1)", "benim için bazı zamanlar geçerli (2)", "benim için yarı yarıya geçerli (3)", "benim için sıklıkla geçerli (4)" ve "benim için her zaman ya da hemen hemen her zaman geçerli (5)" seçenekleri sunulmuştur. Geçerlilik çalışması sonuçlarına göre; derin motivasyon, derin strateji, yüzeysel motivasyon ve yüzeysel strateji alt boyutlarının varlığını öngören özgün yapıya Türkçe ölçekte ulaşılamamıştır. Ancak Türkçe ölçeğin bireylerin derin ve yüzeysel yaklaşımlardan hangisini benimsediklerini geçerli bir şekilde ölçebileceği belirtilmiştir. Ayrıca Biggs ve diğerleri (2001) ölçeğin sadece derin ve yüzeysel yaklaşımı ölçmek için de kullanılabileceğini belirtmiştir. Ölçeğin Türkçe formunun ölçmedeki kararlılığını test etmek için test-tekrar test yönteminden yararlanılmış ve elde edilen sonuçlar ölçeğin iki uygulaması arasındaki tutarlılığın kabul edilebilir düzeyde olduğunu göstermiştir. Ayrıca ölçeğin iç tutarlılığını belirlemek için hesaplanan Cronbach α güvenilirlik katsayısı; derin yaklaşım için .79 ve yüzeysel yaklaşım için ise .73'tür.

Sünbül (2004) tarafından Türkçe'ye uyarlanan düşünme stilleri ölçeği 94 maddeden oluşmaktadır. Maddelerin cevaplanmasında ise beşli derecelendirme kullanılmış ve her bir madde için; "Her zaman (1)", "Sık sık (2)", “Bazen (3)”, “Nadiren (4)” ve “Hiçbir zaman (5)” seçenekleri kullanılmıştır. Öğrencilerin düşünme stillerini belirlemeye yönelik düşünme stilleri ölçeğinde 13 temel düşünme stili temele alınmıştır. Bu düşünme stilleri sırasıyla; Öznel düşünme, kuralcı düşünme, yargılayıcı düşünme, tekilci, aşamalı, eş değerci, kuralsız, bütüncül düşünme, ayrıntıcı düşünme, kendine özgü, dışa dönük, yenilikçi ve gelenekçi düşünme stilleridir. Yapı geçerliği çalışması faktör (temel birleşenler) analizi yöntemi uygulanarak gerçekleştirilmiştir. Yayınlanan ölçekte yer alan maddelerin seçiminde değişim (Varimax) sonrası faktör analizi ile, madde test ve madde kalan korelasyonları temele alınmıştır. Bu çalışmalar sonucunda ölçeğin 13 boyutunun ve açıklanan varyans miktarının yeterli olduğu ayrıca her bir maddenin değişim öncesi ve sonrası faktör yükleri ile madde-alt test ve madde kalan korelasyonlarının yeterli düzeyde olduğu doğrulanmıştır. 13 faktörün birlikte açıkladığı varyans %51,027’dir. Yayınlanan ölçekte alınan tüm maddelerin faktör yükü 0,40’ın üstündedir. Ayrıca ölçeğin iç tutarlılığını belirlemek için hesaplanan Cronbach α güvenilirlik katsayısı; tüm alt ölçekler için 0,70 ile 0,861 arasında değişmektedir.

Verilerin Çözümlenmesi

Araştırma kapsamında elde edilen veriler SPSS (The Statistical Package for The Social Sciences) paket programı kullanılarak çözümlenmiştir. Öğrencilerin öğrenme yaklaşımlarının ve düşünme stillerinin belirlenmesinde betimsel istatistiklerden yararlanılmıştır. Öğrencilerin; öğrenme yaklaşımları ile düşünme stilleri arasındaki ilişkinin belirlenmesinde ise, basit korelasyon tekniğinden yararlanılmıştır.

BULGULAR

Öğrencilerin öğrenme yaklaşımlarına yönelik bulgular:

Araştırma sonucunda toplanan veriler ile yapılan istatistik testlerinin sonucunda, çalışma grubundaki 234 öğrencinin ders çalışma yaklaşımı ölçeğinden aldıkları puanlar; 135’inin derin yaklaşıma, 99’unun ise yüzeysel yaklaşıma sahip olduğunu göstermiştir.

Öğrencilerin düşünme stillerine yönelik bulgular:

Araştırma sonucunda toplanan veriler ile yapılan istatistik testlerinin sonucunda, çalışma grubundaki 234 öğrencinin düşünme stilleri ölçeğinden aldıkları puanlar; 136’sının dışa dönük, 98’inin ise içe dönük olduğunu göstermiştir.

Öğrencilerin öğrenme yaklaşımları ile düşünme stilleri arasındaki ilişkiye yönelik bulgular:

Bu araştırma kapsamında öğrencilerin derin ve yüzeysel öğrenme yaklaşımı yaklaşımları ile içe dönük ve dışa dönük düşünme stillerinin arasındaki ilişkinin belirlenmesinde basit korelasyon tekniğinden yararlanılmıştır. Korelasyon iki değerle ifade edilebilen bir büyüklüktür. Bu değerlerden birisi korelasyonun yönü iken diğeri büyüklüğüdür. Korelasyon katsayısının 1.00 olması, mükemmel pozitif bir ilişkiyi; -1.00 olması, mükemmel negatif bir ilişkiyi; 0.00 olması ise ilişkinin olmadığını gösterir. Alanyazında korelasyon katsayısının büyüklük bakımından yorumlanmasında tam olarak bir fikir birliği olmamakla beraber; korelasyon katsayısının mutlak değerinin 0.70-1.00 arasında olması, yüksek; 0.70-0.30 arasında olması, orta ve 0.30-0.00 arasında olması ise, düşük düzeyde bir ilişki olarak tanımlanabilir (Büyüköztürk, 2011:32).

Öğrencilerin ders çalışma yaklaşımı ölçeğinin derin yaklaşım boyutundan aldıkları puanlar ile içe dönük ve dışa dönük düşünme stilleri arasındaki ilişkiye dair bulgular Tablo 2’de verilmiştir.

Tablo 2. Derin Öğrenme Yaklaşımı ile İçe Dönük ve Dışa Dönük Düşünme Stilleri Arasındaki İlişki

Düşünme Stili	Derin Öğrenme Yaklaşımı
İçe dönük	.283*
Dışa dönük	.283*

*Korelasyon 0.01 düzeyinde anlamlıdır.

Tablo 2’de de görüldüğü gibi, derin öğrenme yaklaşımı ile içe dönük düşünme stili arasında düşük düzeyde, pozitif yönlü ve anlamlı bir ilişki bulunmaktadır. Ayrıca, derin öğrenme yaklaşımı ile dışa dönük düşünme stili arasında da düşük düzeyde, pozitif yönlü ve anlamlı bir ilişki bulunmaktadır.

Öğrencilerin ders çalışma yaklaşımı ölçeğinin yüzeysel yaklaşım boyutundan aldıkları puanlar ile içe dönük ve dışa dönük düşünme stilleri arasındaki ilişkiye dair bulgular Tablo 3’te verilmiştir.

Tablo 3. Yüzeysel Öğrenme Yaklaşımı ile İçe Dönük ve Dışa Dönük Düşünme Stilleri Arasındaki İlişki

Düşünme Stili	Yüzeysel Öğrenme Yaklaşımı

İçe dönük	.934*
Dışa dönük	.056*

*Korelasyon 0.01 düzeyinde anlamlıdır.

Tablo 3'te de görüldüğü gibi, yüzeysel öğrenme yaklaşımı ile içe dönük düşünme stili arasında yüksek düzeyde, pozitif yönlü ve anlamlı bir ilişki bulunmaktadır. Ayrıca, yüzeysel öğrenme yaklaşımı ile dışa dönük düşünme stili arasında da düşük düzeyde, pozitif yönlü ve anlamlı bir ilişki bulunmaktadır.

SONUÇ

Bu araştırma sonucunda, çalışma grubundaki 234 öğrencinin ders çalışma yaklaşımı ölçeğinden aldıkları puanlar; 135'inin derin yaklaşıma, 99'unun ise yüzeysel yaklaşıma sahip olduğunu göstermiştir. Öğrencilerin düşünme stilleri ölçeğinden aldıkları puanlar ise; 136'sının dışa dönük, 98'inin ise içe dönük olduğunu göstermiştir. Öğrencilerin derin öğrenme yaklaşımı ile içe dönük düşünme stili arasında düşük düzeyde, pozitif yönlü ve anlamlı bir ilişki varken; derin öğrenme yaklaşımı ile dışa dönük düşünme stili arasında da düşük düzeyde, pozitif yönlü ve anlamlı bir ilişki bulunmaktadır. Ayrıca, öğrencilerin, yüzeysel öğrenme yaklaşımı ile içe dönük düşünme stili arasında yüksek düzeyde, pozitif yönlü ve anlamlı bir ilişki varken; yüzeysel öğrenme yaklaşımı ile dışa dönük düşünme stili arasında da düşük düzeyde, pozitif yönlü ve anlamlı bir ilişki bulunmaktadır.

ÖNERİLER

Araştırma sonucunda ulaşılan bulgular ışığında, öğrencilerin daha büyük bir bölümünün öğrenme konusunda derin yaklaşıma sahip olabilmeleri için öğretim elemanlarının; daha öğrenci merkezli öğrenme ortamları sunmaları, yüzeysel yaklaşıma sahip öğrencilere derin yaklaşıma uygun stratejileri kullanmaları yönünde rehberlik etmeleri ve öğrenme ortamındaki etkinlikleri başarabilecekleri yönünde öğrencileri motive etmeleri önerilmektedir. Ayrıca, öğrencilerin bireysel farklılıklarının dikkate alındığı dersler tasarlanmalı ve derslerin tasarımında çeşitlilik oluşturularak öğrencilerin derse daha aktif katılımlarının sağlandığı, akademik uğraşılarının daha da artırıldığı, derse karşı daha çok ilgilerinin sağlandığı bir ortam oluşturulmalıdır.

Bu araştırma bir tek meslek yüksekokulunda öğrenim gören öğrenciler üzerinde yürütülmüştür. Bu nedenle, araştırma bulgularının genellenebilmesi için, farklı meslek yüksekokullarında öğrenim gören öğrencilerin de yer aldığı, daha geniş çaplı araştırmalar yapılması önerilmektedir. Ayrıca ileride yapılacak araştırmalarda; farklı eğitim düzeylerindeki (önlisans, lisans vb.) öğrencilerin çeşitli bireysel farklılıklarının da dikkate alındığı çalışmaların yapılması, öğrenme yaklaşımı ile ilgili daha fazla değişken hakkında bilgi sahibi olunmasını sağlayacağından önemli görülmektedir.

ABSTRACT: Drawings have been used to understand meanings preservice teachers attached to mathematics (Burton, 2012). In this study we focused on the preservice early childhood teachers' views regarding mathematics. Fourty-seven preservice early childhood teachers were asked to draw a picture to respond the question "What is Math?" at the beginning and at the end of the "Teaching Mathematics in Early Childhood" course focusing on mathematics concepts and teaching methods for preschool classrooms. Participants were also asked to explain their drawings with some descriptive sentences. Both drawings and written statements were analyzed through open coding with focus on emotions. Comparison of pre- and post-drawings indicated that participants had negative emotions towards mathematics at the beginning of the class while these negative emotions were replaced with positive emotions at the end of the course. Our findings suggest that preservice teachers might bring negative emotions related to mathematics. However, mathematics teaching courses have the potential for developing positive mathematics-related emotions.

ABSTRACT: In this paper we will discuss completeness of dislocated quasi metric space not in the terms of Cauchy sequences but in the terms of existence of fixed point for ψ-φ weakly contractive mappings. This result generalizes the result of Z.Liu in [5]

Key words: completeness, dislocated quasi-metric space, $\varphi - \psi$ weakly contractive mappings.

INTRODUCTION

The concept of dislocated metrics was studied under the name of metric domains in the context of domain theory in [2]. As a generalization of metrics where the self distance for any point need not to be equal to zero, Hitzler and Seda, introduced the notion of dislocated metric spaces [7] and generalized the celebrated Banach Contraction Principle in such spaces. These metrics play a very important role not only in topology but also in other branches of science involving mathematics especially in logic programming and electronic engineering.
Zeyada**[9]** initiated the concept of dislocated quasi-metric space and generalized the result of Hitzler and Seda[1]in dislocated quasi-metric spaces.
Characterization s of metric completeness have received much attention in recent years. Hu [4] show that a metric space is complete if and only if any Banach contradiction on closed subset thereof has a fixed point. Taskovic [8] also obtained a result similar to Hu using the notion of diametral ψ-contraction. Zhang [10] proved that a metric space is complete if and only if each Kannan type contraction on it has a fixed point. Z. Liu [5] extend the result of Zhang and Park and Kang replacing Kannan type contraction with more general conditions and give characterizations of the metric completeness using single valued and multivalued mappings.
The purpose of the present paper is to contribute in this field. We have considered a family of generalized ψ-φ weakly contractive mappings and will discuss completeness of dislocated quasi metric space not in the terms of Cauchy sequences but in the terms of existence of fixed point for ψ-φ weakly contractive mappings.

PRELIMINARIES

Definition 1. 1. Let X be a non-empty set and d is a nonnegative real-valued function on X x X such for all x, y, z ϵ X:

1) $d_1: d(x,x) = 0$
2) $d_2: d(x,y) = d(y,x) = 0 \Rightarrow x = y$
3) $d_3: d(x,y) = d(y,x)$
4) $d_4: d(x,y) \leq d(x,z) + d(x,z)$

If d satisfies the conditions $d_1 - d_4$ then d is called a metric on X. If d satisfies the conditions $d_2 - d_4$ then d is called a dislocated metric if d satisfies only d_2 and d_4 then d is called a dislocated quasi-metric on X [6]. A nonempty set with a dislocated quasi-metric d, i. e., $(X, d)$is called a dislocated quasi-metric space.

Definition 1.2. [6] A sequence (x_n) in a dislocated quasi-metric space (X, d) is called a right Cauchy sequence if $\forall \varepsilon > 0, \exists n_0 \epsilon N$,∀m, n ϵNsuch that n_0<n<m we will have d(x_m, x_n)< ε.

Definition 1.3. [6] A sequence (x_n) in a dislocated quasi-metric space (X, d) is called a left Cauchy sequence if $\forall \varepsilon > 0, \exists n_0 \epsilon N$,∀m, n ϵN such that n_0<n<m we will have d(x_n, x_m)< ε.

Definition 1.4. [6] A sequence (x_n) in a dislocated quasi-metric space (X, d) is called a Cauchy sequence if $\forall\varepsilon > 0, \exists n_0 \epsilon N, \forall$m, n ϵN such that n_0<n,m we will have d(x_n, x_m)< ε or d(x_m, x_n)< ε.

Definition 1. 5. The sequence (x_n) is said to be "bi"-Cauchy if $\forall\varepsilon > 0$, $\exists n_0 \epsilon N$ such that

$\forall n, m > 0$ we have $max\{\, d(x_n, x_m),\ d(x_m, x_n)\} < \varepsilon$.

Definition 1.6. [6] A sequence(x_n) in a dislocated quasi-metric space (X, d) converges with respect to dislocated quasi-metric d if there exists$x \epsilon\ X$, such that $\lim_{n\to\infty} d(x, x_n) = \lim_{n\to\infty} d(x_n,\ x) = 0$.

In this case x is called dq –limit of (x_n) and we write$x_n \to x$.

Definition 1.7. [6] A dislocated quasi-metric space (X, d) is called complete if every Cauchy sequence is convergent with respect to dislocated quasi-metric$d$.

Definition 1.8.The dislocated quasi-metric space (X, d) is said to be "bi"-complete if for every "bi"-Cauchy sequence (x_n) in it, is convergent.

Let be T a self mapping on itself in a dislocated quasi-metric space (X, d). For x , $y \epsilon X$ and $A \subset X$ define O(x, T) $=\{T^n x : n \epsilon N_0\}$ and O(x, y,T)=$O(x,T) \cup O(y, T)$ and

Diam A= δ= sup $\{d(x, y), for\ all\ x, y\ \epsilon A$.

Z.Liu in [5] has proved the following theorem:

Theorem 1.9. For a metric space (X, d) the following statements are equivalent:

1) (X, d) is complete;
2) If f is a self-mapping of X satisfying for every x, y in $X$and some ψ, φ
$d(fx, fy)) \leq \psi(\delta(O(x, y, f)\quad \delta(O(x, y, f) < \infty$, where $\psi,\ \varphi : [0,+\infty[\to [0,+\infty[$, ψ is non-decreasing and continuous on the right, $\psi(t) < t$, for all t >0 then f has a fixed point;

3) If f is a self-mapping of X satisfying the condition $(fx, fy) \leq r(\delta(O(x, y, f))\quad 0 \leq r < 1$, then f has a fixed point.

In this paper we extend the results of Z. Liu [5] replacing the condition (1) in theorem 1. 9 with more general conditions and give characterizations of completeness of dq-metric spaces

MAIN RESULTS

Theorem 2.1 For a dislocated quasi- metric space (X, d) the following statements are equivalent

1) (X, d) is complete;
2) If T is a self mapping of X satisfying for every x, y in X,
$\psi(d(Tx, Ty)) \leq \psi(\delta(O(x)) \cup O(y))$- φ $(\delta(O(x)) \cup O(y))$

Where $\psi,\ \varphi : [0,+\infty[\to [0,+\infty[$, ψ is non-decreasing and continuous, φ is lower semi continuous function, $\psi(t)< t$, $\psi(t) > 0,\ \varphi(t) > 0$ for all $t>0$ and $\psi(0) = \varphi(0) = 0$,

then T has a fixed point;

3) If T is a self-mapping of X satisfying the condition $d(Tx, Ty) \leq r(\delta(O(x)) \cup O(y))$, $\delta(O(x)) \cup O(y)<\infty$, $0 \leq r < 1$, then T has a fixed point.

Proof: Let proof that 1) ⇒2).

For x, y in X and n∈N, let $x_n = T^n x,\ \ y_n = T^n y$. From (2), for $k, m \geq n$ in N we have

$\psi(d(Tx_k, Ty_m)) \leq \psi(\delta(O(x_k)) \cup O(y_m))$- φ $(\delta(O(x_k)) \cup O(y_m))$

$\psi(d(Tx_{n+1}, Ty_{n+1})) \leq \psi(\delta(O(x_{n+1})) \cup O(y_{n+1}))$- φ $(\delta(O(x_{n+1})) \cup O(y_{n+1})) \leq \psi(\delta(O(x_{n+1})) \cup O(y_{n+1}))$.(4)

Hence as ψ is monotonically non-decreasing we have
$d(Tx_{n+1}, Ty_{n+1}) \leq \delta(O(x_{n+1})) \cup O(y_{n+1}))$= $\delta(O(T_x^n)) \cup O(T_y^n))$

$\{\delta(O(T_x^n)) \cup O(T_y^n))\}_{n\in N}$ is not increasing and bounded below, $\delta(O(T_x^n)) \cup O(T_y^n)) \geq 0$, so there exists $\gamma \geq 0$ such that, $\delta(O(T_x^n)) \cup O(T_y^n)) \to \gamma$ and

$$d(Tx_{n+1},Ty_{n+1}) \leq \gamma \leq \delta\big(O\,(T^{n+1}\text{x}) \cup O(T^{n+1}\text{y})\big)$$

Since ψ is continuous and φ is lower semi-continuous, we have

$$\lim_{n\to\infty} \psi(\delta(O(T^n x) \cup O(T^n y)))=\psi(\gamma) \qquad \varphi(\gamma) \leq \lim_{n\to\infty} \inf \varphi(\delta(O(T^n x) \cup O(T^n y))) \;.$$

By (4) and the property of the function ψ and φ we conclude that

$\psi\,(\gamma) \;\leq \psi(\,\gamma) - \;\varphi(\,\gamma)$ from where $\varphi(\,\gamma) \leq 0$ which is a contradiction. That's why

$\varphi(\,\gamma) = 0 \Rightarrow \gamma = 0$ and $\lim_{n\to\infty} \delta\big(O\;(T^n\text{x}) \cup O(T^n\text{y})\big)$=0. (5)

By the definition of δ and (5) we have

$$\lim_{\substack{n\to\infty\\ m\to\infty}} \text{d}\,(x_m, x_n) = \lim_{\substack{n\to\infty\\ m\to\infty}} \text{d}(x_n, x_m) = 0;$$

$$\lim_{\substack{n\to\infty\\ m\to\infty}} \text{d}\,(y_n, y_m) = \lim_{\substack{n\to\infty\\ m\to\infty}} \text{d}(y_m, y_n) = 0,$$

$$\lim_{\substack{n\to\infty\\ m\to\infty}} \text{d}\,(x_n, y_m) = \lim_{\substack{n\to\infty\\ m\to\infty}} \text{d}(y_m, x_n) = 0, \qquad (6)$$

and so (x_n) and (y_n) are "bi"- Cauchy sequences.

By completeness of (X, d) there is a point u $\in$X such that $(x_n) \to u$.

By the triangle inequality of quasi dislocated metric d and (6) we have

$d(y_n, u) \;\leq d(y_n, x_n)$ +$d(x_n, u)$, so $\lim_{n\to\infty} d(y_n, u) = 0$

$d(\,u, y_n) \leq d(u, x_n) + d(x_n, y_n)$, so $\lim_{n\to\infty} d(u, y_n) = 0$

Hence, the sequence (y_n) converges in u.

Now we will proof that u is a fixed point for Twhich is equivalent with $\delta(O\,(\text{u})) \;\to 0$.

Suppose that $\delta(O\,(\text{u}))$>0. For $n, m \in N$ by (2) and knowing that Ψ is non-decreasing,

$\Psi\,(\,d(T^n u, T^{\,m} u)) \leq \psi(\,\delta(O(T^{n-1}u)) \cup\; O(T^{\,m-1}u))$- $\varphi\;(\delta\big(O(T^{n-1}u)\big) \cup\; O(T^{\,m-1}u)) \leq$

$\leq\Psi\,(\,\delta(O(T^{n-1}u) \cup\; O(T^{\,m-1}u)) \leq \psi(\,\delta(u))$

Then $d(T^n u, T^m\text{u}) \leq \delta(O(u))$ for all n,m $\in$N.

So, $\delta(O(Tu) \leq\; \delta\big(O(u)\big) = \sup\{d(\,T^m u, u),\, d(u, T^m u), m\epsilon\text{N}\}$,

By the $x_n \to u$ for every$\varepsilon > 0$, exists $k\epsilon N$such that d(x_n, u)< ε and d(u, x_n)< ε for n>k.

For $m\epsilon$N and n > k, by (2), we have

$d(u, T^m u) \leq d(u, T^n\text{x}) + d(T^n\text{x},T^m u) \leq$

$\leq \varepsilon$+ $\psi\;(\,\delta(O(T^{n-1}x)) \cup\; O(T^{\,m-1}u))$- $\varphi\;(\delta(O(T^{n-1}x)) \cup\; O(T^{\,m-1}u)$

But $\delta(O(T^{n-1}x)) \cup\; O(T^{\,m-1}u)$=max $\{2\,\varepsilon, \delta\big(O(u)\big) +\; \varepsilon\}$.

So, d(u, T^mu) $\leq\; \varepsilon$+ ψ(max$\{2\,\varepsilon, \delta\big(O(u)\big) +\; \varepsilon\}$)- φ(max$\{2\,\varepsilon, \delta\big(O(u)\big)$ for all m$\in$N and

sup$\{d$(u, T^mu) : mϵN$\}\leq \varepsilon +$ ψ(max$\{2\,\varepsilon, \delta\big(O(u)\big) +\; \varepsilon\}$)- φ(max$\{2\,\varepsilon, \delta(O(u) + \varepsilon)\}$).

Hence,

$\delta\big(O(u)\big) = sup\{(u, T^m u)$: mϵN$\}\leq\;$ ψ($\delta\big(O(u)\big)$- $\varphi(\delta\big(O(u)\big) \leq\;$ ψ($\delta\big(O(u)\big)$< $\delta\big(O(u)\big)$,

which is impossible. Hence $\delta\big(O(u)\big) = 0$ and $d(u, Tu)$ = 0 and $d(Tu, u)$ = 0, so u is a fixed point of T, Tu=u.

Now let's proof that 2) ⇒3).

Let's take ψ $(t) = rt$ for all t in [0, +∞) and 0≤ $r < 1$ and $\varphi(t) = (1-r)t$ and form the condition (2) we have

$$d(Tx, Ty) \leq \delta\big(O(x) \cup O(y)\big) - (1-r)\delta\big(O(x) \cup O(y)\big) = r\delta(O(x) \cup O(y))$$

and condition 3) is satisfied so far. Hence T has a fixed point

3) ⇒1). It is true from the theorem 2.1.

This result is more generalized than result of theorem 2.1 of Z.Liu in [5] in two directions. We have replaced the metric spaces with quasi-dislocated spaces and contractive condition (2) in theorem 2.1 of Z.Liu with more general conditions (2) in our theorem.

ÖZET: Bu çalışma, TÜBİTAK tarafından desteklenen doğa eğitimi projesi çerçevesinde gerçekleştirilmiştir. Bu çalışmada, "Fenin Araştırıcı Doğasını Anlıyorum" projesinin, çevreye yönelik tutum, davranış ve düşünce üzerindeki etkililiğini; öğrencilerin fen ve doğa hakkındaki görüşlerini; uygulama öncesinde öğrencilerin projeden beklentileri ve sonrasında da projenin kendilerine olan katkılarını belirlemek amaçlanmıştır. Çalışma grubunu, 12 Ağustos-08 Eylül 2013 tarihleri arasında gerçekleştirilen doğa eğitimi programına katılan 108 ortaokul öğrencisi oluşturmaktadır. Her gruba, uygulamanın başlangıcında ön-test ve bitiminde son-test ölçek uygulaması gerçekleştirilmiş ve açık uçlu sorulardan oluşan bir ölçme aracı da kullanılmıştır. Ölçeklerden elde edilen bulgulara göre; gruplarda ön-test ve son-test uygulamalarında istatistiksel olarak anlamlı bir farklılık saptanmamakla birlikte, gruplar arasında yapılan tek yönlü varyans analizine göre; 5. ve 6. sınıfı bitirmiş öğrencilerin çevresel tutumlarının, diğer gruplara göre daha yüksek olduğu saptanmıştır. Öğrencilerin görüşlerinden elde edilen bulgulara göre; öğrencilerin fen ve doğaya ilişkin görüşlerinin, proje çalışmaları esnasında gerçekleştirdikleri uygulamalı etkinliklerle ve doğada yaşamı tecrübe etmeleriyle, olumlu yönde değiştiği söylenebilir.

Anahtar sözcükler: araştırıcı fen eğitimi, fenin araştırıcı doğası, çevre bilinci

ABSTRACT: The purpose of this study is to investigate the effects of the project "I Understand the Researching Nature of Science" supported by The Scientific and Technological Research Council of Turkey (TUBITAK) on environmental attitudes, behavior and thought; the opinions of the students about science and nature; expectations of the students before the project and contributions of the project at the end of the Project.
The study group consists of 108 secondary school students who participated in this nature education project carried out on 12 August-08 September 2013. For each group, a pretest-scale application was made at the beginning of the application and post test-scale application was made at the end of the application. Based on the findings obtained from the opinions of the students about science; it can be stated that opinions of the students about science have changed favorably by applied activities made during the project studies and by experiencing life in the nature.

Key words: researching science education, nature of researching science education, environmental consciousness

GİRİŞ

"Okul dışı öğrenme" yurtdışı alan yazınında "outdoor education" olarak yer almaktadır. Okul dışı öğrenme (outdoor education); çevre eğitimi (environmental education), okul dışı etkinlik (outdoor activities) ve kişisel ve sosyal gelişiminin (personal & social developmant) birleşiminden meydana gelir (Higgins, Loynes and Crowther, 1997). Benedict (1991) aktif öğrenmenin, çevre eğitiminin duygusal, etik ve davranışsal hedeflerini başarmanın anahtarı olduğunu ifade etmiştir. Yurtdışında yapılan bazı çalışmalarda, birçok dersin okul dışı ortamlarda yapıldığı belirtilmektedir (Barker, Slingsby & Tilling, 2002; Farmer, Knapp, &Benton, 2007; Lugg & Slattery, 2003; Braund, and Reiss, 2006). İlgili çalışmalarda fen eğitiminin, biyoloji eğitiminin okulun dışında da yapılabildiği hususuna vurgu yapılmaktadır. Ülkemizde ise, son yıllarda artan doğa eğitimleri, çevre

[1] Bu çalışma, TÜBİTAK tarafından desteklenen 113B114 kodlu, Fenin Araştırıcı Doğasını Anlıyorum isimli Proje kapsamında gerçekleştirilmiştir.

eğitimleri ve okul dışı etkinlikler; konuya olan ilginin arttığını göstermektedir (Güler, 2009; Atasoy, 2006; Erten, 2004, Uzun, Uzun ve Keleş, 2010; Bozdoğan, 2007; Balkan Kıyıcı ve Atabek Yiğit, 2010).

TÜBİTAK tarafından desteklenen "Fenin Araştırıcı Doğasını Anlıyorum" isimli doğa eğitimi projesi çerçevesinde gerçekleştirilen bu çalışmada, ortaokul öğrencilerinin çevreye yönelik tutum, davranış ve düşüncelerinin doğa eğitimi projesine bağlı değişimini; öğrencilerin fen ve doğa hakkındaki görüşlerini; uygulama öncesinde öğrencilerin projeden beklentilerini ve sonrasında da projenin kendilerine olan katkılarını belirlemek amaçlanmıştır.

YÖNTEM

Çalışmanın Modeli

Bu çalışma öntest-sontest desenine dayalı olarak gerçekleştirilmiştir.

Çalışma Grubu

Çalışma grubunu, TÜBİTAK tarafından desteklenen, 12 Ağustos-08 Eylül 2013 tarihleri arasında gerçekleştirilen "Fenin Araştırıcı Doğasını Anlıyorum" isimli doğa eğitimi programına katılan 108 ortaokul öğrencisi oluşturmuştur. Proje etkinliklerine; birinci hafta 5. sınıfı bitiren 27 öğrenci; ikinci hafta 6. sınıfı bitiren 28 öğrenci; üçüncü hafta 7. sınıfı bitiren 25 öğrenci ve dördüncü hafta 8. sınıfı bitiren 28 öğrenci katılmıştır. Katılımcıların 59'u (%55) kız ve 49'u (%45) erkektir. Öğrenci katılımının bedelsiz gerçekleştirilmesi amaçlandığından; çalışma grubunun belli maddî ve sosyal imkânlardan yoksun, akademik başarıları yüksek olan öğrencilerden seçilerek belirlenmesi önem arz etmiştir. Bu sebeple; dört ayrı grubun aynı tür etkinlikleri gerçekleştirdiği bu çalışmada, Sosyal Hizmetler Çocuk Esirgeme Kurumu'nda kalan ortaokul öğrencileri ve sosyo–ekonomik düzeyi düşük olan ailelerin Eskişehir ilinde ortaokul öğrenimi gören çocukları ile çalışma yürütülmüştür.

Doğa Eğitimi Kapsamında Gerçekleştirilen Etkinlikler

Bu çalışmanın toplam uygulama süresi dört haftadır. Bir haftanın 6 tam günü boyunca atölye ve etkinlikler düzenlenmiştir. Yapılan etkinliklerde, hem en üst düzeyde verim sağlamak, hem de geniş bir kitleye ulaşmak hedeflenmiştir. Bütün etkinlikler, ortaokul düzeyinde öğrenim görmekte olan öğrencilere uygun hazırlanmıştır. Farklı bilimsel konu ve alanlarda gerçekleştirilen gözlem, uygulama ve etkinliklerle, disiplinlerarası yapılan bu çalışmanın; öğrencilere, bilime olumlu bir bakış açısı kazandıracağı düşünülmüştür. Aktif öğrenme yöntemlerinin uygulandığı bu proje ile; doğa kamp ve gezisi, fen etkinlikleri, çevre bilinci kazanımı etkinlikleri, bilim turu, sağlık etkinlikleri gibi, fen bilimlerini temel alan etkinliklerin yanı sıra, sanatsal etkinlikler yoluyla da; öğrencilerin öğrenme becerilerini geliştirmeleri hedeflenmiştir.

Veri Toplama Araçları

Bu çalışmada ortaokul öğrencilerinden oluşan her gruba, doğa eğitimi sonucunda çevre bilinçlerindeki değişimi ölçmek amacıyla, uygulamanın başlangıcında ön-test ve bitiminde son-test ölçek uygulaması gerçekleştirilmiştir.

Tablo 1. Ölçeklere ait croanbach alfa güvenirlik katsayıları

	Ön test	**Son test**
Çevresel davranış ölçeği	0,880	0,919
Çevresel düşünce ölçeği	0,751	0,693
Çevresel tutum ölçeği	0,798	0,832

Üç kısımdan oluşan ölçeğin; birinci kısmı "çevresel davranış alt ölçeği [13 madde]", ikinci kısmı "çevresel düşünce alt ölçeği [14 madde]" ve üçüncü kısmı ise "çevresel tutum ölçeği [24 madde]" olarak hazırlanmıştır. Çevresel tutum ölçeği; Aslan, Sağır ve Cansaran (2008) tarafından Türkçeye uyarlanmıştır. Ölçek, toplam 24 madde bulunan beşli likert tipindedir. Uzun ve Sağlam (2006) tarafından geliştirilen; 13 maddeden oluşan çevresel davranış alt ölçeği ile 14 maddeden oluşan çevresel düşünce alt ölçeği toplam 27 maddenin bulunduğu beşli likert tipindedir. Ölçeklerin güvenirlik katsayıları tablo 1'de verilmiştir.

Verilerin Analizi

Elde edilen verilerin istatistiksel analizinde SPSS 15.0 programı kullanılmıştır. Ölçekten elde edilen toplam puanlar üzerinden, ön-test ve son-test karşılaştırılmasına gidilmiştir. Gruplar arası (5., 6., 7. ve 8. sınıflar) farklılıkların belirlenmesi için tek yönlü varyans analizi yapılmıştır. Ayrıca, etkinliklerin başlangıcında ve bitiminde açık uçlu sorulardan oluşan bir ölçme aracı da kullanılmıştır. Bu ölçme aracında, öğrencilerin fen ve doğa hakkındaki görüşleri elde edilmeye çalışılmıştır. Ayrıca, proje öncesinde öğrencilerin projeden beklentileri ve sonrasında da projenin kendilerine olan katkıları öğrenci görüşlerine göre değerlendirilmiştir.

BULGULAR

Bu bölümde, öntest-sontest desenine dayalı uygulanan, çevresel tutum ve çevresel düşünce ile çevresel davranış alt ölçeklerinden alınan toplam puanlar üzerinden; ön-test ve son-test karşılaştırılmasına gidilmiştir. Gruplar arası (5, 6, 7 ve 8. sınıflar) farklılıkların belirlenmesi için tek yönlü varyans analizi yapılmıştır. Ayrıca, öğrencilerin fene ilişkin görüşleri; etkinlikler öncesinde projeden beklentileri ve etkinlikler sonrasında projenin kendilerine olan katkıları, öğrenci görüşlerine göre değerlendirilmiştir. Bütün katılımcılar için elde edilen sonuçlar, aşağıda sunulmuştur.

Ölçeklerden elde edilen sonuçlar

Çevreye yönelik tutum, davranış ve düşünce ölçeklerinin, gruplara ön-test ve son-test uygulamalarından elde edilen verilere göre, istatistiksel olarak anlamlı bir farklılık saptanmamıştır. Gruplar arasında yapılan tek yönlü varyans analizine göre; 5. ve 6. sınıfı bitirmiş öğrencilerin çevresel tutumlarının, diğer gruplara göre daha yüksek olduğu saptanmıştır. Ayrıca, kız öğrencilerin tutumları ile erkek öğrencilerin tutumları arasında, herhangi anlamlı bir farklılık saptanmamıştır.

Öğrencilerin fene ilişkin görüşlerinden elde edilen sonuçlar

Etkinlikler öncesinde "fen deyince ne anlıyorsunuz?" sorusuna, çoğunlukla "fizik, kimya ve biyoloji anlıyorum" gibi cevaplar veren öğrenciler; etkinlikler sonrasında, "fenin daha ziyade doğa ile ilişkili olduğunu ve gerçek yaşamda gözlemlediğimiz pek çok şeyin aslında fen olduğunu, doğadaki biyolojik çeşitlilik, tabiattaki doğa olayları ve benzeri pek çok durum ve çözüm yolunun fenden geçtiğini anlıyorum" gibi cevaplar vermişlerdir.

Öğrencilerin proje uygulamalarından beklentileri ve projenin öğrencilere kazandırdıkları

Öğrencilerin etkinlikler öncesinde proje uygulamalarından beklentileri ve etkinlikler sonrasında projenin kendilerine olan katkıları, öğrenci görüşlerine göre değerlendirilmiştir. Öğrencilerin büyük bir kısmı, projeden eğlenceli bir süreç ile birlikte yeni bilgiler edinmeyi beklerken, bazıları ise, projeden önümüzdeki yıllarda okul derslerinde faydalı bilgilerin sunulmasını beklemişlerdir. Ayrıca okulda öğrendikleri bilgileri pekiştirmeyi de ümit etmişlerdir. Öğrenciler, proje uygulamaları sonrasında etkinliklerin kendilerine olan katkılarını genel anlamda aşağıdaki sözcüklerle ifade etmişlerdir: Çevre bilinci ve duyarlılığının oluşması; Fen kavramlarının şarkı ve şiirlerle öğrenilmesi; Enerjinin dönüşümü, enerji kaynakları, yenilenebilir ve sürdürülebilir enerjinin kavranması; Doğada yaşamı, yemek yapmayı ve günlük plân program yapmayı öğrenme; Doğada yaşamanın zorluklarıyla başa çıkma yollarını öğrenme; Yaşamın her anında karşılaştıkları durum ve olayların fen ile olan ilişkisini fark etme; Geri dönüşümün sağladığı faydalar; Bağımsız fikir üretme ve deney yapma becerisinin gelişmesi; Okuldaki derslerde fayda sağlayacak bilgiler öğrenme; Fenin zevkli ve bilimsel bir ders olduğunun farkına varma; Bazı bitki ve hayvanları tanıma, doğa yürüyüşünde bunları fark etme ve inceleme; Zehirli hayvanlara karşı önlem almayı öğrenme; Pusula ve harita ile yön bulmayı öğrenme; Birlikte yaşamayı ve toplu hareket edebilmeyi öğrenme; İlk yardım yapmayı öğrenme; Dengeli beslenme ve doğru el yıkamayı öğrenme; Fenin birçok ders ve olayla bağlantılı olduğunu öğrenme, Yaşadığımız ilin tarihini ve kültürünü öğrenme; Fen konularını şarkılarla öğrenme.

SONUÇ ve ÖNERİLER

TÜBİTAK tarafından desteklenen "Fenin Araştırıcı Doğasını Anlıyorum" başlıklı proje çerçevesinde, çalışmada elde edilen sonuçlar, aşağıda özetlenmiştir:

Çevreye yönelik tutum, davranış ve düşünce ölçeklerinden elde edilen bulgulara göre; çalışma gruplarına ön-test ve son-test uygulamalarında istatistiksel olarak anlamlı bir farklılık saptanmamıştır. Bu durumda, projenin başlangıç ve bitiş tarihinin birbirine yakın olması etken olabilir. Gruplar arasında yapılan tek yönlü varyans analizine göre; 5. ve 6. sınıfı bitirmiş öğrencilerin çevresel tutumlarının, diğer gruplara göre daha yüksek olduğu belirlenmiştir. Elde edilen bu bulguya göre, öğrencilerin yaş gurubu büyüdükçe; çevreye, fen ve doğaya olan ilgilerinin nispeten azalabildiği sonucu çıkarılabilir. Çalışma bulgularına göre, kız öğrencilerin tutumları ile erkek öğrencilerin tutumları arasında, anlamlı bir farklılık saptanmamıştır. Elde edilen bulgulara göre, 6 günlük etkinliklerin gerçekleştiği proje uygulamaları programında, öğrencilerin etkinlikler öncesi ve etkinlikler sonrasında, çevreye yönelik tutumlarında anlamlı farklılık olmamasına rağmen, aşağıda sunulan bulgular değerlendirildiğinde; öğrencilerin proje çalışmalarından, daha güçlü olumlu tutumlarla ayrıldıkları söylenebilir.

Mittelstaedt, Sanker ve Vanderveer'in (1999), 5 günlük biyolojik çeşitlilikle ilgili etkinliklerin gerçekleştiği yaz okulu programında, öğrencilerin çevreye yönelik olumlu tutumlara sahip olmalarına rağmen, yaz okulundan daha güçlü olumlu tutumlarla ayrıldıklarını tespit ettikleri bulgu, bu çalışmada ulaşılan bulguları destekler niteliktedir. Bu araştırmanın sonuçlarını destekler nitelikte bazı çalışmalar bulunmaktadır: Ballantyne ve Packer (2002) araştırmalarında, doğayla etkileşimin etkili bir strateji olduğunu belirtmiştir. Keleş, Uzun, N. ve Uzun, V. (2010) araştırmalarında, doğa eğitimi projesinde gerçekleştirilen aktif öğrenme yöntem ve tekniklerinin kullanıldığı etkinliklerin, öğretmen adaylarının çevreye yönelik tutum ve bilinçlerini geliştirmede etkili olduğunu gözlemlemişlerdir.

Etkinlikler öncesinde "fen deyince ne anlıyorsunuz?" sorusuna, çoğunlukla "fizik, kimya ve biyoloji anlıyorum" gibi cevaplar veren öğrenciler; etkinlikler sonrasında, "fenin daha ziyade doğa ile ilişkili olduğunu ve gerçek yaşamda gözlemlediğimiz pek çok şeyin aslında fen olduğunu, doğadaki biyolojik çeşitlilik, tabiattaki doğa olayları ve benzeri pek çok durum ve çözüm yolunun fenden geçtiğini anlıyorum" gibi cevaplar vermişlerdir. Buna göre, öğrencilerin fen hakkındaki görüşlerinin, proje çalışmaları esnasında gerçekleştirdikleri uygulamalı etkinliklerle ve doğada yaşamı tecrübe etmeleriyle, olumlu yönde değiştiği söylenebilir. Doğa Eğitimi Projesi çerçevesinde gerçekleştirilen etkinliklerle, klásik öğrenme metotlarının dışında olan ve daha çok günlük yaşantıdan ve deneyimlerden beslenen bir öğrenme ortamı sunulmuştur. Sözkonusu proje uygulamaları, değişik öğrenme ortamları yoluyla öğrencilerin; basit fen olguları konusunda farkındalık kazanmasına, bilim için gerekli görülen -ve, belki de en önemli duygu olan- merak duygularının artmasına ve araştırma, öğrenme arzularının harekete geçmesine katkıda bulunmuştur. Farklı bilimsel konu ve alanlarda gerçekleştirilen gözlem, uygulama ve etkinliklerle; disiplinlerarası yapılan bu proje uygulamalarının; öğrencilere, bilime olumlu bir bakış açısı kazandırdığını söylemek mümkündür. Elde edilen sonuçlara dayanarak, fen ve teknoloji öğretim programına; günlük hayattaki nesnelerle olaylardaki fen kavramlarının, öğrencilerin sosyalleşmelerine ve hayatın içinde öğrenmelerine imkân sağlayacak biçimde, okul dışında da öğretilebileceği türde bir program eklenmesi ve öğretmenlerin öğretim uygulamalarında bu tarz etkinliklere yer vermeleri önerilmektedir.

Öğrencilerin etkinlikler öncesinde proje uygulamalarından beklentileri ve etkinlikler sonrasında projenin kendilerine olan katkıları, öğrenci görüşlerine göre değerlendirilmiştir. Öğrencilerin büyük bir kısmı, projeden eğlenceli bir süreç ile birlikte yeni bilgiler edinmeyi beklerken, bazıları ise, projeden önümüzdeki yıllarda okul derslerinde faydalı bilgilerin sunulmasını beklemişlerdir. Ayrıca okulda öğrendikleri bilgileri pekiştirmeyi de ümit etmişlerdir. Öğrenciler, proje uygulamaları sonrasında etkinliklerin kendilerine olan katkılarını genel anlamda şu sözcüklerle ifade etmişlerdir: Çevre bilinci ve duyarlılığının oluşması; Fen kavramlarının şarkı ve şiirlerle öğrenilmesi; Enerjinin dönüşümü, enerji kaynakları, yenilenebilir ve sürdürülebilir enerjinin kavranması; Doğada yaşamı, yemek yapmayı ve günlük plân program yapmayı öğrenme; Doğada yaşamanın zorluklarıyla başa çıkma yollarını öğrenme; Yaşamın her anında karşılaştıkları durum ve olayların fen ile olan ilişkisini fark etme; Geri dönüşümün sağladığı faydalar; Bağımsız fikir üretme ve deney yapma becerisinin gelişmesi; Okuldaki derslerde fayda sağlayacak bilgiler öğrenme; Fenin zevkli ve bilimsel bir ders olduğunun farkına varma; Bazı bitki ve hayvanları tanıma, doğa yürüyüşünde bunları fark etme ve inceleme; Zehirli hayvanlara karşı önlem almayı öğrenme; Pusula ve harita ile yön bulmayı öğrenme; Birlikte yaşamayı ve toplu hareket edebilmeyi öğrenme; İlk yardım yapmayı öğrenme; Dengeli beslenme ve doğru el yıkamayı öğrenme; Fenin birçok ders ve olayla bağlantılı olduğunu öğrenme, Yaşadığımız ilin tarihini ve kültürünü öğrenme; Fen konularını şarkılarla öğrenme. Aktif öğrenme yöntemlerinin uygulandığı bu proje çalışması ile; doğa kamp ve gezisi, fen etkinlikleri, çevre bilinci kazanımı etkinlikleri, bilim turu, sağlık etkinlikleri gibi, fen bilimlerini temel alan etkinliklerin yanı sıra, sanatsal etkinlikler yoluyla da; öğrencilerin öğrenme becerilerini geliştirmelerine katkıda bulunulmuştur. Söz konusu etkinliklerde asıl amaç; öğrencileri izleyici ve dinleyici -yâni, pasif- konumdan çıkarıp, daha çok uygulayıcı, yaparak ve yaşayarak öğrenen bireyler haline getirmektir. Böylece elde edilen bilgi; öğrenci tarafından yapılandırılıp, özümseneceği için, kalıcı bilgi haline dönüşecektir. Öğrenci bilgiyi kalıcı biçimde özümsedikçe, bilimsel araştırma ve düşünme hususunda daha fazla inisiyatif sahibi olacaktır. Bu durum, öğrencilerin fen okuryazarı bireyler olmasında önemli katkı sağlayacaktır. Fen okuryazarı sosyal birey, fenin temel becerilerine sahip olmanın yanısıra tarihini de bilen, topluma fayda sağlayabilen, sanatsal konulara ilgili ve sağlık okuryazarı birey olarak da toplumda yerini alacaktır. Bu noktadan hareketle, bu çalışma; fen okuryazarlığının temel bileşenlerini ele alarak, farklı disiplinlerle ilişkilerini ortaya koymuştur. Farklı bilimsel konu ve alanlarda gerçekleştirilen gözlem, uygulama ve etkinliklerle; disiplinlerarası yapılan bu çalışmanın, öğrencilere, bilime olumlu bir bakış açısı kazandırdığı düşünülmektedir. Çalışmada elde edilen sonuçlar, literatürde bulunan bazı çalışmaları (Şahin ve Yazgan, 2013; Keleş, Uzun ve Uzun, 2010; Bogner 1998; Adıgüzel, 2006; Eaton, 2000; Palmberg ve Kuru, 2000) destekler biçimde, fen ve teknoloji öğretim programına, sınıf dışı etkinliklerin eklenmesinin gerekliliğini ortaya koymaktadır. Bundan sonra, hayatın içinde fen öğretimini uygulanabilir kılacak yöntemler geliştirilmesi için zemin hazırlayacak projelerin yapılması/tetiklenmesi önerilir. Ayrıca, araştırmacılara; fen öğretiminde öğrencilerin derse daha etkin bir şekilde katılımını sağlayacak yöntemlerin geliştirilmesine yönelik çalışmalara ağırlık vermesi önerilmektedir.

ÖZET: Bu araştırmanın genel amacı, fizik öğretmen adaylarının sahip oldukları eğitim felsefesine ilişkin görüşlerini eğitim sürecinde öğretmen ve öğrenci rolü açısından değerlendirmektir. Bu amaca uygun olarak araştırmada tarama modeli kullanılmıştır. Araştırmaya 86 öğretmen fizik öğretmen adayı katılmıştır. Veriler; Daimicilik, Esasicilik, İlerlemecilik, Varoluşçuluk, Dielektrik Materyalizm, Naturalizm ve Yeniden Kurmacılık eğitim felsefesi akımlarına ilişkin toplam 77 ilkeyi içeren bir ölçek ile elde edilmiştir. Verilerin analizinde puanların frekans(f), yüzde (%) ve ortalama ($\overline{X}$) değerlerinden yararlanılmıştır. Araştırma sonuçlarına göre, öğretmen adaylarının öğretmenin rolü açısından en yüksek katılım gösterdiği boyut varoluşçuluk alt boyutudur. Öğrencinin rolü açısından esasicilik akımına katılım çok düşük düzeydedir. Araştırmada elde edilen bulgular literatüre dayalı olarak tartışılmıştır.

Anahtar sözcükler: eğitim felsefesi, fizik öğretmen adayı, öğretmenin rolü, öğrencinin rolü.

ABSTRACT: The main purpose of this study is to evaluate department of physics teacher candidates' perceptions about their own educational philosophy in terms of teachers and students roles in learning – teaching process. For this purpose, the study was based on the survey model. A total of 86 physics teacher candidates' participate into the study. The data are collected through a scale which has a total of 77 principles of various issues of educational phisolophies; Perennialism, Essentialism, Progressivism, Existentionalism, Dielectric Materialism, Naturalism and Reconstructionism. In the analyze process of data were used frequency(f), percent rate (%) and arithmetic meaning ($\overline{X}$) values of scores. In terms of the teachers roles in learning – teaching process, the physics teacher candidates' display a higher rate of educational belief in sub-dimensions of both Existentionalism. The teachers candidates' showed a low agreement rate in essentialist educational philosophy. Findings were discussed based on the literature.

Key words: Education philosophies, physics teacher candidates, teachers roles, students roles.

ÖZET: Araştırmanın amacı, Eğitim Fakültesi OFMAE Bölümü Fizik Öğretmenliği programında öğrenim gören Fizik öğretmen adaylarının, Kolb Öğrenme stilleri içerisinden tercih ettikleri baskın öğrenme stillerini belirlemek; motivasyon türü, cinsiyet, akademik başarı, bilgi iletişim becerileri gibi demografik değişkenler açısından incelemektir. Bu araştırmada genel tarama modellerinden tekil ve ilişkisel tarama modelleri kullanılmıştır. Çalışma 50 fizik öğretmen adayıyla gerçekleştirilmiştir. Veriler iki bölümden oluşan bir anket aracılığıyla toplanmıştır. Veri toplama aracı olarak kullanılan anket formunun birinci bölümünü; öğrencilerin kişisel bilgilerini, bilgi ve iletişim teknolojilerini kullanma durumlarını betimsel olarak ortaya çıkartacak demografik bilgiler, ikinci bölümünü ise Kolb Öğrenme Stili Envanteri oluşturmaktadır. Araştırma sonunda öğrencilerin sırasıyla değiştiren, yerleştiren, ayrıştıran ve özümseyen öğrenme stiline sahip oldukları Sonuçlar alan yazınında yer alan araştırmaların çoğunluğunun sonuçları ile farklılık göstermiştir. Elde edilen bulgulara göre bireylerin öğrenme stili, cinsiyet, motivasyon, akademik başarı, bilgi iletişim becerilerine göre farklılaşmamaktadır.

Anahtar sözcükler: öğrenme stili, motivasyon, akademik başarı, bilgi iletişim teknolojileri.

ABSTRACT: In this study, department of physics teacher candidates' dominant learning styles, academic success, gender, motivation information and communication technology were examined. Singular and relational surveymodel used in this study.The sample composed of 50 physics teacher candidates'. The data were collected through a paper based survey composed of two parts. In the first part of the survey there are fifteen items aboutpersonal information and demographic information about students'. In the second part is "Kolb Learning Style Inventory". The data were analyzed by using descriptive statistics and chi-square test. At the end of the study it has been found that physics teacher candidates' have learning styles in order of diverger, accomadator, converger and assimilator. These results have displayed difference to the results of majority studies in literature. According to the data collected, individuals' learning styles do not differ in gender, motivation, academic success and information communication technology.

Key words: learning styles, motivation, academic success, information communication technology.

ÖZET: Her gün bir yenisinin eklendiği mobil uygulamalar günümüzün en popüler teknolojisi olarak görülmekte ve giderek yaygınlaşmaktadır. Bu nedenle teknolojik çözümlerin mobil cihazlar için geliştirilmesi bir zorunluluk halini almıştır. Bu çalışmada, ulusal ve uluslararası tıp kongreleri ve etkinlikleri için katılımcıların etkinlik öncesi, sonrası ve sırasında kullanabilecekleri iOS tabanlı bir mobil uygulama geliştirilmiştir. Böylece tıp kongrelerinde katılımcılara, kongre deneyimlerini arttıracak akıllı mobil çözümler üretilmesi hedeflenmektedir. Kongre esnasında katılımcıların ihtiyaçları ve gereksinimleri ile piyasada var olan örnek uygulamalar incelenmiş, kullanıcılara yeni çözümler ve hizmetler üretmeye yönelik çalışmalar yapılmıştır. Uygulama iOS tabanlı (iPhone ve iPad) cihazlar için geliştirilmiş olup uygulama yazılımı XCode kullanılarak gerçekleştirilmiştir. İçerikler için JSON web servisi kullanılmış olup uygulama ana menü üzerinden ulaşılabilecek birçok sayfadan meydana gelmektedir. Sonuç olarak, geliştirilen bu uygulama ile eğitim amaçlı düzenlenen kongrelerde verilere erişim hızı ve eğitim kalitesi önemli ölçüde arttırılmıştır.

Anahtar sözcükler: mobil uygulama, mobil kongre, iOS

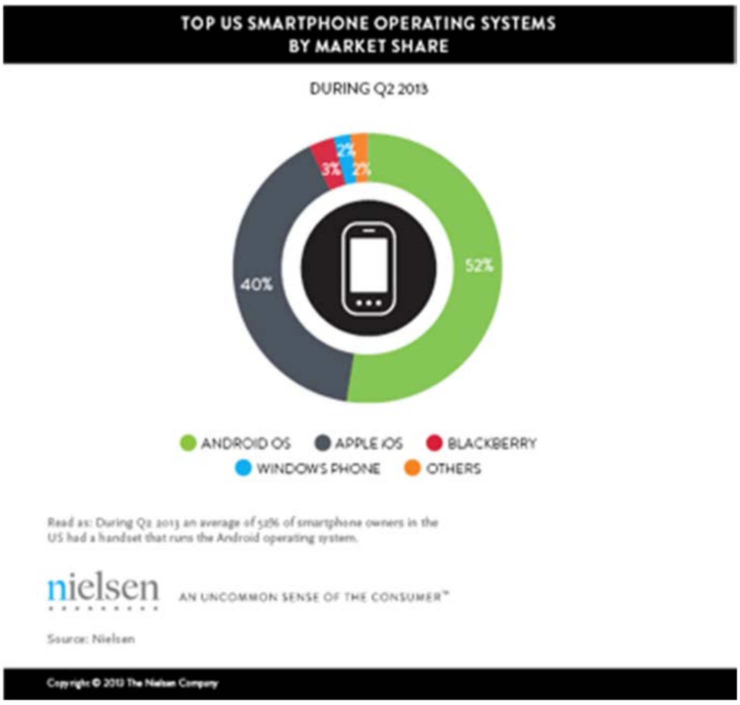
ABSTRACT: Mobile applications, in which a new one emerged each day, appear to be the most popular technology and have become increasingly common. Therefore, development of the technological solutions for mobile devices becomes an obligatory. In this work, an iOS based mobile application was developed, which can be used by participants for national and international medical congresses before-after and during the activity. So, it is aimed to produce an intelligent mobile solution that will raise the congress experiences of the participants. To do that, the needs and requirements of the participants were examined during the congress. Besides, the model applications that are available in the market were also investigated. Further, preliminary studies were conducted on producing new solutions and services to users. The application was developed for devices running on iOS (iPhone and iPad) platform. The software of the application was implemented by using Xcode development environment. For the context of the application, JSON web service was used. The application is composed of several pages that can be reached over main menu. Consequently, the access speed to data was increased and the education quality during the congresses was improved.

Key words: mobile application, mobile congress, iOS

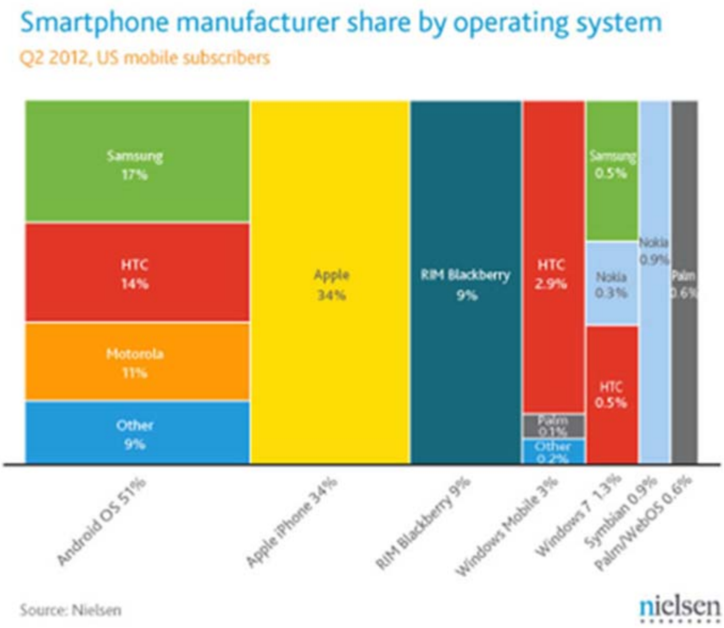
GİRİŞ

Günümüz teknolojisi her geçen gün değişmekte ve gelişmektedir. Mobil cihazlarla birlikte hayatımızın vazgeçilmez parçası olan teknoloji, hayatımızı kolaylaştırmak için her an bizimledir. Her gün bir yenisinin eklendiği mobil uygulamalar günümüzün en popüler teknolojisi olarak görülmekte ve giderek yaygınlaşmaktadır. Bu nedenle teknolojik çözümlerin mobil cihazlar için geliştirilmesi bir zorunluluk halini almıştır.

Bu çalışma kapsamında Tıp kongrelerinde katılımcılara; kongre öncesinde, sonrasında ve süresince kullanabilecekleri, işlerini kolaylaştıracak servisler sunan akıllı bir uygulama geliştirilmiştir.
Bu araştırmada mobil platform olarak iOS'un seçilmesinin temel nedeni; Şekil-1 ve Şekil-2'de de görüldüğü gibi Android işletim sisteminin son yıllarda mobil uygulama pazarında daha büyük bir yere sahip olmasına rağmen, uygulamayı kullanacak olan hedef kitlenin yani tıp doktorların büyük bir çoğunluğunun iOS işletim sistemine sahip cihazlar kullanmasıdır.



Şekil 1. Akıllı Telefon İşletim Sistemlerinin Pazar Payları



Şekil 2. Akıllı Telefon Kullanıcılarının Kullandıkları Cihaz Markaları ve İşletim Sistemleri

Uygulama yazılımı , XCode geliştirme ortamı kullanılarak gerçekleştirilmiştir. Kullanıcının uygulama içeriğini sürekli güncel olarak görüntüleyebilmesi için JSON web servisler kullanılmıştır. Ayrıca kullanıcıların interneti olmadığı durumlarda da içeriklere ulaşabilmeleri için güncel içerikler uygulama veritabanına kaydedilmektedir. Uygulama internete bağlı olarak her açıldığında uygulamanın daha güncel bir sürümü olup olmadığı kontrol edilmekte ve eğer varsa güncelleme yapılmaktadır. Bu sayede kongre esnasında bilimsel programda ya da herhangi bir etkinlikte bir güncelleme yapıldığında anlık olarak katılımcılara yansımaktadır.

UYGULAMA İÇERİĞİ

Uygulama ana menü üzerinden ulaşılabilecek birçok sayfadan meydana gelmektedir. Bu sayfalar incelenen yerli ve yabancı uygulama örnekleri ve kullanıcı ihtiyaçları göz önünde bulundurularak belirlenmiştir. Bunlar; "Şu Anda", "Bilimsel Program", "Konuşmacılar", "Genel Bilgiler", "Bildiriler", "Medya", "Duyurular", "Arama" sayfalarıdır.

1. Şu Anda

Bu sayfada katılımcılar kongrede o esnada başlamış, devam eden ve yaklaşmakta olan oturumların listesini görüntüleyebilmektedir. Şekil 3'te de görüldüğü gibi ilk ekranda oturum ve salon isimleri görünmekte, içerik detay sayfasında ise oturumdaki konuşmalar ve konuşmacı bilgilerine erişilebilmektedir.

Şekil 3. Kongre Uygulamasının Şu Anda Sayfası

2. Bilimsel Program

Şekil 4'te de görüldüğü gibi Bilimsel Program sayfasından kongre programının tümüne, (gün veya kategori bazlı) salon adı, saati ve oturumun tipine bu sayfadan liste halinde ulaşılabilmektedir. Detay sayfalarında ise oturumlarda yapılacak sunumların detaylarına erişilebilmektedir. Bu detaylar; oturum başkanı, konuşmacı bilgileri, salon yeri ve saat bilgisi, sunum özetleri ve ayrıca pdf'lerden oluşmaktadır.

Şekil 4. Kongre Uygulamasının Bilimsel Program Sayfası

3. Konuşmacılar

Kongreye katılan, sunum ya da diğer çalışmaları gerçekleştiren ya da hazırlayan ekipte yer alan tüm yazar/konuşmacıların listesine, oturum – sunum bilgilerine ve bildiri özetlerine (ayrıca varsa bu özetlerin tam metinlerine) bu sayfadan ulaşılabilmektedir.

4. Genel Bilgiler

Kongre ile genel bilgilere erişim imkanı sağlayan sayfadır. Bu sayfadan kullanıcı; kongre bilgilerine, kurul bilgilerine, kongre otellerine, sosyal programlara, transfer bilgilerine, salon planları vb. bilgilere erişebilmektedir.

5. Bildiriler

Konuşmacılar tarafından yayınlanmasına izin verilen bildirilerin listelendiği sayfadır. Bu sayfadan kullanıcılar bildiri özetlerine ve tam metin bildirilere erişebilmektedir.

6. Medya

Kongre esnasında çekilen salon ve genel alanların fotoğraflarının bulunduğu fotoğraf ve video galerileri ve kongre gazeteleri yer almaktadır.

7. Duyurular

Kongre öncesinde, kongre esnasında ve sonrasında yapılacak olan kongre ile ilgili duyurulara ve anlık bildirimlere bu sayfadan erişim sağlanabilmektedir.

8. Arama

Kongrede yer alan tüm çalışmaları, konuşmacı adı soyadı, sunum adı, oturum adı, bildiri adı kıstaslarına göre filtreleyerek kullanıcının aradığı bilgiye anında erişim sağlamasına ve ilgili sayfaya yönlendirmesine olanak sağlamaktadır.

9. Anketler

Kongre boyunca katılımcı memnuniyetini ölçmek, oturum ve sunumlarda dinleyicilere anlık sorular yöneltilmesine olanak vermektedir.

10. Favoriler

Kullanıcıların katılmayı düşündükleri oturumları bilimsel programdan favorilere eklemeleri sonucunda listelenen sayfadır. Ayrıca favorilere eklenen uygulamalar otomatik olarak kullanıcıya oturum öncesinde hatırlatma yapmaktadır.

SONUÇ ve ÖNERİLER

Sonuç olarak, geliştirilen bu uygulama ile eğitim amaçlı düzenlenen kongrelerde verilere erişim hızı ve eğitim kalitesi önemli ölçüde arttırılmıştır. Ayrıca kongreler için kullanıcılara dağıtılacak olan basılı materyal miktarı önemli ölçüde azaltılmış, bu sayede doğaya verilen zarar azaltılmıştır. Bunlara ek olarak katılımcılara duyurular uygulama üzerinden anlık olarak ve daha hızlı bir şekilde ulaştırılmıştır. Geliştirilen bu uygulama ulusal ve uluslararası olmak üzere 7 farklı kongrede kullanılmıştır. Bu kongreler Apple Store' da "TIHUD 2013", "39. UHK", "Uroonkoloji", "ASNO 2014", "NEFROLOJI 2013", "KLIMUD", "Politzer 2013" isimleri ile bulunmaktadır.

Geliştirilen bu uygulamadaki amaç katılımcıların kongre deneyimlerini arttırmak ve teknoloji ile bütün içeriklere anında erişim sağlamalarına olanak vermek olmuştur. İleriki çalışmalarda katılımcıların kişisel bilgileri alınarak uygulamanın kişiselleştirilerek kullanıcıya özgü olması ve kişiye özel çözümler sunmasını sağlamak hedeflenmektedir.

BİLİM İÇİN BİR BULUŞMA NOKTASI: CAFÉ SCIENTIFIQUE

A MEETING POINT FOR SCIENCE: *CAFÉ SCIENTIFIQUE*

Sultan ÇIKRIK
Gazi Üniversitesi
sultanaltunsoy@gazi.edu.tr

Mustafa YEL
Gazi Üniversitesi
musyel@gazi.edu.tr

ÖZET: Bu çalışmanın amacı, *Café Scientifique* ile ilgili alan yazını incelenmek, bilgileri sentezlemek ve uygulama örneklerini sunmaktır. *Café Scientifique*, kafe gibi informel bir ortamda, her yaştan ve seviyeden katılımcıların güncel ya da sosyo-bilimsel konularda dinleme, soru sorma, konuşma ve tartışma gibi aktiviteleri yapabileceği bilimsel bir programdır. Rahat bir atmosferde, daha önceden belirlenmiş bir soru ya da konu üzerinde rehberli bir tartışma yürütülmektedir. Bu programda herhangi bir sunum ya da resmi bir anlatım yapılmamaktadır. *Café Scientifique* programının, bilimsel okuryazarlık için alternatif bir etkinlik olabileceği düşünülmektedir.

Anahtar sözcükler: *Café Scientifique*, bilim insanı, bilimsel okuryazarlık, bilimin doğası

ABSTRACT: The aim of this study, to investigate the literature on *Café Scientifique*, to synthesize information and to present application examples. *Café Scientifique* is a scientific program in which participants from all ages and levels can realize activities such as listening, asking questions, talking, and, debating about actual or socio-scientific issues in an informal environment such as café. A guided discussion about predetermined question or subject is conducted in a relaxed atmosphere. In this program, any presentation or formal lecture is made. It is thought that, *Café Scientifique* could be an alternative activity for scientific literacy.

Key words: *Café Scientifique*, scientist, scientific literacy, nature of science

FEN BİLGİSİ ÖĞRETMEN ADAYLARININ ORGANİK BİLEŞİKLERİ IUPAC SİSTEMİNE GÖRE ADLANDIRMADA KARŞILAŞTIĞI ZORLUKLAR

Doğan DOĞAN

Organik kimya, fen bilgisi öğretmen adaylarının mezuniyetleri için almaları gereken temel alan derslerinden biridir. Fen bilgisi öğretmen adaylarından bir kimyager ya da kimya öğretmeni kadar organik kimya bilgisine sahip olmaları beklenmez. Ancak organik kimyanın günlük yaşamdaki yeri ve organik kimyada temel kavramlar hakkında yeterli bilgiye sahip olmaları ve organik bileşikleri IUPAC kurallarına göre adlandırabilmeleri gerekir. Yapılan çeşitli araştırmalar, organik kimya konularının farklı öğrenim düzeyindeki öğrenenler tarafından zor veya çok zor olarak algılandığını göstermiştir. Örneğin, İrlanda da farklı eğitim düzeyindeki öğrencilerle yapılan bir araştırmada (Childs & Sheehan, 2009), organik tepkime mekanizmaları ve organik sentez konularının çok zor, organik bileşiklerin adlandırılmasının ise ortanın üzerinde zor bir konu olarak algılandığı belirlenmiştir. Yakın zamanda yapılan başka bir araştırmada (Adu-Gyamfi, 2013) ise, lise öğrencilerinin organik bileşikleri IUPAC sistemine göre adlandırmadaki performansları belirlenmeye çalışılmıştır. Mevcut literatür incelendiğinde, organik bileşikleri IUPAC kurallarına göre adlandırmada karşılaşılan güçlükler ile ilgili herhangi bir çalışmaya rastlanılmamıştır. Bu nedenle araştırmada, fen bilgisi öğretmen adaylarının organik bileşikleri adlandırılmada karşılaştıkları zorluklar tipleri belirlenmeye çalışılmıştır. Bu amaçla, 2012-2013 akademik öğrenim yılı bahar döneminde, ülkemizin kuzey batısında yer alan bir üniversitede öğrenim gören toplam 125 gönüllü öğretmen adayına, adlandırma konusunun bitiminde araştırmacı tarafından geliştirilen toplam 25 maddelik Organik Bileşikleri Adlandırma Zorlukları anketi yöneltilmiştir. Verilerin analizinden, katılımcıların organik bileşikleri adlandırmada zorlandıkları noktalar tespit edilmiştir. Bu çalışmanın, organik bileşiklerin adlandırılmasının öğretimine katkı sunacağı umulmaktadır.

Anahtar Kelimeler: organik bileşikler, adlandırma, öğrenme zorlukları, fen öğretmen adayı

DIFFICULTIES ENCOUNTERED BY PRESERVICE SCIENCE TEACHERS IN NAMING ORGANIC COMPUNDS ACCORDING TO IUPAC SYSTEM

Doğan DOĞAN

Organic chemistry is one of the main course of preservice primary science teachers as a requirement for their major. Preservice science teachers cannot be expected to have mastered in the knowledge of organic chemistry as a chemistry teacher or chemist. However, they should have enough knowledge about the place of organic chemistry in daily life, basic concepts in organic chemistry, and be able to name the organic compounds according to IUPAC rules. Various studies have showed that organic chemistry topics perceived as difficult or very difficult by learners at different educational levels. For example, it was determined that organic reaction mechanisms and organic synthesis topics were perceived as very difficult, and naming organic compounds as moderately difficult in a study carried with students at different educational levels in Ireland (Childs & Sheehan, 2009). Also in another study carried out recently (Adu-Gyamfi, 2013), performance of a group of high school students in naming organic compounds according to the IUPAC system was tried to be determined. The available literature was examined, but it was not found any study about the difficulties encountered in naming organic compounds according to the IUPAC rules. Therefore, in this study, types of difficulties preservice science teachers encountered in naming organic compounds were tried to be determined. To this end, in the spring semester of 2012-2013 academic year, a 25-item Likert-style questionnnaire (Organic Compounds Naming Difficulties Questionnaire) developed by the reseacher was given to a total of 125 volunteer preservice primary science teachers studying at a university located in the north west of Turkey after completing the nomenclature unit. From the analysis of the data, difficult points in naming the organic compounds encountered by the participants have been identified. It is hoped that the current study will contribute to the teaching of organic compounds nomenclature.

Keywords: organic compounds, nomenclature, learning difficulties, preservice science teacher

TEACHING AND LEARNING IN HIGHER EDUCATION

Professor Moofik Al-Tai

Staffordshire University, United Kingdom

Email: m.al-tai@staffs.ac.uk

ABSTRACT: The success of Higher Education (HE) Institutions depends on the success of their students and the quality of the student learning experience will increasingly be a key determinant HE institutions success in the context of the emerging competitive higher education landscape. The HE institution's Strategic Framework for Learning and Teaching reflects the HE institution's ambition to support students to be successful at each stage of their engagement with them - from first contact through to successful entry into employment.

This paper explores effective ways of teaching and learning in higher education. It focuses especially on teaching and learning to achieve equality in diverse student access, and to achieve equity and fairness in student success and outcomes from higher education.

This paper will also deal with the current higher education teaching and learning issues and challenges. It will consider issues relating to various methods of learning including class room based learning (face to face learning), e-learning, work-based learning and distance learning. E-learning is well suited to distance learning and flexible learning, but it can also be used in conjunction with face-to-face teaching, in which case the term blended learning is commonly used. HE institutions may explore these learnings in order to improve their students' success.

Keywords: Teaching, Learning, Higher Education.

INTRODUCTION

Higher Education students should have the opportunity to develop the study skills and outlook necessary to support their currency with their chosen subject throughout their future careers. To this end the HE institution's learning and teaching strategy aims to provide a resource based learning environment with an emphasis on student opportunity rather than simple direct teaching. Each student is a partner in the learning experience and is expected to take responsibility for his/her study. The HE institutions should lay emphasis on the role of the lecturer as a learning facilitator who enables the student to take a responsibility for her/his own learning.

Student learning opportunities include e-learning, classroom-based learning; work-based learning and distance learning. These learnings involve a broad spectrum of activities appropriate to the learning outcomes and the assessment methods. These activities range from entirely self-managed study, timetabled formal lectures, tutorials, laboratory based work and presentations. Students have opportunities to use and develop theoretical knowledge, computer based models, and to design, implement and test. The transferable skills of presenting, writing, discussing, working with others, and managing one's own time are developed throughout the programme of study.

Practical work is an essential feature of many programmes of study and may take place in a number of settings including the computer laboratory or classroom. Practical work is required for preparation, assessment and other course work. As students' progress, directed reading becomes more demanding in line with the intellectual development required at all levels.

Students are encouraged to undertake independent learning to extend the material presented. The value of self-gained knowledge and understanding is emphasised both as an essential skill/practice for lifelong learning and as an expectation on professionals to continue their professional development.

E-LEARNING

E-learning is the use of electronic media and information and communication technologies in education. E-learning is broadly inclusive of all forms of educational technology in learning and teaching. E-learning is inclusive of, and is broadly synonymous with multimedia learning, technology-enhanced learning, computer-based instruction, computer-based training, computer-assisted instruction or computer-aided instruction, internet-based training, web-based training, online education, and Virtual Learning Environments (VLE). These alternative names emphasize a particular aspect, component or delivery method.

E-learning includes numerous types of media that deliver text, audio, images, animation, and streaming video, and includes technology applications and processes such as audio or video tape, satellite and computer-based learning, as well as local intranet/extranet and web-based learning. Information and communication systems, whether free-standing or based on either local networks or the Internet in networked learning, underlay many e-learning processes[1].

WORK BASED LEARNING

Work Based Learning (WBL) is a modern way of creating Higher Education (HE) level learning in the workplace. Its special work-linked features enable learning to be centred and take place throughout the working environment [2].

WBL involves HE institutions, students and employers working in partnership to provide high-quality learning for students. This includes a wide range of practice, ranging from fully-integrated WBL programmes, through work placements and practice-based learning, to the accreditation of employer provision by HE institutions [3].

WBL can help employees in making career decisions, developing job skills relevant to future employment, achieving a recognised academic qualification, enhancing their academic knowledge, achieving a recognised academic qualification and improving their personal and professional development [4].

As the HE institution builds relationships with employers, they must then transfer the appropriate information through materials. These materials represent the knowledge the HE institution holds that must be given to the students on the programme and employers themselves. With this knowledge employers can develop an understanding of the programme of content that will be given to their employees. The employees themselves will be able to have this foundation of understanding and then use the teaching materials to learn the programme of content and fully understand the subject in which they wish to build and develop their knowledge.

DISTANCE LEARNING

Distance Learning is a modern way of studying for an undergraduate, Master or PhD degree courses without actually being on site at the students chosen HE institution by using new technology in the delivery of subjects associated with these courses, including the use the VLE through the Internet.

Instead of attending lectures, students study online, attending 'virtual' tutorials and submit their assignments over the Internet. They can be in the same country as the HE institution, or overseas.

Distance learning gives the students the opportunity to study through a university that they would not necessarily be able to attend due to their physical location, or to fit study around work or other commitments.

Distance learning, presentation and interaction with materials must be approached in an alternative way to when students are regularly attending the campus, and on site at teaching locations. When a student is on campus, they are learning in direct contact with the Higher Education (HE) institution and academically trained members of staff that can facilitate their learning with their direct knowledge and supporting materials. However, a student who is off campus, and receives the course programme through means of distance learning, learns through another channel, and must therefore have materials that cater to the fact they are in a remote location.

Distance learning does not always meet the requirements of courses such as Engineering and Technology related courses where the physical classroom attendance is mandatory to complete the course. In this case a blended learning may be required.

BLENDED LEARNING

Blended learning is a combination of face-to-face learning, online assessment and feedback, mediated instruction (E-Learning) and traditional study methods, as illustrated in Figure 1 [5].

Because of the face-to-face learning sessions, blended learning can be applied to engineering and technology related courses which require a significant amount of laboratory based work in order to satisfy the accreditation requirements by professional bodies.

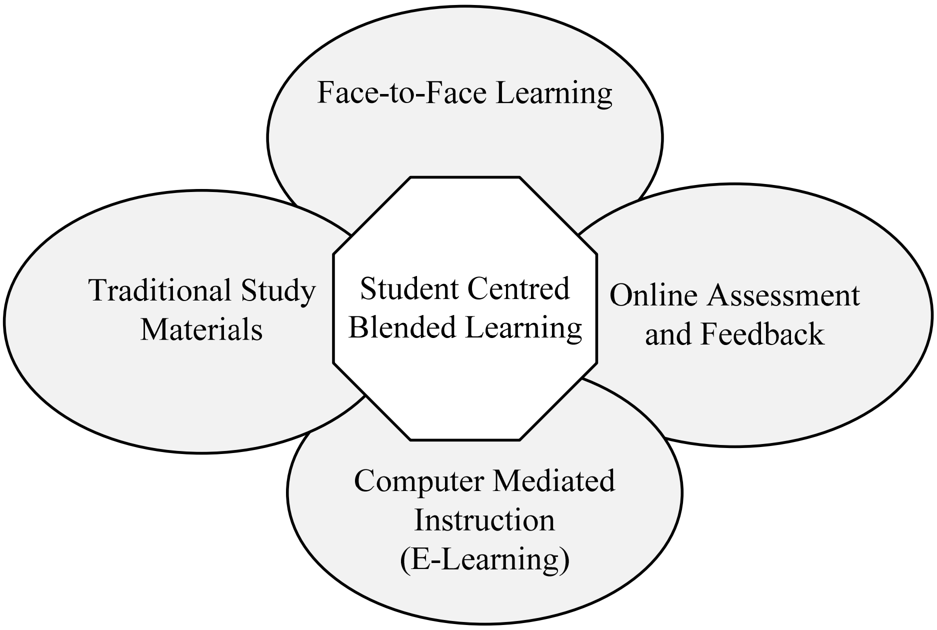

Figure 1: Blended Learning Model

LEARNING MATERIALS IN DISTANCE LEARNIG ENVIROMENT

There are four means in which materials work in the distance learning environment:

(a) Material-Based Learning

This is where learning resource materials made available to the students by the course programme for the sole basis for their understanding of the course content.

b) Direct Communication

Materials may also be provided in the situation where learning is supported from the HE institution remotely from the student.

(c) Lecturer Delivery in the Students Place of Work

Another option would be for the HE institution to physically send relevant staff to the employer at regular intervals to deliver the materials.

(d) Virtual Learning Environment

The VLE is a system which changes the way materials are delivered. The VLE is designed to facilitate the delivery of course programmes to students, through providing a means in which the students can learn without having to be in the classroom.

LEARNING OPPORTUNITIES

Examples of good learning opportunities with reference to relevant assessment methods are presented below:

Laboratory assignments / practical work / log book records / reports - Computer based exercises - Simulation exercises:

Many learning opportunities are provided by practical work of some form. This occurs for example in laboratory based assignments for which students maintain a log book (whilst they are in the laboratory) and produce a report. The practical work may take the form of undertaking experimental test measurements, building items of technical equipment, undertaking design work, implementing web-based or other computer-based or media-based code or solution, or implementing an individual design project. Technical instruction and support should be available wherever appropriate. Generally practical work is linked to theoretical concepts and analytical skills developed in lectures and tutorials.

Presentations and oral examinations:

Opportunities are provided in assignments in which presentations, as well as project management techniques, team working, design and written reports, play a part.

Problem solving exercises:

Problem solving activities are normally undertaken by the students at all levels. As a formal component of subjects within the curriculum of the course, tutors set problems for students to tackle, and on which assessment may be based. The level of challenge ranges from fundamental knowledge to those that develop a deeper understanding. These are often generated entirely by the subject tutors based on their own experience.

Design tasks:

Design skills (if required by the course) should be introduced and developed through tutorials and problem solving exercises. Design requires knowledge and understanding, a requirement and specification, the tools and techniques to design, realise and test, and the project management skills to manage the process.

Individual projects and report:

Many courses require the completion of individual projects. Students may require to and produce a proposal, and final report. In this case students should review published literature and other relevant published works, and to set their work in the context of other work in the field.

ASSESSMENT MTHODS

The assessment methods used with the programme of study are varied, formative and develop students' transferable skills as well as their technical ability. Students' ability to plan, judge, communicate complex issues, solve problems logically, and develop original solutions, in appraising critically the work of others, and in managing their own learning are all significant contributors to determining a students' mark for a subject within the programme of study . In addition a student's technical understanding of the context of their work alongside that of others, of the breadth of their subject of study, and of the depth of their specialist area of study, also are key to the assessment process.

Assessment methods applied should include:

- Unseen examinations / class tests.
- Laboratory assignments / practical work / log book records / reports.
- Learning Portfolio
- Case Studies
- Presentations and oral examinations
- Problem solving exercises
- Essay assignments
- Assessments of work-based learning
- Design tasks
- Computer-based/Simulation exercises
- Poster displays
- Individual projects and reports and Graduate Show presentations

LEARNING RESOURCES

Many HE institutions have made substantial investments in information and learning technology and many have bespoke Learning Resource Centres which are curriculum-zoned. These resources enhance the delivery of courses in the classroom and remotely through the Internet.

HE institutions normally have an extensive range of journals; including those online and relevant to higher level study. A positive and distinctive feature is that students should be able to have access to the online learning resources of the institution.

FEEDBACK ON STUDENT WORK

There should be an agreed point of reference and common starting point between students and staff as to what constitutes the purpose and use of feedback as part of a learning process.

The feedback should generate a series of questions for the students which makes them think about their learning now, and what they need to do to develop their learning in the future. This will enable them to understand the purpose of the feedback in each specific context; create the capacity to developing evaluative judgment; the ability to review their own performance against professional and academic criteria; and to think about learning strategies they need to develop in the future.

The dialogue and understanding that emerges from the feedback should be applicable both to the current debate and also contain elements that are able to be translated to a range of current and future learning situations. As the student progresses through their learning journey they should be developing a more sustained and sophisticated approach to their learning, culminating in the expression of the graduate attributes appropriate to their level and subject specialism.

Feedback isn't simply an activity that takes place after assessment – it isn't something that is simply done to students! Feedback that is effective and timely occurs when students know when they need it, recognise what they want it for, and know how to ask for it in a way that is appropriate to their needs.. It is multi-faceted both in terms of content and format.

QUALITY ASSURANCE

HE institutions are responsible for ensuring that appropriate standards are being achieved and a good quality education is being offered.

Academic standards are a means of describing the level of achievement that a student has to reach to gain an academic award.

Academic quality is a means of describing how well the learning opportunities available to students help them to achieve their chosen programme of study. It is about making sure that appropriate and effective teaching, support, assessment and learning opportunities are provided for students.

ETHICS

Ethics is a set of principles to determine correct conduct. It is a system of moral values and moral choices made by the ethical person. It is based on moral values and rules and determines what is right and what is immoral. In the workplace, it is the rules or standards defining the conduct of a person, or members of a profession.

Handling ethical issues is an important element in many academic courses, in particular when undertaking work-based learning. Academic honesty and project integrity are vital to student's success. Students need to be aware of the skills needed to understand ethical issues.

When working in professions, the HE institution involved and the students must adhere to ethics and practices of the HE institution.

Ethical issues revolve around the importance and sensitivity of the materials and records of the business. It also includes the codes of practice required by the professional bodies and how the student responds and adheres to the code.

Within ethics confidentiality is an important factor. Confidentiality means holding information from an individual or about an individual throughout the professional relationship secure and secret from others. Confidentiality is seen as important to the maintenance of the relationship and the development of trust between individuals.

CONCLUSION

This paper has dealt with the current higher education teaching and learning issues and challenges. The paper presented methods, guidelines and procedures for teaching and learning in Higher Education.

It must be noted that, students on each course are different, and this must be reflected in the range and diversity in the materials provided. Teaching and learning must be supported depending on the course studied, with the level of materials equal to the level of the course. Materials developed and delivered must take into account that courses will undoubtedly place a great emphasis on all types of learning and the materials should take this into consideration.

When HE institutions deliver courses by distance learning they need to make sure this type of learning may not always meet all the teaching and learning needs and blended learning may be required.

Focused attention should be given to ethical issues and relationships connected with teaching and learning. HE institutions and students must adhere to ethics and practices of the HE institutions.

Good feedback on student work should create the environment whereby effective and productive learning is taking place, leading to the emergence of a flourishing learning community.

Mineaktas07@gmail.com

ÖZET: Bu çalışma, 7. sınıf matematik dersi müfredatında yer alan "Dönüşüm Geometrisi" alt öğrenme alanında bir dinamik geometri yazılım programı olan GeoGebra'nın öğrenci başarısına ve kalıcılığa etkisini incelemek amacıyla yapılmıştır. Bu araştırmada, araştırma yöntemlerinden ön-test, son-test kontrol gruplu deneysel çalışma uygulanmıştır. Bu araştırmanın çalışma grubunu 2011-2012 eğitim öğretim yılı bahar döneminde, Ankara ilinde bulunan, MEB'e bağlı bir ilköğretim okulunda öğrenim gören toplam 37 öğrenciden oluşan iki ilköğretim 7. sınıf şubesi oluşturmuştur. GeoGebra'nın öğrenci başarısına ve kalıcılığa etkisini tespit edebilmek amacıyla deney (17) ve kontrol grupları (20) oluşturulmuştur. Deney grubu için GeoGebra destekli MEB müfredat programına uygun iki haftalık ders planlanmıştır. Ders süresinde GeoGebra'nın etkin kullanımını içeren, yapılandırılmış GeoGebra inşa aktiviteleri öğrenme ve öğretim süresi boyunca öğrencilerle paylaşılmıştır. Eş zamanlı olarak, kontrol grubunda MEB müfredat programına uygun olarak eğitime devam edilmiştir. Sınıf içi aktivitelerden önce ve sonra olmak üzere, hazırlanan konu başarı testi gruplara, ön-test, son-test ve kalıcılık testi olarak uygulanmıştır. Verilerin çözümlenmesi, SPSS-17.0 programı kullanılarak bilgisayar ortamında yapılmıştır. Grupların erişi düzeyleri arandaki farkın belirlenmesi için bağımlı ve bağımsız örneklemler için T testleri kullanılmıştır. Testler ve gruplar arasında yapılan karşılaştırmalar sonucunda, GeoGebra'nın öğrencilerin öğrenme ve başarılarını olumlu yönde etkilediği görülmüştür. Kalıcılık testi sonuçlarında da deney grubu lehine anlamlı bir fark bulunmuştur.

Anahtar sözcükler: Bilgisayar Destekli Öğretim, GeoGebra, Dönüşüm Geometrisi

ABSTRACT: The aim of this study is to find out the effects of a dynamic geometry software program GeoGebra in teaching the subject of "Transformation Geometry", which is a part of primary school seventh grade Math class, on students' achievement and retention levels. This is an experimental study in which pre-test, post-test and control group have been used. The participants of the study are 37 seventh grade students divided into two classrooms in a state primary school in Ankara. The study was conducted in Spring Term of 2011-2012 academic year. To find out the effects of GeoGebra on students' achievement and retention levels, an experimental group consisting of 17 students and a control group consisting of 20 students have been assigned. The experimental group was offered a GeoGebra based course for two weeks in accordance with Ministry of National Education curriculum. During this 2-week-course, students were provided with GeoGebra construction activities involving active use of GeoGebra. Meanwhile, control group was taught the same units only in accordance with the curriculum of Ministry of National Education. Achievement tests prepared for the particular units were administered to both groups as pre-test, post-test and retention tests before and after the activities in class. Data analysis has been conducted through SPSS17.0. Independent sample t-test and paired sample t-test have been used in order to find out the difference between the achievement levels of the groups. As a result of data analysis, GeoGebra was found to affect the achievement and learning of students positively. Moreover, there was significant difference favoring the experimental group according to retention test results.

Key words: Computer-based Teaching, GeoGebra, Transformation Geometry

ÖZET: Bu çalışmanın amacı, öğrencilerin 'Maddenin Ayırt Edici Özellikleri' konusundaki kavram yanılgılarının kavramsal değişim metinleri kullanılarak giderilmesini sağlamaktır. Bu deneysel çalışmanın örneklemi kavramsal değişim metinleriyle dersi alan 24 beşinci sınıf öğrenci ile geleneksel öğretim yöntemiyle dersi alan 24 beşinci sınıf öğrenciden oluşmaktadır. Araştırmacılar tarafından oluşturulmuş kavram yanılgıları testi deney ve kontrol grubu öğrencilerine ön ve son test olarak uygulanmıştır. Bu uygulamaların ön test ve son test sonuçları Mann-Whitney U ve Wilcoxon İşaret Sıraları Testleri kullanılarak analiz edilmiştir. Analiz sonuçları değerlendirildiğinde, kavramsal değişim metinleri ile dersi alan öğrencilerin kavram yanılgılarının giderilmesinde istatistiksel olarak anlamlı düzeyde gelişme gösterdiği tespit edilmiştir.

Anahtar sözcükler: maddenin ayırt edici özellikleri, kavram yanılgıları ve kavramsal değişim metinleri.

ABSTRACT: The purpose of this study is to remedy the students' misconceptions on the topic of distinguishing features of the substances by using conceptual change texts. The sample of this experimental study was consisted of 24 fifth grade students who took the course within conceptual change texts as the experimental group and 24 fifth grade students who took the course within traditional methods as the control group. A conceptual change test who developed by the researchers was assigned to the groups as pre and post tests. The data obtained from the results of pre and post tests were analyzed via Mann-Whitney U and Wilcoxon Signed Rank Tests. The result of the study indicated that the students who took the course within conceptual change texts displayed statıstically meaningful development in remediation of their misconceptions.

Key words: distinguishing features of the substances, conceptual change, and conceptual change texts.

MAKİNE ÖĞRENMESİ ALGORİTMALARI KULLANILARAK KALP HASTALIĞI TESPİTİ

DIAGNOSIS OF HEART DISEASE BY USING MACHINE LEARNING ALGORITHMS

ÖZET: Başlıca görevi vücuda kan pompalamak olan kalp, metabolizma faaliyetleri sonrası oluşan artık ürünlerin vücuttan uzaklaştırılması, vücut ısısının düzenlenmesi, asit-baz dengesinin korunması, hormonlar ve enzimlerin vücudun gerekli bölgelerine taşınması gibi görevleri yapar. Hareketsiz yaşam tarzı, aşırı yağlı yiyecek tüketimi, alkol, sigara kullanımı gibi etmenler kalbin çalışmasını olumsuz etkileyerek kalp hastalıklarının oluşmasına neden olabilmektedir. İnsan vücudu için birinci derecede hayati öneme sahip kalpte oluşan hastalıkların erken bir aşamada tespit edilmesi oldukça önemlidir. Bu çalışmada kalp damar hastalıkların teşhisi için Yapay Sinir Ağları (YSA) tabanlı bir sistem kullanılmıştır. Bu sistem ile bir veri setinde bulunan kalp hastası olan ve olmayan katılımcılardan alınan veriler başarılı bir şekilde eğitilip sonrasında YSA ve Bayes Sınıflandırma yöntemleri ile test edilmiştir. Ardından iki farklı test çıktılarından elde edilen sonuçlar doğruluk performansı açısından karşılaştırılmıştır.

Anahtar sözcükler: kalp, hastalık teşhis, bayes algoritması, yapay sinir ağları, sınıflandırma

ABSTRACT: The purposes of your heart are to pump fresh blood to the organs and tissues of your body, after metabolism activities occurs to remove waste products from the body, regulation of body temperature, protection of acid-base balance, hormones and enzymes to move to the necessary parts of the body. The motionless life, making excessive and chronic alcohol, smokes, excessive consumption of fatty foods can cause heart diseases. Diagnosis of the heart diseases at an early stage is important for human body. In this study, a system depend on artificial neural network (ANN) is used for analyse of heart diseases. The heart disease dataset have been classified as absence or presence of heart disease. Furthermore, results of ANN have been compared with Naive Bayes classification results and than obtained test results from the output were compared in terms of performance.

Key words: heart, diagnosis of disease, bayes algorithm, artificial neural network, classification

GİRİŞ

Kalp hastalıkları dünya çapındaki ölümlerin en büyük nedenlerinden birisidir. Son yirmi yıl içinde, bu hastalıklardan ölüm oranları yüksek gelirli ülkelerde düşmüş olsa da hastalık ve ölüm oranları düşük ve orta gelirli ülkelerde şaşırtıcı derecede hızlı bir şekilde artmıştır.[1] Koroner Arter Hastalığı, koroner arterlerin duvarlarında oluşan plaklardan ötürü ortaya çıkan bir hastalıktır. Koroner kalp hastalığı veya kısaca CHD (Coronary Heart Disease) olarak da adlandırılır.[2] Bu hastalıklar genellikle yaşlı yetişkinlerde görülse de özellikle ateroskleroz, (damar tıkanıklığı) geçmişi çocukluk çağına dayandığından birincil korunma çabaları yaşamın erken dönemlerinde başlamalıdır.[3]

Birçok rahatsızlıkta olduğu gibi kalp hastalığınında erken teşhisi ve tedavisi insan hayatı için son derece önemlidir. Günümüzde hastalıkların teşhisinde biyomedikal alanda birden çok farklı sınıflandırma yöntemlerinin kullanılması yaygın bir hale gelmiştir. Bunun sebebi ise bilgisayar tabanlı sınıflandırma yöntemleri ile doğruya yakın sonuç elde edilmesi gösterilmektedir.

Bu çalışmada, kalp hastalıkların teşhisi için literatürde en çok tercih edilen sınıflandırma yöntemlerinden birisi olan yapay sinir ağları (YSA) kullanılmıştır. Bu sistem sayesinde katılımcılardan alınan çeşitli veriler ile kalp hastalığı teşhisi yapılmıştır. YSA ile elde edilen performans sonuçları Naive Bayes sınıflandırma algoritması ile karşılaştırılmış ve YSA'nın daha başarılı bir sınıflandırma yaptığı gözlenmiştir.

MATERYAL ve YÖNTEM

Yapılan bu çalışmada YSA sınıflandırması ile kalp hastalığı tespiti yapılmış ve bulunan sonuçlar diğer bir sınıflandırma yöntemi olan Naive Bayes algoritması kullanılarak karşılaştırılmıştır. Kalp hastası olan ve olmayan hastaların tespiti için kullanılan veriler UCI Machine Learning Respository [5] veri tabanındaki "Heart Disease" veri kümesinden alınmıştır.

Veri Seti

Yapılan çalışmada kullanılan veri seti için UCI Machine Learning Respository veri tabanında bulunan kalp hastalığı veri seti (Heart Disease Dataset) kullanılmıştır. Kullanılan veri setindeki datalar 150 kalp hastası olan ve 120 kalp hasta olmayan kişiler olmak üzere toplamda 270 adet katılımcıdan alınmıştır. Alınan veri setindeki toplam 13 özelik için katılımcılar üzerinde çeşitli ölçümler yapılmıştır ve bu özelikler tablo 1' de detaylı olarak verilmiştir.

Tablo 1. Kalp Hastalığı Veri Seti Özellikleri

Özellik No	Özellik Bilgisi
1	Hastanın yaşı

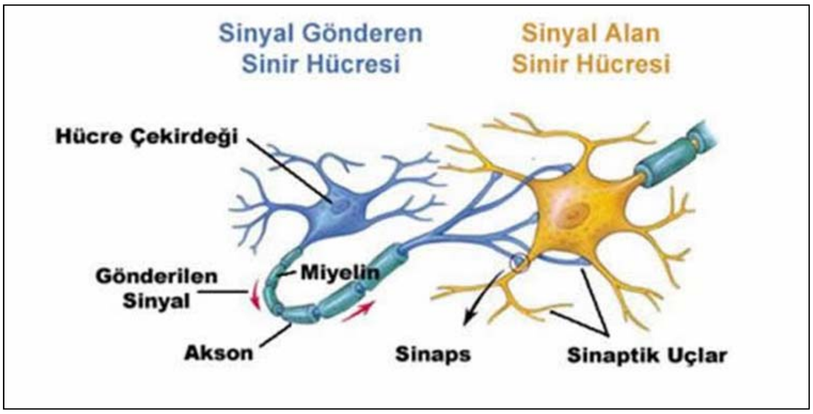
Yapay Sinir Ağları

Yapay sinir ağı; elektronik ortamda insan beyninin sinir hücrelerinden oluşmuş katmanlı yapısının tüm fonksiyonlarıyla beraber gerçeklenmeye çalışılan modellenmesidir. Elektronik ortam ile belirtilmek istenen donanım ve yazılımdır. Bir yapay sinir ağı hem yazılımsal hem de donanımas olarak oluşturulabilir. Çok katmanlı yapay sinir ağları çalışma adımları şunları içerir:

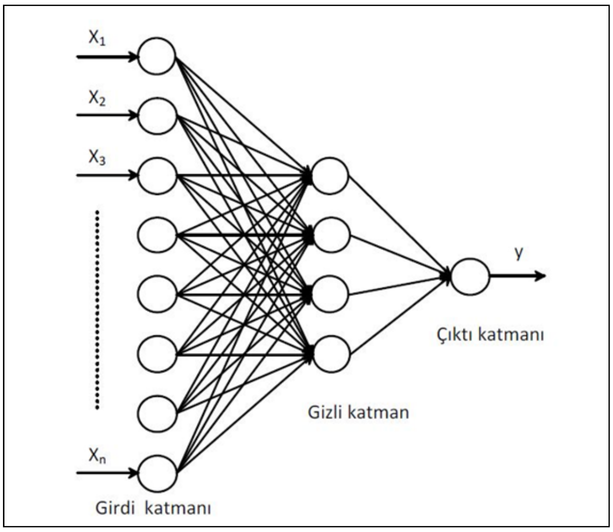
- Örneklerin toplanması
- Ağın topolojik yapısının belirlenmesi
- Öğrenme parametrelerinin belirlenmesi
- Ağırlıkların başlangıç değerlerinin verilmesi
- Öğrenme setinden örneklerin seçilmesi ve ağın eğitilmesi
- Öğrenme esnasında ileri hesaplama yapılması
- Çıktının beklenen ile ile karşılaştırılması
- Ağırlıkların güncellenmesi



Şekil 1. Sinir Hücresi Yapısı

YSA'ları, ağırlıklandırılmış şekilde birbirlerine bağlanmış birçok işlem biriminden (nöronlar) oluşan matematiksel sistemlerdir. Bir işlem birimi, aslında sık sık transfer fonksiyonu olarak anılan bir denklemdir. Bu işlem birimi, diğer nöronlardan sinyalleri alır; bunları birleştirir, dönüştürür ve sayısal bir sonuç ortaya çıkartır. Genelde, işlem birimleri kabaca gerçek nöronlara karşılık gelirler ve bir ağ içinde birbirlerine bağlanırlar; bu yapı da sinir ağlarını oluşturmaktadır. Günümüzde yapay sinir ağlarında Perceptron, Adaline, Çok Katmanlı Algılayıcı Modeli(Hatayı Geriye Yayma), Vektör Kuantizasyon Problemleri, Hopfield Ağları ve Elman Ağları gibi bir çok öğrenme modeli vardır[4,6].

Yapılan bu çalışmada YSA Çok Katmanlı Algılayıcı Modeli kullanılmıştır. İleri beslemeli geri yayılımlı Çok Katmanlı Ağ Modeli Şekil 1' de gösterilmiştir.



Şekil 2. YSA Çok Katmanlı Algılayıcı Modeli

Naive Bayes Sınıflandırıcı

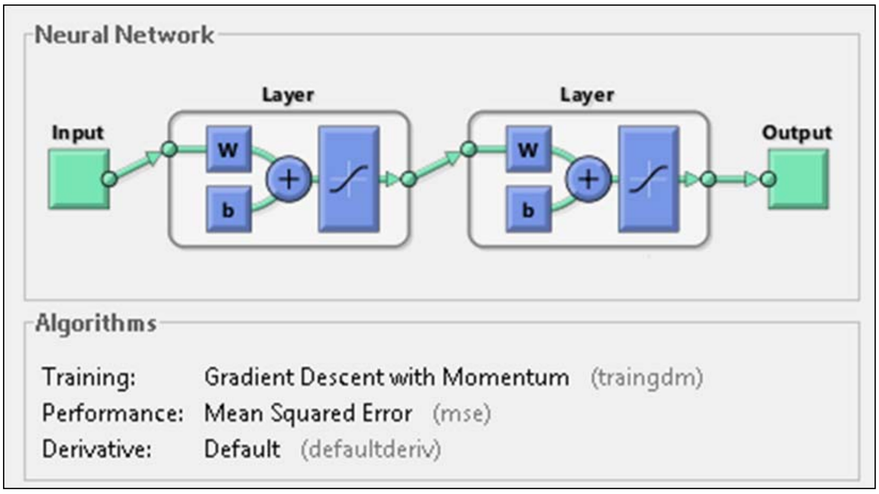
Naive Bayes Sınıflandırıcı Örüntü tanıma problemine ilk bakışta oldukca kısıtlayıcı görülen bir önerme ile kullanılabilen olasılıkcı bir yaklaşımdır. Bu önerme örüntü tanıma da kullanılacak her bir tanımlayıcı nitelik ya da parametrenin istatistik açıdan bağımsız olması gerekliliğidir. Her ne kadar bu önerme Naive Bayes Sınıflandırıcısının kullanım alanını kısıtlandırsa da, genelde istatistik bağımsızlık koşulu esnetilerek kullanıldığında da daha karmaşık Yapay sinir ağları gibi metodlarla karşılaştırabilir sonuçlar vermektedir. [7]

Naive bayes Algoritması, veri madenciliği, örüntü tanıma, makine öğrenmesi gibi disiplinler içinde yer alan bir sınıflandırma algoritmasıdır. Birbirinden bağımsız eğitim verileri ile algoritma eğitilir ardından yeni bir veri geldiğinde eğitilen verilere göre hangi gruba ait olduğu tahmin edilir.

BULGULAR

Çalışma kapsamında kalp hastalığı tespiti için MATLAB ortamındaki YSA ve Naive Bayes sınıflandırıcıları kullanılmış ve sınıflandırma yapılarak sonuçları karşılaştırılmıştır.

Çalışmada kullanılan veri setinde 120 adet kalp hastası ve 150 adet ise kalp hastası olmayan katılımcılara ait toplamda 270 adet veri kümesi vardır. 270 veri setinden alınan 140 (70 kalp hastası ve 70 kalp hastası olmayan) kişi ile bir ileri beslemeli yapay sinir ağı eğitimi yapıldı. Bu eğitilmiş ağımız ile kalan 130 veri üzerinden 60 veri alınarak başarılı bir şekilde test yapıldı. Teste tabi tutulan 60 kişiden 30'u kalp hastası diğer 30'u ise kalp hastası olmayan kişilerden seçilip test edilmiştir.



Şekil 3. Sistemde Kullanılan Matlab'te Tasarlanmış Yapay Sinir Ağ Modeli

Bu çalışmada MATLAB üzerinde şekil 1'de tasarlanmış ileri beslemeli yapay sinir ağı kullanılmıştır. Ağ için kullanılan aktivasyon fonksiyonu sigmoid, eğitim fonksiyonunda ise momentum geri yayılım algoritması kullanılmıştır.
Kullanılan ağın performansı ROC (Receiver Operating Characteric - Alıcı İşletim Karakteristiği) ve "Doğruluk Yüzdesi - Hata Yüzdesi" kriterlerine göre analizi yapılmıştır
ROC analizi için kullanılan parametreler;
TP: Olumlu sonucu olan ve olumlu öngörülmüş örnek sayısıdır.
FN: Olumlu sonucu olan ve olumsuz öngörülmüş örnek sayısıdır.
FP : Olumsuz sonucu olan ve olumlu öngörülmüş örnek sayısıdır.
FP : Olumsuz sonucu olan ve olumsuz öngörülmüş örnek sayısıdır.
Her iki sınıflandırma yöntemi için elde edilen doğruluk - hata yüzdeleri ve ROC analizleri Tablo 2 ve 3'te gösterilmiştir.

Tablo 2. Kullanılan İki farklı Yönteme Göre Performans Yüzdeleri

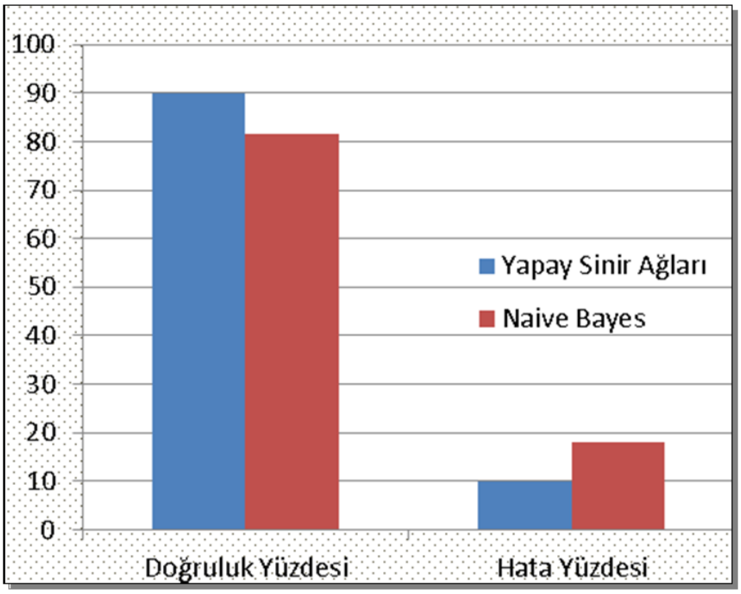
Yöntem	Doğruluk Yüzdesi	Hata Yüzdesi
YSA	90	10
Naive Bayes	81,667	18,333

Test edilen 60 verinin yapılan analiz sonucunda doğru tespit yüzdesi YSA kullanılarak yapılan sınıflandırmada %90 olurken, yanlış tespit yüzdesi ise %10 olarak hesaplanmıştır. Daha sonra aynı test verileri Naive Bayes algoritması ile test edilmiştir. Bayes teoremi ile %81,667 doğruluk yüzdesi, %18,333 hata yüzdesi tespit edilmiştir. Bu sonuçlar ışığında YSA ile yapılan testin performans sonuçlarının daha yüksek olduğu görülmüştür.

Tablo 3. Kullanılan İki farklı Yöntemin Test Sonuçları

Yöntem	TP	TN	FP	FN	Hatalı Sonuç
YSA	28	26	2	4	6
Naive Bayes	26	25	4	5	9

YSA ve Naive Bayes sınıflandırma yöntemleri sonucu elde edilen başarım yüzdelerinin sonuçları ise Şekil 4' deki grafik üzerinde gösterilmiş ve performans kıyaslamaları yapılmıştır.



Şekil 4. YSA ve Naive Bayes Yöntemlerinin Doğruluk-Hata Yüzde Oranları

SONUÇ

Bu çalışmada, kalp hastalığı öznitelik vektörlerinin, geri yayılımlı ileri beslemeli yapay sinir ağı (çok katmanlı algılayıcı) ve Naive Bayes sınıflandırıcı kullanılarak sınıflandırılmasına dayalı bir kalp hastalık teşhisi yapılmıştır. Kullanılan iki sınıflandırıcı performans açısından değerlendirilmiştir. Bu değerlendirme sonucunda YSA sınıfladırıcısından elde edilen sonuçların Naive Bayes yöntemine göre elde edilen sonuçlardan daha başarılı olduğu gözlemlenmiştir.

ÖNERİLER

Yapılan çalışmanın test performansını yükseltmek için daha farklı önişleme teknikleri kullanılabilir ve farklı sınıflandırma yöntemleri ile bu çalışmanın başarım değerlendirmesi yapılabilir.

ÖZET: Matematik dersi ülkemizde ilköğretimden orta öğretime(SBS) ve orta öğretimden üniversite eğitimine(YGS ve LYS) geçişte gerçekleştirilen sınavlarda önemli bir belirleyici derstir. Buna karşın alınan eğitimlerin yeterliliği ve test teknikleri geliştirmek için ilave olarak alınan ek dersler(dershane eğitimi) bu dersteki başarıyı önemli olarak etkilemektedir. Bu çalışmada, Adapazarı Hacı Zehra Akkoç Kız Lisesinde okuyan 9. Sınıftan 201, 10. Sınıftan 140. 11. Sınıftan 150 ve 12. Sınıftan 143 olmak üzere toplam 634 öğrenci ile anket çalışması gerçekleştirilmiştir. Hazırlanan anket soruları ile öğrencilerin matematik dersine karşı çekinceleri, bu dersi sevmemelerinde etken olan unsurlar ve ailenin öğrencinin matematik dersini sevmesi üzerine katkısı araştırılmıştır.

Anahtar sözcükler: Matematik eğitimi, Anket, İstatistiksel değerlendirme, Temel istatistiksel Analiz, Lise

ABSTRACT: Among our country mathematics, secondary education (SBS) and secondary University education (YGS and LYS) is an important determinant in the exams held in the transition. By contrast, received training in addition to develop and test the adequacy of techniques taken from additional courses (classroom training) this tutorial as a significant success. In this study, Adapazari Hacı Zehra Akkoç Girl's Anatolian School recited by 9. Class 201, 10. Class 140. 11. The class 150 and 12. A total of 143 from 634 student survey was carried out. Students with the math lesson reservations against the prepared the survey questions, this class is the unlike factor in the contribution of the student to love math features and family was investigated.

Key words: Mathematic Education, Survey, Statistical Evaluation, Basic Statistical Analysis , High School

GİRİŞ

Matematik dersi ülkemizde ilköğretimden orta öğretime(SBS) ve orta öğretimden üniversite eğitimine(YGS ve LYS) geçişte gerçekleştirilen sınavlarda önemli bir belirleyici derstir. Buna karşın alınan eğitimlerin yeterliliği ve test teknikleri geliştirmek için ilave olarak alınan ek dersler(dershane eğitimi) bu dersteki başarıyı önemli olarak etkilemektedir. Son günlerde gerek bu geçiş sınavlarında yapılan yeni düzenlemeler gerekse yenilenen ve sürekli değişen ders müfredatları eğitim konusunda birçok belirsizlikler ortaya çıkarmaktadır.
Bu çalışmada, Adapazarı Hacı Zehra Akkoç Kız Anadolu Lisesinde okuyan 9. Sınıftan 201, 10. Sınıftan 140. 11. Sınıftan 150 ve 12. Sınıftan 143 olmak üzere toplam 634 öğrenci ile anket çalışması gerçekleştirilmiştir(Ek1). Hazırlanan anket soruları ile öğrencilerin matematik dersine karşı çekinceleri, bu dersi sevmemelerinde etken olan unsurlar ve ailenin öğrencinin matematik dersini sevmesi üzerine katkısı araştırılmıştır.

Matematik dersinin öğretilmesi ve öğrenilebilmesi üzerine birçok bilimsel araştırma çalışmaları gerçekleştirilmiştir. Bunlarda farklı araştırma ve analiz teknikleri kullanılarak matematik dersi üzerine öğrencilerin kaygı, bakış açışı ve algılamaları ile ilgili çalışmalar yapılmıştır. Günümüzde

N. İzzet KURBANOĞLU ve Mithat TAKUNYACI[1] tarafından gerçekleştirilen çalışmada, lise öğrencilerinin matematik dersine yönelik kaygı, tutum ve öz-yeterlik inançlarının, cinsiyet, okul türü ve sınıf düzeyi açısından anlamlı bir fark oluşturup oluşturmadığını incelemektir. Çalışmada veri toplama aracı olarak, Matematik Tutum Ölçeği, Matematik Kaygısı Değerlendirme Ölçeği ve Güdülenme Ölçeği kullanılmıştır.

Kemal ÖZGEN ve Recep BİNDAK[2] tarafından gerçekleştirilen çalışmada, lise öğrencilerinin (9., 10., 11. ve 12. sınıf) matematik okuryazarlığı öz yeterlik inançlarını belirleme¬yi ve öğrencilerin öz yeterlik inançlarının cinsiyet, sınıf, okul türü, matematik dersi başarı puanı, anne- aba eğitim durumu ve matematik dersine verilen önem değişkenlerine göre incelemeyi amaçlamaktadır.

Özge ARICI[3] , tarafından gerçekleştirilen çalışmada, öğretmen görüşlerine göre öğrencilerin matematik dersine yönelik tutumlarını etkileyen faktörler ikili karşılaştırma yöntemiyle ölçeklenmiştir. Araştırmanın verileri 2011-2012 eğitim-öğretim yılında Türkiye'nin çeşitli yerlerinde görev yapan 243 öğretmenden toplanmıştır. Araştırmada, öğretmen görüşlerine göre öğrencilerin matematik dersine yönelik tutumlarını en çok etkileyen faktörün öğretmenin dersini öğrenciye sevdirebilmesi olduğu bulgusuna ulaşılmıştır.

Arif DANE[4] v.d tarafından gerçekleştirilen çalışmada, lise öğrencilerinin matematik başarılarını olumsuz yönde etkileyen faktörleri incelemek ve alınabilecek önlemler için bazı öneriler sunmaktır. Bu amacı gerçekleştirmek üzere; veri toplama aracı olarak araştırmacılar tarafından hazırlanan bir anket formu kullanılmıştır. Bu çalışmanın örneklemini 2002-2003 öğretim yılında Sivas ilinde rasgele (Random) seçilen 6 farklı liseye devam eden, 152 kız ve 134 erkek olmak üzere toplam 286 öğrenci oluşturmuştur.
Dr. Murat PEKER[5] v.d tarafından gerçekleştirilen çalışmada, resmi genel liselerin ikinci sınıf öğrencilerinin matematiğe yönelik tutumlarını, matematik başarılarını ve öğrencilerin tutum puanları ile başarı puanları arasındaki ilişkiyi incelemektir. Öğrencilerin matematiğe yönelik tutumları Aşkar (1986) tarafından geliştirilen matematik tutum ölçeği ile belirlenmiştir. Öğrencilerin matematik başarıları yazar tarafından hazırlanan matematik başarı testi ile belirlenmiştir.

YÖNTEM

Bu çalışmada, öğrencilerin matematik dersini neden sevmedikleri üzerine bir araştırma gerçekleştirilmiştir. Öğrencilerin matematik dersine karşı olan tutumlarını belirlemek ve buna etken olan sebepleri araştırmak üzere anket soruları hazırlanmıştır(Ek1). Hazırlanan bu anket sorularını, 9. Sınıftan 201, 10. Sınıftan 140. 11. Sınıftan 150 ve 12. Sınıftan 143 olmak üzere toplam 634 öğrenci cevaplamıştır. Verilen cevaplar üzerine yapılan temel istatistiksel analiz sonucunda elde edilen değerler grafikler halinde sunulmuştur. Sunumlarda sınıf ve şube bazında sonuçlara yer verilmiştir.

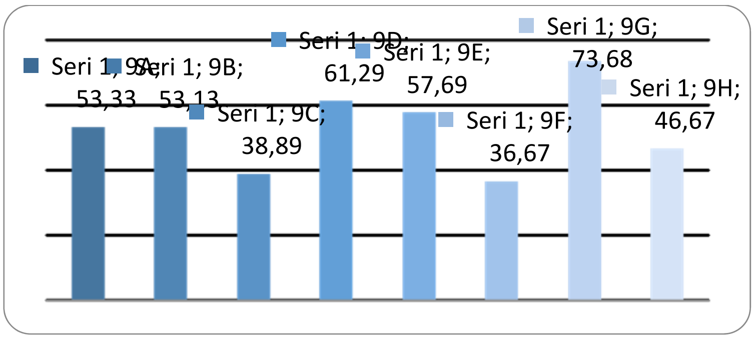
Anket Çalışması
Anket soruları hazırlanırken(Ek), Lise öğrencilerinin her sınıftan matematik dersine karşı tutumlarını belirmek ve bu dersi sevmemelerinde etken olan sebepleri araştırmak hedeflenmiştir. Öğrencilerin sorulan sorulara 5 farklı kademede not vermesi istenmiştir.

ANALİZ VE DEĞERLENDİRMELER

Öğrenciler tarafından Matematik dersinin sevilmemesinde bu dersin zor olduğu düşüncesi önemli etkendir. Bu amaçla hazırlanan anket çalışmasının ilk sorusunda "Matematik dersi gördüğüm derslerin içerisinde bana göre en zor derstir" denmiştir. Katılan öğrencilerin Katılıyorum ve Kesinlikle Katılıyorum diyerek değerlendirdiği ilk soruda 9. Sınıf öğrencilerin ortalama % 51, 93'ü dersi çok zor olarak görmektedir.

Tablo1. 9. Sınıf öğrencilerine göre dersin zor olduğuna dair değerlendirmesi

Sınıflar	9A	9B	9C	9D	9E	9F	9G	9H
Katılıyorum	4	8	3	6	6	4	2	0
Kesinlikle Katılıyorum	12	9	4	13	9	7	12	7
Toplam	32	32	18	31	26	30	19	15
Yüzdelik	53,33	53,13	38,89	61,29	57,69	36,67	73,68	46,67

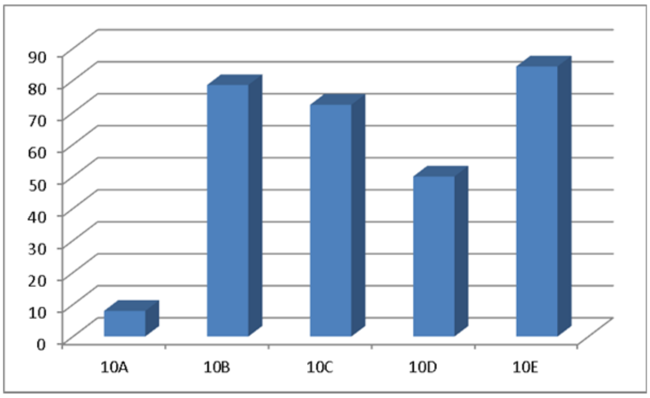


Şekil 1. 9. Sınıfların zorluk durumu değerlendirme grafiği

9. Sınıf sonunda öğrenciler Sayısal, Sözel ve Eşit Ağırlık sınıfları olarak ayrılmaktadır. Anket sonucu incelendiğinde sadece sayısal sınıf olan 10 A'nın matematik dersini çok zor görmediği, buna karşılık sözel ve eşit ağırlık öğrencileri ortalama %71,34 oranında çok zor bir ders olarak görmektedir.

Tablo 2. 10. Sınıf öğrencilerine göre dersin zor olduğuna dair değerlendirmesi

Sınıflar	10A	10B	10C	10D	10E
Yüzdelik	8	78,57	72,41	50	84,38

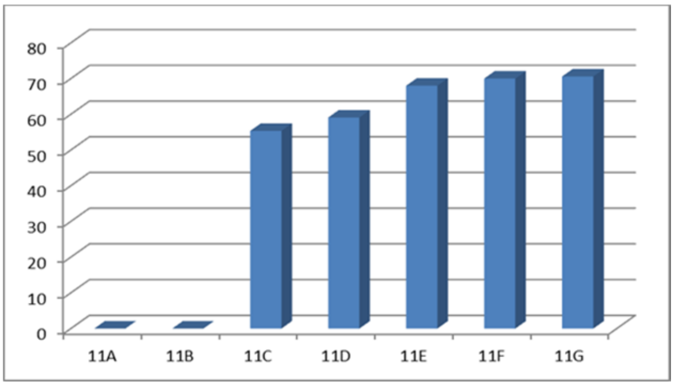


Şekil 2. 10. Sınıfların zorluk durumu değerlendirme grafiği

Öğrencilerin üniversite tercihleri konusunda odaklandığı ve öğrenimleri ile ilgili gelecek hesapları yaptığı 11. Sınıfta matematik dersi özellikle sayısal sınıflarında(11A-B) temel ders olmakta ve korku ciddi ölçüde azaldığı görülmektedir. Buna karşın eşit ağırlık ve sözel bölüm sınıflarında(11C-D-E-F-G) korku %70 oranında kendini göstermiştir

Tablo 3. 11. Sınıf öğrencilerine göre dersin zor olduğuna dair değerlendirmesi

Sınıflar	11A	11B	11C	11D	11E	11F	11G
Yüzdelik	0	0	55,35	59,09	68	70	70,59

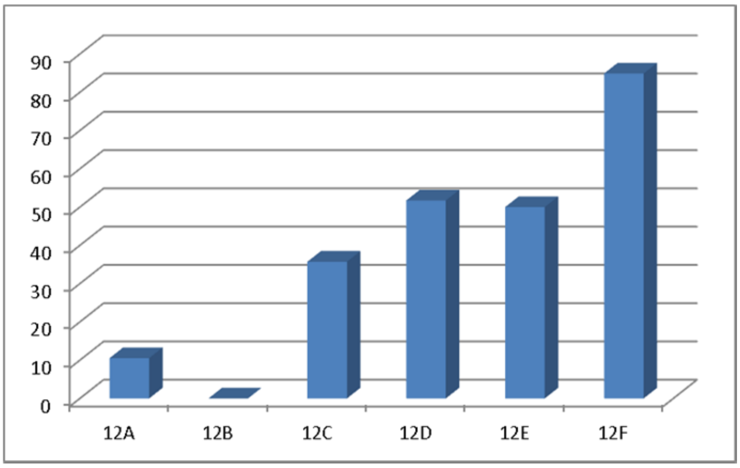


Şekil 3. 11. Sınıfların zorluk durumu değerlendirme grafiği

Okul eğitimlerinin son halkası olan üniversite eğitime giriş için oldukça yoğunlaşan son sınıf öğrencilerinde aldıkları eğitim ve öz güvenlerinin artmasıyla bu korku oldukça azalmış görünmektedir. Buna karşın özellikle sözel öğrencilerinde matematik dersi % 84,89 oranında zor olarak kabul edilmiştir.

Tablo 4 12. Sınıf öğrencilerine göre dersin zor olduğuna dair değerlendirmesi

Sınıflar	12A	12B	12C	12D	12E	12F
Yüzdelik	10,53	0	35,72	51,72	50	84,89

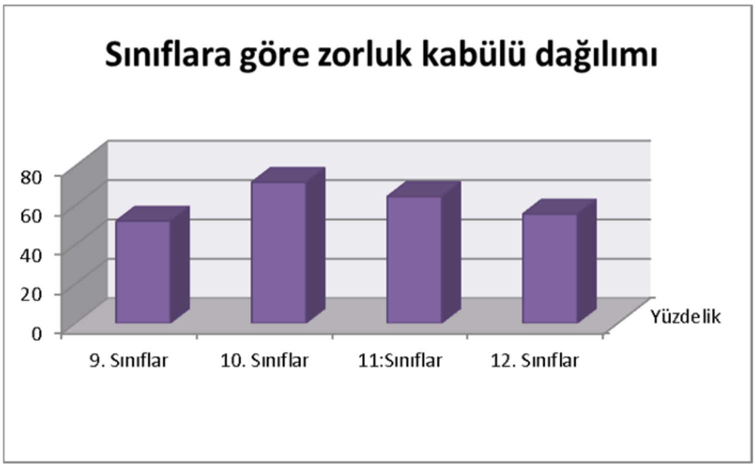


Şekil 4. 11. Sınıfların zorluk durumu değerlendirme grafiği

10, 11 ve 12. Sınıftaki sayısal sınıflar çıkarıldığında kalan eşit ağırlık ve sözel öğrencilerine göre matematik dersinin zorluğuna dair düşünceleri aşağıdaki grafiklerde açıkça görülmüştür.

Tablo 5. Sınıflar bazında bütün öğrencilerin matematik dersi zorluk değerlendirmesi

Sınıflar	9. Sınıflar	10. Sınıflar	11. Sınıflar	12. Sınıflar
Yüzdelik	51,93	71,64	64,41	55,58

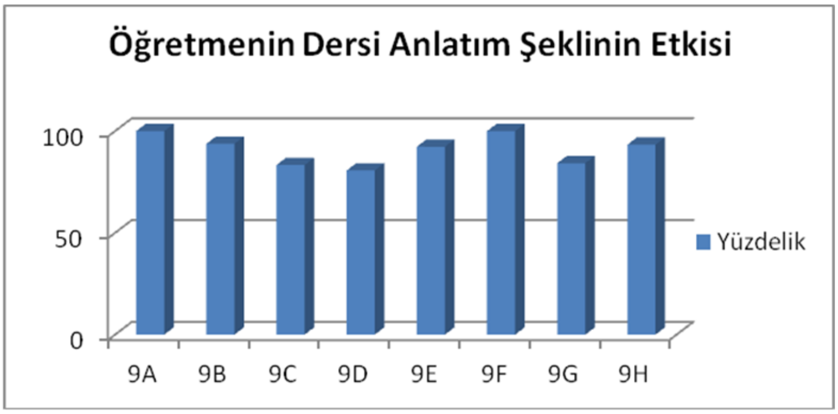


Şekil 5. Sınıflar bazında zorluk kabulünün dağılımı

Öğrencilerin dersi sevmesinde öğretmenlerin dersi anlatma şeklinin etkili olup olmadığını araştırmak üzere anket çalışmamızda sorulan yedinci soruda "Öğretmeninin dersi anlatım şekli konuları kolay kavramamızda önemli etkendir." denmiştir.

Tablo 6. 9. Sınıflar için öğretmenin dersi anlatım şeklinin etkisi değerlendirmesi

Sınıflar	9A	9B	9C	9D	9E	9F	9G	9H
Katılıyorum	5	8	3	6	6	3	0	3
Kesinlikle Katılıyorum	25	22	12	19	18	27	16	11
Toplam	30	32	18	31	26	30	19	15
Yüzdelik	100	93,75	83,33	80,65	92,31	100	84,21	93,33

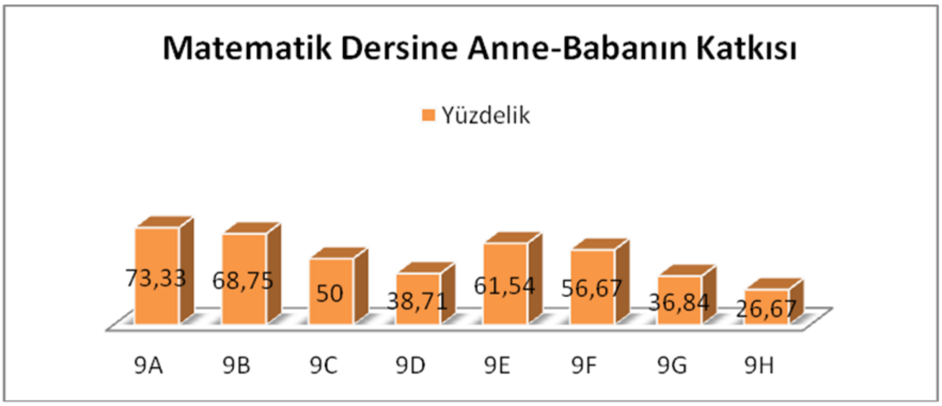


Şekil 6. 9. Sınıf öğrencilerinin öğretmenin dersi anlatım şeklinin etkisi üzerine değerlendirmesi

Öğrencilerin okulda gördüğü matematik dersiyle ilgili olarak gördüğü eksiklikleri aileleri yardımıyla çözebilme yeteneklerini ölçmek üzere " ***Dersteki eksiklerimizin giderilmesinde anne-babamızın katkısı olmamaktadır***." şeklinde altıncı soru yöneltildi. Sorulara verilen cevaplar analiz edildiğinde kesinlikle katılmıyorum ve katılmıyorum cevapları esas alınarak yapılan analizde ailelerin bu konuda pek desteklerinin olmadığı anlaşılmaktadır**.**

Tablo 7. 9. Sınıf öğrencilerinin dersteki eksikliklerin giderilmesinde ailelerin katkısı üzerine değerlendirme

Sınıflar	9A	9B	9C	9D	9E	9F	9G	9H
Kesinlikle Katılmıyorum	17	9	7	7	10	13	7	3
Katılmıyorum	5	13	2	5	6	4	0	1
Toplam	30	32	18	31	26	30	19	15
Yüzdelik	73,33	68,75	50	38,71	61,54	56,67	36,84	26,67

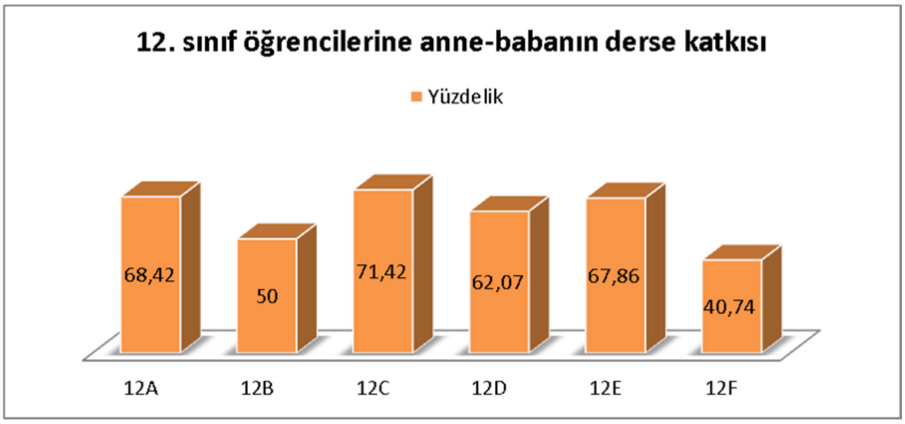


Şekil 7. 9. Sınıf öğrencilerine anne-babaların matematik dersine katkısı

Üniversite giriş sınavına hazırlığın son dönemeci olan lise son sınıfa gelindiğinde öğrencilerin okul dışında dershane takviyesi de aldığından ailesinin katkısını genelde görememektedir. Ya da anne-babalarının yerine dershane veya okul öğretmenlerinden destek almaktadır.

Tablo 8. 12. Sınıf öğrencilerin matematik dersine anne-babalarının katkısı

Sınıflar	12A	12B	12C	12D	12E	12F
Kesinlikle Katılmıyorum	9	4	7	13	12	6
Katılmıyorum	4	2	13	5	7	5
Toplam	19	12	28	29	28	27
Yüzdelik	68,42	50	71,42	62,07	67,86	40,74



Şekil 8. 12. Sınıf öğrencilerinde matematik dersine anne-babanın katkısı analizi

SONUÇ

Hacı Zehra Akkoç Kız Anadolu Lisesi, 9. Sınıf itibarıyla SBS sınav sonuçlarına göre öğrenci kaydı almaktadır. Okul puanı incelendiğinde emsallerine göre bir miktar düşük puanlı öğrenciler yerleştirilmiştir. Ancak okuldaki yetkin ve başarılı öğretmen kadrolarının verdiği düzeyli eğitimle seviyeleri yükseltilmeye çalışılmaktadır. Yapılan anket çalışmaları göstermiştir ki;

1. Öğrencilerin büyük bir bölümü az sayıda matematik sorusu cevapladığından ve matematik alt yapılarındaki yetersizliklerden dolayı matematik dersi çok zor bir ders olarak nitelendirilmektedir.

2. Öğrencilerin "Öğretmeninin dersi anlatım şekli konuları kolay kavramamızda önemli etkendir." sorusu için ankete verdiği sonuçlar incelendiğinde 9. Sınıfların %90,95 'inin öğrencilerin matematik dersini sevmesinde öğretmenin dersi anlatım şeklinin önemli olduğu görüşünü belirtmiştir.

3. Anne ve babalarının eğitim seviyelerine bağlı olarak değişse de öğrencilerin büyük bir bölümü matematik dersini öğrenmede anne ve babalarından destek görememektedir

4. Ankete katılan öğrencilerin %90'ının üzerine büyük bir bölümü tüm sınıflarda ve şubelerde dahil olmak üzere, matematik dersini sevmemelerinde ilk ve orta öğretimdeki temel altyapı eksikliklerinin önemli rol oynadığını belirtmişlerdir.

5. Öğrencilerin %80'inin üzerinde bir kısım derslerde yeteri kadar örnek çözülmemesinin dersi öğrenmeyi zorlaştırdığı görüşünü bildirmiştir.

6. Öğrencilerin %60'sinin üzerinde bir kısmı iş hayatımda matematiğin benim için bir önemi olacağına inanmaktadır. Özellikle sayısal bölüm tercih eden öğrenciler matematiğin iş hayatlarının vazgeçilmez bir parçası olduğunu düşünmektedir.

7. Ankete katılan öğrencilerin %85'i kadar büyük çoğunluğu matematik dersinde gördüğü konuların çokluğu ve yoğunluğundan yakınmakta, bo yoğunluğun dersi kolay kavramalarını güçleştirdiğini düşünmektedirler.

8. Öğrencilerin büyük bir kısmının matematik dersini anlama ve sevmelerinde destek olduklarını, bu amaçla gerek okulda gerekse dershanelerde açılan kurslara yönlendirerek başarı derecesini arttırmaya çalıştıklarını bildirmektedir.

9. Özellikle sözel ve eşit ağırlık bölümü seçmiş öğrencilerin %50 sine yakın bir kısmı zor bir problemle uğraşıp onu çözmeye çalışmak yerini birinin çözülmüş halini kendisine vermesini tercih etmektedir. Bu durum öğrencide matematik üzerine yoğunlaşma ve çabalamayı engellemekte öğrencileri kolaycılığa alıştırmaktadır. Oysa öğrencilerin yardımcı kaynak kitaplardan ya da konuyu kendisinden daha iyi kavradığını anladığı arkadaşlarıyla yardımlaşarak çözmesi ona önemli kazançlar sağlayacaktır.

Yaptığınız ANKET ile ilgili değerlendirmeleri aşağıdaki derecelendirme kriterlerine göre yapınız. **1: Kesinlikle Katılmıyorum 2: Katılmıyorum , 3: Kararsızım, 4:Katılıyorum, 5: Kesinlikle Katılıyorum**	**PUAN** **(1-5)**
1. Matematik dersi gördüğüm derslerin içerisinde bana göre en zor derstir.	
2. Dersi sevmememde ilkokul ve ortaokulda yeterli alt yapımın oluşmaması önemli bir etkendir.	
3. İşlem yeteneğimin tam gelişmemesi dersi sevmememde etkilidir.	
4. İşlenen konuların çokluğu ve yoğunluğu dersi kolay öğrenmemimizi engellemektedir.	
5. Derste yeteri kadar örnekler çözülmemesi konuları daha iyi kavramamızı engellemektedir.	
6. Dersteki eksiklerimizin giderilmesinde anne-babamızın katkısı olmamaktadır.	
7. Öğretmeninin dersi anlatım şekli konuları kolay kavramamızda önemli etkendir.	
8. Liseden mezun olduktan sonraki yaşamımda matematiğe ihtiyacım olmayacağını düşünüyorum.	
9. İş hayatımda matematiğin benim için bir önemi olmayacağına inanıyorum.	
10. Matematik ilerideki güncel yaşamımda çok nadir olarak kullanacağım bir alandır.	
11. Ailem matematik dersinde başarılı olabilmem için beni cesaretlendirir.	
12. Matematik problemlerini çözemediğimde kendime olan özgüvenimi kaybediyorum.	
13. Çözemediğim problemlerle ilgili öğretmenlerimden destek almak beni heveslendirir.	
14. Zor bir matematik sorusu çözmek yerine, birinin bana sorunun çözümünü vermesini beklerim.	
15. Matematik dersinde katılımcı olup anlamadığım soruları anında sormak öğrenmemi kolaylaştırır.	

KNOWLEDGE OF CURRİCULUM OBJECTİVES AND POSSESSİON OF THE SUBJECT – NECESSİTY FOR ALBANİAN LANGUAGE ACQUİSİTİON FROM STUDENTS

Aimir OSMANİ

ABSTRACT: This paper addresses the importance of theoretical knowledge of the subject objectives of the Albanian language in its practical application within the 9 - year-old school curriculums. Albanian schools after '90, was faced with a new reality and didactic concepts that should be included in the teaching process. So as curriculums , textbooks also began to be developed on the basis of a new concept, having undergone changes both in content and in structure, guided by the experience of our school with a history more than a century, but in especially the new developments of the Albanian society. In these circumstances, the work should focus on two aspects: firstly; the work of teachers, his preparation and ability to teach this subject more clearly, to achieve the main objective of communication, as well as the preparation of students for the learning Albanian language, to see the advantage that it helps to throw in society. Two goals are: To achieve communication skills, to help the whole cycle of communication and given and collated knowledge to Albanian language and its system. These lines are carried through listening, speaking, reading and writing. Knowledge of the curriculum by the teacher is a necessity, since there are clearly marked by class objectives that must arrive. Conception of a class in accordance with the standards, based on the most successful achievements related the scientific and didactic, using a contemporary literature, but not excluding threesome teacher - student - family, will create all the chances of achieving a compelling linguistic background and accepted for Albanian society today. Therefore the main task before the school remains active and practical possession of the Albanian language.

6-7-8. SINIF MATEMATİK DERSİ ÖĞRETİM PROGRAMINDA YER ALAN ARA DİSİPLİNLERE YÖNELİK ÖĞRETMEN GÖRÜŞLERİ

THE OPINIONS OF SIXTH, SEVENTH AND EIGHTH GRADE MATHS TEACHERS ABOUT CROSS CURRICULUM DISCIPLINES

Şule AKYOL
Mehmet Akif Ersoy Üniversitesi
sakyol@mehmetakif.edu.tr

Esed YAĞCI
Hacettepe Üniversitesi
esed@hacettepe.edu.tr

ÖZET: Bu çalışma 6-7-8. sınıf matematik dersi öğretim programında yer alan ara disiplinlere yönelik öğretmen görüşlerini belirlemek amacıyla yapılmıştır. Araştırmanın çalışma gurubunu Burdur ili merkez ve ilçelerindeki devlet ve özel okullarda görev yapan 91 matematik öğretmeni oluşturmuştur. Öğretmenlere, araştırmacı tarafından geliştirilen ve uzman görüşleriyle nihai şeklini alan anket uygulanmıştır. Verilerin analizinde aritmetik ortalama, standart sapma, Mann Whitney U- Testi ve Kruskal Wallis H-Testi kullanılmıştır. Öğretmen görüşlerinde anketin bazı maddelerine verilen cevaplar arasında cinsiyete, kıdeme ve mezuniyet durumuna göre .05 düzeyinde anlamlı farklar bulunmuştur. Öğretmenlerin çoğunluğu, ara disiplinlerin matematiği diğer derslerle ve yaşamla ilişkilendirmede öğrencilere yardımcı olduğunu düşünmektedir. Öğretmenler ara disiplinler konusunda bilgilendirmeye ihtiyaç duymaktadır. Öğretmenler, ara disiplin kazanımlarının kazandırılabilir nitelikte olduğunu düşünmektedir

Anahtar sözcükler: ara disiplinler, ara disiplin kazanımları, 6-7-8. sınıf matematik dersi öğretim programı

ABSTRACT: This study was conducted to take teachers opions about cross curriculum approach which taken part in 6, 7, 8. grade maths curriculum. The group of study is formed by 91 maths teachers who work in the nation and private elementary schools which is placed in Burdur. The data was gathered from survey, is developed by the researcher and taken last form by the expert's opinions. Mean, standard deviation and Mann Whitney U-Test, Kruskal Wallis H- Test were used. It was found significant difference at .05 level in teacher's opinions among the some answers of survey according to gender, seniority and graduation situation. Most of the teachers thought that cross curriculum disciplines are assisting students about overarching maths with life and other disciplines. Techers need information. Teachers thought that the attainments of cross curriculum disciplines are attainable qualification.

Key words: cross curriculum disciplines, attainments of cross curriculum, 6, 7, 8. grade maths curriculum.

GİRİŞ

Ara disiplinler; ilköğretim matematik dersi öğretim programı ile ilişkilendirilmiş, bütün programlarda yer alan ve ortak olarak kazandırılması gereken özelliklerdir (Akyol, 2011).

Matematik programına ara disiplinler yerleştirilerek kazanımlar zenginleştirilmiş, öğrencilerin korkulu rüyası olan matematik dersi yaşamla ve bazı belirlenen alanlarla ilişkilendirilerek tek bir disiplin olarak sıkışıp kalması engellenmek istenmiştir (Akyol, 2011). Matematik öğretim programının kazanımlarıyla ilişkilendirilen 8 ara disiplin bulunmaktadır. Bunlar; Sağlık Kültürü, İnsan Hakları ve Vatandaşlık, Girişimcilik, Kariyer Bilinci Geliştirme, Rehberlik ve Psikolojik Danışma, Spor Kültürü ve Olimpik Eğitim, Afetten Korunma ve Güvenli Yaşam, Özel Eğitimdir. MEB, matematik dersi 6-8. sınıf öğretim programı ve kılavuzunda 'ilişkilendirme önemsenmelidir' başlığı altında ara disiplinlerin programa yerleştirilmesinin sebebini şu şekilde ifade etmiştir: "Matematik bilgilerinin, hem gerçek hayatla hem de diğer derslerde öğrenilenlerle ilişkilendirilmesine önem verilmelidir. Günlük yaşamda, birçok durumda çeşitli zorluk derecelerinde matematiğe ait problemler karşımıza çıkmakta ve matematik pek çok meslek dalında kullanılmaktadır. Bu nedenle problemler, öğrencilerin matematiğin günlük hayattaki kullanımını açık biçimde görmelerine yardımcı olacak şekilde seçilmelidir. Öğrenciler matematiğin diğer derslerde de kullanılabildiğini gördüklerinde, kazanımları daha anlamlı olacaktır. Bu amaçla matematik dersi belli başlı ara disiplinlerle ilişkilendirilmiştir (MEB, 2009)." MEB aynı yerde, etkinlikler planlanırken ve yürütülürken alt öğrenme alanlarındaki kazanımlar ile ara disiplinlerin kazanımlarının aynı anda edinilmesine dikkat edilmesi gerektiğini belirtmiştir.

2005'te uygulamaya koyulan yeni ilköğretim programlarının gerek ders içi, gerekse diğer derslerle ve ara disiplinlerle ilişkilendirmeler boyutlarında önceki programlara göre önemli ölçüde değişim gösterdiği görülmüştür. Demirel ve Coşkun (2009), bu değişimin programın uygulayıcıları olan öğretmenler tarafından ne derece benimsendiği ve uygulamaya konduğu konusunu incelenmesi gereken bir durum olarak görmüştür.

Ara disiplinler, program hazırlama sürecinde göz önünde bulundurulan ana disiplinlerle açık ve kapsayıcı biçimde örtüşen diğer disiplinler olarak tanımlanmıştır (ERG, 2005, s. 118).

Ara disiplin temaları; bilginin belirli bir alana veya disipline hapsedilmemesini, aralarında ilişkilendirilmesini gerektirmektedir (Print, 1993; Dolz ve diğerleri, 1994; Akt. Naval ve diğerleri, 2003). Örneğin İspanya'da ara disiplinler; vatandaş ve değer eğitimi, barış eğitimi, sağlık eğitimi, cinsiyetler arasında fırsatlar eşitliği eğitimi, çevre eğitimi, cinsiyet eğitimi, tüketici eğitimi ve trafik eğitimini içermektedir (MEC 1992; Akt. Naval ve diğerleri, 2003).

Ara disiplin temaları, sosyal taleplere veya konulara cevap vermektedir. Okulun sosyal içeriğinde rastlanılan sosyal ve insan problemlerini göstermektedir; böylece okulun sosyalleştirme fonksiyonunu güçlendirmektedir. Ek olarak ara disiplin temaları, ülke insanlarının günlük yaşamına değindikçe, kaçınılmaz bir şekilde daha özgür, barışçıl ve doğal çevre konusunda daha sorumlu insanlarla dolu toplumun yapısını inşa edecektir (MEC 1992a; Akt. Naval ve diğerleri, 2003). Özet olarak ara disiplin temaları; toplumun ve öğrencilerin hayati tecrübelerinden ortaya çıkmaktadır ve çevreyle ilgili sosyal taleplere cevap vermektedir, günlük hayattaki zıtlıkları içeren kritik davranışları teşvik etmektedir; programın gizli (örtük) kısmına ait açıklığı içermektedir, bireylerin gelişimini tamamlamaya katkıda bulunmaktadır (Naval ve diğerleri, 2003). Ara disiplinler sayesinde öğrenciler; 1) Başkalarının ve kendilerinin sorumluluğunu ve değerini öğrenmektedir. 2) Toplumdaki insanların dayanışmasını anlamaktadır. 3) Fiziksel, ruhsal, sosyal potansiyellerini başararak; kendini bilme ve özsaygılarını geliştirmektedir. 4) Yetişkin bireyler olarak; anlayış ve bilgilerini ve diğer güçlü yönlerini ve sınırlarını, kişisel özelliğini, ilgilerini, yeteneklerini, becerilerini, potansiyelini, değerlerini, motivasyon ve ihtiyaçlarını geliştirmektedir (DENI, 2008).

Yağcı, Demirel ve Tatar (2009), ara disiplinlerle bütünleştirilmesi amacıyla programlarda yapılan düzenlemelerin olumlu bir girişim olduğunu, ancak programların asıl uygulayıcıları olan öğretmenlerin yaşadığı sorunların dikkate alınarak gerekli düzenlemelerin yapılması gerekmekte olduğunu vurgulamıştır. Bu amaçla bu araştırmada matematik programında yer alan ara disiplinlere ilişkin öğretmen görüşlerini belirlemek ve elde edilen bulgular ışığında yorum yapmak ve öneriler sunmak hedeflenmiştir. Araştırma, matematik öğretmenlerinin ara disiplinlerden haberdar olma düzeyini ortaya çıkarması açısından önemlidir.

Çalışmada şu alt problemlere yanıt aranmıştır: 1) 6-7- 8. sınıflar matematik dersi öğretim programında yer alan ara disiplinlere yönelik öğretmen görüşleri nelerdir? 2) Cinsiyete göre öğretmen görüşleri arasında anlamlı bir fark var mıdır? 3) Kıdeme göre öğretmen görüşleri arasında anlamlı bir fark var mıdır? 4)Mezuniyet durumuna göre öğretmen görüşleri arasında anlamlı bir fark var mıdır?

YÖNTEM

Araştırmanın Modeli

Bu araştırmada geçmişte ya da halen var olan bir durumu var olduğu şekliyle betimlemeyi amaçlayan araştırma yaklaşımlarından biri olan tarama modeli kullanılmıştır. Bu modelde araştırmaya konu olan birey ya da nesne kendi koşulları içinde ve olduğu gibi tanımlanmaya çalışılır (Karasar, 2009, s.77).

Çalışma Grubu

Araştırmanın çalışma gurubunu Burdur ili merkez ve ilçelerindeki devlet ve özel okullarda görev yapan 91 matematik öğretmeni oluşturmuştur.

Matematik öğretmenlerinin 54'ü (% 59) kadın, 37'si (% 41) erkektir. Öğretmenlerin 35'i (% 38,5) 1-5 yıl, 41'i (% 45) 6-10 yıl, 10'u (% 11) 11-15 yıl, 1'i (% 1) 16-19 yıl ve 4'ü (% 4) 20 yıl ve üstü kıdeme sahiptir. Öğretmenlerin 5'i (% 5,5) eğitim enstitüsü, 71'i (% 78) eğitim fakültesi ilköğretim matematik öğretmenliği ve 15'i (% 16,5) diğer (fen edebiyat matematik bölümü, matematik öğretmenliği, yüksek lisans…) okul mezunudur.

Veri toplama araçları

Öğretmenlere, araştırmacı tarafından geliştirilen ve uzman görüşleriyle nihai şeklini alan anket uygulanmıştır. Anketin cronbach- alfa katsayısı .87'dir. Anket beşli likert tipinde hazırlanmıştır. Tamamen katılıyorum, katılıyorum, kısmen katılıyorum, katılmıyorum, hiç katılmıyorum seçeneklerinden oluşmaktadır. Anket 26 maddeden oluşmaktadır.

Verilerin analizi

Verilerin analizinde yüzde, frekans, aritmetik ortalama, standart sapma, Mann Whitney U- Testi ve Kruskal Wallis H-Testi kullanılmıştır.

BULGULAR VE YORUM

1.Alt Probleme İlişkin Bulgular

"6-7- 8. sınıf matematik dersi öğretim programında yer alan ara disiplinlere yönelik öğretmen görüşleri nelerdir?"

Aşağıda en yüksek aritmetik ortalama ve en düşük aritmetik ortalama değerine sahip anket maddelerine ilişkin bulgulara yer verilmiştir.

Anketin 4 nolu maddesinde "*ara disiplinler öğrencilerin matematiği diğer derslerle ilişkilendirmesine yardımcı olur*" ifadesi yer almaktadır. Bu maddede öğretmenlerin %35,2' si tamamen katılıyorum seçeneğini, %50,5 i katılıyorum seçeneğini, %12,1 i kısmen katılıyorum seçeneğini, %2,2 si katılmıyorum seçeneğini işaretlemiştir. Hiç katılmıyorum seçeneğini işaretleyen öğretmen bulunmamaktadır. Bu maddeye ilişkin öğretmen görüşlerinin aritmetik ortalaması 4,19 dur. Bu anketteki en yüksek aritmetik ortalama değeridir ve öğretmen görüşlerinin ortalamasının "katılıyorum" düzeyinde olduğunu göstermektedir. Bu bulgulara göre öğretmenlerin ara disiplinlerin matematiği diğer derslerle ilişkilendirmede öğrencilere yardımcı olduğunu düşündüğü kanısına varılabilir. Anketin 2 nolu maddesi "*ara disiplinler öğrencilerin matematiği yaşamla ilişkilendirmesine yardımcı olur*" şeklindedir. Bu maddeye ilişkin öğretmen görüşleri; %38,5 tamamen katılıyorum, %41,8 katılıyorum, %17,6 kısmen katılıyorum, %2,2 katılmıyorum şeklindedir. Öğretmenlerden hiç biri hiç katılmıyorum seçeneğini işaretlememiştir. Bu maddeye yönelik öğretmen görüşlerinin aritmetik ortalaması 4,16' dır. Bu anketteki en yüksek 2. aritmetik ortalama değeridir ve öğretmen görüşlerinin ortalamasının "katılıyorum" düzeyinde olduğunu göstermektedir. Buradan öğretmenlerin ara disiplinlerin öğrencilerin matematiği yaşamla ilişkilendirmesine yardımcı olduğunu düşündüğü yargısına ulaşılabilir. Anketin 3 nolu maddesi "*ara disiplinler öğrencilerin matematiği bazı meslek dallarıyla ilişkilendirmesine yardımcı olur*" ifadesidir. Bu maddeye ilişkin öğretmen görüşlerinin aritmetik ortalaması; %29,7 tamamen katılıyorum, %57,1 katılıyorum, %12,1 kısmen katılıyorum, %1,1 katılmıyorum şeklindedir. Öğretmenlerden hiç katılmıyorum seçeneğini işaretleyen olmamıştır. Öğretmen görüşlerinin bu maddeye ilişkin aritmetik ortalaması 4,15 'dir. Bu anketteki en yüksek 3. aritmetik ortalama değeridir ve öğretmen görüşlerinin ortalamasının "katılıyorum" düzeyinde olduğunu göstermektedir. Benzer şekilde öğretmenlerin ara disiplinlerin matematiği bazı meslek dallarıyla ilişkilendirdiği görüşüne katıldığı söylenilebilir. Anketteki 8 nolu madde "*matematik dersinin ara disiplinlerle ilişkilendirilmesi gereksizdir.*" ifadesidir. Bu maddeye ilişkin öğretmen görüşleri; %3,3 tamamen katılıyorum, %7,7 katılıyorum, %13,2 kısmen katılıyorum, %45,1'i katılmıyorum ve %30,8 hiç katılmıyorum şeklindedir. Bu maddeye ilişkin öğretmen görüşlerinin aritmetik ortalaması 2,08'dir. Bu değer en düşük aritmetik ortalama değeridir ve öğretmen görüşlerinin ortalamasının "katılmıyorum" düzeyinde olduğunu göstermektedir. Öğretmenler, matematik dersinin ara disiplinlerle ilişkilendirilmesinin gereksiz olduğu fikrine katılmamaktadır.

2.Alt Probleme İlişkin Bulgular

"Cinsiyete göre öğretmen görüşleri arasında anlamlı bir fark var mıdır?"

Çizelge 4'te görüldüğü gibi, Mann Whitney U-Testi sonucunda, anketin 12. ve 23. maddelerine verilen cevaplarda ,05 anlamlılık düzeyinde öğretmen görüşleri arasında cinsiyete göre anlamlı bir fark vardır ($p = .039 < .05$; $p = .001 < .05$). (12. Madde: Ara disiplin kazanımlarının edinilmesine yönelik programdaki etkinlikler yeterlidir. 23. Madde: Ara disiplin kazanımlarını ölçmeye yönelik uygulamalar yapmaktayım.)

Çizelge 4: Cinsiyet Değişkeni Açısından Mann Whitney U-Testi Sonucu

Madde	Cinsiyet	n	Sıra Ortalaması	Sıra Toplamı	U	p
Madde 12	Kadın	54	41,44	2238	753	.039
	Erkek	37	52,65	1948		
Madde 23	Kadın	54	39,02	2107	622	.001

	Erkek	37	56,19	2079	

3.Alt Probleme İlişkin Bulgular

“Kıdeme göre öğretmen görüşleri arasında anlamlı bir fark var mıdır?”

Kruskal Wallis H- Testi sonucunda, anketin 6, 10, 12, 17, 23 ve 24. maddelerine verilen cevaplarda ,05 anlamlılık düzeyinde öğretmen görüşleri arasında kıdeme göre anlamlı bir fark vardır ($p < 0.05$). (Maddeler sırasıyla, Öğretme-öğrenme sürecinde ara disiplin kazanımlarının edinilmesine yönelik uygulamalara yer veririm, Programda ve öğretmen kılavuz kitabında ara disiplin dallarına ve uygulamalarına yönelik verilen açıklamalar yeterlidir, Ara disiplin kazanımlarının edinilmesine yönelik programdaki etkinlikler yeterlidir, Ara disiplinlere yönelik programda yer alanlar dışında kendim ek etkinlikler hazırlıyorum, Ara disiplin kazanımlarını ölçmeye yönelik uygulamalar yapmaktayım, Ara disiplin kazanımları kazandırılabilir niteliktedir.)

Çizelge 5: Kıdem Değişkeni Açısından Kruskal Wallis H-Testi Sonucu

Maddeler	Kıdem	N	Sıra Ortalamaları	sd	χ^2	p	Anlamlı Fark
6	1-5 yıl	35	37,37	4	10,86	.028	1-5 yıl ile 6-10 yıl

	16-19 yıl	1	86				
	20 yıl ve üstü	4	29,63				

4.Alt Probleme İlişkin Bulgular

Mezuniyet durumuna göre öğretmen görüşleri arasında anlamlı bir fark var mıdır?

Kruskal Wallis H- Testi sonucunda, anketin 26. maddesine verilen cevaplarda mezuniyet durumuna göre anlamlı bir fark vardır. (26.madde: Ara disiplin kazanımlarına ve uygulanmasına yönelik daha fazla bilgiye ihtiyacım var.)

Çizelge 6: Mezuniyet Durumu Değişkeni Açısından Kruskal Wallis H-Testi Sonucu

Madde	Mezuniyet Durumu	n	Sıra Ortalamaları	sd	χ^2	p	Anlamlı Fark

	Diğer	15	46,13				

SONUÇ VE ÖNERİLER

Matematik programına ara disiplinler yerleştirilerek kazanımlar zenginleştirilmiş, öğrencilerin korkulu rüyası olan matematik dersi yaşamla ve bazı belirlenen alanlarla ilişkilendirilerek tek bir disiplin olarak sıkışıp kalması engellenmek istenmiştir (Akyol, 2011).

Araştırmada, öğretmenlerin ara disiplinler konusunda çok az ve sınırlı bilgiye sahip olduğu sonucuna ulaşılmıştır. Bu sonuç, Taş (2010)'ın araştırma sonuçlarıyla da örtüşmektedir. Anketin 'Programda ve öğretmen kılavuz kitabında ara disiplin dallarına ve uygulamalarına yönelik verilen açıklamalar yeterlidir' maddesine ilişkin öğretmen ortalaması kısmen katılıyorum düzeyindedir. Buradan, program ve öğretmen klavuz kitabının ara disiplinlere ilişkin yeterli açıklama içermediği sonucuna ulaşılabilir. Ermiş (2008) de, sosyal bilgiler dersindeki ara disiplinlerin sınıf içi uygulamalarına ilişkin öğretmen görüşlerini belirlemek amacıyla yapmış olduğu çalışmada, ara disiplinler ile ilgili verilmiş olan açıklamaların öğretmenler tarafından yetersiz bulunduğu sonucuna ulaşmıştır.

Öğretmenler, ara disiplin kazanımlarının kazandırılabilir nitelikte olduğunu düşünmektedir. Öğretmenler ara disiplinler konusunda bilgilendirmeye ihtiyaç duymaktadır. Kadın öğretmenler erkek öğretmenlere göre ara disiplinler konusunda daha fazla bilgiye ihtiyaç duymaktadır. Erkek öğretmenler kadın öğretmenlere göre ara disiplinlerin amacına ulaşması konusunda programda önemli değişikliklerin yapılmasını daha fazla savunmaktadır. Bütün kıdem türündeki öğretmenler ara disiplinlerin amacına ulaşması adına programda gerekli değişikliklerin yapılmasından yanadır. Ara disiplinlere yönelik eğitim fakültesi ilköğretim matematik öğretmenliği mezunlarının eğitim enstitüsü mezunu ve diğer mezuniyet türündeki öğretmenlerden daha bilgili olduğu söylenilebilir.

Bu sonuçlardan hareketle, programın uygulayıcısı olan öğretmenlere ara disiplinler konusunda hizmet içi eğitim verilmelidir. Öğretim Programında ve öğretmen klavuz kitabında ara disiplinlere yönelik yeterli açıklama ve yönergelere yer verilmelidir.

HARMANLANMIŞ ÖĞRENME ALANINDA TÜRKİYE'DE YAPILMIŞ YÜKSEK LİSANS VE DOKTORA TEZLERİNİN İNCELENMESİ

EXAMINATION OF MASTER AND DOCTORATE THESES ON THE FIELD OF BLENDED LEARNING IN TURKEY

Murat GÖKCÜL
Gazi Üniversitesi, Eğitim Bilimleri Enstitüsü, Bilgisayar ve Öğretim Teknolojileri Eğitimi
muratgokcul@gmail.com

ÖZET : Bu araştırmanın amacı; harmanlanmış öğrenme ortamları hakkında ülkemizde şimdiye kadar yapılmış yüksek lisans ve doktora tezlerini inceleyerek, araştırma eğilimlerini ortaya koymak ve gelecekte yapılacak çalışmalara ışık tutmaktır. Çalışmada herhangi bir örneklem yöntemine başvurulmamış ve çalışma evreninin tamamı incelenmiştir. Bu kapsamda, YÖK Tez Merkezi'nin web sayfasında yapılan taramalarda; 25'i yüksek lisans ve 18'i doktora seviyesinde olmak üzere toplam 43 adet teze ulaşılmıştır. Bu tezler; türlerine, araştırmanın yürütüldüğü yıllara, üniversitelere, yazım dillerine, danışmanların unvanlarına, danışmanlara, anabilim dallarına ve araştırılan değişkenlere göre incelenmiştir. İnceleme sonuçlarına göre, Harmanlanmış Öğrenme alanında; en fazla tez yürüten üniversitenin Gazi Üniversitesi olduğu (n=12), en fazla tez hazırlanan yılların 2009 ve 2011 olduğu (n=10) görülmüştür. Ayrıca Bilgisayar ve Öğretim Teknolojileri Eğitimi ana bilim dalı da, bu alanda en fazla tez hazırlayan anabilim dalı (n=16) olarak öne çıkmıştır.

Anahtar kelimeler: Harmanlanmış Öğrenme, Yüksek Lisans Tezleri, Doktora Tezleri

ABSTRACT: The purpose of this research is to identify research trends by analyzing master and doctorate theses which have been made about blended learning in our country so far and to enlighten future studies. None of sampling methods is applied in the study and all of studying group are analyzed. In this context, 25 master and 18 doctorate, totally 43 theses have been accessed during scans at webpage of YÖK Thesis Center. These theses are analyzed according to the type, year, university, written language, supervisor, title of supervisor, master of science and research variables. According to the results of the research; Gazi University has the maximum number of theses on blended learning (n=12), 2009 and 2011 are the years when maximum number of thesis are studied (n=10). In addition, Computer and Instructional Technology Education is the master of science where maximum number of theses have been studied (n=16).

Key words: Blended Learning, Master Theses, Doctorate Theses

GİRİŞ

Bilim ve teknolojideki değişimler ve gelişmeler hayatımızın her alanına nüfuz etmekte ve yaşam stillerimizi de değiştirmektedir. Kültürel hayatımızdan eğlence sektörüne, sağlık alanından iletişim araçlarımıza kadar çok farklı alanlarda etkisini her geçen gün daha da fazla hissettiğimiz bu gelişmeler, eğitim hayatımızı da her yönden etkilemiş ve yeni biçimlendirmelerle farklı boyutlar katmıştır.

Özelde bireydeki genelde ise toplumdaki değişime paralel olarak, öğrenme ve öğretme etkinlikleri de değişmiş ve yeni öğrenme-öğretme ortamlarına ihtiyaç duyulmuştur. Bu bağlamda, harmanlanmış öğrenme, farklı öğrenme ortamlarını harmanlayarak bireyin öğrenme ortamlarının çeşitlenmesini sağlamıştır (Bersin, 2004).

Eğitim ortamlarında bu çeşitlenmelerin kullanılması; araştırma, karşılaştırma, geliştirme ve değerlendirme çalışmalarını da beraberinde getirmiştir. Özellikle her yeni alanda ya da eğilimde yapılan araştırmalarla ilgili olarak alanyazın taramalarının yapılması, yapılmış çalışmaların incelenmesi veya belirli aralıklarla gözden geçirilmesi, ileride yapılacak çalışmalara yön vermesi açısından faydalıdır. Ayrıca bu yolla; yapılmış çalışmaların geçerli ve önyargısız bir biçimde değerlendirilmesi imkânı da sunulmaktadır (Ocak, 2010).

Ülkemizde harmanlanmış öğrenme alanında yüksek lisans veya doktora seviyesinde ilk çalışmalar 2000'li yılların başında yapılmıştır (YÖK,2014). Çok yeni sayılabilecek bu alanda yapılan çalışmaları incelemek, nitel ve istatistik açısından analizini yapmak ve sonuçları tartışmak, alanla ilgili genel eğilimlerin ortaya konmasında ve yapılacak yeni çalışmalara ışık tutulmasında yardımcı olacaktır.

Bu amaçla çalışmamızda; harmanlanmış öğrenme alanında ülkemizde yapılmış ve YÖK web sayfasında kayıtlı yüksek lisans ve doktora tezleri incelenecek ve aşağıdaki sorulara cevaplar aranacaktır:

Harmanlanmış öğrenme alanında yapılan tezlerin;

a) Türlerine,

b) Yıllara,
c) Araştırmanın yürütüldüğü üniversitelere,
d) Yazım dillerine,
e) Danışman unvanlarına,
f) Danışmanlarına,
g) Anabilim dallarına,
h) Araştırılan değişkenlere göre, dağılımları nedir?

YÖNTEM

Bu çalışmada, nitel araştırma yöntem ve teknikleri kullanılmıştır. YÖK Tez Merkezi'nden ulaşılan tezlerin doküman incelemesi ile analizi yapılmıştır (YÖK, 2014). Doküman incelenmesi, araştırılan konu veya problemle ilgili bilgi içeren yazılı kaynakların analizini ifade etmektedir (Yıldırım ve Şimşek, 2010).

Miles ve Huberman 1994 yılında yaptıkları çalışmalarında; veri analiz sürecini üç adımda incelemişlerdir (Aktaran: Yıldırım ve Şimşek, 2010):

I) Verilerin indirgenmesi (data reduction)
II) Verilerin görselleştirilmesi (data display)
III) Sonuç çıkarma ve doğrulama (drawing conclusion and verification)

Verilerin indirgenmesi sürecinde; YÖK Tez Merkezi'nin web sayfasında harmanlanmış öğrenme, karma öğrenme, hibrit öğrenme, harmanlanmış öğrenim, harmanlanmış öğretim, karma öğrenim, blended learning, hybrid learning ve blended course anahtar kelimeleri kullanılarak tez taramaları yapılmıştır.

Listelenen tezler, *pdf* formatında indirilerek tam metne erişim sağlanmıştır. İzin sorunu olan ve kısıtlı kullanım imkânı bulunan tezlerin ise özetlerinden faydalanılmıştır. Bu açıdan çalışmada herhangi bir örneklem seçilmemiş, özetlerine veya tam metinlerine ulaşılan yüksek lisans ve doktora tezlerinin tamamı araştırmanın evreni olarak incelenmiştir.Ulaşılan tezlere ait bilgiler, kodlanarak Microsoft Excel programında tablolaştırılmış ve istatistik hesaplamaları da bu program aracılığı ile yapılmıştır.

Kodlanan bilgilerden araştırma sorularına uygun alt tablolar oluşturularak verilerin görselleştirilmesi sağlanmıştır. Sonuç çıkarma ve doğrulama sürecinde ise, oluşturulan alt tablolar hem nitel hem de istatistik açıdan incelenmiş ve ulaşılan sonuçlar ve öneriler 4.bölümde sunulmuştur.

BULGULAR

YÖK Tez Merkezi'nde farklı arama terimleri ile yapılan taramalarda, Tablo 1'de de görüldüğü gibi toplam 43 teze ulaşılmıştır. Ancak izin ve kısıtlı kullanım sebepleriyle bunlardan 6 tanesinin tam metnine ulaşılamamış, bu nedenle de özetlerinden faydalanılmıştır. Dolayısıyla, çalışmamızın evrenini bu 43 yüksek lisans ve doktora tezi oluşturmaktadır.

Tablo 1. Taramaların Sayısal Sonuçları

Tarama Terimi	**Listelenen Tez Sayısı**
Harmanlanmış Öğrenme	22
Karma Öğrenme	11
Hibrit Öğrenme	1
Harmanlanmış Öğrenim	1
Harmanlanmış Öğretim	3
Karma Öğrenim	2
Blended Learning	36
Hybrid Learning	3
Blended Course	4
BİLEŞİK TOPLAM	**43**
TAM METNİNE ULAŞILABİLEN TEZ SAYISI	**37**

Ülkemizde harmanlanmış öğrenme ortamları hakkındaki tez seviyesinde yapılan çalışmaların 10 yıllık bir geçmişi olduğu görülmektedir. Bu süreç içerisinde İngilizceden yapılan farklı çeviriler ve ortak bir kullanımın oluşturulamaması sebebiyle farklı terimlerin kullanıldığı görülmüştür. Tablo 1'de görüldüğü gibi İngilizcede "blended learning", "hybrid learning" ve "blended course" terimi ile yapılan taramalara karşılık, Türkçede harmanlanmış öğrenme, harmanlanmış öğretim, harmanlanmış öğrenim, karma öğrenme, karma öğrenim ve hibrit öğrenme anahtar kelimeleri ile ilişkilendirilmiş çalışmalar bulunmaktadır.

Tezlerin Türlerine Göre İncelenmesi

YÖK Tez Merkezinin web sayfasında yapılan taramalar sonucu ulaşılan tezlerin türlere göre dağılımı Tablo 2'de görülmektedir. Buna göre; 18 doktora ve 25 yüksek lisans tezine ulaşılmıştır.

Tablo 2. Tezlerin Türlerine Göre Dağılımı

Türü	Tez Sayısı	
	(n)	(%)
Yüksek Lisans	25	58
Doktora	18	42
TOPLAM	**43**	**100**

Tezlerin Yıllara Göre İncelenmesi

Harmanlanmış öğrenme alanında hazırlanan yüksek lisans ve doktora tezleri incelendiğinde; çalışmaların 2003-2013 yılları arasında gerçekleştirildiği ve en fazla çalışmanın 10 adet tez ve %23,2'lik bir oran ile 2009 ve 2011 yıllarında yapıldığı Tablo 3'te görülmektedir. Ayrıca 2009 yılında yapılan 6 adet doktora çalışması ile 2011 yılında yapılan 8 adet yüksek lisans çalışması da diğer yıllarla karşılaştırıldığında dikkat çekici bir seviyededir.

Tablo 3. Tezlerin Yıllara Göre Dağılımı

Yıllar	Tez Sayıları		TOPLAM	
	Yüksek Lisans	Doktora	(n)	(%)
2003	-	1	1	2,3
2005	1	-	1	2,3
2006	1	-	1	2,3
2007	1	2	3	7,0
2008	1	-	1	2,3
2009	4	6	10	23,2
2010	2	1	3	7,0
2011	8	2	10	23,2
2012	5	3	8	18,7
2013	2	3	5	11,7
TOPLAM	**25**	**18**	**43**	**100**

Tezlerin Üniversitelere Göre İncelenmesi

Tezlerin üniversitelere göre dağılımı Tablo 4'te verilmiştir. Buna göre; Harmanlanmış Öğrenme alanında en fazla tez hazırlayan üniversitenin toplam 12 tez ile Gazi Üniversitesi olduğu görülmektedir. Türkiye'de bu alanda tez yürüten üniversitelerin toplam sayısı ise 16'dır.

Tablo 4. Tezlerin Üniversitelere Göre Dağılımı

Üniversite	Tez Sayıları		TOPLAM	
	Yüksek Lisans	Doktora	(n)	(%)
Gazi	5	7	12	28,0
ODTÜ	1	5	6	14,0
Hacettepe	4	1	5	11,6
Fırat	4	0	4	9,3
Anadolu	1	2	3	7,0
Celal Bayar	2	0	2	4,7
Bilkent	2	0	2	4,7
Ahi Evran	1	0	1	2,3
Dicle	0	1	1	2,3
Marmara	0	1	1	2,3
Dokuz Eylül	1	0	1	2,3
Sakarya	1	0	1	2,3
Yıldız Teknik	0	1	1	2,3
Zonguldak Karaelmas	1	0	1	2,3
Mustafa Kemal	1	0	1	2,3
Selçuk	1	0	1	2,3
TOPLAM	**25**	**18**	**43**	**100**

Tezlerin Yazım Dillerine Göre İncelenmesi

Tezlerin yazım dili incelendiğinde; Tablo 5'te de görüleceği gibi, 34 tez Türkçe, 9 tez ise İngilizce yazılmıştır.

Tablo 5. Tezlerin Yazım Dillerine Göre Dağılımı

Dili	Tez Sayıları		TOPLAM	
	Yüksek Lisans	Doktora	(n)	(%)
Türkçe	22	12	34	79
İngilizce	3	6	9	21
TOPLAM	**25**	**18**	**43**	**100**

Tezlerin %79'luk bir oranda Türkçe yazıldığı görülmektedir. İngilizce yazılan tezlerin ise; 6 tanesi ODTÜ, 2 tanesi Bilkent ve 1 tanesi de Anadolu Üniversitesi'ne aittir.

Tezlerin Danışman Unvanlarına Göre İncelenmesi

Yapılan tezlerin danışmanlarına göre bir inceleme yapıldığında, unvanlara göre eşit sayılabilecek bir dağılım ortaya çıkmaktadır. Tablo 6'ya bakıldığında, 13 tezin Prof.Dr., 14 tezin Doç.Dr. ve 16 tezin de Yrd.Doç.Dr. unvanlı danışmanlar tarafından yürütüldüğü görülmektedir.

Tablo 6. Tezlerin Danışman Unvanlarına Göre Dağılımı

Unvan	Tez Sayıları		TOPLAM	
	Yüksek Lisans	Doktora	(n)	(%)
Prof.Dr.	3	10	13	30,3
Doç.Dr.	8	6	14	32,5
Yrd.Doç.Dr.	14	2	16	37,2
TOPLAM	**25**	**18**	**43**	**100**

Ayrıca Prof.Dr. unvanlı danışmanların doktora tezlerine, Yrd.Doç.Dr. unvanlı danışmanların ise yüksek lisans tezlerine daha fazla danışmanlık yaptığı söylenebilir.

Tezlerin Danışmanlarına Göre İncelenmesi

Tezlerin danışmanlarına göre incelendiği Tablo 7'ye bakıldığında, en fazla tez (n=4) danışmanlığı yapanların; Orta Doğu Teknik Üniversitesi'nden Prof.Dr. M.Yaşar Özden ile Gazi Üniversitesi'nden Doç.Dr. M.Akif Ocak olduğu görülmektedir.

Tablo 7. Tezlerin Danışmanlarına Göre Dağılımı

Danışman		Tez Sayıları		TOPLAM
	Üniversite	Yüksek Lisans	Doktora	(n)
Prof.Dr. M.Yaşar Özden	O.D.T.Ü.	-	4	4
Doç.Dr. M.Akif Ocak	Gazi Üniversitesi	3	1	4
Prof.Dr. H.İbrahim Yalın	Gazi Üniversitesi	-	2	2
Doç.Dr. Osman Nafiz Kaya	Fırat Üniversitesi	2	-	2
Yrd.Doç.Dr. Hasan Çakır	Gazi Üniversitesi	2	-	2

Tezlerin Ana Bilim Dallarına Göre İncelenmesi

YÖK Tez Merkezinin web sayfasından ulaşılan 43 tezin ana bilim dallarına göre dağılımını gösteren Tablo 8 aşağıdadır.

Tablo 8. Tezlerin Ana Bilim Dallarına Göre Dağılımı

Ana Bilim dalı	Tez Sayıları		TOPLAM	
	Yüksek Lisans	Doktora	(n)	(%)
B.Ö.T.E.	11	5	16	37,2
E.P.Ö.	4	3	7	16,2
Fen Bilgisi Eğitimi	3	1	4	9,3
Eğitim Teknolojisi	-	2	2	4,7
İlköğretim	1	1	2	2,3
İngilizce Eğitimi	1	1	2	2,3
Ortaöğretim Fen ve Matematik Eğitimi	2	-	2	2,3
Uzaktan Eğitim	1	-	1	2,3

Elektrik-Elektronik Mühendisliği	-	1	1	2,3
Eğitim Bilimleri	-	1	1	2,3
Beden Eğitimi ve Spor Öğretmenliği	-	1	1	2,3
Biyoloji Eğitimi	-	1	1	2,3
Coğrafya Eğitimi	-	1	1	2,3
Fizik Eğitimi	1	-	1	2,3
Sınıf Öğretmenliği	1	-	1	2,3
TOPLAM	**25**	**18**	**43**	**100**

Buna göre; en fazla tez çalışmasının yürütüldüğü ana bilim dalı Bilgisayar ve Öğretim Teknolojileri Eğitimi'dir (n=16 %37,2).

Harmanlanmış öğrenme alanının, yüksek lisans ve doktora tezleri aracılığı ile ilişkilendirildiği ana bilim dalı toplam sayısı ise 15'tir.

Tezlerin Araştırılan Değişkenlere Göre İncelenmesi

Ulaşılan tezler araştırılan değişkenler bakımından incelendiğinde Tablo 9'de görülen dağılım ortaya çıkmıştır.

Tablo 9. Tezlerin Araştırılan Değişkenlere Göre Dağılımı

Araştırılan Değişkenler	**Tez Sayıları**		**TOPLAM**
	Yüksek Lisans	**Doktora**	
Akademik Başarıya Etkisi	9	7	16
Kalıcılığa Etkisi	1	1	2
Tutuma Etkisi	8	3	11
Motivasyona Etkisi	4	4	8
Özyeterlik Algılarına Etkisi	2	1	3
Derse Katılıma Etkisi	2	1	3
Öğrenci Görüşleri	3	0	3
Öğrenci Algılarına Etkisi	1	3	4
Psikomotor Becerilere Etkisi	1	1	2
Doyum Üzerindeki Etkisi	0	1	1
Öğretmen / Öğretim Elemanlarının Görüşleri	3	0	3
Öğretmen Algıları	0	1	1
Memnuniyete Etkisi	1	2	3
Öğrenci Etkileşimlerine Etkisi	0	1	1
Öğrenme Düzeylerine Etkisi	0	2	2
Sunum Hazırlama Becerilerine Etkisi	1	0	1
İletişim Becerilerine Etkisi	1	0	1
Dinleme ve Konuşma Becerilerine Etkisi	0	1	1
Bağımsız Öğrenme Becerilerine Etkisi	2	1	3
Bilgi Transferine Etkisi	1	0	1
Bilişsel Becerilerin Gelişimine Etkisi	2	0	2
Ortamın Etkililiğini Değerlendirme	0	1	1
Bir Ders Ortamı Geliştirme	0	1	1
Öğrenme Stillerine Etkisi	1	0	1
Yazılım Algoritması Oluşturma	0	1	1
Web Materyali Kullanma Davranışlarına Etkisi	0	1	1
Özdüzenleme Becerilerine Etkisi	1	0	1
Öğretim Bulunuşluğuna Etkisi	0	1	1
Sosyal Bulunuşluğa Etkisi	0	1	1
Bilimsel Araştırmaları Anlamaya Etkisi	1	0	1
Bilimin Doğasını Anlamaya Etkisi	1	0	1
TOPLAM	**46**	**36**	**82**

Araştırmalarda araştırılan değişkenlerin toplam sayısı 31'dir. Bu değişkenler arasında çoğunlukla, harmanlanmış öğrenme ortamlarının akademik başarı (n=16), tutum (n=11) ve motivasyon (n=8) üzerindeki etkilerinin incelendiği görülmektedir.

SONUÇLAR VE ÖNERİLER

Türkiye'de harmanlanmış öğrenme alanında yapılmış yüksek lisans ve doktora tezlerinin incelendiği bu çalışmada, aşağıdaki sonuçlar elde edilmiştir:

- Ülkemizde harmanlanmış öğrenme alanında yapılmış ve YÖK Tez Merkezi'nden ulaşılabilen 25'i yüksek lisans ve 18'i doktora olmak üzere toplam 43 adet tez bulunmaktadır. Ancak bu tezlerden; bu çalışmanın yapıldığı tarih itibariyle izin ve kısıtlı kullanım sebebiyle 37 tanesinin tam metnine ulaşılıp *pdf* formatında indirilmesine imkân vardır.
- Harmanlanmış öğrenme alanı için yapılan taramalarda, harmanlanmış öğrenme anahtar kelimesi ile birlikte; karma öğrenme, hibrit öğrenme, harmanlamış öğrenim, harmanlanmış öğretim ve karma öğrenim ifadeleri de kullanılmıştır. İngilizce yapılan taramalarda ise blended learning, hybrid learning ve blended course anahtar kelimeleri kullanılmıştır.
- En fazla tez hazırlanan yılların 2009 ve 2011 yılları olduğu görülmüştür (n=10).
- Harmanlanmış öğrenme alanında en fazla tez hazırlayan üniversite, 5'i yüksek lisans 7'si doktora olmak üzere 12 tez ile Gazi Üniversitesi'dir.
- Hazırlanan tezlerin %79'unda yazım dili olarak Türkçe kullanılırken, %21'inde İngilizce kullanılmıştır.
- Tezlerin danışmanlığını yürüten hocaların unvanlarına göre de birbirine yakın bir dağılım göze çarpmaktadır.
- Bu alanda en fazla tez danışmanlığı yapan hocalar; 4 tez danışmanlığı ile Orta Doğu Teknik Üniversitesi'nden Prof.Dr. M.Yaşar Özden ile Gazi Üniversitesi'nden Doç.Dr. M.Akif Ocak'tır.
- Bilgisayar ve Öğretim Teknolojileri Eğitimi ana bilim dalı, 16 tez ile en fazla tez yürüten ana bilim dalıdır (%37,2).
- Tezler araştırılan değişkenlere göre incelendiğinde, en çok araştırılan temaların akademik başarı, tutum ve motivasyon olduğu görülmüştür.

Bu araştırmada elde edilen bulgulara göre; ülkemizde harmanlanmış öğrenme çalışmalarının son 5 yılda hız kazandığı görülmektedir. Hazırlanan tezlerin sonuçlarına bakıldığında HÖ ortamları hakkında daha fazla çalışmanın yapılmasına ihtiyaç olduğu söylenebilir.

Tez çalışmalarını yürüten ana bilim dalları incelendiğinde 16 adet farklı A.B.D. karşımıza çıkmaktadır. Yeni bir alan olması sebebiyle dar bir boyutta kaldığı görülen harmanlanmış öğrenme çalışmalarının spordan müziğe, mühendislik bilimlerinden tıp sektörüne kadar uzanan geniş bir yelpazede araştırılması ve buna uygun öğrenme ortamlarının tasarlanması gerektiği düşünülmektedir.

Ayrıca yapılan tezlerde dikkat çeken bir diğer önemli nokta ise; harmanlamanın genelde etkinlik ve ders düzeyinde olduğudur. Bu açıdan; program ve kurumsal düzeyde yapılacak harmanlanmış öğrenme çalışmalarına ihtiyaç olduğu düşünülmektedir.

PROSPECTIVE MIDDLE SCHOOL MATHEMATICS TEACHERS' COMPUTATIONAL ESTIMATION STRATEGIES FOR ADDITION

Seçil YEMEN-KARPUZCU

Rukiye AYAN

Mine IŞIKSAL-BOSTAN

Computational estimation (CE) tasks of number sense are important for understanding numbers and quantities as conceptual environments (Greeno, 1991). To develop students productively in CE, mathematics teachers also need to have skills to make CEs and understand conceptually the numbers and operations. The aim of this study was to identify the prospective middle school mathematics teachers' CE strategies regarding addition operation. Data were collected from 37 junior prospective teachers who were attending to the methods of teaching mathematics course in a public university in Turkey as a part of the methods of teaching mathematics course. Data collection instrument involved 3 open-ended CE tasks. In different contexts, the tasks (1, 2, 3) included adding 7 numbers between 5 and 13, 7 numbers between 26 and 76, 8 numbers between 35 and 92, respectively. Participants were required to estimate the sum of the numbers and explain their strategies in detail. The data were analyzed using Sowder and Wheeler's (1989) skill components in CE and Dowker's (1992) strategy classification. The researchers analyzed the written responses until full consensus was reached on categories that strategies fall into. The responses for both the strategies and the interval of estimation values were identified to catch the trend of strategies. In task 1, most of the students had a good estimation using averaging strategy or using both compatible numbers and rounding strategies. Most of the students had a good estimation using rounding strategy in task 2. Lastly, some students had a good estimation using rounding strategy in tasks 3. Another group of students had a moderate estimation using averaging or rounding strategy. The findings indicated that while averaging strategy was highly preferred for task 1, rounding strategy was preferred for tasks 2 and 3. Therefore, the strategies were not quite diversified for estimation.

INVESTIGATING MASTER THESIS AND DOCTORAL DISSERTATIONS ABOUT NATURE OF SCIENCE: TURKEY SAMPLE

It's become crucial to make students realize the nature of science properly soon after renewed Science and Technology course curriculum, in 2005, which aimed to educate science literate individuals as a major vision. It has come up as a cognitive learning goal instead of affective byproduct, thus, researches connected to nature of science has increased until 2005. Current study aims to investigate master thesis and doctoral dissertations carried out in Turkey and about nature of science. In this context, universe of the study was consisted of dissertations reached from the National Dissertation which is contained within Center Council of Higher Education. 52 dissertations were investigated because of having problems accessing to some studies. Document analysis was preferred as a qualitative research method. It was seen that the studies aimed to determine views about nature of science concluded that many of the students and the teachers interiorized non-contemporary conceptions. Besides, analysis of the studies aimed to develop views on nature of science showed that making a special effort on individuals to make them sense of nature of science provides to bring contemporary to views. As a consequence it is suggested to give place to nature of science as objectives in curriculum and enriching activities of Ministry of Education textbooks related to nature of science.

Key Words: Nature of science, thesis and dissertations.

ÖĞRENCİLERİN MOBİL TEKNOLOJİLERE İLİŞKİN ÖN BİLGİ DÜZEYLERİNİN FARKLI DEĞİŞKENLER AÇISINDAN İNCELENMESİ

EXAMINATION OF STUDENTS' PRIOR KNOWLEDGE LEVEL OF MOBILE TECHNOLOGY USING DIFFERENT VARIABLES

Yusuf Ziya OLPAK
Ahi Evran Üniversitesi
yusufziyaolpak@gmail.com

Agah Tuğrul KORUCU
Necmettin Erbakan Üniversitesi
agah.korucu@gmail.com

ÖZET: Bu araştırma kapsamında, öğrencilerin mobil teknolojilere ilişkin ön bilgi düzeylerinin farklı değişkenler ile olan ilişkisini incelemek amaçlanmıştır. Tarama modeline göre yürütülen araştırma, kullanılan veri toplama araçlarındaki sorulara uygun şekilde yanıtlar veren 309 öğrenciden elde edilen veriler ile gerçekleştirilmiştir. Verilerin toplanmasında; yazarlar tarafından yükseköğretimdeki öğrencilerin mobil teknolojilere ilişkin ön bilgi düzeylerinin belirlenebilmesine yönelik olarak geliştirilen veri toplama aracından faydalanılmıştır. Verilerin çözümlenmesinde ise; ilişkisiz örneklemler için t-testi ve ilişkisiz örneklemler için tek faktörlü varyans analizi kullanılmıştır. Araştırma sonucunda ulaşılan bulgular; öğrencilerin mobil teknolojilere ilişkin ön bilgi düzeyi puanlarının, sahip oldukları mobil cihaz(lar)a ve haftalık internet kullanım süresine göre değiştiğini ancak cinsiyete göre değişmediğini göstermiştir.

Anahtar sözcükler: mobil teknolojiler, öğretmen adayı, ön bilgi

ABSTRACT: In this study, it is aimed to examine students' level of prior knowledge of mobile technologies using different variables. The study was planned and carried out in accordance with the survey model, and the data were obtained from 309 students who gave proper answers the questions contained in the data collection tools. The data collection tools developed by the authors to determine university students' level of mobile technology prior knowledge were used. The independent samples t-test and one-way ANOVA were used to analyze the data. The findings show that the students' scores that represent their mobile technology prior knowledge levels vary depending on the mobile device(s) they have and their weekly internet usage, not their sex.

Keywords: mobile technologies, preservice teacher, prior knowledge

GİRİŞ

Çağımızda teknolojik olarak yaşanan hızlı gelişmelerden dolayı, üretilen bilgi miktarı da hızla artmaktadır. Bireylerin bu hızlı değişime ayak uydurabilmeleri için, yaşam boyu öğrenmeye açık olmaları ve ihtiyaç duydukları bilgileri istedikleri zaman öğrenebilmeleri önem arz etmektedir. Bu bağlamda eğitim etkinliklerinde kullanılabilecek teknolojiler de değişim ve gelişim göstermektedir. Bunlardan biri de son zamanlarda üzerinde sıkça durulan mobil teknolojilerdir. Mobil teknolojiler taşınabilirlik/hareketlilik, hızlı erişilebilirlik ve bağlanılabilirlik gibi özellikleri ile diğer eğitim teknolojilerinden ayrılmaktadır ve mobil cihazlar öğrencilerin öğrenme şekillerini değiştirmektedir (Song, 2011). Mobil öğrenme ile ilgili ilk araştırmalar 1990'ların sonlarına doğru başlamıştır ve günümüzde yaşanan teknolojik gelişmelere paralel olarak da büyük bir hızla devam etmektedir (Woodill, 2010, s. 9). Alanyazında mobil öğrenme ile ilgili yapılan ilk tanımlarda teknoloji odak noktası olarak alınmış ve mobil öğrenme, bir mobil cihaz aracılığıyla öğrenme şeklinde ifade edilmiştir (Woodill, 2010, s. 14). Ancak zaman içerisinde farklı araştırmacılar tarafından çeşitli tanımlar yapılmıştır (Geddes, 2004; Keegan, 2005; O'Malley ve diğerleri, 2005). Avrupa'da mobil öğrenme ile ilgili çok yıllık bir çalışma olan MOBIlearn projesinde ise, mobil öğrenme; öğrencilerin önceden belirlenmiş bir yerde sabit olarak kalmasına gerek olmadan, mobil teknolojiler tarafından sağlanan öğrenme fırsatları ile ilgili avantajları kullanarak, gerçekleştirdikleri her türlü öğrenme olarak tanımlanmıştır (Vavoula, 2005).

Mobil öğrenmenin; zamandan ve mekândan bağımsız olarak bilgiye erişebilmeye imkân sağlaması, öğrenmeyi destekleyici farklı araçları kullanabilme imkânı tanıması, iletişimi artırması ve yaşam boyu öğrenmeye olanak sağlaması gibi avantajlarının (Al-Fahad, 2009; Bulun, Gülnar ve Güran, 2004; Uzunboylu, Cavus ve Ercag, 2009) yanı sıra; mobil cihazların genel özelliklerinden kaynaklanan (küçük ekran boyutları nedeni ile gezintide ve okumada yaşanan güçlükler, internete erişim için gereken ilave maliyet, küçük olan tuş takımları veya klavyeler nedeni ile metin girişindeki zorluklar ve sınırlı pil ömrü vb.) dezavantajları (Stockwell, 2007; Thornton ve Houser, 2002; Waycott and Kukulska-Hulme, 2003) da bulunmaktadır..

Mobil öğrenmenin avantajlarından en iyi şekilde yararlanıp dezavantajlarından da en az derecede etkilenmek için, tasarlanan öğrenme ortamlarının öğretme-öğrenme etkinliklerinin merkezinde yer alan öğrencilerin ihtiyaçlarına en iyi şekilde cevap vermesi gerekmektedir. Bu noktada öğrencilerin ön bilgilerinin dikkate alınması da oldukça önemlidir ve ancak böyle, öğretme-öğrenme için uygun ortamlar tasarlanabilir. Ayrıca öğretmen adaylarının geleceğin nesillerini yetiştirecekleri göz önünde bulundurulursa aldıkları eğitimin kalitesinin ne kadar önemli olduğu daha da iyi anlaşılacaktır. Çünkü; artık günlük hayatın bir parçası haline gelen mobil uygulamaların (hastane randevusu alma, ulaşım araçları ile ilgili sefer saatlerini öğrenme, uçak bileti alma vb.) eğitim etkinliklerinde de kullanılması kaçınılmaz hale geldiğinden, öğrencilerin mobil teknolojilere ilişkin ön bilgi düzeylerinin belirlenmesi önemlidir. Bu bağlamda bu araştırma kapsamında, öğretmen adaylarının mobil teknolojilere ilişkin ön bilgi düzeylerinin farklı değişkenler ile olan ilişkisini incelemek amaçlanmıştır. Bu genel amaç çerçevesinde de aşağıdaki sorulara cevap aranmıştır:

1. Öğrencilerin mobil teknolojilere ilişkin ön bilgi düzeyleri sahip oldukları mobil cihaz(lar)a göre anlamlı bir farklılık göstermekte midir?
2. Öğrencilerin mobil teknolojilere ilişkin ön bilgi düzeyleri cinsiyete göre anlamlı bir farklılık göstermekte midir?
3. Öğrencilerin mobil teknolojilere ilişkin ön bilgi düzeyleri haftalık internet kullanım süresine göre anlamlı bir farklılık göstermekte midir?

YÖNTEM

Araştırmanın Modeli ve Çalışma Grubu

Tarama modeline göre yürütülen bu araştırma, 2013-2014 eğitim-öğretim yılı Bahar döneminde, Necmettin Erbakan Üniversitesi eğitim fakültesi öğrencilerinden araştırma kapsamında kullanılan veri toplama aracındaki sorulara uygun şekilde yanıt veren 309 öğrenciden elde edilen veriler ile gerçekleştirilmiştir.

Veri Toplama Araçları

Araştırma kapsamında, yazarlar tarafından yükseköğretimdeki öğrencilerin mobil teknolojilere ilişkin ön bilgi düzeylerinin belirlenebilmesine yönelik olarak geliştirilen veri toplama aracından faydalanılmıştır. Belirtilen veri toplama aracı geliştirilirken kapsamlı bir alanyazın taraması yapılmış ve oluşturulan taslak maddeler kapsam geçerliliği ve hedeflere uygunluğu açısından beş farklı alan uzmanının görüşüne sunulmuştur. Uzmanlardan alınan geribildirimler doğrultusunda veri toplama aracı (Ek-1) tekrar düzenlenmiş ve son hâli verilerek araştırma kapsamında kullanılmıştır. Veri toplama aracı kişisel bilgiler ilgili maddeler ve mobil teknolojilere ilişkin ön bilgi düzeyini belirlemeye yönelik maddeler olmak üzere iki bölümden oluşmaktadır. Öğrencilerin mobil teknolojilere ilişkin ön bilgi düzeyleri bu maddelerden ne kadar puan aldıklarına göre belirlenmektedir ve puanların artması yüksek ön bilgi düzeyini azalması ise düşük ön bilgi düzeyini göstermektedir. Veri toplama aracının araştırma kapsamında elde edilen verilerle hesaplanan Cronbach α güvenilirlik katsayısı ise; 0.73'tür ve güvenilirlik açısından kabul edilebilir düzeydedir.

Verilerin Çözümlenmesi

Araştırma kapsamında elde edilen veriler SPSS (The Statistical Package for The Social Sciences) paket programı kullanılarak çözümlenmiş ve tüm hipotezler 0.95 güven düzeyinde ($p = 0.05$) test edilmiştir. Araştırma kapsamında elde edilen veriler parametrik test varsayımlarını karşıladığından, verilerin çözümlenmesinde parametrik testlerden (ilişkisiz örneklemler için t-testi ve ilişkisiz örneklemler için tek faktörlü varyans analizi) yararlanılmıştır.

BULGULAR

Öğrencilerin mobil teknolojilere ilişkin ön bilgi düzeylerinin sahip oldukları mobil cihaz(lar)a göre anlamlı bir farklılık gösterip göstermediğine yönelik bulgular:

Öğrencilerin mobil teknolojilere ilişkin ön bilgi düzeylerinin sahip oldukları mobil cihaz(lar)a göre anlamlı bir farklılık gösterip göstermediğini çözümlemek için, ilişkisiz örneklemler için tek faktörlü varyans analizi kullanılmıştır. Öğrencilerin mobil teknolojilere ilişkin ön bilgi düzeyi puanlarının sahip oldukları mobil cihaz(lar)a göre ortalamaları ve standart sapma değerleri Tablo 1'de verilmiştir.

Tablo 1. Öğrencilerin Mobil Teknolojilere İlişkin Ön bilgi Düzeyi Puanlarının Sahip Oldukları Mobil Cihaz(lar)a Göre Betimsel İstatistikleri

Sahip Olunan Mobil Cihaz(lar)	N	$\overline{X}$	S
1) Akıllı Telefon	27	9.37	1.925
2) Akıllı Telefon, Dizüstü Bilgisayar	120	9.94	1.204
3) Akıllı Telefon, Minibook (Netbook)	2	10.00	.000
4) Akıllı Telefon, Tablet (iPad, Samsung Tab vb.)	21	9.67	1.528
5) Cep Telefonu	32	8.13	2.121
6) Cep Telefonu, Dizüstü Bilgisayar	83	9.17	2.129
7) Cep Telefonu, Tablet (iPad, Samsung Tab vb.)	16	9.56	1.315
8) Cep Telefonu, Minibook (Netbook)	8	9.88	1.126
Toplam	**309**	**9.46**	**1.762**

Tablo 1'de de görüldüğü gibi; 'Akıllı Telefon' sahibi olan öğrencilerin mobil teknolojilere ilişkin ön bilgi düzeyi puanlarının ortalaması 9.37, 'Akıllı Telefon ve Dizüstü Bilgisayar' sahibi olanlarınki 9.94, 'Akıllı Telefon ve Minibook (Netbook)' sahibi olanlarınki 10.00, 'Akıllı Telefon ve Tablet (iPad, Samsung Tab vb.)' sahibi olanlarınki 9.67, 'Cep Telefonu' sahibi olanlarınki 8.13, 'Cep Telefonu ve Dizüstü Bilgisayar' sahibi olanlarınki 9.17, 'Cep Telefonu ve Tablet (iPad, Samsung Tab vb.)' sahibi olanlarınki 9.56 ve 'Cep Telefonu ve Minibook (Netbook)' sahibi olanlarınki 9.88'dir. Öğrencilerin mobil teknolojilere ilişkin ön bilgi düzeyi puanlarının sahip oldukları mobil cihaz(lar)a göre anlamlı bir farklılık gösterip göstermediğine dair bulgular ise Tablo 2'de verilmiştir.

Tablo 2. Öğrencilerin Mobil Teknolojilere İlişkin Ön bilgi Düzeyi Puanlarının Sahip Oldukları Mobil Cihaz(lar)a Göre ANOVA Sonuçları

Varyansın Kaynağı	Kareler Toplamı	Sd	Kareler Ortalaması	F	p
Gruplararası	95.155	7	13.594	4.749	.000
Gruplariçi	861.506	301	2.862		
Toplam	**956.660**	**308**			

Tablo 3. Çoklu Karşılaştırma -Tukey Testi- Sonuçları

Yöntem	1	2	3	4	5	6	7	8
1) Akıllı Telefon	-	-	-	-	-	-	-	-
2) Akıllı Telefon, Dizüstü Bilgisayar	-	-	-	-	*	*	-	-
3) Akıllı Telefon, Minibook (Netbook)	-	-	-	-	-	-	-	-
4) Akıllı Telefon, Tablet (iPad, Samsung Tab vb.)	-	-	-	-	*	-	-	-
5) Cep Telefonu	-	*	-	*	-	-	-	-
6) Cep Telefonu, Dizüstü Bilgisayar	-	*	-	-	-	-	-	-
7) Cep Telefonu, Tablet (iPad, Samsung Tab vb.)	-	-	-	-	-	-	-	-
8) Cep Telefonu, Minibook (Netbook)	-	-	-	-	-	-	-	-

Tablo 2'de de görüldüğü gibi, ilişkisiz örneklemler için tek faktörlü varyans analizi kullanılarak elde edilen bulgulara göre, öğrencilerin mobil teknolojilere ilişkin ön bilgi düzeyi puanları sahip oldukları mobil cihaz(lar)a göre anlamlı bir farklılık göstermektedir [$F_{(7\text{-}301)}=4.749$, $p<.05$]. Diğer bir ifadeyle, öğrencilerin mobil teknolojilere ilişkin ön bilgi düzeyi puanları sahip oldukları mobil cihaz(lar)a göre değişmektedir. Farklılıkların hangi ikili gruptan kaynaklandığını gösteren çoklu karşılaştırma testi (Tukey testi) sonuçlarına ilişkin Tablo 3 incelendiğinde; "Akıllı Telefon, Dizüstü Bilgisayar" - "Cep Telefonu", "Akıllı Telefon, Dizüstü Bilgisayar" - "Cep Telefonu, Dizüstü Bilgisayar" ve "Akıllı Telefon, Tablet (iPad, Samsung Tab vb.)" - "Cep Telefonu" (2-5, 2-6 ve 4-5) sahibi olan öğrencilerin mobil teknolojilere ilişkin ön bilgi düzeyi puanları arasında anlamlı bir fark olduğu görülmektedir.

Öğrencilerin mobil teknolojilere ilişkin ön bilgi düzeylerinin cinsiyete göre anlamlı bir farklılık gösterip göstermediğine yönelik bulgular:

Öğrencilerin mobil teknolojilere ilişkin ön bilgi düzeylerinin cinsiyete göre t-testi sonuçları Tablo 4'te verilmiştir.

Tablo 4. Öğrencilerin Mobil Teknolojilere İlişkin Ön bilgi Düzeyi Puanlarının Cinsiyete Göre T-Testi Sonuçları

Cinsiyet	N	$\overline{X}$	S	Sd	T	P
Kadın	184	9.29	1.764	307	2.047	0.42
Erkek	125	9.70	1.737			

Tablo 4’te de görüldüğü gibi, ilişkisiz örneklemler için t-testi kullanılarak elde edilen bulgulara göre, öğrencilerin mobil teknolojilere ilişkin ön bilgi düzeyi puanları cinsiyete göre anlamlı bir farklılık göstermemektedir ($p > .05$). Diğer bir ifadeyle, öğrencilerin mobil teknolojilere ilişkin ön bilgi düzeyi puanları cinsiyete göre değişmemektedir.

Öğrencilerin mobil teknolojilere ilişkin ön bilgi düzeylerinin haftalık internet kullanım süresine göre anlamlı bir farklılık gösterip göstermediğine yönelik bulgular:

Öğrencilerin mobil teknolojilere ilişkin ön bilgi düzeylerinin haftalık internet kullanım süresine göre anlamlı bir farklılık gösterip göstermediğini çözümlemek için, ilişkisiz örneklemler için tek faktörlü varyans analizi kullanılmıştır. Öğrencilerin mobil teknolojilere ilişkin ön bilgi düzeyi puanlarının haftalık internet kullanım süresine göre ortalamaları ve standart sapma değerleri Tablo 5’te verilmiştir.

Tablo 5. Öğrencilerin Mobil Teknolojilere İlişkin Ön bilgi Düzeyi PuanlarınınHaftalık İnternet Kullanım Süresine Göre Betimsel İstatistikleri

Haftalık İnternet Kullanım Süresi	N	$\overline{X}$	S
0-3 saat	70	8.77	1.987
3-6 saat	95	9.53	1.428
6-9 saat	62	9.73	1.776
9 saat ve üzeri	82	9.76	1.775
Toplam	**309**	**9.46**	**1.762**

Tablo 5’te de görüldüğü gibi; haftada 0-3 saat arasında internet kullanan öğrencilerin mobil teknolojilere ilişkin ön bilgi düzeyi puanlarının ortalaması 8.77, haftada 3-6 saat arasında internet kullananlarınki 9.53, haftada 6-9 saat arasında internet kullananlarınki 9.73 ve haftada 9 saat ve üzerinde internet kullananlarınki 9.76’dır. Öğrencilerin mobil teknolojilere ilişkin ön bilgi düzeyi puanlarının haftalık internet kullanım süresine göre anlamlı bir farklılık gösterip göstermediğine dair bulgular ise Tablo 6’da verilmiştir.

Tablo 6. Öğrencilerin Mobil Teknolojilere İlişkin Ön bilgi Düzeyi Puanlarının Haftalık İnternet Kullanım Süresine Göre ANOVA Sonuçları

Varyansın Kaynağı	Kareler Toplamı	Sd	Kareler Ortalaması	F	P
Gruplararası	45.172	3	15.057	5.039	.002
Gruplariçi	911.488	305	2.988		
Toplam	**956.660**	**308**			

Tablo 7. Çoklu Karşılaştırma -Tukey Testi- Sonuçları

Yöntem	1	2	3	4
1) 0-3 saat	-	*	*	*
2) 3-6 saat	*	-	-	-
3) 6-9 saat	*	-	-	-
4) 9 saat ve üzeri	*	-	-	-

Tablo 6’da da görüldüğü gibi, ilişkisiz örneklemler için tek faktörlü varyans analizi kullanılarak elde edilen bulgulara göre, öğrencilerin mobil teknolojilere ilişkin ön bilgi düzeyi puanları haftalık internet kullanım süresine göre anlamlı bir farklılık göstermektedir [$F_{(3\text{-}305)}=5.039$, $p<.05$]. Diğer bir ifadeyle, öğrencilerin mobil teknolojilere ilişkin ön bilgi düzeyi puanları haftalık internet kullanım süresine göre değişmektedir. Farklılıkların hangi ikili gruptan kaynaklandığını gösteren çoklu karşılaştırma testi (Tukey testi) sonuçlarına ilişkin Tablo 7 incelendiğinde; “0-3 saat” - “3-6 saat”, “0-3 saat” - “6-9 saat” ve “0-3 saat” - “9 saat ve üzeri” (1-2, 1-3 ve 1-4) haftalık internet kullanım süresine sahip öğrencilerin mobil teknolojilere ilişkin ön bilgi düzeyi puanları arasında anlamlı bir fark olduğu görülmektedir.

SONUÇ

Bu araştırma sonucunda, öğrencilerin mobil teknolojilere ilişkin ön bilgi düzeyi puanları sahip oldukları mobil cihaz(lar)a ve haftalık internet kullanım süresine göre anlamlı bir farklılık göstermiştir. Ancak, öğrencilerin mobil teknolojilere ilişkin ön bilgi düzeyi puanları cinsiyete göre anlamlı bir farklılık göstermemiştir. Bulgular ayrıntılı olarak incelendiğinde ise; “Akıllı Telefon, Dizüstü Bilgisayar” - “Cep Telefonu”, “Akıllı Telefon, Dizüstü Bilgisayar” - “Cep Telefonu, Dizüstü Bilgisayar” ve “Akıllı Telefon, Tablet (iPad, Samsung Tab vb.)” - “Cep Telefonu” (2-5, 2-6 ve 4-5) sahibi olan öğrencilerin mobil teknolojilere ilişkin ön bilgi düzeyi puanları arasında anlamlı bir fark olduğu görülmektedir.Ayrıca; “0-3 saat” - “3-6 saat”, “0-3 saat” - “6-9 saat” ve “0-3 saat" - "9 saat ve üzeri" (1-2, 1-3 ve 1-4) haftalık internet kullanım süresine sahip öğrencilerin mobil teknolojilere ilişkin ön bilgi düzeyi puanları arasında da anlamlı bir fark olduğu görülmektedir.

ÖNERİLER

Bu araştırmanın çalışma grubunu bir devlet üniversitesinde bulunan eğitim fakültesinde öğrenim gören öğretmen adayları oluşturmaktadır. Bu nedenle, araştırma bulgularının genellenebilmesi için, farklı eğitim fakültelerinde öğrenim gören öğrencilerin de yer aldığı, daha geniş çaplı araştırmalar yapılması önerilmektedir. Ayrıca ileride yapılacak araştırmalarda; farklı eğitim düzeylerindeki öğrencilerin, çeşitli bireysel farklılıklarını da göz önünde bulundurarak, mobil teknolojilere ilişkin ön bilgi düzeylerinin belirlenilmeye çalışılması önerilmektedir.

Istanbul Aydın University

ABSTRACT: This research aims to investigate to what extent a visit to climate change-oriented exhibition embedded within an environmental education course has effects on pre-service elementary teachers' understandings about climate change. Sample of the study includes 58 pre-service teachers, enrolled in Environmental Education course offered in the 2011-2012 academic year in Elementary Education Program at a private university in Turkey. The course lasted 13 weeks and the context is composed of various environmental issues as well as an exhibition visit and student reflections. Pre-service elementary teachers' pre- and post-reflections were analyzed and coded for examining effects of visit on their understandings about climate change. It was found that the course seem to have an impact on pre-service elementary teachers' understanding of climate change. Besides, the exhibition visit resulted in increased understanding in consequences of climate change and the participants were able to make more individual-oriented suggestions for the climate change problem.

Key words: Environmental education, understanding of climate change, pre-service elementary teachers.

INTRODUCTION

Since the planet we inhabit has been facing serious environmental problems, educating environmentally literate citizens becomes increasingly important and therefore, environmental education has taken place in the curricula from early grades to higher grades of education. Besides, there is growing emphasis on the environmental education research. However, the studies investigating effectiveness of teaching programs in terms of students' understandings of environmental problems are rarely found. Although the positive and inevitable outcomes of visits to informal science settings are reported in science education literature (Rickinson et. al., 2004), there are not enough environmental education researches studying effects of visits on visitors' understandings on environmental problems. Investigating pre-service elementary teachers' understanding of environmental problems is significant because they will educate future citizens.

Scientists argue that climate change has negative impacts on human life and natural systems and continuously leads to problems such as droughts, floods, heavy precipitation, diseases, etc. Educating children about climate change can decrease their vulnerability risk as well as it will contribute to their understandings of sustainability on Earth (UNICEF, 2013).

Selection of the theme for the visit was intentional, because climate change is a dynamic and complex problem by its nature. The complexity of climate change stems from long delays between emissions of greenhouse gases (GHGs), their accumulation in atmosphere, their effects to temperature and climate, and eventually insufficient changes in emission policies (Moxnes and Saysel, 2009). These complexities result in misconceptions about climate change. Even, graduate students from prestigious universities like MIT and Harvard have misconceptions about how GHGs accumulate in atmosphere (Sterman and Sweeney, 2002).

Recent literature often focuses on perceptions, knowledge, and understanding about climate change (Bord, O'Connor, & Fisher, 2000; O'Connor, Bord, & Fisher, 1999), the gap between environmental knowledge, environmental awareness and displaying pro-environmental behavior (Kollmuss & Agyeman, 2002) and the actions people take in order to mitigate the climate change (Whitmarsh, 2009). However, studies searching the impact of a treatment on student learning about climate change are rarely found.

The treatment that might affect learning outcome is chosen as visit because the researches in science education point out the impact of the visits on various learning outcomes. The benefits of the visit to a science center or museums are reported as making students have fun (Lucas, 2000), fostering knowledge and learning (Bamberger & Tal, 2008), and increased attitudes toward protecting wildlife (Hughes, Packer, & Ballantyne, 2011). However, there are not enough studies investigating the effect of visit to science centers, museums, and etc. on students understanding of climate change.

The study presented here contributes to the environmental education (EE) literature in curricular way. The purpose of this study is to examine to what extent the visit to an exhibition embedded within an environmental education course has effects on pre-service elementary teachers' understandings about climate change. By pointing out this effect, it will be possible to improve environmental education courses at education faculties.

METHOD

Sample

58 students, who enrolled in EE course in Elementary Education Program at a private university in Turkey in the spring semester of 2011-2012, participated in this study. 14% of the participants was male and 86% was female. 71% of the participants specified their hometown as metropolitan, 22% of them specified it as rural area, 3% of them specified it as town and 2% specified it as village while 2% didn't answer this question. Metropolitans let in so many immigrants in recent years in Turkey, so identification may not be sufficient to depict the sample. For this reason, we need to identify the education level of the participants' parents. Regarding the education level of their mothers, 10% of the participants specified the education level of their mothers as university graduate, 31% as high-school graduate, 16% as middle school graduate, 38% as primary-school graduate, and %5 didn't specify at all. Regarding the education level of their fathers, 2% of the participants specified the education level of their fathers as doctorate, 19% of them specified it as university graduate, 39% as high-school graduate, 17% as middle school graduate, and 21% as primary-school graduate, while 2% didn't answer this question.

Research Questions

This paper reports effects of an exhibition visit on pre-service elementary teachers' understanding of climate change. The study presented here addresses the following research questions:

1. To what extent does the exhibition visit embedded within an environmental education program have effects on pre-service elementary teachers' understandings about climate change?
2. Does the EE course have an effect on participants' understandings on climate change?
3. Is there a significant difference of understanding climate change between the students who attended the exhibition and those who did not?

Research Design and Procedure

This research incorporates pre-test-post-test design by collecting pre and post-reflections at the beginning and at the end of the EE course. Quantitative and qualitative analyses were implemented to get deeper insights from the reflections and to make more comprehensive comparisons between pre and post-reflections.

The treatment was implemented in the EE course that lasted 13 weeks. During the first five weeks, basic concepts about ecology and general information about the historical development and the causes of environmental problems were introduced. The following five weeks, the pre-service teacher- groups (with three or four members) made presentations about various current environmental problems listed below:

1. Water pollution,
2. Air pollution,
3. Soil pollution and erosion,
4. Radioactive pollution,
5. The depletion of ozone layer,
6. The loss of biological diversity,
7. Wastes,
8. Energy,
9. Hormone-injected foods and genetically modified organisms, and
10. Global warming.

At the beginning of the term, the pre-service teachers submitted pre-reflections on climate. After the presentations, the participants went to an exhibition about climate change. Participation to exhibition visit was voluntary, but they were all supposed to submit their post-reflections on climate change at the end of the term. 33 pre-service teachers volunteered to participate the visit, while 25 did not.

INSTRUMENTS

Pre-and post-reflections are the instruments in this study. The reflections were expected to include definition, causes, consequences, and suggestions for possible solutions for climate change. The exhibition visitors were expected to write their impressions about the exhibition including the things that attracted their attention most on their post-reflections. The reflections were coded and evaluated by the first and the second author of this paper. Agreement percentages for each code were calculated and it was found the two experts were in 75-99% range of agreement. After individual assessments, the two raters came together to discuss about the inconsistencies and complete agreement was reached.

RESULTS

The reflections were analyzed under four categories. Specified codes, their frequencies, and percentages within the sample are reported on separate tables for each category. Tables (1-4) are formed to represent the general picture for the categories; definitions, causes, consequences, and suggestions of climate change, respectively. Further statistical analyses are included in the following pages.

Table 1. Frequency distributions for definitions of climate change

		CODES		
		Change	Long-term	Weather Conditions
Pre-Reflection	Frequency	16	6	17
	Percentage (%)	27.5	10.3	29.3
Post-Reflection	Frequency	46	34	47
	Percentage (%)	79.3	58.6	81

The McNemar test was used to analyze the codes emerged from the participants' pre- and post-reflections. This test is used for investigating whether there are significant differences on dichotomous variables for dependent samples (Laerd Statistics, 2013). Table 5 shows the statistically significant results of the change in understanding of climate change of pre-service elementary teachers both who attended the exhibition and those who did not throughout the course at .05 confidence interval. It is found that the EE course results in significant changes in specified categories for both visitors and non-visitors to the exhibitions.

Table 2. Frequency distributions for causes of climate change

		CODES								
		GHGs	Name of GHGs	Source of GHGs	Natural Causes	Deforestration	Industry	Global Warming	Ozone Depletion	Irregular Urbanization
Pre-Ref.	Fre.	31	13	12	4	5	13	10	9	5
	Perc. (%)	53.4	22.4	20.6	6.8	8.6	22.4	17.2	15.5	8.6
Post-Ref.	Fre.	51	36	41	24	28	31	6	9	11
	Perc. (%)	87.9	62	70.6	41.3	48.2	53.4	10.3	15.5	18.9

Table 3. Frequency distributions for consequences of climate change

		CODES								
		Melting of Glaciers	Rising Sea Level	Global Warming	Droughts	Floods	Famine	Diseases & Deaths	Extinction of Species	Discussion about Turkey
Pre-Ref.	Fre.	18	18	26	24	22	11	18	22	8
	Perc. (%)	31	31	44.8	41.3	37.9	18.9	31	37.9	13.7
Post-Ref.	Fre.	40	38	41	37	33	13	30	34	12

Table 4. Frequency distributions of suggestions for climate change

		CODES						
		Saving Energy	Renew. Energy	Public Transport	Green Buildings	Forestation	Organizations	Waste Management
Pre-Ref.	Fre.	15	7	5	1	11	13	0
	Perc. (%)	25.8	12	8.6	1.7	18.9	22.4	0
Post-Ref.	Fre.	29	38	30	8	28	23	8
	Perc. (%)	50	65.5	51.7	13.7	48.2	46.5	13.7

Two groups were formed according to participation to the exhibition; the visitors groups (n=33) and the non-visitors group (n=25). To make deeper analyses between visitors and non-visitors to the exhibitions, Chi-square test was used to compare the data for each. At the beginning of the course, the number of students who did not attend the exhibition addressed the importance of the role of the organizations, foundations, and governments for the solution of the climate change is significantly higher than those who attended the exhibition ($p<0.05$) (Table 6). These students might have attributed the solutions of environmental problems on the decisions of organizations, foundations and governments and underestimate individual efforts. This result can be accepted as an indication of their unwillingness to act environmentally. No significant difference was found between the two groups in terms of the other categories ($p>0.05$).

Table 5. McNemar test results for the reflection categories wrt visitors and non-visitors

		Visitors		Non-Visitors	
		N	Sig. (2-tailed)	N	Sig. (2-tailed)
Definition	Change	33	0.00*	25	0.01*
	Weather conditions	33	0.00*	25	0.01*
	Long period of time	33	0.00*	25	0.00*
Causes	Name of the gases	33	0.00*		

	Sources of the gases	33	0.00*	25	0.02*
	Natural causes	33	0.03*	25	0.00*

	Organizations			25	0.00*

*p<0.05

Table 7 shows the Chi-square analysis of the categories that emerged from the participants' post-reflections. Pearson chi-square value was used to analyze the data for the categories of the names of the gases and individual efforts. Continuity correction value was utilized to interpret the result of the category of irregular urbanization because observed value was less than 5 in one of the cells in the analysis of this category. Table 7 reveals that the number of the participants who attended the exhibition visit is significantly higher than those who did not in terms of the knowledge of names of the greenhouse gases, and irregular urbanization as a factor affecting climate change and suggesting individual efforts for the solution of this environmental problem.

Table 6. Chi-square test results for pre-reflections between visitors and non-visitors

Pearson Chi-square	Value	df	Asympt. Sig. (2 sided)
Organizations	5.25	1	0.02

Insights from the Reflections

Apart from the quantitative findings, the reflections include some invaluable phrases that enable to make comparisons between pre-and post-reflections. Firstly, it should be noted that the pre-service teachers were free to utilize any reliable resources from both internet and books. As indicated with statistical tests, the participants seemed to learn from the EE course and their essays reflect their learning. The pre-reflections include several direct and in-direct quotations from various resources, while the post-reflections include their own statements with fewer references. The post-reflections of the visitor group especially refer to the exhibition while giving information on climate change.

In addition to selection of references, identification of the four categories is another issue between the pre-and post-reflections. Definitions, causes, consequences, and suggestions can be identified clearly in the post-reflections. This might be another reason for the frequency differences on Table 5. As a complex environmental problem, it is hard to understand the structure of climate change, identify the causes and consequences because they are nested. On post-reflections, there are clear statements like *"Global warming is not a cause, but a consequence of climate change."* that might represent their understanding about climate change. The terminology they selected changed from the pre- and the post-reflections. Some participants mentioned about GHGs as "harmful gases" on their pre-reflections, while there was no phrase as "harmful gases" on the post-reflections.

The difference between post-reflections of the visitors and non-visitors lies on the suggestions they made. The suggestions of the visitors seem to be diverse and more individual-oriented. They included constructing green buildings, consuming thrifty bulbs, insulation of apartments, consuming less hot water, using non-plastic bags for shopping, consuming less, riding bicycles, and preferring vehicles operating with renewable energy sources. Besides, the case for coral reefs was only mentioned on some of the post-reflections of the visitors. They also mentioned about how they were impressed with the coral reef model at the exhibition. Table 8 represents the attracting themes at the exhibition mentioned by the visitors.

Table 8 Impressions about exhibition

Themes	Visitors (%)
Polar bears	63.64
Models	48.48
Green buildings	18.18
Energy platforms	15.15
Polar fox	12.12
Recycled materials	12.12
CO_2 graph	9.09
Pressing the button	9.09
Other	33.33
Not identified	12.12

CONCLUSION

Today we all know the fact that EE has a crucial role for educating environmentally literate citizens. For achieving this aim, most of the teacher education curricula have incorporated EE courses into their programs. There is also growing literature in the research on EE. However, there's also a need of researches investigating the impacts of some methods and activities conducted in EE courses. The study presented here aims to fulfill this requirement.

The results of this study revealed that the EE course, focusing on informing about ecological concepts, presenting and discussing various environmental problems, seem to have an impact on pre-service elementary teachers' understanding of climate change. The pre-service elementary teachers also seem to have benefited from this course regarding the suggestions for the solutions of the climate change. They seem to have improved their understanding the importance of the usage of renewable energy resources, various individual efforts to be made, and public transportation throughout the course. This result is consistent with the literature emphasizing impacts of EE on various learning outcomes (Hungerford and Volk, 1990; Grotzer and Basca, 2003; Doğança, 2013).

The most distinctive aspect of the study presented here is organization of an exhibition visit and to ask the volunteer visitors to write reflections after the visit, although all the pre-service elementary teachers wrote reflections before and after the course. Comparison of the reflection of the visitors and non-visitors reveal that the exhibition visit contributes to the increased understanding in terms of naming the greenhouse gases, negative consequences of climate change, such as destroyed habitats, the importance of natural sources, and constructing green buildings for the solution of climate change. Attending exhibition visit also seem to have an impact on the awareness of the negative effect of the irregular urbanization on climate change and the importance of the individual efforts for the solution of this environmental problem.

Another finding of this study was related to attributing solutions of environmental problems to organizations, foundations, and governments. This attribution might have a negative influence on attending informal learning environments, thereby to take an action against any of the environmental problems. For this reason, students' beliefs should also be taken into account for designing EE curricula. Moreover, continuing efforts must be taken to overcome students' negative beliefs for the solution of environmental problems.

The pre-service elementary teachers' reflections indicated that affective content of the representations attracted most of the participants' attention more than the intellectual one. This result can be interpreted that informal learning environments, such as exhibitions presenting models and pictures that create dramatic effect on people can be more instructive than the intellectual ones. This finding can also be explained by the background of the participants of this study. These participants have limited background of science and EE and most of them chose to answer the questions of language and social part of the university entrance exam. These participants' background may have affected the content of the exhibition that attracted their attention. Further study, conducted on different samples and investigating affective outcomes may bring light to this issue.

The data of this study were participants' reflections. Interviews with some of the participants might have brought a deeper insight on their understanding of the climate change. Further research examining the effect of different methods implemented in EE courses on various outcomes in different grade levels is needed.

ÖZET: Uzaktan eğitim, son zamanlarda birçok eğitim kurumu veya üniversite tarafından öğrencilere sunulan bir öğretim şeklidir. Teknolojinin gelişmesiyle ortaya çıkan bu eğitim şekli, örgün eğitimde karşılaşılan eğitim mekanının sabit kalması, uzakta olan öğrencilerin ulaşım zorluğu, eğitici sayısının sınırlı olması ve öğretim kaynaklarının yetersiz olması gibi nedenlerden dolayı popülerlik kazanmıştır. Uzaktan eğitim şeklinin faydalarının yanında bazı dezavantajları bulunmaktadır. Bu dezavantajlardan biri öğrencilerin çevrimiçi ders sırasında derse giriş yaptıktan sonra bilgisayarının başından ayrılması ve bu aralıkta ders veren öğreticinin bu durumdan geç haberdar olması veya hiç haberdar olamamasıdır. Bu çalışmada, bu tip durumları takip eden ve kayıt altına alan bir yoklama sistemi tasarımı önerilmektedir. Bu sistemde öğrencinin çevrimiçi ders sırasında, bilgisayarında dersi dinleyip dinlemediği bir kamera vasıtasıyla alınan görüntülerden anlaşılmakta ve görüntülerin sadece dersi alan kişiye ait olup olmadığı bir yüz tanıma yazılımıyla sağlanmaktadır. Bu şekilde gerçekte öğrencinin dersi dinleyip dinlemediği anlaşılarak derse devam-devamsızlık durumu daha net bir şekilde kaydedilebilmektedir.

Anahtar sözcükler: uzaktan eğitim, çevrimiçi ders, yoklama sistemi, yüz tanıma.

ABSTRACT: Distance education is a form of teaching offered to students by many educational institutions or universities in these days. With the development of technology, this emerging form of education has gained popularity because of the reasons such as constant training venues encountered in formal education, transportation challenges of remote students, limited number of educators and inadequate teaching resources. Besides the benefits of distance learning, it has some disadvantages. One of these disadvantages, after the students logged in the system, they leave the computer during the online course and the instructor becomes aware late or doesn't. In this study, it is proposed design of an attendance system which tracks and records this type of situations. In this system, the student is listening or not is detected from the images taken by a camera and with a face-recognition software, it is provided the images belong to student or not. In this way, the student's course attendance-absence status can be recorded in a clearer way with detection of that the students are actually listening or not.

Key words: remote education, online course, attendance system, face recognition.

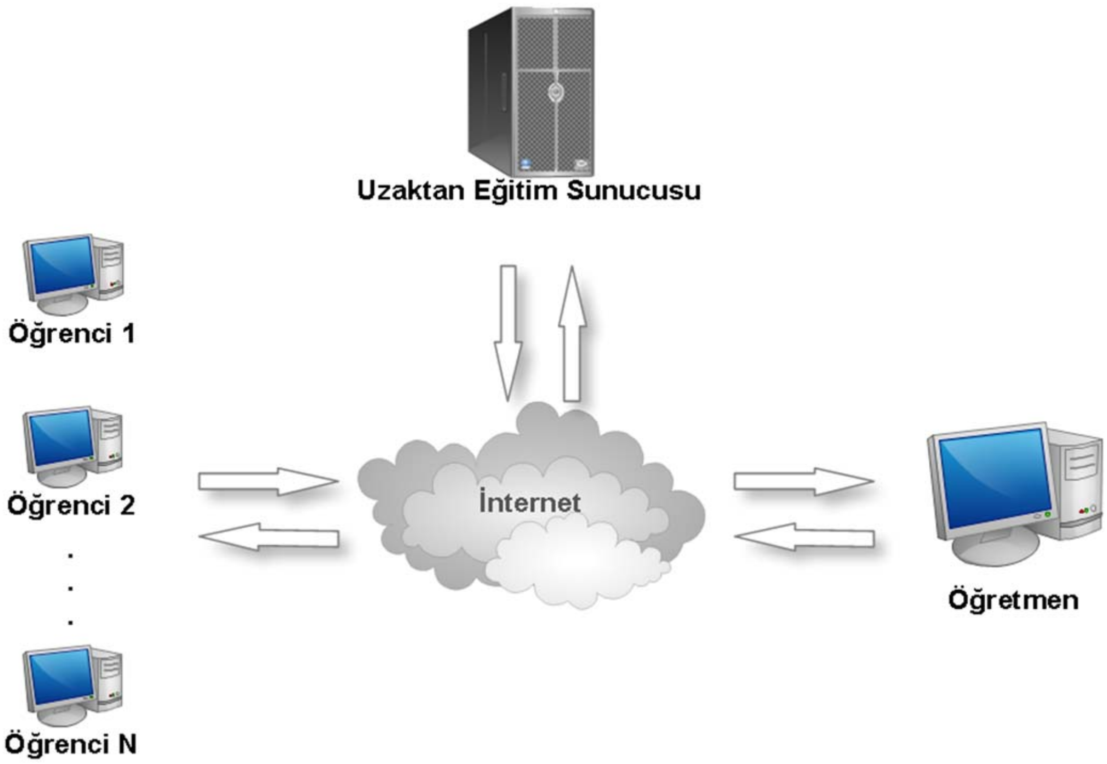
GİRİŞ

Uzaktan eğitim (Moore, 2013; Willis, 1993), son zamanlarda birçok eğitim kurumu veya üniversite tarafından öğrencilere sunulan bir öğretim şeklidir. Teknolojinin gelişmesiyle ortaya çıkan bu eğitim şekli, örgün eğitimde karşılaşılan eğitim mekanının sabit kalması, uzakta olan öğrencilerin ulaşım zorluğu, eğitici sayısının sınırlı olması ve öğretim kaynaklarının yetersiz olması gibi nedenlerden dolayı popülerlik kazanmıştır (Yavuz BAYAM, 2002). Uzaktan eğitim şeklinin faydalarının yanında bazı dezavantajları bulunmaktadır. Bu dezavantajlardan biri öğrencilerin çevrimiçi ders sırasında derse giriş yaptıktan sonra bilgisayarının başından ayrılması ve bu aralıkta ders veren öğreticinin bu durumdan geç haberdar olması veya hiç haberdar olamamasıdır. Bu durumda gerçekte öğrencinin ders dinleyip dinlemediği anlaşılamamakta ve dolaysıyla çevrimiçi ortamda verilen ders gerçekten amacına hizmet edememektedir.

Bu çalışmada, bu tip durumları takip eden ve kayıt altına alan bir yoklama sistemi tasarımı önerilmektedir. Bu sistemde öğrencinin çevrimiçi ders sırasında, bilgisayarında dersi dinleyip dinlemediği bir kamera vasıtasıyla alınan görüntülerden anlaşılmakta ve görüntülerin sadece dersi alan kişiye ait olup olmadığı bir yüz tanıma yazılımıyla sağlanmaktadır. Bu şekilde gerçekte öğrencinin dersi dinleyip dinlemediği anlaşılarak derse devam-devamsızlık durumu daha net bir şekilde anlaşılabilecektir.

SİSTEM TASARIMI

Uzaktan eğitim sisteminde çevrimiçi dersler yapılırken bir senkron iletişim aracı olan kamera kullanılmakta ve öğrenci-öğretmen arasındaki iletişim rahatlıkla sağlanmaktadır (M. Hakan Çetiner, 1999). Şekil 1'de bir uzaktan eğitim sisteminin genel yapısı verilmektedir. Bu sistemde öğrenciler ve öğretmenler sisteme internet üzerinden bağlanabilmektedir. Kayıtlı oldukları kurum veya üniversite tarafından kendilerine sağlanan kullanıcı adı ve şifrelerle sisteme giriş yaptıktan sonra açık veya aktif olan derslere rahatlıkla erişebilmektedir. Çevrimiçi sunulan derste, öğretmenin veya öğreticinin kişisel bilgisayarına bağlı olan kameradan alınan görüntüyü o anki derse katılan tüm öğrencilere eş zamanlı olarak gönderilmektedir. Ayrıca derse katılmış olan öğrencinin bilgisayarına bağlı kameradan da diğer kullanıcılara görüntü aktarımı yapılabilmektedir.



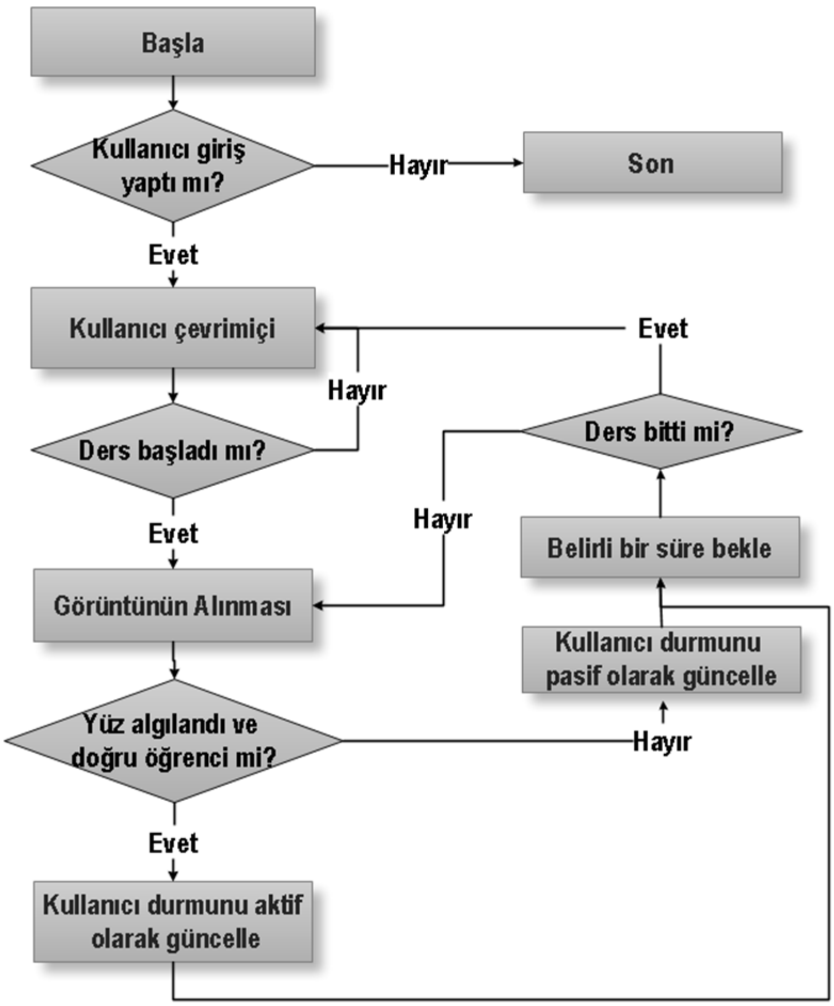
Şekil 1. Uzaktan Eğitim Sistemi Genel Diyagramı

Uzaktan eğitim sisteminde çevrimiçi derse katılan bir öğrenci, dersi anlatan öğretmeni dinlerken öğretmenin kamerasından kendi kişisel bilgisayarına uzaktan eğitim sunucusu vasıtasıyla aktarılan görüntü dizisini yani videoyu görmektedir. Bu sistemin bir eksiği, öğrencinin bilgisayarın karşısından ayrılması, öğretmen kontrol etmediği takdirde anlaşılamamaktadır. Var olan bu eksiklik, sistem kullanıcılarında hazır halde bulunan kameraların kullanılmasıyla öğrencilerin bilgisayarlarından belirli zaman aralıklarında alınacak görüntülerle giderilebilir. Bu görüntülerde, öğrencinin yüzünün olması gerekmekte aksi halde sistem çalışmayacaktır.

Yüz Tanıma Tabanlı Yoklama Modülü

Yüz tanıma, birçok sistemde kullanılan ve son zamanlarda artık kişisel bilgisayarlarda da kullanılan yaygın bir biyometrik tanıma şeklidir (Wechsler & Division, 1998; Zhao, Chellappa, Phillips, & Rosenfeld, 2003). Bu tanıma çeşidinde her kişiye özgü olan insan yüzü kullanılmakta ve sonuç olarak gerçekte bu kişinin doğru kişi olup olmadığı veri tabanına bakılarak tespit edilebilmektedir.

Şekil-2'den de anlaşılacağı üzere şu anda kullanılan uzaktan eğitim sistemlerine ekstra bir donanım alınmadan ve sadece yüz tanıma özelliği içeren bir yoklama modülü yazılımı eklenerek rahatlıkla öğrencilerin gerçekte derse katılıp katılmadığı anlaşılabilir.



Şekil 2. Yüz Tanıma Tabanlı Yoklama Sistemi Algoritması

Yüz tanıma tabanlı yoklama sisteminde, başlangıç olarak uzaktan eğitim sistemine kayıt olan öğrencilerin yüz resimlerinden (vesikalık resim) sisteme kayıt oluşturulur. Uzaktan eğitime kayıt aşamasında öğrenci yüz resimleri öğrencilerden alınmakta ve ilave bir işlem gerekmemektedir. İleride sorgulanmak üzere yüz resimlerinden kayıtların oluşturulması, sistemi geliştirenlerin kullandığı bir yüz tanıma algoritmasına göre yapılmaktadır. Seçilen yüz tanıma algoritması, sistemin çalışmasında önemli rol oynamaktadır. Çünkü gerçekte derse katılan kişiyi sistem yanlış kişi olarak algılarsa öğrencinin derse katılmadığı kayıtlara işlenecektir.

Yüz tanıma algoritması seçilirken dikkat edilmesi gereken ikinci bir kısım ise algoritmanın gerçek zamanlı (Nasrollahi & Moeslund, 2013; Shou-Jen, Chao-Yang, Mei-Hsuan, Chi-Sen, & Chu-Sing, 2010) çalışabilir olmasıdır. Yüz tanıma bir kişi için belirli zaman aralıklarında yapılması önerilse de aynı anda sunulan birçok derse katılmış çok sayıda kişide yüz tanıması yapılması gerekecektir. Görüntülerin öğrenci bilgisayarlarından alınması zaman aralığı, sistem yöneticileri tarafından sistemin genel yüküne bağlı olarak değiştirilebilmesi gerekir.

SONUÇ

Yapılan bu çalışmada, uzaktan eğitim sistemde çevrimiçi derslerde kullanılmak üzere bir yoklama sistemi önerilmektedir. Bu sistemde teknolojinin gelişmesiyle yaygınlaşan bir biyometrik tanıma çeşidi olan yüz tanıma kullanılması önerilmektedir. Bu biyometrik tanımanın seçilmesinin nedeni, uzaktan eğitime kayıtlı öğrencilerde kameranın olması, uzaktan eğitime kayıt sırasında yüz resimlerinin alınması, yüz tanıma başarı oranının yüksek olması, gerçek-zamanlı çalışabilmesi ve şu anda çalışan sistemlere kolay entegre edilebilir olması şeklinde sıralanabilir.

ÖZET: Bu çalışmanın amacı ilköğretim matematik öğretmen adaylarının matematik öğretimine dair etkisinde kaldıkları matematik öğretim modellerini tespit ve teşhir etmektir. Araştırma Türkiye'de İç Anadolu bölgesindeki bir üniversitenin ilköğretim matematik öğretmenliği bölümünün 3. sınıfında okumakta olan öğretmen adayları üzerinde yapılmıştır. Araştırma esnasında öğretmen adayları matematiği, eğitimini ve öğretimini bir bütün şeklinde ele alan ve doktoralı bir matematik eğitimcisi tarafından verilmekte olan Özel Öğretim Yöntemleri adlı bir derse kayıtlı olup bu derste matematik öğretimine dair zengin içerikli deneyimler kazanmışlardır. Dersler esnasında öğretmen adaylarına literatürden hareketle yapılandırmacı kuramın gereklilikleri dikkate alınarak hazırlanmış etkinlik temelli denk kesirler konusuna dair hazır bir ders uygulanmış ve bu dersin sınıf içinde nasıl şekillenip ortaokul öğrencilerince nasıl yapılandırılabileceği üzerinde analiz yapmaları sağlanmıştır. Sonrasında öğretmen adaylarından bu dersi kendilerinin gerçek birer ortaokul öğrencisi bularak bu öğrenci üzerinde uygulamaları istenmiştir. Bu uygulamalar kendilerince videoya çekilmiş ve toplamda 20 öğretim videosu elde edilmiştir. Yapılan içerik analizinde matematik öğretimi esnasında öğretmen adaylarının referans aldıkları öğretim modelleri, kullandıkları sorgulama çeşitleri, öğretime dair yaptıkları yaygın hatalar ve eğitim ve öğretime bakış açıları üzerine yoğunlaşılmaktadır. Yapılan ilk fasıl incelemelerde öğretmen adaylarının benimsedikleri öğretim modellerinin öğretimlerini ciddi anlamda yönlendirdiği görülmüştür.

Anahtar sözcükler: matematik öğretim modeli, öğretmen adayları, yapılandırmacılık

ABSTRACT: The purpose of this research is to determine the mathematics teaching models under the influence of which the prospective middle school teachers work. The research was conducted on third year prospective middle school mathematics teachers from a university in Anatolia, Turkey. During the investigation the participants were registered to a Mathematics Methods course focusing on mathematics, its learning and its teaching that was taught by a PhD mathematics educator and in which they gain rich experiences about mathematics teaching. During the course the participants were exposed to a set of classes about teaching equivalent fractions that was designed by considering the constructivist principles. They were also given opportunities to reflect on and analyze how such classes play out in a regular classroom and how students might construct the targeted ideas. Then the participants were asked to find a middle school student and apply equivalent-fractions class on that student. These applications were videotaped by each participant and we gathered 20 such videos. In analyzing the data we focus on the kind of teaching models the participants use as a guide in their teaching, the questioning strategies they use, common mistakes they make, and perspectives they adopt for teaching and learning. As a result of the first phase analysis we found that the kind of teaching models the participants adopt seriously guide their teaching.

Key words: mathematics teaching models, prospective middle school teachers, constructivism

ASSESSING STUDENT LEARNING OUTCOMES THROUGH TECHNOLOGY

Bilge SULAK

Sema SULAK

Expected student behaviors are anticipated to be different as a result of education. Especially in outcome-based education, learning outcomes is a product of the education process. Outcome-based education (OBE) is a widely accepted educational approach from elementary school to higher education. The questions “What are some traits of a successful educator?”,“What kinds of educators will the training produce?”, “How competent will educators-in-training be as a result of the training?” are some of the questions that are tried to be answered. It can be attributable that it is challenging to assess student learning outcomes. Student learning outcomes explore the effects of the education on the student, and how they are different as a result of interacting with the program. There is a need to have a comprehensive assessment model to evaluate competence because each individual has a different development level. In literature there is a big gap concerning how to assess student learning outcomes as well as lack of reliable and valid assessment methods. Hence, this paper aims to offer a systemic framework for student learning outcomes and their assessment. Further this paper will provide an overview for benefits of utilizing technology as well as several innovative techniques can be used during assessment phase.

ÖZET: Teknolojinin hızla ilerlemesiyle birlikte, bilgi ve iletişim teknolojilerinin hayatımızın her alanında önemli bir yer tuttuğunu söyleyebiliriz. Bu nedenle bilgi ve iletişim teknolojilerinin eğitime entegrasyonunu sağlamak için dünyada ve ülkemizde çalışmalar yapılmaktadır. Bu çalışmaların donanım, alt yapı hizmetleri, içerik, öğretim programları, teknoloji bilinci, hizmet içi eğitimler gibi birçok boyutu olmasına rağmen, en önemli boyutu eğitimde teknoloji entegrasyonunu sağlamada kilit rol üstlenen öğretmenler ve onların eğitime teknoloji entegrasyonundaki bilgi ve becerileridir. Bu bağlamda öğretmenlerin teknolojik pedagojik alan bilgileri (TPAB), eğitime teknoloji entegrasyonunda önemli bir yer tutmaktadır. Bu alanda yapılan çeşitli çalışmalara baktığımızda TPAB yüksek olan öğretmenlerin, eğitime teknoloji entegrasyonunda diğer öğretmenlere oranla daha başarılı olduğu görülmektedir. Bu nedenle bu araştırmada öğretmenlerin TPAB çeşitli değişkenler açısından incelenecektir. Bu amaçla veri toplama aracı olarak Sahin'in (2011) geliştirmiş olduğu "Öğretmenlerin Teknolojik Pedagojik Alan Bilgisi Ölçeği" kullanılmıştır. Öğretmenlerden elde edilen veriler bu amaçlar doğrultusunda analiz edilerek, bulgular eğitime teknoloji entegrasyonu boyutunda tartışılmıştır.

Anahtar Kelimeler: Öğretmenler, Teknolojik Pedagojik Alan Bilgisi, Eğitime Teknoloji Entegrasyonu

ABSTRACT: It can be said that ICT have an important place in every area of our lives with the rapid advancement of technology. Therefore, studies are done in our country and around the world to ensure the education integration of information and communication technologies. Although these studies have many dimensions as the hardware, infrastructure services, content, education programs, technology awareness, in-service training, the most important aspect of the study is that the teachers play a key role in ensuring the integration of technology in education, and their knowledge and skills have a great importance in technology integration in education. In this context, teachers' technological pedagogical content knowledge (TPACK) has a great importance in the integration of technology in education. When we look at the various studies done in this area, teachers with a high TPACK are seen to be more successful than other teachers in the context of the integration of technology in education. Therefore, in this study, teachers' TPACK will be examined in terms of several variables. As data collection tool for this purpose, "Teachers' Technological Pedagogical Content Knowledge Scale" which was developed by Sahin (2011) is used. By analyzing data obtained from teachers for these purposes, results were discussed in terms of technology integration in education.

Keywords: Teachers, Technological Pedagogical Content Knowledge, Technology Integration in Education

GİRİŞ

Teknolojinin hızla ilerlemesiyle birlikte, bilgi ve iletişim teknolojilerinin hayatımızın her alanında önemli bir yer tuttuğunu söyleyebiliriz. Bilgi ve iletişim teknolojilerinin toplumun hemen hemen her alanını etkilemesine rağmen, eğitim uygulamalarına entegrasyonu tam olarak sağlanamadığından (Wang, 2009), çeşitli ülkelerde eğitime teknoloji entegrasyonunun arttırılması için çalışmalar yapılmaktadır. Türkiye'de de Milli Eğitim Bakanlığı (MEB) 2010 yılında; sınıflarda teknolojinin etkin kullanılmasıyla öğrenci başarısını arttırmayı hedefleyen Fırsatları Arttırma Teknolojiyi İyileştirme Hareketi (FATİH) projesini duyurmuştur (Demirer, Saban, Küçük, & Şahin, 2011; Kayaduman, Sırakaya & Seferoğlu, 2011).

Ferdig (2006), eğitime teknolojik yenilik getirme konusunu sorgulamış ve iyi bir yeniliğin pedagoji, insan ve performans boyutlarını içerdiğini savunmuştur. Eğitime teknoloji entegrasyonunu sağlamada sadece teknolojiyi tanıtmanın yeterli olmadığının (Koehler & Mishra, 2005) tam aksine, öğretmenlerin teknolojiyi kullanma şeklinin eğitimi değiştirme potansiyeline sahip olduğunun farkına varılmıştır (Carr, Jonassen, Litzinger, & Marra, 1998). Bu bağlamda eğitime teknoloji entegrasyonunda öğretmen yeterliliklerini yeniden şekillendiren Mishra ve Koehler (2005), Shulman'ın (1987) öğretmen yeterliliklerine kazandırdığı pedagojik alan bilgisi kavramına, teknolojik bilgi kavramını da dahil ederek Teknolojik Pedagojik Alan Bilgisi (TPAB) çerçevesini oluşturmuşlardır.

Teknolojik pedagojik alan bilgisi; alan, pedagoji ve teknoloji bilgisinin etkileşiminden ortaya çıkan anlayışla ilgili bilgidir. Öğretimin etkinliği için teknolojik pedagojik alan bilgisinin bu üç temel kaynağı arasındaki karmaşık etkileşimlerle ilgili bir anlayış geliştirmek gerekmektedir (Kereluik, Mishra, & Koehler, 2011). Öğretmenler ders anlatırken; teknoloji, pedagoji ve alan bilgisini eş zamanlı olarak bütünleştirerek, teknolojik pedagojik alan bilgilerini ortaya koymaktadırlar. Bu nedenle öğretmenlerin ders sırasında karşılaştığı her durum, bu üç faktörün eşsiz kombinasyonudur ve buna göre her öğretmen, her ders veya her öğretim görüşü için tek bir çözüm yolu olmamaktadır. Bunun tam aksine olası çözüm yolları; öğretmenin, teknoloji, pedagoji ve alan bilgisi olarak tanımlanan üç bileşenin ve bunların belirli bağlamlardaki karmaşık etkileşimlerinin arasındaki ilişkileri esneklikle çözebilme yeteneğine bağlıdır. Bu nedenle öğretmenlerin sadece bu üç yönde değil, bunların arasındaki etkileşim durumları hakkında da kendilerini geliştirmeleri gerekir (Koehler & Mishra, 2009). Böylece öğretmenler kendi eğitsel alanını, pedagojik ve teknolojik ortamına uyarlayabilir (Kereluik, Mishra, & Koehler, 2011).

Teknolojik pedagojik alan bilgisi ile ilgili yapılan çalışmalara bakıldığında, öğretmenlerden çok, öğretmen adaylarının teknolojik pedagojik alan bilgilerine yönelik çalışmaların yer aldığı görülmektedir (Akyüz, Pektaş, Kurnaz, & Memiş, 2014; Özgen, Narlı, & Alkan, 2013; Pamuk, Ülken, & Dilek, 2012). Diğer eğitime teknoloji entegrasyonu hareketlerinde olduğu gibi FATİH projesi'nin temelinde de bu işin uygulayıcıları olan öğretmenlerin yer aldığı yadsınamaz bir gerçektir (Demirer vd., 2011). Bununla birlikte projenin uygulayıcıları olan öğretmenlerin teknolojik pedagojik alan bilgisi (TPAB) düzeylerinin FATİH projesi'nin sürdürülebilirliğinde önemli bir rolü olacaktır. Bu nedenle bu araştırmada öğretmenlerin teknolojik pedagojik alan bilgilerinin ortaya konulması ve çeşitli değişkenler açısından incelenmesi amaçlanmıştır.

YÖNTEM

Öğretmenlerin TPAB'lerinin inceleneceği bu araştırma tarama modeline göre desenlenmiştir. Araştırmada örneklem grubunun özellikleri, kullanılan ölçme aracı ve veri analiz işlemleri bu bölümde belirtilmiştir.

Evren ve Örneklem

Araştırmanın evrenini ilkokul, ortaokul ve lisede görev yapan öğretmenler oluşturmaktadır. Evrendekilerin tamamına erişmek mümkün olmadığından evreni temsil eden kolay ulaşılabilir örnekleme ile öğretmenlerden veri toplanmıştır. Araştırmaya Afyonkarahisar, Aksaray ve Isparta illerinden toplam 256 öğretmen katılmıştır. Normallik ve uç değer analizleri sonunda veri setinden 14 veri atılmış ve toplamda 242 tane öğretmenin verisi analiz edilmiştir.

Veri Toplama Aracı

Veri toplama aracı olarak Sahin'in (2011) geliştirmiş olduğu "Öğretmenlerin Teknolojik Pedagojik Alan Bilgisi Ölçeği" ile birlikte bireysel bilgi formu ve likert tipinde bir soru uygulanmıştır. TPAB ölçeği yedi alt boyut (TB, PB, AB, TPB, TAB, PAB ve TPAB) ve 47 maddeden oluşmaktadır. Her bir alt boyuttan alınan yüksek puan, söz konusu bilginin uygulanmasına yönelik yüksek algıyı belirtmektedir. Likert tipindeki ölçeğin seçenekleri ise su şekilde sıralanmıştır: (1) Hiç bilmiyorum, (2) Az düzeyde biliyorum, (3) Orta düzeyde biliyorum, (4) İyi düzeyde biliyorum, (5) Çok iyi düzeyde biliyorum. Bu çalışmada ölçeğin alt boyutlarının Cronbach alfa güvenirlik katsayıları 0.88 ve 0.97 arasında değiştiği belirlenmiştir. Kişisel bilgi formunda öğretmenlerin cinsiyet, yaş, eğitim durumu ve internet kullanım sıklıklarına ilişkin bilgiler sorulmuştur. Ayrıca öğretmenlere derslerinde bilişim teknolojilerini kullanım sıklıklarını belirlemek amacıyla Likert tipinde bir soru yöneltilmiştir. Soru,“ Sınıfınızda/derste öğretim amacıyla bilişim teknolojilerini kullanıyor musunuz? şeklinde sorulmuş ve seçenekleri “hiç, nadiren, bazen, sık sık, her zaman” olarak belirlenmiştir.

Veri Analizi

Öğretmen adaylarının TPAB puanlarına yönelik elde edilen verilerin analizinde, frekans, yüzde ve ortalama gibi betimsel istatistikler kullanılmıştır. Ayrıca, TPAB ölçeği alt boyut puanlarının, değişkenlere göre anlamlı farklılık gösterip göstermediğini belirlemek için çok değiskenli varyans analizi (MANOVA) gerçekleştirilmiştir. Sonuçların istatiksel olarak anlamlı çıkması durumunda, farklılığın hangi gruplardan kaynaklandığını tespit etmek amacıyla, çoklu karşılaştırma testlerinden Bonferroni testi kullanılmıştır. Analizler öncesinde

MANOVA’nın varsayımları test edilmiştir. Öncelikle tek değişkenli ve çok değişkenli uç değerler belirlenerek veri setinden atılmış, varyansların homojenliği için Levene testi, varyans-kovaryans matrislerinin homojenliği için ise Box’s M testi kullanılmıştır.

BULGULAR

Öğretmenlerin teknolojik pedagojik alan bilgileri boyutlarında hangi düzeyde olduklarını belirtmek amacıyla, her bir boyuta ait istatistiksel bilgiler Tablo 1'de sunulmuştur.

Tablo 1. TPAB boyutlarına ilişkin istatistiksel bilgiler

	$\bar{X}$	Ss	En Düşük	En Yüksek	Ranj	Çarpıklık	Basıklık
TB	55.74	12.753	19	75	56	-0.160	-0.724
PB	22.82	3.516	12	30	18	-0.285	0.107
AB	23.55	3.837	13	30	17	-0.349	-0.389
TPB	15.48	2.590	9	20	11	-0.219	-0.434
TAB	14.85	2.808	7	20	13	-0.210	-0.208
PAB	27.25	4.163	14	35	21	-0.281	-0.100
TPAB	19.09	3.303	11	25	14	-0.208	-0.428

Ölçeğin boyutlarına ait istatistiklere bakıldığında, öğretmenlerin bilgi düzeyleri arasındaki farklılıkların TB düzeyinde ($\bar{X}$ = 55.74, Ss = 12.75) en yüksek, TPB düzeyinde ($\bar{X}$ = 15.48, Ss = 2.59) en düşük olduğu; ortalama puanlara bakıldığında ise öğretmenlerin bilgi düzeylerinin tamamının ölçekten alınabilecek en yüksek ve en düşük puanlara göre ortalamanın üzerinde olduğu görülmektedir. Öğretmenlerin TPAB'ın boyutları arasında AB düzeylerinin en yüksek, TAB düzeylerinin en düşük olduğu görülmektedir. Bu sonuçlara bakarak öğretmenlerin alan bilgilerinin iyi düzeyde olmasına rağmen, alan bilgilerini teknolojiye entegre etme konusunda aynı düzeyde yeterli olmadıkları söylenebilir.

Cinsiyete Göre Öğretmenlerin Teknolojik Pedagojik Alan Bilgileri

Öğretmenlerin TB, PB, AB, TPB, TAB, PAB ve TPAB düzeylerini cinsiyetlerine göre kıyaslamak için tek faktörlü MANOVA analizi yapılmıştır. Öğretmenlerin cinsiyetlerine göre TPAB boyutlarına ait puanların bütüncül olarak anlamlı bir farklılık gösterdiği sonucuna ulaşılmıştır (Wilk’s Lambda = 0.91, $F_{[7\text{-}234]}$=3.19, η^2=0.09, $p < 0.01$). Her bir değişken için tek yönlü ANOVA sonuçlarına bakıldığında, öğretmenlerin teknolojik bilgi ($F_{[1\text{-}240]}$ = 6.01, η^2 = 0.02, $p < 0.05$) ve pedagojik alan bilgisi düzeylerinde ($F_{[1\text{-}240]}$ = 5.02, η^2 = 0.02, $p < 0.05$) cinsiyete göre anlamlı farklılık bulunmuştur. Erkeklerin ($\bar{X}$ = 57.47, Ss = 13.15) teknolojik bilgi düzeyleri, kadınlara ($\bar{X}$ = 53.45, Ss = 11.89) göre daha yüksekken; kadınların pedagojik alan bilgi düzeyleri ($\bar{X}$ = 27.93, Ss = 3.85), erkeklerden ($\bar{X}$ = 26.73, Ss = 4.33) yüksektir. Ancak cinsiyetin teknolojik bilgi ve pedagojik alan bilgisi düzeyleri üzerinde etkisi çok düşük olup toplam varyansın sadece %2'sini açıklamaktadır. Cinsiyetin, öğretmenlerin TPAB düzeylerine etkisini araştıran çalışmaların genelinde çoğu bilgi düzeyinde erkeklerin, kadınlara oranla bilgi düzeylerinin daha yüksek olduğu (Erdogan & Sahin, 2010; Jang & Tsai, 2013; Koh, Chai & Tsai, 2014) bulunmasına rağmen; Kazu ve Erten (2014), kadınların pedagojik ve teknolojik pedagojik bilgi düzeylerinin, erkeklerin pedagojik ve teknolojik pedagojik bilgi düzeylerinden daha yüksek olduğunu tespit etmiştir. Lin, Tsai, Chai ve Lee (2013) erkeklerin teknolojik bilgi düzeylerinin kadınlardan, kadınların pedagojik bilgi düzeyinin ise erkeklerden yüksek olduğunu tespit etmiştir. Jang ve Tsai (2012) ise cinsiyetin TPAB düzeyleri üzerinde herhangi bir etkisinin olmadığını belirtmiştir. Cinsiyetin TPAB'ın farklı düzeyleri üzerindeki etkilerini gösteren farklı çalışmalar bulunmasına rağmen, eğitime teknoloji entegrasyonu arttıkça bu etkinin düşeceği ön görülmektedir.

Yaş Gruplarına Göre Öğretmenlerin Teknolojik Pedagojik Alan Bilgileri

Öğretmenlerin TB, PB, AB, TPB, TAB, PAB ve TPAB düzeylerini belirli yaş gruplarına göre kıyaslamak için tek faktörlü MANOVA analizi yapılmıştır. Öğretmenlerin yaş gruplarına göre TPAB boyutlarına yönelik puanları bütüncül olarak anlamlı bir farklılık göstermektedir (Pillai’s Trace = 0.91, $F_{[14\text{-}468]}$ = 1.87, η^2 = 0.05, $p < 0.05$). Her bir değişken için tek yönlü ANOVA sonuçlarına bakıldığında, öğretmenlerin teknolojik bilgi ($F_{[2\text{-}239]}$ = 9.14, η^2 = 0.07, $p < 0.01$), teknolojik alan bilgisi ($F_{[2\text{-}239]}$ = 3.70, η^2 = 0.03, $p < 0.05$] ve pedagojik alan bilgisi düzeylerinde ($F_{[2\text{-}239]}$ = 3.93, η^2 = 0.03, $p < 0.05$] yaş gruplarına göre anlamlı farklılık bulunmuştur. 20-29 yaş aralığındaki öğretmenlerin teknolojik bilgi ($\bar{X}$ = 59.33, Ss = 12.31), teknolojik alan bilgisi ($\bar{X}$ = 15.38, Ss = 2.69) ve pedagojik alan bilgisi düzeyleri ($\bar{X}$ = 28.04, Ss = 4.04); 30-39 yaş aralığındaki öğretmenlerin teknolojik bilgi ($\bar{X}$ = 53.90, Ss = 12.21), teknolojik alan bilgisi ($\bar{X}$ = 14.53, Ss = 2.78) ve pedagojik alan bilgisi düzeylerinden ($\bar{X}$ = 26.83, Ss = 4.16) ve 40 yaş üzeri öğretmenlerin teknolojik bilgi ($\bar{X}$ = 50.91, Ss = 12.66), teknolojik alan bilgisi ($\bar{X}$ = 14.23, Ss = 2.97) ve pedagojik alan bilgisi düzeylerinden ($\bar{X}$ = 26.21, Ss = 4.18) yüksektir. Yaşın teknolojik bilgi düzeyi üzerinde etkisi orta düzeyde olup toplam varyansın %7sini açıklamasına rağmen teknolojik alan bilgisi ve pedagojik alan bilgisi düzeyleri üzerinde etkisi düşük olup toplam varyansın %3'ünü açıklamaktadır. Yapılan çalışmalarda genel olarak yaşın TB düzeyiyle negatif yönde (Chuang & Ho, 2011; Kazu & Erten, 2014; Koh & Sing, 2011; Koh vd., 2014), PAB düzeyiyle ise pozitif yönde ilişkili olduğu (Chuang & Ho, 2011; Koh vd., 2014; Kazu & Erten, 2014) belirtilmiştir. Yaş ilerledikçe yeni teknolojileri öğrenmenin zorluğu teknolojik bilgiyi olumsuz etkilemektedir. Bununla birlikte pedagojik alan bilgisinin artmasında yaşla birlikte tecrübenin de ortak etkisi olduğu görülmektedir (Koh vd., 2014).

Eğitim Durumlarına Göre Öğretmenlerin Teknolojik Pedagojik Alan Bilgileri

Öğretmenlerin TB, PB, AB, TPB, TAB, PAB ve TPAB düzeylerini eğitim durumlarına göre kıyaslamak için tek faktörlü MANOVA analizi yapılmıştır. Öğretmenlerin eğitim durumlarına göre TPAB boyutlarına yönelik puanları bütüncül olarak anlamlı farklılık göstermiştir (Wilk's Lambda = 0.94, $F_{[7-234]} = 2.12$, $\eta^2 = 0.06$, $p < 0.05$]. Her bir değişken için tek yönlü ANOVA sonuçlarına bakıldığında, öğretmenlerin alan bilgisi ($F_{[1-240]} = 6.01$, $\eta^2 = 0.02$, $p < 0.05$) ve teknolojik pedagojik alan bilgisi düzeylerinde ($F_{[1-240]} = 5.02$, $\eta^2 = 0.02$, $p < 0.05$) eğitim durumlarına göre anlamlı farklılık bulunmuştur. Eğitim durumu lisansüstü olan öğretmenlerin alan bilgisi ($\bar{X} = 25.11$, Ss = 3.29) ve teknolojik pedagojik alan bilgisi düzeyleri ($\bar{X} = 20.11$, Ss = 2.78), lisans mezunu öğretmenlerin alan bilgisi ($\bar{X} = 23.25$, Ss = 3.87) ve teknolojik pedagojik alan bilgisi düzeylerinden ($\bar{X} = 18.90$, Ss = 3.37) yüksektir. Ancak eğitim durumunun alan bilgisi ve teknolojik pedagojik alan bilgisi düzeyleri üzerindeki etkisi düşük olup, alan bilgisi düzeyinde toplam varyansın %3'ünü ve teknolojik pedagojik alan bilgisi düzeyi üzerinde ise toplam varyansın sadece %2'sini açıklamaktadır. Lisansüstü eğitimde öğretmenler alanında uzmanlaştıkları için, lisans mezunu öğretmenlere göre alan bilgisi düzeyleri buna bağlı olarak da TPAB düzeyleri yüksek olabileceği söylenebilir.

Eğitimde Bilişim Teknolojileri Kullanımına Göre Öğretmenlerin Teknolojik Pedagojik Alan Bilgileri

Öğretmenlerin TB, PB, AB, TPB, TAB, PAB ve TPAB düzeylerini eğitimde bilişim teknolojilerini kullanım düzeylerine göre kıyaslamak için tek faktörlü MANOVA analizi yapılmıştır. Öğretmenlerin eğitimde bilişim teknolojileri kullanımına göre TPAB boyutlarına yönelik puanları bütüncül olarak anlamlı farklılık göstermiştir (Pillai's Trace = 0.35, $F_{[28-936]} = 3.21$, $\eta^2 = 0.09$, $p < 0.01$]. Her bir değişken için tek yönlü ANOVA sonuçlarına bakıldığında, öğretmenlerin teknolojik bilgi ($F_{[4-237]} = 16.28$, $\eta^2 = 0.22$, $p < 0.01$), pedagojik bilgi ($F_{[4-237] =}$ 2.95, $\eta^2 = 0.05$, $p < 0.05$), alan bilgisi ($F_{[4-237]} = 4.34$, $\eta^2 = 0.07$, $p < 0.01$), teknolojik pedagojik bilgi ($F_{[4-237]} = 5.54$, $\eta^2 = 0.09$, $p < 0.01$), teknolojik alan bilgisi ($F_{[4-237]} = 8.36$, $\eta^2 = 0.12$, $p < 0.01$], pedagojik alan bilgisi ($F_{[4-237]} = 3.53$, $\eta^2 = 0.06$, $p < 0.01$) ve teknolojik pedagojik alan bilgisi düzeylerinde ($F_{[4-237]} = 6.14$, $\eta^2 = 0.09$, $p < 0.01$), eğitimde bilişim teknolojilerini kullanım düzeylerine göre anlamlı farklılık bulunmuştur. Eğitimde bilişim teknolojilerini her zaman kullanan öğretmenlerin; TB ($\bar{X} = 64.89$, Ss = 10.28), AB ($\bar{X} = 25.16$, Ss = 3.53), TPB ($\bar{X} = 16.60$, Ss = 2.59), TAB ($\bar{X} = 16.35$, Ss = 2.77) ve TPAB düzeyleri ($\bar{X} = 20.50$, Ss = 2.83) eğitimde bilişim teknolojilerini hiç kullanmayan öğretmenlerin; TB ($\bar{X} = 51.39$, Ss = 14.09), AB ($\bar{X} = 22.28$, Ss = 4.10), TPB ($\bar{X} = 14.00$, Ss = 2.72), TAB ($\bar{X} = 13.50$, Ss = 3.22) ve TPAB düzeylerinden ($\bar{X} = 17.28$, Ss = 3.10) yüksektir. Eğitimde bilişim teknolojileri kullanım düzeylerinin; teknolojik bilgi düzeyi üzerinde etkisi geniş olup toplam varyansın %22'sini açıklamaktadır. Eğitimde bilişim teknolojilerini kullanım düzeylerinin AB, TPB, TAB, PAB ve TPAB düzeyleri üzerinde etkisinin orta düzeyde, pedagojik bilgi düzeyi üzerinde ise düşük düzeyde bir etkiye sahip olduğu görülmektedir. Akyüz ve arkadaşları (2014) deneysel çalışmalarında akıllı tahta kullanımının fen bilgisi öğretmen adaylarının TPAB düzeylerine olumlu etkisi olduğunu belirtmişlerdir. Demir ve Bozkurt (2011) ise öğretmenlerin teknoloji entegrasyonunda sahip olması gereken yeterliklerin teknoloji bilgisi ile ilişkilendirildiğini ve etkili bir teknoloji kullanımı açısından değerli görüldüğünü belirtmiştir. Buna göre eğitimde bilişim teknolojileri kullanımı ile TPAB düzeylerinin birbirini pozitif yönde etkilediği söylenebilir.

İnternet Kullanım Sıklıklarına Göre Öğretmenlerin Teknolojik Pedagojik Alan Bilgileri

Öğretmenlerin TB, PB, AB, TPB, TAB, PAB ve TPAB düzeylerini internet kullanım sıklığı düzeylerine göre kıyaslamak için tek faktörlü MANOVA analizi yapılmıştır. Öğretmenlerin internet kullanım sıklıklarına göre TPAB boyutlarına yönelik puanları bütüncül olarak anlamlı farklılık göstermiştir (Wilk's Lambda = 0.68, $F_{[28-834.31]} = 0.68$, $\eta^2=0.09$, $p < 0.01$]. Her bir değişken için tek yönlü ANOVA sonuçlarına bakıldığında, öğretmenlerin teknolojik bilgi ($F_{[4-237]} = 22.59$, $\eta^2 = 0.28$, $p < 0.01$), pedagojik bilgi ($F_{[4-237]} = 3.56$, $\eta^2 = 0.06$, $p < 0.01$], alan bilgisi ($F_{[4-237]} = 2.92$, $\eta^2 = 0.05$, $p < 0.05$], teknolojik pedagojik bilgi ($F_{[4-237]} = 7.45$, $\eta^2 = 0.11$, $p < 0.01$), teknolojik alan bilgisi ($F_{[4-237]} = 7.86$, $\eta^2 = 0.12$, $p < 0.01$), pedagojik alan bilgisi ($F_{[4-237]} = 4.60$, $\eta^2 = 0.07$, $p < 0.01$] ve teknolojik pedagojik alan bilgisi düzeylerinde ($F_{[4-237]} = 4.86$, $\eta^2 = 0.08$, $p < 0.01$), internet kullanım sıklıklarına göre anlamlı farklılık bulunmuştur. İnterneti günde 4 saat ve üzeri kullanan öğretmenlerin; TB ($\bar{X} = 65.33$, Ss = 10.86), PB ($\bar{X} = 23.76$, Ss = 3.64), AB ($\bar{X} = 24.84$, Ss = 3.84), TPB ($\bar{X} = 16.55$, Ss = 2.70), TAB ($\bar{X} = 16.25$, Ss = 2.74), PAB ($\bar{X} = 28.69$, Ss = 4.26) ve TPAB düzeyleri ($\bar{X} = 20.44$, Ss = 3.64); interneti haftada

1-2 saat kullanan öğretmenlerin; TB ($\bar{X}$ = 45.14, Ss = 7.88), PB ($\bar{X}$ = 20.96, Ss = 3.72), AB ($\bar{X}$ = 22.07, Ss = 3.10), TPB ($\bar{X}$ = 13.54, Ss = 1.95), TAB ($\bar{X}$ = 13.04, Ss = 2.47), PAB ($\bar{X}$ = 24.93, Ss = 4.00) ve TPAB düzeylerinden ($\bar{X}$ = 17.50, Ss = 3.04) yüksektir. İnternet kullanım sıklığının; teknolojik bilgi düzeyi üzerinde etkisi geniş olup toplam varyansın %28'ini açıklamaktadır. İnternet kullanım sıklığının PB, TPB, TAB, PAB ve TPAB düzeyleri üzerinde etkisinin orta düzeyde, AB düzeyi üzerinde ise düşük düzeyde bir etkiye sahip olduğu görülmektedir. Chuang ve Ho (2011) çalışmalarında teknoloji kullanım sıklığı ile TB, PB, AB, TPB ve TAB düzeyleri arasında anlamlı ilişkili olduğunu belirtmişlerdir. Sonuç olarak internete erişimin bilgiye erişimle eşdeğer olarak görüldüğü günümüzde, internet kullanım sıklığının bilginin tüm alanlarını etkilediği söylenebilir.

SONUÇ ve ÖNERİLER

Bu çalışmada öğretmenlerin TPAB düzeylerini etkileyen çeşitli faktörler olduğu görülmüştür. Mishra ve Koehler'in (2005) oluşturmuş olduğu TPAB ile ilgili araştırmalar genellikle öğretmen adayları üzerine yoğunlaşmış olup, son yıllarda öğretmenlere yönelik yapılan çalışmaların arttığı görülmektedir. Bu araştırmada öğretmenlerin cinsiyet, yaş, eğitim durumu, eğitimde BT kullanımı ve internet kullanım sıklığına göre TPAB düzeyleri incelenmiş olup, sonuçları şu şekildedir:

- Öğretmenlerin teknoloji ve pedagojik alan bilgisi cinsiyete göre anlamlı farklılık göstermektedir. Erkeklerin teknolojik bilgisi düzeyinin kadınlardan, kadınların pedagojik alan bilgi düzeyinin ise erkeklerden yüksek olduğu görülmektedir.
- Öğretmenlerin teknolojik bilgi, teknolojik alan bilgisi ve pedagojik alan bilgisi düzeylerinde yaş gruplarına göre anlamlı farklılık bulunmuştur. 20-29 yaş grubu öğretmenlerin TB, TAB, PAB düzeylerinin diğer yaş grubundaki öğretmenlerin TB, TAB, PAB düzeylerinden yüksek olduğu görülmektedir.
- Öğretmenlerin alan bilgisi ve teknolojik pedagojik alan bilgisi düzeyleri eğitim durumlarına göre anlamlı farklılık göstermektedir. Eğitim durumu lisansüstü olan öğretmenlerin, lisans mezunu öğretmenlere göre AB ve TPAB düzeylerinin yüksek olduğu tespit edilmiştir.
- Derste bilişim teknolojilerini kullanma düzeyi daha yüksek olan öğretmenlerin, TB, PB, AB, TAB, TPB, PAB ve TPAB düzeylerinin diğer öğretmenlerin bilgi düzeylerine göre yüksek olduğu bulunmuştur.
- Öğretmenlerin internet kullanım sıklıklarına göre TPAB düzeyleri incelendiğinde ise interneti sık kullanan öğretmenlerin, interneti az kullanan öğretmenlere göre TB, PB, AB, TAB, TPB, PAB ve TPAB düzeylerinin yüksek olduğu görülmüştür.

Bu bağlamda öğretmenlerin TPAB düzeylerinin cinsiyet, yaş ve eğitim durumlarına göre anlamlı farklılıklar gösterdiğini aynı zamanda derste bilişim teknolojilerini kullanım düzeyi ve internet kullanım sıklığı ile yakından ilgili olduğu söylenebilir. Bu bulgular ışığında öğretmenlerin TPAB düzeylerinin geliştirilmesi için önerilerimiz şunlardır:

- Öğretmenlerin TPAB düzeylerinin farkında olması, kendini geliştirmesi ve eğitime teknolojiyi daha iyi entegre edebilmesi açısından faydalı olacaktır.
- Yaşça büyük olan öğretmenlerin eğitime teknoloji entegrasyonunda geride kalmamaları için, genç öğretmenlerin teknoloji ve teknolojinin eğitimde nasıl kullanılacağı ile ilgili bilgilerini yaşça büyük olan öğretmenlerle paylaşıp, aynı zamanda onların tecrübelerinden de faydalanması gerekmektedir.
- Öğretmenlerin derse teknolojiyi entegre etme konusundaki öz güvenleri arttırılmalı çünkü derste teknolojiyi kullandıkça TPAB düzeylerinde de artış görülmesi muhtemeldir.
- İnternete erişimin bilgiye hızlı erişimle eşdeğer olduğu düşünüldüğünde öğretmenlerin özellikle eğitime yönelik interneti daha sık kullanmaları sağlanarak eğitimde kullanılacak web tabanlı uygulamaların yaygınlaştırılması ve öğretmenlere tanıtılması sağlanmalıdır.

Sonuç olarak yapılan bu ve buna benzer çalışmalarla, eğitime teknoloji entegrasyonunun tek bir boyutu olmadığının, çok boyutlu düşünülmesinin gerekliliğinin farkına varılacak ve öğretmenlerin TPAB düzeylerinin, eğitime teknoloji entegrasyonunda önemi daha net anlaşılacaktır.

AZERBAYCAN VE TÜRKİYE'DE OKUTULAN 1.SINIF MATEMATİK DERS KİTAPLARININ İÇERİK AÇISINDAN KARŞILAŞTIRILMASI

THE COMPARISON OF TURKISH AND AZERBAIJAN MATHEMATICS TEXTBOOK BASED ON THEIR CONTENT

Nimet PIRASA
Recep Tayyip Erdoğan Üniversitesi
nimet.pirasa@erdogan.edu.tr

ÖZET: Ders kitapları hem öğretmenlerin ders işleyişinde, hem de öğrencilerin ders çalışırken başvurdukları birincil eğitsel kaynaklardır. Yapılan çalışmalarda, 2005 İlköğretim 1-5. Sınıflar Matematik Dersi Öğretim Programı doğrultusunda hazırlanan ve MEB tarafından basılan ders kitaplarının öğretmenlerin öğretim programını anlama ve yorumlamada onlara yol gösterici olduğu anlaşılmaktadır. Bu çalışmada Azerbaycan ve Türkiye'de okutulan 1.sınıf matematik ders kitaplarının içerik açısından karşılaştırılması amaçlanmıştır. Bunun için Azerbaycan'da okutulan Radius Yayıncılık tarafından 2012 yılında basılmış 1.sınıf ders kitabı, Türkiye'de okutulan matematik ders kitaplarından biri olan MEB tarafından 2013 yılında basılmış İlköğretim 1. Sınıf Matematik Ders Kitabı ele alınmıştır. Bu kitapların içerik analizi yapılmıştır. Bu kitaplar içerik düzeni, öğrenme alanlarına verilen ağırlık, konu başlıkları, konuların sunuluşunda hâkim olunan yaklaşımlar vb. açılardan karşılaştırılmıştır. Bu doğrultuda matematik ders kitaplarının içerik açısından düzenlenmesi konusunda önerilerde bulunulmuştur.

Anahtar sözcükler: matematik ders kitabı, ilkokul 1.sınıf matematik eğitimi, uluslar arası karşılaştırmalı çalışma

ABSTRACT: Textbooks are primary educational resources for teachers while teaching and for students while studying. It is stated that the textbooks are prepared in accordance with Elementary Mathematics Education Program for 1-5. Grades (2005) and published by Turkish Ministry of National Education (MNE) were the guidance of the teachers to understand and interpret the curriculum. In this study, it is aimed to compare Azerbaijan and Turkey mathematics textbooks at grade level 1. Thus, the mathematics textbooks for grade level 1published by Radius Publishing in 2012 in Azerbaijan and MNE Publishing in 2013 in Turkey are analyzed. The comparisons focused on their organization of chapters, the relative weights of learning domain, content topics covered, styles of presentation, etc. In this respect, it is made suggestions regarding the regulation of the content of mathematics textbooks.

Key words: mathematics textbooks, elementary mathematics education at grade 1^{st}, international comparative studies

EĞİTSEL OYUNLARLA MATEMATİK ÖĞRETİMİ DERSİNDE TASARLANAN OYUNLARIN ANALİZİ

THE ANALYSES OF GAMES AT MATHEMATİCS TEACHING WITH EDUCATIONAL GAMES COURSE

Nimet PIRASA
Recep Tayyip Erdoğan Üniversitesi
nimet.pirasa@erdogan.edu.tr

ÖZET: Matematik dersinin zor ve anlaşılması kolay olmayan derslerin başında geldiği ve bu yüzden pek sevilmediği bir gerçektir. Matematiğe karşı olumlu tutum geliştirilmelidir (MEB,2005). Çocuk için oyun eğlenceli bir uğraş olmasının yanı sıra birçok şeyi farkına varmadan öğrendiği bir süreçtir. Çoğu derste eğitsel oyunlarla dersin öğretilmesi tavsiye edilmektedir. Çünkü çocuk oyun içerisinde deneyim kazanmakta, taktikler geliştirmekte, düşünüp çözüm yolları üretmekte ve çeşitli kararlar almaktadır (MEB, 2006). Bu çalışmada seçmeli ders olarak okutulan Eğitsel Oyunlarla Matematik Öğretimi dersinde 52 öğrencinin oluşturmuş olduğu eğitsel oyunların analizi yapılmıştır. Bu ders kapsamında öğrencilerin her hafta gerek bireysel gerekse de grup olarak inceledikleri veya tasarladıkları oyunlar (eğitsel bilgisayar oyunları, matematik araçlarıyla tasarlanan eğitsel oyunlar, sınıf içinde materyal kullanılmadan oynanabilen eğitsel oyunlar ve el yapımı materyallerin kullanıldığı eğitsel oyunlar gibi) ele alınan konu, oyunda kullanılan araç gereçler ve uygulanabilirlik açısından sınıflandırılmıştır. Bu doğrultuda ortaokul matematik derslerinde oynatılabilecek farklı türde eğitsel oyunlar ile ilgili fikir sahibi olunacaktır.

Anahtar sözcükler: eğitsel oyun, matematik, öğretmen adayı

ABSTRACT: It is known that math lesson is the beginning of the primarily course that is difficult and not easy to understand and therefore not much liked. Positive attitudes should be developed towards mathematics. For children game is a fun exercise besides a process that can be learnt many things without realizing. At most of the courses it is recommended to be taught with educational games. Owing to the game process child gains experience, develops tactics, produces many solutions and makes several decisions. In this study educational games that have been designed by 52 students at the course of Mathematics Teaching with Educational Games are analyzed. Educational games (computer games, with math tools games, with no material games and with handmade materials games, etc.) that are scanned or designed by students in the course period are classified in terms of the math topics, the tools used in etc. Accordingly the options of educational games that can be played in middle school math classes will have an idea about.

SPATİAL SKİLLS AS PREDİCTORS OF SUCCESS İN MATHEMATİCS

Sheryl SORBY

The ability to visualize in three dimensions is a cognitive skill that has been shown to be important for success in engineering and other technological fields. For engineering, the ability to mentally rotate 3-D objects is especially important. Unfortunately, of all the cognitive skills, 3-D rotation abilities exhibit robust gender differences, favoring males. The assessment of 3-D spatial skills and associated gender differences has been a topic of educational research for nearly a century; however, a great deal of the previous work has been aimed at merely identifying differences. For nearly two decades, the author has been conducting research aimed at identifying practical methods for improving 3-D spatial skills, especially for women engineering students. This presentation details the significant findings obtained over the past several years through this research and identifies strategies that appear to be effective in developing 3-D spatial skills and in contributing to student success. Data obtained for students enrolled in introductory mathematics courses will also be presented.

Keywords: spatial skills, gender differences, student success

GÖRÜNTÜ PARAMETRELERİNİN PARÇACIK SÜRÜ OPTİMİZASYONU YÖNTEMİ İLE ENİYİLEMESİ

OPTIMIZING IMAGE PARAMETERS BY PARTICAL SWARM OPTIMIZATION

ÖZET: Sayısal bilgisayarlar hayatımızın vazgeçilmez bir parçasıdır. Sayısal bilgisayarlar yardımıyla günlük hayatımızda kullanılan veriler hızlı ve etkin bir şekilde işlenip bilgi çıkarımı yapılmaktadır. Bilgi çıkarımı sırasında kullanılan bu verilerden en önemlisi optik aygıtlar aracılığıyla elde edilen sayısal görüntülerdir. Sayısal görüntülerin işlenmesi için çeşitli yöntemler bulunmaktadır. Bu yöntemlerden en çok kullanılanı, görüntü zenginleştirme yöntemidir. Bu çalışmada, görüntülerin zenginleştirilmesi işlemi için bazı görüntü parametrelerinin parçacık sürü optimizasyonu (PSO) yöntemiyle eniyilemesi gerçekleştirilmiştir. Görüntünün kontrast (karşıtlık), parlaklık ve gama bileşenleri PSO algoritmasıyla sezgisel olarak iyileştirilmiştir. Bu işlemleri kullanıcının kolay uygulayabilmesi ve sonuçları gözlemleyebilmesi için, C# tabanlı bir grafik ara yüz gerçekleştirilmiştir. Geliştirilen yazılım, görüntü işleme ve yapay zekâ konularında eğitim yazılımı olarak kullanılabilir.

Anahtar sözcükler: görüntü iyileştirme, parçacık sürü optimizasyonu, pso

ABSTRACT: Digital computers are indispensable part of our lives. Physical signals in the real world are processed via computers quickly and efficiently. As a result of this process, information extraction is carried out. During the information extraction, digital images are used frequently. The digital image is two dimensional data that is obtained by optical devices. There are many methods for the processing of digital images. One of the most important methods of image processing is image enhancement. In this study, Image enhancement has been carried out by particle swarm optimization method. Some important image parameters such as brightness, contrast and gamma values, have been optimized with Particle Swarm Optimization. A graphical user interface has been implemented by C# to use easily and to examine visually optimization results. The developed software can be used as educational software for image processing and artificial intelligence.

Key words: image enhancement, particle swarm optimization, PSO

GİRİŞ

Sayısal görüntü işleme ve yapay zekâ günümüzde çok sayıda araştırmaların yapıldığı alanlardır. Günlük hayatta birçok kaynaktan elde edilen görüntü verilerinden bilgi çıkarımı yapmak için klasik teknikler ve yapay zekâ teknikleri geliştirilmiştir. Örneğin; görüntü onarma, görüntü bölütleme, görüntü sıkıştırma ve görüntü iyileştirme görüntü işlemede sıklıkla kullanılan tekniklerdir. Görüntü iyileştirme tekniği, mevcut görüntüden bilgi çıkarımı yapabilmek için görüntünün niteliklerinin yükseltilmesi olarak tanımlanabilir (Gonzalez ve Woods, 2007). Mevcut görüntüden daha nitelikli görüntü elde etmek için kullanılan çok fazla yöntem bulunmaktadır. Histogram dengeleme, kontrast iyileştirme bunlardan bazılarıdır. Görüntü iki boyutlu bir işaret olduğu için, görüntüler üzerinde klasik algoritmaların kullanılması çok fazla işlem karmaşıklığına neden olmaktadır. Sayısal bilgisayarın bellek kapasitesi sınırlı olduğu için yapay zekâ yöntemleri sayesinde daha az işlem karmaşıklığıyla daha kaliteli sonuçlar alabilmek klasik yöntemlere göre daha mümkündür. Bu çalışmada görüntü parametreleri, sürü zekâsı yöntemlerinden olan parçacık sürü optimizasyonu ile iyileştirilmiştir. Görüntünün parlaklık, karşıtlık ve gama parametreleri, görüntünün istatistiksel değerleri kullanılarak sezgisel olarak iyileştirilmiş ve sonuç olarak daha çok bilgi verebilecek nitelikte görüntüler elde edilmiştir. Yapılan tüm işlemlerin görüntü işleme ve yapay zekâ eğitiminde eğitim yazılımı olarak etkin bir şekilde kullanılması için görsel ara yüz geliştirilmiştir. Bu sayede görüntü parametrelerinin değiştirilmesinin sonuca etkisi, kullanılan yapay zekâ yönteminin çalışma prensibi rahatlıkla gözlemlenebilmektedir.

Çalışmanın ikinci bölümünde, literatür çalışması ve görüntünün iyileştirilmesi işleminde kullanılan PSO yöntemi detaylı olarak incelenmiştir. Sürü zekâsına göre matematiksel olarak modellenen PSO algoritması, bir çok alanda karşılaşılan optimizasyon problemlerinin çözümünde başarılı sonuçlar vermektedir. Tekrarlama sayısı önceden belirlenen bu yöntemle arama uzayında elde edilen en iyi sonuç bulunmuş ve görüntünün iyileştirilmesi gerçekleştirilmiştir. Üçüncü bölümde, görüntü iyileştirme ve PSO işlemlerini etkin ve görsel olarak gerçekleştiren uygulama hakkında bilgiler verilmiştir. Tasarlanan bu yazılım, verilen bir görüntüyü iyileştirmekle birlikte, sayısal görüntü işleme ve yapay zekâ gibi ilgili konularda verilen eğitimlere kaynak olarak kullanılabilir.

LİTERATÜR ÇALIŞMASI VE PARÇACIK SÜRÜ OPTİMİZASYONU

Parçacık Sürü Optimizasyonu (PSO), ilk olarak Kennedy ve Eberhart tarafından 1995 yılında ortaya atılmış popülasyon temelli sezgisel bir optimizasyon yöntemidir (Kennedy ve Eberhart, 1995). PSO algoritması hayvanlar arasındaki sosyal etkileşimden esinlenerek bulunan ve temel olarak sürü zekâsına dayanan bir algoritmadır. Kuş ve balık sürülerinin yiyecek arayışları ve tehlikeden kaçışları esnasındaki toplu hareketlerinden esinlenerek modellenmiştir. PSO hızlı sonuç bulması, az parametre gerektirmesi ve yerel optimumlara takılma riskinin az olması sebebiyle diğer birçok arama algoritmasına üstünlük kurmuştur. PSO, yapay sinir ağı eğitimi, fonksiyon optimizasyonu, sıralama ve çizelgeleme problemleri gibi yapısında çok fazla değişken ve parametre barındıran problemlerin çözümünde başarı ile kullanılmıştır (Bergh, 1999).
PSO'da her bir elemana parçacık (particle) denir ve parçacıklardan oluşan topluluğa da sürü (swarm) denir. Sürüdeki bütün parçacıklar çözüm uzayında rastgele değerler alarak arama işlemine başlarlar. Her bir parçacık konum (X) ve hız (V) vektörü olmak üzere iki vektörel bileşene sahiptir. Konum vektörü parçacığın konum bilgisini, hız vektörü ise parçacığın konum değiştirme miktarı ve yön bilgisini tutar. PSO, temel olarak sürüdeki her bir parçacığın konumunu, daha önce bulmuş olduğu en iyi konuma (pbest) ve sürünün o ana kadar bulmuş olduğu en iyi konuma (gbest) yaklaştırmasına dayanır. Tüm parçacıklar hız vektörleriyle bu iki en iyi konuma yönelmeye çalışırlar (Ortakcı ve Göloğlu 2012).
Örneğin parçacık sürüsünün D boyutlu N adet parçacıktan oluştuğunu varsayalım. Bu durumda popülasyon parçacık matrisi eşitlik (1)'deki gibidir.

$$X = \begin{bmatrix} X_{11} & X_{12} & \cdots & \cdots & X_{1D} \\ X_{21} & X_{22} & \cdots & \cdots & X_{2D} \\ \cdots & \cdots & \cdots & \cdots & \cdots \\ \cdots & \cdots & \cdots & \cdots & \cdots \\ X_{N1} & X_{N2} & \cdots & \cdots & X_{ND} \end{bmatrix}_{N\times D} \tag{1}$$

i'nci parçacığın konumu $X_i = [X_{i1}, X_{i2}, ..., X_{iD}]$ olarak gösterilir.
i'nci parçacığın hızı $V_i = [V_{i1}, V_{i2}, ..., V_{iD}]$ olarak gösterilir.
i'nci parçacığın önceki iterasyonlarda bulduğu en iyi konum $pbest_i = [P_{i1}, P_{i2}, ..., P_{iD}]$ olarak gösterilir.
Parçacık sürüsü tarafından önceki iterasyonlarda bulunan en iyi konum $gbest = [P_1, P_2, ..., P_D]$ olarak gösterilir.
Her bir iterasyonda parçacıkların hızları ve konumları aşağıda verilen (2) ve (3) nolu denklemlere göre güncellenir (Gözde vd., 2008).

$$V_i^{k+1} = W.V_i^k + c_1.rand_1^k\left(pbest_i^k - X_i^k\right) + c_2.rand_2^k\left(gbest^k - X_i^k\right) \tag{2}$$

$$X_i^{k+1} = X_i^k + V_i^{k+1} \tag{3}$$

c_1, c_2 : Öğrenme faktörleri
$rand_1, rand_2$: [0, 1] arasında düzgün dağılımlı rastgele sayılar
W : Eylemsizlik ağırlığı
k : İterasyon sayısı

PSO Parametreleri

Parçacık sayısı: Sürüyü oluşturan her bir elemandır. Sayısı problemin türüne göre değişebilir.
Parçacık boyutu: Optimum değeri bulunacak uygunluk fonksiyondaki değişken sayısını belirtir. Örneğin; $f(x)=5x^2+3y^3+(z/w)^2+4$ fonksiyonu 4 boyutlu bir fonksiyondur. (Tamer ve Karakuzu, 2006).
Parçacık aralığı: Problem tabanlı olarak değişmektedir. Uygunluk fonksiyonundaki değişkenlerin aralıkları ile tespit edilir. (Tamer ve Karakuzu, 2006).
V_{max}: Parçacığın ulaşabileceği maksimum hızı belirler ve bu değer genellikle parçacık aralığına göre belirlenir. Örneğin; parçacık [0, 10] aralığında ise ise V_{max} değeri 10 olarak belirlenebilir. (Tamer ve Karakuzu, 2006).
Öğrenme faktörleri (c_1, c_2): c_1 ve c_2 parametreleri, her bir parçacığı pbest ve gbest konumlarına doğru yönlendiren sabit değerlerdir. c_1 parametresi, parçacığın kendi tecrübelerine göre, c_2 parametresi ise sürüdeki diğer parçacıkların tecrübelerine göre hareket etmesini sağlar. Genellikle $c_1 = c_2 = 2$ olarak seçilir.
Eylemsizlik ağırlığı (W): Global ve yerel arama arasındaki dengeyi sağlamak için kullanılır. Bu değerin büyük seçilmesi parçacıkların global arama yapmasını, küçük seçilmesi ise parçacıkların yerel arama yapmasını sağlar. Genellikle [0.1 1] arasında seçilir. (Tamer ve Karakuzu, 2006).
Durma koşulu: Önceden belirlenen maksimum tekrar sayısı kadar veya sonucun belirli bir başarı yüzdesine ulaşmasına kadar belirlenir. (Tamer ve Karakuzu, 2006).

Şekil 1. PSO Algoritması Sözde Kodu

PSO ALGORİTMASIYLA GÖRÜNTÜ İYİLEŞTİRME

Bu bölümde görüntü iyileştirme işleminin PSO algoritmasıyla nasıl gerçekleştirildiği anlatılmıştır. Geliştirilen uygulama görüntüye kontrast, parlaklık ve gama işlemleri uygulayarak görüntünün iyileştirilmesini sağlar. Bu kontrast, parlaklık ve gama işlemlerinin resme hangi değerlerde uygulanacağı ise PSO algoritması kullanılarak belirlenmiştir. PSO algoritmasının sözde kodu Şekil 1'de gösterilmektedir. PSO algoritması Tablo 1'de belirtilen parametre değerleri ile oluşturularak arama işlemi başlatılır.

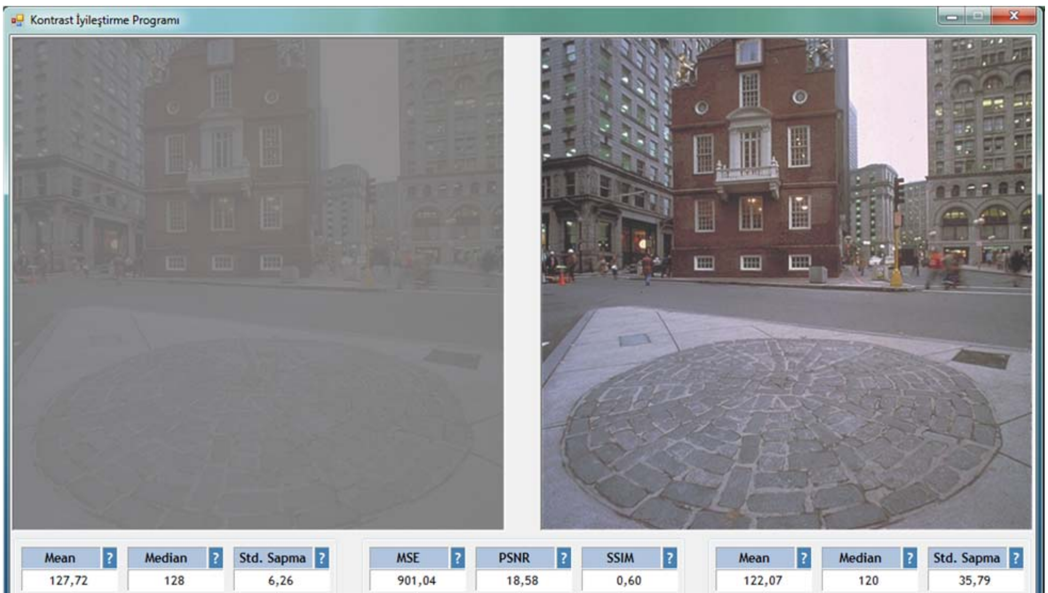
Tablo 1. PSO Algoritmasının Parametre Başlangıç Değerleri

Parametre	Başlangıç Değeri
Parçacık sayısı	25
Parçacık boyutu	3 (alfa, beta, gama)
Parçacık aralığı	alfa: [0, 10], beta: [-50, 50], gama: [0, 10]
V_{max}	alfa: 10, beta: 100, gama: 10
c_1, c_2	$c_1 = 2$, $c_2 = 2$
W	1 (Her iterasyonda $W^{k+1} = W^k * 0.999$)
Durma koşulu	Sürünün gbest değeri art arda 1000 iterasyon güncellenmeyene kadar arama yap

PSO algoritması arama boyunca parçacıkları sürekli olarak hareket ettirir. Her yer değiştirme işleminden sonra parçacıkların yeni konumları bir uygunluk fonksiyonu tarafından değerlendirilir. Bu uygunluk fonksiyonu kendisine verilen 3 adet parametreyi (alfa, beta, gama) resmin histogramına uygulayarak yeni bir histogram elde eder. Daha sonra fonksiyon elde edilen bu yeni histogramı değerlendirerek bir uygunluk değeri döndürür. PSO algoritması da uygunluk fonksiyonunun belirlediği uygunluk değerine göre parçacıkların yeni hızlarını ve konumlarını belirler. Bu işlem iteratif olarak devam eder ve sonunda parçacıklar en iyi değere ulaşırlar.
PSO algoritması arama işlemini bitirdikten sonra sürünün arama boyunca bulmuş olduğu en iyi değer olan gbest değeri alınır. Bu değer görüntüye uygulanacak olan alfa (kontrast), beta (parlaklık) ve gama (gama) değerlerini içerir. Hesaplanan alfa, beta ve gama değerleri orijinal görüntüye uygulanarak yeni ve iyileştirilmiş görüntü elde edilir. Daha sonra yeni görüntünün ortalama (mean), ortanca (median) ve standart sapma değerleri hesaplanır. Ayrıca orijinal görüntü ile yeni görüntü karşılaştırılarak MSE (Mean Square Error), PSNR (Peak Signal to Noise Ratio) ve SSIM (Structural Similarity) değerleri hesaplanır. Son olarak iyileştirilen görüntü ve hesaplanan bu değerler ve bulunan alfa, beta, gama değerleri ekranda gösterilerek arama işlemi bitirilir.

BULGULAR

Çalışmanın bu bölümünde görüntü iyileştirme işleminin görsel olarak uygulanabilmesi ve sonuçların daha iyi bir şekilde görülebilmesi için hazırlanan C# tabanlı arayüz uygulaması anlatılmıştır. Uygulamanın ekran görüntüsü Şekil 2'de gösterilmektedir. Uygulama ekranında "Resim Yükle" butonuna basıldığında ekrana gelen diyalog penceresi kullanılarak görüntüsü iyileştirilecek resim dosyası programa yüklenir. Seçilen resim uygulama ekranının sol tarafındaki resim alanında gösterilir. Programa yüklenen resmin ortalama, ortanca ve standart sapma değerleri hesaplanarak resmin altındaki ilgili alanlarda gösterilir.



Şekil 2. Uygulamanın Ekran Görüntüsü

Resim dosyası programa yüklendikten sonra kullanıcı iki farklı yolla görüntüyü iyileştirebilir. İlk seçenekte kullanıcı uygulamadaki “Kontrast İyileştir” butonu yardımıyla PSO algoritmasını kullanarak görüntüyü iyileştirmeye çalışır. PSO algoritmasının arama sonunda bulduğu en iyi alfa, beta ve gama değerleri orijinal resmin histogramına uygulanarak yeni görüntü elde edilir. Diğer seçenekte ise kullanıcı uygulama ekranının alt orta kısmındaki “Alfa”, “Beta” ve “Gama” alanlarına istediği alfa, beta ve gama değerlerini girer ve “Parametreleri Uygula” butonu yardımıyla belirlenen alfa, beta ve gama değerleri orijinal resmin histogramına uygulanarak yeni görüntü elde edilir.

Her iki durumda da elde edilen yeni resim uygulama ekranının sağ tarafındaki resim alanında gösterilir. Daha sonra yeni resmin ortalama, ortanca ve standart sapma değerleri yeni resmin altındaki ilgili alanlarda hesaplanarak gösterilir. Son olarak orijinal görüntü ile yeni görüntü piksel boyutunda karşılaştırılarak bu iki resmin MSE (Mean Square Error), PSNR (Peak Signal to Noise Ratio) ve SSIM (Structural Similarity) değerleri hesaplanarak iki resmin alt orta kısmındaki MSE, PSNR ve SSIM alanlarında gösterilir. MSE, PSNR ve SSIM değerlerinin hesaplama formülleri (4), (5) ve (6) nolu denklemlerde gösterilmektedir.

$$MSE = \frac{1}{N \times M} \sum_{i=0}^{N-1} \sum_{j=0}^{M-1} [X(i,j) - Y(i,j)]^2 \quad (4)$$

N, M : Orijinal resmin satır ve sütun sayıları
$X(i,j)$: Orijinal resmin i. satır ve j. sütundaki piksel renk tonu
$Y(i,j)$: Yeni resmin i. satır ve j. sütundaki piksel renk tonu

$$PSNR = 20 \times \log_{10}\left(\frac{255}{\sqrt{MSE}}\right) \quad (5)$$

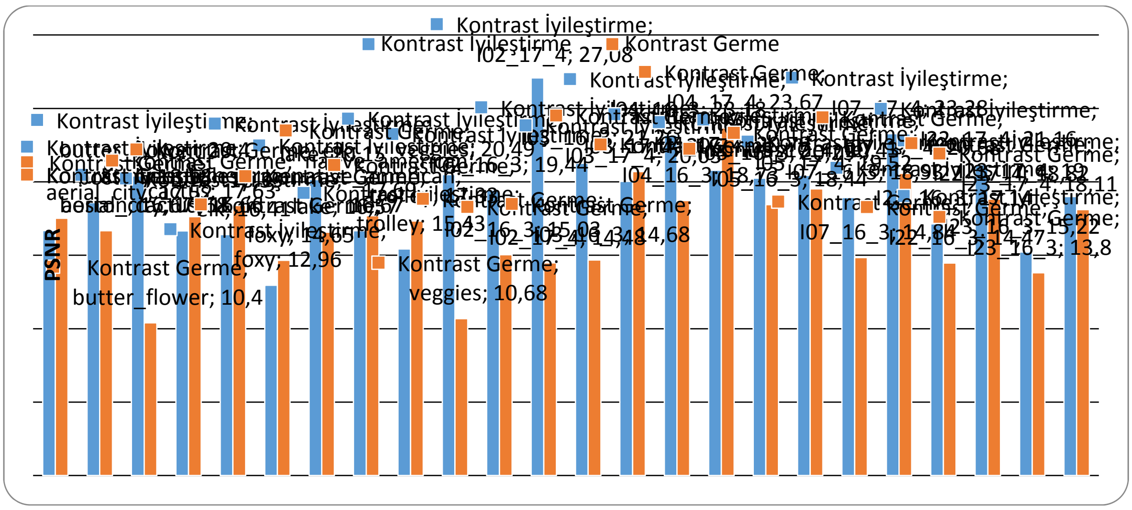
$$SSIM(x,y) = \frac{(2\mu_x\mu_y + C_1)(2\sigma_{xy} + C_2)}{(\mu_x^2 + \mu_y^2 + C_1)(\sigma_x^2 + \sigma_y^2 + C_2)} \quad (6)$$

μ_x : x’in aritmetik ortalaması
μ_y : y’nin aritmetik ortalaması
σ_{xy} : x ve y’nin kovaryansı
σ_x^2 : x’in varyansı
σ_y^2 : y’nin varyansı
C_1 : $(0{,}01 * 255)^2 = 6{,}5025$
C_2 : $(0{,}03 * 255)^2 = 58{,}5225$

SSIM yöntemi; NxN’lik bir çerçeve orijinal ve yeni resim üzerinde sol üsten başlayarak sağ alt köşeye kadar maskeleme yöntemi gibi gezdirilerek uygulanır. Her adımda denklem (6)’daki işlem mevcut çerçeve için yapılır. Her bir adımda elde edilen sonuçlar toplanır ve toplam sonuç adım sayısına bölünerek iki resim arasındaki SSIM değeri hesaplanır.
Kullanıcı uygulama ekranında “Resmi Kaydet” butonuna basarak iyileştirilmiş yeni resmi bmp dosya olarak bilgisayara kaydedebilir.

DENEYSEL SONUÇLAR

Bu çalışmada, çevrimiçi olarak ulaşılabilen TID2008 (TID2008, 2014) ve The CSIQ (The CSIQ, 2014) veri tabanlarından seçilen resimlere kontrast iyileştirme ve kontrast germe işlemleri ayrı ayrı uygulanmıştır. Kontrast iyileştirme işlemi geliştirilen uygulama tarafından PSO algoritması kullanılarak sezgisel olarak yapılmıştır. Her iki algoritmada elde edilen sonuçların PSNR değerleri Şekil 3’te karşılaştırılmalı olarak gösterilmektedir.



Şekil 3. Test Resimlerinin PSNR Değerlerinin Karşılaştırılması

Grafik incelendiğinde önerilen kontrast iyileştirme işleminin kontrast germeye göre daha iyi sonuçlar verdiği görülmektedir. 24 test resminden 16 tanesinde kontrast iyileştirme algoritması kontrast germeye göre daha iyi sonuçlar vermiştir. Kontrast germe işlemi, kontrast değeri iyi olan bazı resimlerin görüntüsünü bozduğu görülmüştür ancak geliştirilen kontrast iyileştirme algoritması iyi olan resimleri bozmamıştır.

SONUÇ

Bu çalışmada, interaktif, açık kaynaklı ve kullanıcı dostu grafik ara yüz gerçeklenmiştir. Uygulamadaki "Mean", "Median", "Std. Sapma", "MSE", "PSNR", "SSIM", "Alfa", "Beta" ve "Gama" yazılarının yanlarındaki simgeleri ile işlemler hakkında bilgiler verilmektedir. Tasarlanan yazılım hem görüntü işleme aracı hem de kullanılan yöntemleri öğretici özellikte olması bu tür çalışmalara ilgi duyanlara kaynak olacaktır. Gelecek çalışmalarda, daha çok görüntü işleme ve yapay zekâ yöntemlerinin görsel olarak uygulamaya dâhil edilmesi planlanmaktadır.

TURKISH AND ISLAMIC SCIENTISTS IN TURKISH SCIENCE TEXTBOOKS

Şahin İDİN

Yalçin YALAKİ

The purpose of this study was to investigate the proportion of Turkish and Islamic scientists, who had significant contributions to science in history, that were mentioned in textbooks based on the current and past science and technology curriculums. For this purpose, science textbooks that were prepared based on the 1994, 2000, 2005, and 2013 National Science / Science and Technology Curriculums were investigated. One of the qualitative techniques, document analysis was used for data collection and anlysis. Results showed that very few Turkish and Islamic scientits were mentioned in science textbooks, if any. We argue that more Turkish and Islamic scientists should be mentioned in science textbooks in a Turkish and Islamic state. We made suggestions on which Turkish and Islamic scientist may be mentioned in which textbook unit and how they shold be mentioned as a conclusion.

Keywords: Turkish Islamic scientists, science text book

BİLGİSAYAR DESTEKLİ ÖĞRETİMİN LİNEER BAĞIMSIZLIK KONUSUNDA AKADEMİK BAŞARI ÜZERİNE ETKİSİ

THE EFFECT OF COMPUTER ASSISTED INSTRUCTION ON ACADEMIC ACHIEVEMENT IN LINEAR INDEPENDENCE ISSUE

ÖZET: Bu çalışmanın amacı, bilgisayar destekli öğretimin Lineer Cebir dersine ait Lineer Bağımsızlık konusunda akademik başarı üzerine etkisini incelemektir. Çalışma, 2013-2014 eğitim-öğretim yılında bir devlet üniversitesinin İlköğretim Matematik Öğretmenliği programının 2.sınıfına kayıtlı 68 öğretmen adayı ile gerçekleştirilmiştir. Bu araştırmada, araştırma yöntemlerinden ön test-son test kontrol gruplu yarı deneysel desenlerden eşleştirilmiş desen uygulanmıştır. Uygulama boyunca Lineer Cebir dersine ait Vektörler, Matris Cebiri, Lineer Denklem Sistemleri ve Lineer Bağımlılık-Bağımsızlık konuları kontrol grubunda geleneksel yöntemlerle anlatılırken deney grubuna Geogebra yazılımı kullanılarak cebirsel kavramların geometrik temsilleri ve bu kavramların birbirleri ile ilişkisi üzerine hazırlanmış etkinlikler aracılığıyla interaktif uygulamalarla işlenmiştir. Bu çalışmada ölçme aracı olarak araştırmacı tarafından geliştirilen Lineer Cebir Başarı Testi hem ön test hem de son test olarak kullanılmıştır. Lineer Cebir Başarı Testindeki Lineer Bağımsızlık ile ilgili sorulara ilişkin test puanları Mann Whitney U testi kullanılarak analiz edilmiş ve deney grubu lehine anlamlı bir fark ($Z=-4.138$, $p<.001$) bulunmuştur. Deney grubunun sıralama puanlarının ortalaması 43.97 iken kontrol grubunun sıralama puanları ortalaması 25.03 olarak bulunmuştur. Burada $Z=-4,138$ olması kontrol grubunun erişi puanlarının sıralama puanlarının ortalamasının 4 standart puan altında olduğunu, $p<.001$ olması da bu farkın şans eseri olma ihtimalinin .001'den daha az olduğunu gösterir. Bu durum bilgisayar destekli öğretimin lineer cebir dersine ait lineer bağımsızlık konusunda akademik başarı üzerine olumlu bir etki yaptığını gösterir.

Anahtar sözcükler: Lineer Cebir, Lineer Bağımsızlık, Geometrik temsil, Germe.

ABSTRACT: This study was conducted to investigate the effects of computer assisted instruction on academic achievement in Linear Independence issue. The sample consists of 68 second grade elementary mathematics preservice teachers from a state university. The study's design is the matching only design from pretest – posttest quasi-experimental designs with control group. In this study a researcher-made questionnarie LCBT was applied as pretest and posttest. During the research, while vector, matrix, systems of linear equations and linear independence issues of Linear Algebra was taught in traditional methods in control group, geometric representations of these algebraic concepts and relationships between them were taught with interactive GeoGebra worksheets in experimental group. The test scores of questions related to the Linear Indepence in LCBT was analysed with Mann-Whitney U test and significant difference ($Z=-4.138$, $p<.001$) was found between groups in favour of experimental group. This result shows that the computer assisted instruction affects academic achievement positively in linear independence issue.

Key words: Linear Algebra, Linear Independence, Geometric Representation, Span

LİSE ÖĞRENCİLERİNİN MATEMATİK DERSİNDE ÖĞRENME STİLLERİNE GÖRE UYGULANAN ETKİNLİK TÜRLERİNE YÖNELİK TERCİHLERİ

HIGH SCHOOL STUDENTS' PREFERENCES for ACTIVITY TYPES which is APPLIED at MATHEMATICS COURSE ACCORDING to LEARNING STYLES

ÖZET: Bu çalışmanın amacı, lise öğrencilerinin matematik dersinde öğrenme stillerine göre uygulanan etkinlik türlerine yönelik tercihlerini incelemektir. Bu çalışmada fonksiyon ve türev kavramlarının öğrenimi sürecinde, yapılandırmacı öğrenme yaklaşımı kapsamında, McCarthy'nin 8 aşamalı 4MAT sistemi benimsenerek öğrencilerin öğrenme stillerine uygun öğrenme etkinlikleri geliştirilmiş ve uygulanmıştır. Uygulama sonrasında öğrencilerin etkinlik tercihlerine yönelik görüşleri belirlenmiştir. Araştırmanın çalışma grubu, bir devlet lisesindeki 19 öğrenciden oluşmaktadır. Kişisel bilgi formu, öğrenme stili ölçeği ve öğrenme etkinliklerine yönelik tercih ölçeği veri toplama araçları ile veriler toplanmıştır. Elde edilen nicel verilerin analizinde betimsel ve parametrik olmayan istatistiksel analizler kullanılmıştır. Verilerin analizi sonucunda öğrencilerin öğrenme etkinliği türlerine yönelik görüşlerinin genelde olumlu olduğu belirlenmiştir. Ayrıca, öğrencilerin öğrenme stillerine göre öğrenme etkinliklerine yönelik tercihlerinin istatistiksel olarak anlamlı bir şekilde farklılaşmadığı saptanmıştır.

Anahtar sözcükler: matematik, etkinlik, öğrenme stili

ABSTRACT: The aim of this study was to investigate high school students' preferences for activity types which is applied at mathematics course according to students' learning styles. As part of the study, activities which were suitable to the students' learning styles were developed within constructivist learning approach in line with McCarthy's 4MAT system with 8 steps of learning and used for the learning of the concepts of function and derivative. After the experimental application, students' preferences about activity types were determined. The participants of the study were consisted 19 students at a state high school. Data were collected using data collection tools such as a personal information form, a learning styles scale and a preference scale for learning activities. Descriptive and non-parametric statistics were used for the analysis of quantitative data. Students' views on learning activities were generally positive. Moreover, students' preferences for learning activities in relation to their learning styles did not differ significantly.

Key words: mathematics, activity, learning style

GİRİŞ

Etkinlik, öğrenme-öğretme süreçlerinin temel yapı taşları olarak görülebilir. Diğer disiplinlerde ve özellikle matematik eğitiminde etkinliklerle öğrenme-öğretme süreci ve bunun öğrenmeye faydaları üzerinde ortak görüş birliğine ulaşılmıştır. Northcote et al. (2001) etkinlikleri öğrencilerin öğrenmelerini geliştirmede özel olarak tasarlanan görevlerdir diye tanımlamışlardır. Simon et al. (2010) ise etkinliği, öğrencilerin belirli bir matematiksel görevi başarmadaki girişimlerinde amaca yönelik zihinsel ve fiziksel eylem olarak tanımlamaktadırlar. Bunun yanında, Wasserman et al.(2007) etkinlik türlerini sınıflandırırken, yalnız sınıf içinde, yalnız sınıf dışında ve hem sınıf içi hem de sınıf dışında yapılabilen 50'den fazla etkinlik türü (sunum, beyin fırtınası, örnek olay, problem çözme, işbirlikli öğrenme, tartışma, laboratuar, simülasyon, proje, kavram haritası, araştırma, inceleme, rol oynama, panel vb. etkinlikler) olduğunu belirtmişlerdir.

Değişik etkinlikler ve farklı yollarla öğrenme öğrencilere yardımcı olmalıdır (Stylianides & Stylianides, 2008). Öğrencilerin matematik yapma performansını geliştirmek için çok yönlü matematiksel etkinliklerle uğraşabilecekleri ortamlar oluşturulmalıdır (Henningsen & Stein, 1997). Bu tür matematiksel etkinlikler "*matematiğin ne olduğu?*" ve "*matematik yapıyor olmanın neyi gerektirdiği?*" konularında mesajları içermelidir (NCTM, 1991).
Wasserman et al. (2007) çalışmalarında, etkili öğrenme etkinliklerinin özellikleri arasında *"farklı öğrenme stillerinin gereksinimlerini desteklemesine de"* yer vermektedirler. Öğrenenlerin bireysel öğrenme stilleri ile uyum gösteren öğrenme etkinliklerinin öğrenenin başarısını arttırdığı ortaya konmaktadır (Dunn, Beaudry &

Klavas, 1990-91). Fer’e (2003) göre bu durum oldukça mantıklıdır çünkü her birey farklı öğrenme stiline sahiptir ve bazı etkinlikler bazı öğrenenler üstünde olumlu etkiye sahipken, diğerleri üstünde olumsuz etki oluşturabilmektedir.

Öte yandan öğretmenlerin yeterlikleri arasında da “*öğrenenlerin bireysel farklılıklarını göz önüne alma*” istenen yeterliklerden biri olarak görülmektedir ve gittikçe önem kazanmaktadır. Bu yaklaşım ile MEB’in (2008) hazırladığı öğretmenlik mesleği genel yeterlikleri arasında öğrenme etkinliklerine ve bireysel farklılıklara yönelik vurguların olduğu görülmektedir. Matematiği öğrenme-öğretme sürecinde öğrencilerin öğrenme stillerine uygun etkinliklerin geliştirilmesi ve uygulanmasının önemli olduğu ortaya çıkmaktadır. Böyle bir yaklaşım ile farklı öğrenme etkinlik türleri ile matematik öğrenme sürecinin geliştirilmesi kaçınılmazdır. Farklı öğrenme stillerine sahip öğrencilerin etkinlik türlerine yönelik tercihlerinin belirlenmesinin önemli olduğu düşünülmektedir. Bu araştırmanın amacı, lise öğrencilerinin matematik dersinde öğrenme stillerine göre uygulanan etkinlik türlerine yönelik tercihlerini incelemektir.

YÖNTEM

Bu çalışmada fonksiyon ve türev kavramlarının öğrenimi sürecinde, yapılandırmacı öğrenme yaklaşımı kapsamında, McCarthy’nin 8 aşamalı 4MAT sistemi benimsenerek öğrencilerin öğrenme stillerine uygun öğrenme etkinlikleri geliştirilmiş ve uygulanmıştır. Uygulama sonrasında öğrencilerin etkinlik tercihlerine yönelik görüşleri belirlenmiştir. Araştırmanın çalışma grubu, bir devlet lisesindeki 19 öğrenciden oluşmaktadır. Çalışma grubunun 12’si (%63,2) erkek ve 7’si (%36,8) bayan şeklindedir.

4MAT modeli bir öğrenme döngüsü ve dört öğrenme stilini temsil eden 4 çeyrekten oluşmaktadır. Her bir çeyrekte kendi içinde sağ/sol mod tercihleri gözeten 2 aşamayı içermektedir. Çalışmada kullanılmak üzere geliştirilen öğrenme etkinlikleri bu kuramsal ilkelere bağlı kalarak uygulanmıştır. Başka bir deyişle her ana kavram için 1.Tip (hayal gücü yüksek olanlar), 2.Tip (analitik öğrenenler), 3.Tip (sağduyulu öğrenenler) ve 4.Tip (dinamik öğrenenler) öğrenenlere yönelik 8 aşamalı öğrenme döngüsüne uygun etkinlikler geliştirilmiştir. Etkinliklerin oluşturulması aşamasında her stilin ana öğeleri (örneğin 1.Tip öğrenenlerde, kendi yaşamından olay seçimi, ilişkilendirerek düşünme, tartışma açma, zihin haritaları vb.) öne çıkarılmıştır. Fonksiyon ve türev kavramlarının kritik noktaları belirlenmeye çalışılmıştır. Bu adımdan sonra belirlenen kritik noktalar çerçevesinde öğrenilmesi hedeflenen içerik 4MAT sistemindeki aşamalara, aşamaların karakteristik özelliklerine göre dağıtılmaya çalışılmıştır.

Veri Toplama Aracı

Öğrencilerin öğrenme stillerini belirlemek için McCarthy'nin geliştirdiği, Elçi (2008) tarafından Türkçe’ye çevirisi yapılmış ölçekten yararlanılmıştır. Öğrenme stilleri ölçeği iki bölümden oluşmaktadır. A bölümü, her biri 4 seçenekli 15 madde içermektedir. Öğrencilerden her bir maddenin altındaki 4 seçenekten her birini kendilerine en çok uyanı “4” ve en az uyanı “1” ile göstermek üzere sıralamaları istenmektedir. Maddelerin altındaki dört seçeneğin her biri 4 öğrenme stiline karşılık gelmektedir. B bölümü ise her biri iki seçenekli 11 maddeden oluşmaktadır. Öğrencilerden her maddenin altındaki 2 seçenekten kendilerine en uygun olanını işaretlemeleri istenmektedir. Maddenin altındaki iki seçenek “Yaparak” ve “İzleyerek” seçeneklerine karşılık gelmektedir. Öğrenme stilleri ölçeğinin Cronbach Alfa ölçüm güvenirliği katsayıları sırasıyla öğrenme stillerinin her biri için 0.74, 0.71, 0.73, 0.76 olarak hesaplanmıştır.

Öğrenme etkinliklerine yönelik tercihleri belirlemek için Özgen ve Alkan (2011) tarafından geliştirilen ve 21 maddeden oluşan*“öğrenme etkinliklerine yönelik tercih ölçeği”* kullanılmıştır. Ölçekte, bazı öğrenme etkinlik türleri sıralanmaktadır. Öğrencilerden sıralanan etkinlik türlerinden hangilerinin öğrenme süreçlerine katkı sağladığını belirtmeleri istenmiştir. Her bir maddede verilen öğrenme etkinliğinin, öğrenme süreçlerini tam etkilediğine inandıkları için *“Tamamen”*, kısmen etkili olduğuna inandıkları için *“Kısmen”* ve hiç etkili olmadığına inandıkları için *“Hiç”* seçeneklerinden birini işaretlemeleri istenmiştir. Madde içerikleri dikkate alınarak 1.faktöre *“uygulamaya yönelik etkinlikler”*, 2.faktöre *“birlikte çalışmaya yönelik etkinlikler”*, 3.faktöre *“olay ve olguyu tanıma ve planlamaya yönelik etkinlikler”*, 4.faktöre *“yapılan çalışmaların önceki çalışmalarla ilişkilendirmesine yönelik etkinlikler”*, 5.faktöre *“bilgilendirilmeye yönelik etkinlikler”* ve 6.faktöre *“geliştirmeye yönelik etkinlikler”* isimleri verilmiştir. Öğrenme etkinliklerine yönelik tercih ölçeğinin ölçüm güvenirlik katsayısı (Cronbach alfa) 0,82 olarak belirlenmiştir.

Verilerin Analizi

Elde edilen nicel verilerin analizinde betimsel ve parametrik olmayan istatistiksel analizler kullanılmıştır. Öğrenme stilleri ölçeğinin A bölümünde I., II., III. ve IV. Tip öğrenme stillerinin her birine yönelik 15 madde olumsuzdan olumluya “1,2,3 ve 4” olarak kodlanmıştır. Sonuçta her bir stil için alınabilecek en yüksek puan 60 ve en düşük 15 puan belirlenmiştir. Böylelikle bireyin baskın öğrenme stili bulunmaktadır. Araştırmanın kapsamından dolayı B bölümü dikkate alınmamıştır. Öğrencilerin ölçekten aldıkları puanların öğrenme stillerine göre anlamlı farklılık gösterip göstermediğinin belirlenmesinde Kruskal-Wallis testi uygulanmıştır. Öğrenme etkinliklerine yönelik algılara ilişkin aritmetik ortalamaları yorumlarken, 1.00-1.66 arasındaki ortalama değerlerin "*Düşük*", 1.67-2.33 "*Orta*" ve 2.34-3.00 "*Üst*", düzeyde değer taşıdığı varsayılmıştır. Ölçekteki her bir maddeye ve tüm ölçeğe yönelik elde edilen ortalama puanların yüksek oluşu belirtilen öğrenme etkinliğine yönelik etkililik algısının ve o etkinliği tercih etme durumunun yüksek olduğu şeklinde yorumlanmıştır.

BULGULAR

Tablo 1. Öğrenme Stiline Göre Etkinlik Tercihlerine Yönelik Betimsel İstatistiksel Bilgiler

	Etkinlikler	Öğrenme Stili									
		1.Tip (n=2)		2.Tip (n=5)		3. Tip (n=8)		4.Tip (n=4)		Toplam (n=19)	
		$\bar{X}$	SS	$\bar{X}$	SS	$\bar{X}$	SS	$\bar{X}$	SS	$\bar{X}$	SS
1.Faktör	Hedef sınavlar	2,00	1,41	1,80	,44	2,37	,51	2,50	1,00	2,21	,71
	Problem çözerek öğrenme	3,00	,00	2,80	,44	2,87	,35	2,50	1,00	2,78	,53

	Grup tartışması	3,00	,00	2,20	,44	2,50	,53	2,75	,50	2,52	,51
3.Faktör	Sunum	2,50	,70	2,20	,83	2,12	,35	2,50	,57	2,26	,56
	Öğrenci sunumları	2,50	,70	2,40	,54	2,12	,64	1,75	,95	2,15	,68
	Model oluşturma	3,00	,00	2,80	,44	2,75	,46	2,25	,95	2,68	,58
	Projeler	3,00	,00	2,80	,44	2,50	,53	2,25	,95	2,57	,60
4.Faktör	Kütüphane araştırmaları	3,00	,00	2,60	,54	2,50	,53	2,50	,57	2,57	,50
	Bireysel raporlar	2,50	,70	2,60	,54	2,37	,51	2,25	,50	2,42	,50
	Grupla proje raporu	3,00	,00	2,00	,70	2,50	,53	2,75	,50	2,47	,61
5.Faktör	Uzman toplantıları	3,00	,00	2,20	,83	2,37	,51	2,75	,50	2,47	,61
	Geniş seminerler	3,00	,00	2,40	,89	2,25	,70	2,75	,50	2,47	,69
6.Faktör	Benzetimler	3,00	,00	2,40	,54	2,75	,46	2,50	1,00	2,63	,59
	Rol oynama	3,00	,00	2,60	,89	2,37	,51	2,00	,81	2,42	,69

Ölçeğin her bir maddesine ait genel ortalamalara göre öğrenciler *"konu testleri, hedef sınavlar, sunum, öğrenci sunumları"* gibi öğrenme etkinliklerini *"orta"* düzeyde ve geriye kalan öğrenme etkinliklerinin *"üst"* düzeyde etkili bulmaktadırlar. Buna karşılık öğrenme etkinlikleri ortalamaların hiçbiri, *"düşük"* düzeyde kalmamaktadır. En yüksek ortalamayı *"beyin fırtınası"* öğrenme etkinliği alırken en düşük ortalama *"öğrenci sunumları"* öğrenme etkinliği türündedir. Öğrenme etkinliği türlerinin çoğunda, 1.Tip öğrenenlerin ortalamaları en üst düzeydedir. Buna karşılık, *"bireysel raporlar"* öğrenme etkinliği türünde, 2. Tip öğrenenlerin ortalamaları en yüksektir. Öte yandan *"sınıf tartışması"* öğrenme etkinliği türünde 3. Tip öğrenenler en yüksek tercihi kullanmışlardır. *"Hedef sınavlar"* öğrenme etkinliği türünde 4. Tip öğrenenlerin ortalamalarının ve "*konu testleri, beyin fırtınası, grupla problem çözme, sunum"* gibi öğrenme etkinliği türlerinde 1. Tip ve 4. Tip öğrenenlerin ortalamalarının en yüksek olduğu görülmektedir.

Belirtilen öğrenme etkinliklerini, 1. Tip öğrenenlerin en çok ve 2. Tip öğrenenlerin en az etkili bulduğu söylenebilir. Buna ek olarak öğrenme stillerine göre faktörlerden alınan ortalama puanlar, tüm faktörlerde 1.Tip öğrenenlerin en üst düzeyde olduğunu göstermektedir. 1, 2, 4 ve 5. faktörlerde 2. Tip öğrenenlerin ortalama puanları ve 3 ve 6. faktörlerde 4. Tip öğrenenlerin ortalama puanları en düşüktür. 1. Tip ve 4. Tip öğrenenlerin diğer öğrenenlere göre öğrenme etkinliklerini daha etkili buldukları ve tercih ettikleri söylenebilir.

Öğrenciler, öğrenme etkinliklerine yönelik tercih ölçeğinin alt faktörlerinde ve ölçeğin tümünde, öğrenme stillerine göre anlamlı şekilde farklılaşmamaktadırlar. Gruplara ilişkin sıra ortalamalarında farlılıklar olmasına rağmen, bu fark istatistiksel olarak anlamlı değildir. Bu bulgu öğrenme stilinin, öğrencilerin öğrenme etkinliklerine yönelik tercihlerinde benzer etkilere sahip olduğunu gösterir.

Tablo 2. Etkinlik Tercihlerine Yönelik Puanların Öğrenme Stiline Göre Kruskal Wallis Testi Sonuçları

	4. Tip	4	10,50			

TARTIŞMA, SONUÇ VE ÖNERİLER

Etkinliklere yönelik tercih ölçeğindeki öğrenme etkinliği türlerine yönelik görüşlerin genelde olumlu olduğu görülmektedir. Hiçbir etkinlik türüne yönelik ortalama puanların düşük düzeyde olmadığını görmek olumlu bir sonuçtur. Gerçekte öğrenciler, bazı etkinlik türleri dışında kalan, tüm öğrenme etkinliklerini üst düzeyde etkili bulmuşlardır. Ayrıca öğrencilerin "*beyin fırtınası, problem çözerek öğrenme*" gibi etkinliklere üst düzeyde tercih yöneltmeleri düşünce üretmeye yönelmeye başladıklarını gösterir. Öğrenme etkinliği türlerinin birçoğunda 1.Tip öğrenenlerin ortalamalarının en yüksek düzeyde iken 2. Tip öğrenenler birçok öğrenme etkinliği türlerinde en düşük ortalamaya sahiptir. Ölçek maddelerinin ortalama puanlarına göre öğrenciler, öğrenme stillerine göre benzer görüşlerde birleşmektedir. Geliştirilmiş her öğrenme etkinliği için öğrenci tercihleri orta ve üst düzeydedir.

Önceki çalışmalarda, bazı öğrenme etkinliklerinin belirli öğrenme stilindeki öğrencilerce daha uygun bulunduğunu göstermektedir. Başka bir deyişle öğrenciler öğrenmede bu etkinlikleri tercih etmektedirler (Fer, 2003; Svinicki & Dixon, 1987). Bizim çalışma sonuçlarımız da buradakilerle benzerlik göstermektedir. Bazı etkinliklerle ilgili belli bir öğrenme stilindeki öğrenenler bir adım daha önde görülmektedir. Buna rağmen, öğrenme etkinliklerinin tümünde belirli bir öğrenme stiline yönelik kesin sınırları çizilebilen bir eşleştirme ya da sınıflamanın yapılması güçtür. Çünkü bazı etkinlikler (beyin fırtınası, problem çözerek öğrenme gibi), tüm öğrenme stillerindeki öğrencilerce üst düzeyde etkili bulunmuşlardır. Bergsteiner, Avery & Neumann (2010), bu durum ile ilgili olarak Kolb'ün yaşantısal öğrenme modelini, öğrenme etkinlikleri bazında eleştirmektedirler. Bu modeldeki öğrenme stilleri ile öğrenme etkinlikleri arasında uygun farklılaştırma yapmanın başarısız girişim olduğunu belirtmişlerdir. Ayrıca, bazı etkinliklerin birden çok öğrenme stili ile bağlantılı olabileceğini (laboratuar, sunum…) ve bir öğrenme etkinliği birçok öğrenme deneyimi içermesi durumunda belirli bir etkinliği bir öğrenme stili ile eşleştirmenin güç olacağını belirtmişlerdir.

Öğrencilerin öğrenme etkinliklerine yönelik tercih ölçeğinin alt faktörleri ve ölçeğin tümünde, öğrenme stillerine göre anlamlı bir şekilde farklılaşmadığı saptanmıştır. Başka bir deyişle öğrenme stili, öğrencilerin öğrenme etkinliklerine yönelik tercihlerinde benzer etkilere sahiptir. Bu istenen ve arzu edilen olumlu bir sonuçtur. Çünkü bu sonuca göre uygulanan 4MAT sistemi ve ona uygun öğrenme etkinlikleri, öğrencilerin hem kendi öğrenme stillerine uygun öğrenme etkinlikleri hem de diğer stillere uygun etkinliklerde deneyim kazanmasına fırsat sağlanmıştır. Bu nedenle tüm öğrenme stillerindeki öğrenenler, 4MAT sistemine uygun hazırlanan etkinlikler ile öğrenmeyi kolaylaştırma fırsatlarından yararlanmışlardır.

Önceki çalışmalarda, öğrenme stili ve etkinlik tercihleri arasında anlamlı ilişkiler (Fer, 2003; Schaller et al., 2007) ve zayıf ilişkiler (Loo, 2004) ve güçlü olmayan ilişkiler (Sadler-Smith, 1997) olduğunu belirten araştırmalara rastlanmaktadır. Ayrıca Fer (2003) matematik, fizik ve kimya öğretmenliği öğrencilerinin öğrenme stilleri ile kolay öğrendikleri öğrenme etkinlikleri arasında anlamlı bir ilişki olduğunu ve öğrenme stili boyutlarının çoğunda ilk tercih edilen etkinliğin geleneksel bir yöntem olan anlatım, ikincisi beyin fırtınası olduğunu belirtmiştir. Bu sonuçlar bizim bulgularımız ile tam olarak uyuşmamaktadır. Çünkü bizim araştırmamızda öğrenenler beyin fırtınasını üst düzeyde etkili bulurken sunuma dayalı etkinlikleri daha düşük düzeyde etkili bulmuşlardır.

Tüm öğrenme stili modellerinde olduğu gibi McCarthy öğrenme stili modelinde de farklı öğrenme tercihlerinin (somut yaşantı, yansıtıcı gözlem, soyut kavramsallaştırma, aktif yaşantı) olduğu görülmektedir. Bu tercihlerin bileşimi bireyin öğrenme stilini belirtilmektedir. Öğrenme stilindeki bu karmaşık yapının öğrenme etkinliklerine yönelik tercihlere de yansımalarını benimsememiz gerekir. Çünkü öğrenme tercihlerinin ve stillerinin statik ve tek yapılı olduğu görüşü bizim araştırma bulguları ile de uyuşmamaktadır. Doğru olan öğrencilerin çoklu tercihlerle öğrendikleri ilkesini (Karns, 2006) benimsemektir. Ancak öğrenenlerin tercih ettikleri stile uygun öğretim yöntemleri ile daha iyi öğrendikleri bir gerçektir. Tüm öğrenme stillerini kapsayan 4MAT sistemi gibi modellere uygun öğrenme etkinlikleri benimsenmelidir. Bu doğrultuda, Loo (2004), belirli öğrenme stillerine belirli öğrenme yöntemlerini kullanma yerine çok çeşitli öğrenme yöntemleri kullanılması ve öğrencilerin bu yöne çekilmesi gerekir tezini savunmaktadır. Benzer şekilde Wasserman et al. (2007) öğrenme etkinliklerinde, çoklu öğrenme stillerinin tercih edilmesi ve tüm öğrenme stillerini kapsayan öğrenme etkinliklerinden yararlanılması vurgulamaktadır.

Matematik eğitiminde farklı etkinlik türlerinin kullanımı daha çok benimsenmeli ve öğrenciler bu yöne yönlendirilmelidir. Matematik öğretmenleri öğrencilerinin öğrenme stillerine göre farklı etkinlikler ile öğrenme süreçlerini yönlendirebilmelidirler. Öğrenciler böyle bir yaklaşım ile öğrenme açısından birçok olumlu fırsata sahip olabilir ve öğrenmeler kolaylaşabilir.

AN ANALYSİS OF NUMBER SENSE OF THE HİGH-ACHİEVİNG HİGH SCHOOL STUDENTS

Sare ŞENGÜL

Hande GÜLBAĞCI DEDE

Mehmet ÖZCAN

Number sense is described as having a good understanding with the numbers and operations and also using this understandingflexibly and effectively in mathematical situations. Students with good number sense can use numbers and operations flexibly, have mental computation and estimation ability, recognize the relative effect of operation on numbers, develop benchmarks.The earlier studies about number sense show that students have an inclination to use rule based methods and standard written algorithms and generally have low number sense. The aim of this study is to find out the number sense of high school students who are high-achieving.112 students (54 girls, 58 boys) from public science high school in Istanbul participated the study. As an instrument, multiple-choice test including 12 number sense problems is used.Three components of number sense were included in the test. These are; understanding the meaning of the numbers, recognizing relative number size and judging the reasonableness of computational results.Each participant is given the number sense test and asked to explain their solution strategy in written form. In data analysis, the answers of the problems are analyzedin both mathematical correctness and solution strategy (number sense strategy or rule-based strategy).According to the analysis, the success of the students in the number sense test was %87.5 and 66% of the solutionsincluded number sense aspects. The results of this study showed that high-achieving high school students can use number sense strategies efficiently.

Keywords: number sense, number sense strategy, high-achieving

ODAK GRUP GÖRÜŞMESİ İLE KÜTLE VE AĞIRLIK KAVRAMLARININ ÖĞRETİMİ

TEACHING OF MASS AND WEIGHT CONCEPTS THROUGH FOCUS GROUP INTERVIEWS

ÖZET: Bu çalışmanın amacı öğrencilerin "Kütle ve Ağırlık" konusundaki kavram yanılgılarını tespit etmek ve bu kavram yanılgılarını kavram karikatürlerinin kullanıldığı odak grup görüşmesi ile gidermektir. Bu çalışmanın örneklemini ilköğretim düzeyinde beş sekizinci sınıf öğrencisi, üç de yedinci sınıf öğrencisi olmak üzere toplam sekiz öğrenci oluşturmaktadır. Çalışmada öğrencilerin kavram yanılgılarını tespit etmek için açık uçlu ve çoktan seçmeli ön test uygulanmıştır. Ön testten elde edilen veriler ışığında öğrencilerin kavram yanılgılarını içeren kavram karikatürleri hazırlanmıştır. Daha sonra odak grup görüşmesi yoluyla öğrencilerin kavram yanılgıları giderilmeye çalışılmıştır. Bu uygulamaların sonucunda öğrencilerin "Kütle ve Ağırlık" kavramına ilişkin yeni anlayışları oluşturdukları kavram haritası ile değerlendirilmiştir. Araştırma sonuçları göstermiştir ki odak grup görüşmesi ile kavram karikatürlerinin birlikte uygulanması öğrencilerin "Kütle ve Ağırlık" anlayışlarını önemli ölçüde düzeltmiştir.

Anahtar sözcükler: kütle ve ağırlık, kavram karikatürleri, kavram haritası ve odak grup görüşmesi

ABSTRACT: The purpose of this study is to determine students' misconceptions for the concepts of mass and weights and to remedy these misconceptions in a focus group interviews employed concept caricatures. The sample of the study consists of five of eighth grade and three of seventh grade students. As a pre test, a set of open ended questions and multiple choice test was administered to determine students' misconceptions. In light of pre-test results, a set of concept caricatured were prepared comprising students' misconceptions about mass and weight. At the end, it was tried that students' misconceptions would disappear through focus group interviews. After these applications, the students' new understandings were assessed by their concept maps about mass and weight. The results of the study indicated that combining focus group interviews and concept caricatures in teaching pretty much enhanced students' understandings in the concept of mass and weight.

Key words: mass and weight, concept caricatures, concept map, and focus group interviews

FEN VE TEKNOLOJİ ÖĞRETMENLERİN TEKNOLOJİ DOĞASI HAKKINDAKİ DÜŞÜNCELERİ

Yrd. Doç. Dr. Sinan ÇINAR
Recep Tayyip Erdoğan Üniversitesi Eğitim Fakültesi
sinan.cinar@erdogan.edu.tr

Bu çalışmanın amacı fen ve teknoloji öğretmenlerin teknolojinin doğası ve fen ve toplumla olan ilişkisi hakkında görüşlerini ortaya çıkarmaktır. Araştırma var olan durumu betimleme amacı taşıdığından araştırma yöntemi olarak özel durumu çalışması benimsenmiştir. Araştırmanın örneklem grubunu Recep Tayip Erdoğan Üniversitesi Eğitim Fakültesinde öğrenim göre 100 fen ve teknoloji öğretmen adayı oluşturmaktadır. Örnek grubunda veriler anket ve mülakat teknikleri kullanarak toplanmıştır. Anket verileri yüzdelik olarak analiz edilirken ve mülakat verilerinde içerik analiz tekniği kullanılmıştır. Araştırmada kullanılan Teknoloji Doğası Anketi- TDA, View on Science, Technology, Society-VOSTS anketinin adaptasyonundan elde edilmiştir. Anket beş alt kategori içermektedir; 1) teknolojinin tanımı, 2)teknolojinin fen ile olan ilişkisi, 3)toplumun teknoloji üzerine etkisi, 4) teknolojinin toplum üzerine etkisi ve 5)teknolojinin sosyal yapısı şeklindedir. Diğer bir veri toplama aracıda mülakattır; mülakat soruları anket sorularından elde edilen verilerin güvenirliği sağlamak için 5 alt kategoriyi kapsayacak şekilde beş sorudan oluşmaktadır. Çalışmada elde edilen veriler; fen ve teknoloji öğretmen adaylarının teknolojiyi fennin uygulaması olarak tanımlamakta teknoloji ile fennin bir birinin aynı olduğu ve teknolojinin fendeki bilgi yapısı üzerine geliştiğini savunmaktadır. Toplumun teknolojiyi sadece teknolojik çalışmaları maliyet bakımından destekleme boyutunda etkilediği, teknolojinin ise toplumu rahatlık, huzur ve ahlak gibi birçok yönden etkilediğini düşünmektedir. Teknolojik çalışmaların uygulanabirliliği hakkında ise kesinlikle bu duruma bilim adamlarının karar vermesi gerektiğini düşünmektedir. Mülakattan elde edilen verilerde bu durumu desteklemektedir. Yaşamımızın teknolojiye dayalı olduğu bu çağda öğretmen adaylarının özelliklede fen ve teknoloji öğretmen adaylarının teknolojinin yapısı hakkında yeterli bilgiye sahip olmaması oldukça manidardır. Bu bağlamda fen ve teknoloji öğretmen hizmet öncesi ve hizmet–içi eğitim programlarına teknoloji ile ilgili derslerin ve seminerlerin düzenlemesi ve koyulması gerekmektedir.

Anahtar sözcükler: fen ve teknoloji öğretmen adayları, teknolojinin doğası, fen ve teknoloji öğretimi

TURKISH PROSPECTIVE ELEMENTARY SCIENCE TEACHER'S VIEWS ABOUT NATURE OF TECHNOLOGY

Yrd. Doç. Dr. Sinan ÇINAR
Recep Tayyip Erdoğan Üniversitesi Eğitim Fakültesi
sinan.cinar@erdogan.edu.tr

Technology's effects on human life a new research area has occurred and attitudes towards technology have started to develop. It is related with the development in content knowledge to become a knowledge society technological literacy us defined as individual s' understanding, using, directing and evaluating technology. This study explores the Turkish prospective elementary science teachers' views of technological nature. We collected data from 100 prospective elementary science teachers. Data were collected using an adopted "Views on Science – Technology–Society (STS)" instrument. Analysis revealed that Turkish prospective elementary science teachers viewed technology as an application of science, and some viewed science as explanatory and an interpretation of nature. They viewed individual value and confidence more important than technological information and practice in decision making process interested to daily life.

Key words: Prospective Turkish elementary science teachers, nature of technology, science and technology teaching.

BİLGİSAYAR MÜHENDİSLİĞİNE GİRİŞ DERSİNE İLİŞKİN ÖĞRENCİ GÖRÜŞLERİNİN DEĞERLENDİRİLMESİ

Abdullah Erdal TÜMER
Necmettin Erbakan Üniversitesi Mühendislik ve Mimarlık Fakültesi
Bilgisayar Mühendisliği
tumer@konya.edu.tr

ÖZET: Bu araştırmada, Bilgisayar Mühendisliği bölümlerinin temel derslerinden olan Bilgisayar Mühendisliğine Giriş (BMG) dersine ilişkin öğrenci görüşlerinin belirlenmesi ve değerlendirilmesi amaçlanmıştır. Bu amaçla, Necmettin Erbakan Üniversitesi Mimarlık ve Mühendislik Fakültesi Bilgisayar Mühendisliği 1. Sınıf öğrencilerden bu dersi alanların derse ilişkin görüşlerinin belirlenmesi amacıyla nitel bir araştırma yapılmıştır. Bu kapsamda veriler, öğrencilerden açık uçlu sorularla toplanmıştır. Öğrencilerden elde edilen verilerin analizi betimsel analiz yoluyla yapılmıştır. Sonuç olarak, dersten başarılı olan öğrencilerin ilgili dersten genel olarak istifade ettiklerini ve diğer dönemlerde görecekleri derslere bir ışık tuttuğunu belirtmişlerdir. Buna ek olarak, dersten başarılı olan öğrenciler BMG dersinin birçok açıdan yararlar sağladığı konusunda olumlu görüşler bildirmişlerdir. Dersten başarısız olan öğrencilerin ise zaten ileride ayrıntılı bir şekilde görecekleri derslerin önceden kendilerine özet olarak sunulmasının gereksiz olduğunu belirtmişlerdir.

Anahtar sözcükler: bilgisayar mühendisliğine giriş, öğrenci görüşleri,

GİRİŞ

Bilgisayar Mühendisliğine Giriş dersi hemen hemen tüm mühendislik fakülteleri bilgisayar Mühendisliği bölüm öğrencilerine 1. Yarıyıl okutulan zorunlu bir derstir. Bu derste bilgisayar mühendislik programında alınması gereken ana derslere yönelik temel oluşturan ön bilgiler verilir. Bu dersler donanım, işletim sistemi, programlama, veri tabanı, ağ ve iletişim konuları gibi geniş bir yelpaze içerir. Bu dersin temel de iki amacı vardır: (i) öğrencilerin bilgisayar mühendisliği ve akademik temellerini güçlendirmek ve (ii) daha sonraki yıllarda alınacak derslerde başarının kolaylaştırılmasıdır (Hsien-Tsai et al., 2014). Bu amacın gerçekleştirilebilmesi için bu dersi alan öğrencilerin derse ilişkin görüşlerinin bilinmesi birçok açıdan gereklidir. Çünkü her hangi bir derse karşı öğrencilerin görüşleri, tutumları akademik başarılarını büyük ölçüde etkilemektedir (Başer & Geban, 2007; Gagne 1992).

Bilgisayar Mühendisliğine Giriş Dersi

Bilgisayar Mühendisliğine giriş dersinin kavramsal çerçevesinin özü 6 katmandan oluşmaktadır (şekil 1). Bu katmanlar en içte bilgi, donanım, programlama, işletim Sistemi, uygulamalar ve en dışta iletişim katmanı şeklindedir (Dale&Lewis, 2007). Bu katmanlarda bahsedilen konular da aşağıdaki gibidir:

Şekil 1 Bilgisayar Mühendisliğine Giriş Dersi İçerik Katmanları

Bilgi Katmanı	: Sayı sistemleri, dönüşümler, veri formatları ve sayı gösterimleri
Donanım Katmanı	: Mantıksal Kapılar ve devreler, CPU ve Bellek, Giriş/Çıkış elemanları
İşletim Sistemi Katmanı	: İşletim sistemleri, dosya sistemleri

Programlama Katmanı : Problem çözme, Algoritma, düşük ve yüksek seviyeli programlama dilleri, soyut veri tipleri
Uygulama Katmanı : Bilgi sistemleri, Yapay zeka, Simülasyon, Grafikler
İletişim Katmanı : Ağlar ve Web teknolojileri

Bilgisayar mühendisliğine ait yukarıda katman ve içerikleri sunulan bu temel kavramlar, öğrencilerin daha iyi anlayabilmesi için uygulamalı örnekler eşliğinde slayt ve sözlü anlatım şeklinde sunulmuştur. Bu dersin değerlendirmesi ödev (% 10), ara sınav (% 30) ve final (% 60) şeklinde yapılmıştır.
Sadece derse karşı tutumları değil öğretmenlerine yönelik tutumları da önemlidir. Ayrıca öğrencilerin dersi anlama, başarma noktasında gerekli bilgi veya belirli bir görevi gerçekleştirmek için gerekli becerilere sahip olabilirler. Ama kendinden şüphe, motivasyon eksikliği gibi faktörler nedeniyle de başarılı olmayabilirler. Bu ders çok geniş bir içeriğe sahip olduğundan tamamen anlaşılmaması, başarı elde edilememesi gibi ihtimal dahilindede zorluklar vardır (Merrick, 2010; Verginis et al., 2011)..Bu ve benzeri zorlukları aşmak için literatürde çeşitli çalışmalar yapılmıştır (Koile & Singer, 2006; Merrick, 2010; Parhami, 2009; Verginis et al., 2011).

Bilgisayar Mühendisliğine Giriş dersini alan öğrencilerin görüşlerinde farklılıklar olması oldukça doğaldır. Bu farklı görüşlerinbelirlenmesi, dersin öğretilmesi açısından oldukça önemlidir. Sadece dersin öğretilmesi değil dersi alan öğrencinin motivasyonunu, ilgisini ve başarısını da etkileyeceği düşünülmüştür. Bu düşünceler doğrultusunda bu çalışmada bilgisayar mühendisliğinin 1. Yarıyılında okutulan Bilgisayar Mühendisliğine Giriş dersine yönelik öğrencilerin görüşleri alınarak var olan durumu ortaya koymak üzere bir açık uçlu sorular hazırlanmıştır. Açık sorular yardımıyla bu dersi alan öğrencileringörüşleri araştırılmıştır. Ayrıca literatüraraştırmamızdabu derse karşı sınırlı sayıda yabancı çalışmalara rastlanılmıştır. Ancak ülkemizde böyle bir araştırmanın olmadığı tespit edilmiştir. Bu yüzden bu çalışmanın bu derse ait çalışmalara bir başlangıcı olacağı düşünülmektedir.

YÖNTEM

Araştırma Modeli

Bu araştırmada durum çalışması yöntemi kullanılmıştır. Yin'e (1984) göre durum çalışması, araştırılan olguyu kendi yaşam çerçevesi içinde inceleyen, olgu ve içinde bulunduğu ortam arasındaki sınırların kesin hatlarla belirgin olmadığı durumlarda kullanılan bir araştırma yöntemidir. Araştırmada toplanan veriler ise betimsel analiz yöntemi ile yapılmıştır. Bu analizde toplanan verinin orijinal halini mümkün olduğunca değiştirmeden ve gerektiğinde katılımcıların ifadelerinden doğrudan alıntı yapılarak betimsel bir yaklaşımla veriler paylaşılmıştır (Woncott, 1994).

Çalışma Grubu

Necmettin Erbakan Üniversitesi (NEÜ) 2010 yılında Konya'da kurulan üniversitelerden dördüncüsüdür. Mühendislik ve Mimarlık Fakültesi Bilgisayar Mühendisliği Bölümü ilk öğrencilerini 2013-2014 eğitim öğretim yılında almıştır. Bölümün amacı, sürekli iyileştirme ve değerlendirme yoluyla, öğrencilerini yazılım ve donanım alanında seçkin mühendisler olarak yetiştirmektir. Bu çalışma Bilgisayar Mühendisliği birinci sınıfta okuyan, haftalık ders saati 2 olan ve 14 hafta süren zorunlu BMG dersini alan 40 öğrenciden alınan görüşler doğrultusunda yapılmıştır. Ara sınavın % 40 'ı ve final sınavının % 60 alındığında en az ortalaması 60 puan ve üzerinde not alanlar bu dersten başarılı sayılmaktadır. Çalışmaya yaş ortalaması 19,5 olan 24 kız ve 16 erkek öğrenci katılmıştır.

Verilerin Toplanması

Öğrencilerin bilgisayar mühendisliğine giriş dersine ilişkin görüşlerini belirlemek amacıyla tarama modelinde 9 açık uçlu soru hazırlanmıştır. Bu sorular şu şekildedir:

- BMG dersi için seçilen konular hakkında ne düşünüyorsunuz?
- BMG dersi için beklentileriniz karşılandı mı?
- BMG dersinde hangi metotla anlatım size daha faydalı oldu?
- BMG dersine aktif katılabildiniz mi? Bunun size dönüşümü nasıl oldu?
- BMG dersinde en kolay anladığınız ve en zorlandığınız konu hangisi oldu?
- BMG dersinizin gelecekteki kariyerinize etkisini nasıl değerlendiriyorsunuz?
- BMG dersine ne kadar ilgilisiniz?
- BMG dersinin önünüzdeki 4 yıl boyunca alacağınız derslere bir fayda sağlayacağını düşünüyor musunuz? Neden?
- BMG dersinin hocası siz olsaydınız bu dersi nasıl yürütürdünüz (içerik, anlatım metodu, ödev vs.)

Özgüven, 1998 ‘ e göre sorularhazırlandıktan sonra konu uzmanlarının görüşlerine başvurulması ve amaca uygun olup olmadığına ilişkin görüş alınması gerekir. Bu nedenle uzman eleştirileri doğrultusunda sorular yeniden düzenlenmiştir. Daha sonra, dersi alan öğrencilere sorular dağıtılarak görüşlerini yazmaları istenmiştir. Sorulara yazılan görüşlerin değerlendirilme aşamasında ise öğrencilerin bazı ifadelerine yer verilmiştir. Ayrıca veriler tablolaştırılmıştır.

BULGULAR VE YORUM

Araştırmaya katılan öğrencilere tarama modelinde hazırlanan sorular yöneltilmiştir. Elde edilen veriler çeşitli temalar etrafında düzenlenerek betimsel analize tabi tutulmuş ve aşağıdaki tabloda özetlenmiştir.

Aşağıdaki tablo 1 de görüleceği gibi dersten başarılı olan öğrencilerde daha sonraki derslere yönelik bir farkındalık oluştuğu, mesleki alanları ile ilgili geniş ve kapsamlı bilgi sahibi olduklarını belirtmişlerdir. Ayrıca, ders saatinin az olmasına rağmen beklentilerinin karşılandığını ifade etmişlerdir. Dersten başarılı olan öğrenciler, slaytlar eşliğinde anlatımla daha fazla konu işlendiğinden memnun olmakla beraber not alamadıklarını söylemişlerdir. Tahtanın daha etkin kullanılması gerektiğini vurgulamışlardır. Derse aktif katıldıklarını, buna bağlı olarak da sınavda başarılı olduklarını ifade etmişlerdir. Kolay ve zor öğrenilen konularda bir homojenliğin olmadığı tespit edilmiştir. Öğrenciler ilgi alanlarına göre farklı dersleri işaret etmişlerdir.

Tablo 1. Görüşmeden Elde Edilen Bulgular

Temalar	Dersten Başarılı Olan Öğrenciler	Dersten Başarısız Olan Öğrenciler
Seçilen Konular	Bütün dönemler boyunca işlenecek konular hakkında bir farkındalık oluşturdu. Branşımızı daha yakından tanımamızı sağlayan oldukça faydalı konulardı. Branşımla ilgili merak ettiğim konular ve cevap bekleyen soruların artmış olması beni çok mutlu etti. Genel itibariyle iyi seçilmiş ve oldukça faydalandığımız konular vardı. Ama donanım konusuna biraz daha fazla değinilmeliydi.	Daha sonraki yıllarda ayrıntılı bir şekilde göreceğimiz konulardan şimdiden sorumlu tutulmam çok gereksiz. Konular fazlasıyla teorik, ayrıntılı ve ezbere dayalı idi. Dikkat çekici değildi. Kafamızdaki sorulara cevap veremedi. konular.
Beklentiler	Çok verimli geçen ama ders saati az olan, sadece tek dönemlik bir ders olması ve öğrenmemiz gereken konular fazla ayrıntıya girilmemesine rağmen beklentilerim büyük ölçüde karşılandı.	Konular çok soyut ve ezbere dayalı olduğundan genel itibariyle beklentilerimin karşılandığını düşünmüyorum. Bölümümüz için gerekli bir ders olarak görmüyorum.
Beğenilen Anlatım Metodu	Slaytlı anlatım daha çok konu işlememizi sağladı ama not alamadık. Tahtaya yazarak anlattıklarınızdan daha çok yararlandık. Hem not alabildik hem de daha aktif derse katılabildik. Görsel ve uygulamalı anlatılması daha iyi olacağı kanaatindeyim.	Slaytlı anlatım faydalı olmadı ve yetersizdi. Slaytları sizden alacağımız için not almadık ve tabii olarak hep uykumuz geldi. Donanım konusu daha görsel olabilirdi. Örnekler artırılmalıydı. Daha eğlenceli anlatılabilirdi.Tahta daha fazla kullanılması gerekirdi.
Akif Katılım	Derse aktif bir şekilde katıldım. Anlamam daha kolay oldu. Daha önce ne duyduğum ne gördüğüm pek çok konuyu öğrenmiş oldum. Katılamadığım zamanlarda dinlemeye çalıştım. Anlamadığım yerleri hemen sordum. Sınavda da faydasını gördüm.	Aktif katılamadım. Sadece dinledim. Sınavlara çalışmaya hiçbir bir şey bilmeden hazırlanmaya çalıştım. Ama başarılı olamadım.
En kolay Öğrenilen Konu	Boolean Cebri, İşletim Sistemleri, Mantık devreleri,giriş/çıkış sistemleri	Sayı Sistemleri
En Zor Öğrenilen Konu	Kayan noktalı sayılar, Veri Yapıları, Mantık devreleri, Bilgisayar ağları	Boolean Cebri, Bellek Haritaları,
Kariyere etki	Bu dersin meslek hayatımdaki kariyerime bir etkisi olabileceğini düşünmüyorum. Branşımızın kapsadığı konuları ve daha sonraki dönemlerde nelerle karşılaşacağımızı, hangi dersleri işleyeceğimizi öğrenmiş olduk.	Bu dersin kariyerime herhangi bir etkisini olacağını sanmıyorum.
Gelecekteki Derslere Fayda	Mesleğimiz hakkında genel bilgi sahibi olduk. Daha sonraki derslerin bir özeti mahiyetindeydi. Bazı kavramları önceden öğrenmiş olduğumuz için gelecekteki dersleri de faydasını olacaktır.	Bu dersin gelecekteki derslere fazla bir faydası olacağını düşünmüyorum. Çünkü o derslerde bu konular zaten tekrar anlatılacaktır. Sadece bazı şeyleri anımsatabilir.
Öğrenci önerileri	Öncelikle bu dersin 2 dönemde de olması ve ders saatinin artırılması önerirdim. Slaytla beraber önemli noktaları not aldırırdım. Her konu ile ilgili ödevler	Ben bu dersin hocası olsaydım önce bu dersin kaldırılmasını teklif ederdim. Kalkmazsa öğrencileri sınıfta daha aktif hale getirirdim. Onlara da ders

	verirdim. Uygulamalı yapardım. Dersin daha eğlenceli bir hale gelmesi için çaba sarf ederdim.	anlattırırdım. Soru-cevap ve karşılıklı tartışma yaptırırdım. Uygulama ortamı sağlardım.

Her ne kadar gelecek yıllarda alacakları derslere ciddi katkı sağlayacağını düşünseler de ilerideki kariyerlerine bir etkisi olmayacağını söylemişlerdir. Ders saatinin artırılması ve dersin 2 dönemde de okutulması gerektiğini vurgulamışlardır.

Bu dersi alıp ve başarısız olan öğrenciler genellikle dersle ilgili olumsuz görüşlerde bulunmuşlardır. Daha sonraki dönemlerde ayrıntılı işleyecekleri derslerin daha önceden sorumlu tutulmalarının yanlış olduğunu ve dersin kaldırılmasını talep etmişlerdir. Dersin ezbere dayalı olduğu gerekçesi ile aktif katılamadıklarını ve beklentilerinin karşılanmadığını vurgulamışlardır. Dersten başarılı olan öğrencilerle ortak düşünceleri ise (i) kolay ve zor öğrenilen konularda da bir homojenliğin olmadığı ve (ii) dersin kariyerlerine herhangi bir katkısının olmayacağı yönünde olmuştur.

SONUÇ VE ÖNERİLER

Bu çalışmada Necmettin Erbakan Üniversitesi Mühendislik ve Mimarlık Fakültesi Bilgisayar Mühendisliği 1. Sınıf öğrencilerinin Bilgisayar Mühendisliğine Giriş dersine yönelik öğrenci görüşleri dersten başarılı olan ve olmayanlara göre alınmıştır. Öğrencilere yöneltilen sorular uzman görüşü alındıktan sonra son şekli verilmiştir. Elde edilen bulgular dersten başarılı olan öğrencilerin bu dersi gerekli, yeterli, katkı sağlayıcılı, slaytta anlatımın faydalı olduğu ve beklentilerinin karşılandığı yönünde olumlu görüş belirtmişlerdir. Bunun yanında başarılı öğrenciler ders saatinin az olması, sadece bir dönemlik ders olması, tahtanın etkin kullanılmadığı ve kariyerlerine bir etkisi olmayacağı yönünde de olumsuz görüş beyan etmişlerdir. Bu dersten başarısız olan öğrenciler de genellikle bu dersin ezberci ve gereksiz olduğunu, kaldırılması gerektiğini, beklentilerinin karşılanmadığını ve kariyerlerine bir etkisi olmadığını beyan etmişlerdir.

Bir ders ait olumsuz görüşler o derse olan başarıyı da olumsuz etkilemektedir. Bu yüzden öğrencilerin derse karşı olumsuz tutumlarının giderilmesinin yolları aranmalıdır. Derse sorumlularının slaytla beraber tahtayı da daha etkin kullanmaları gerekmektedir. Ayrıca ders saatinin en az 3 saat olarak belirlenmesi, derse aktif katılımın artması için ders öncesi hazırlık sorularının ders sonrası pekiştirici ödevlerin verilmesinin uygun olacağı düşünülmektedir.

ÖĞRETMENLİK UYGULAMASINDA GÖREV ALAN UYGULAMA ÖĞRETMENLERİNİN FEN VE TEKNOLOJİ ÖĞRETMEN ADAYLARININ YAPISALCI ÖĞRENME KURAMINA KARŞI TUTUMLARI ÜZERİNE ETKİSİ

Yrd. Doç. Dr. Sinan ÇINAR
Recep Tayyip Erdoğan Üniversitesi Eğitim Fakültesi
sinan.cinar@erdogan.edu.tr

Bu çalışmanın amacı ilköğretim fen ve teknoloji öğretmen adaylarının yapısalcı öğrenme kuramına karşı tutum geliştirmelerinde uygulama öğretmenlerinin etkisi olup olmadığını tespit etmektir. Araştırma yöntemi olarak betimsel araştırma yöntemlerinden biri olan özel durum araştırma yöntemi kullanılmıştır. Çalışma 20011–20013 yılları arasında RTE Üniversitesi Eğitim Fakültesi ile Rize Milli Eğitim Müdürlüğüne bağlı ilköğretim okulları işbirliğinde yürütülen öğretmenlik uygulaması dersini kapsamaktadır. Çalışmada veri toplama aracı olarak mülakat ve doküman analizi tekniği kullanılmıştır. İki eğitim öğretim yılında fen ve teknoloji öğretmenliği bölümünden öğrenim gören adaylardan rastgele seçilen 40 öğretmen adayı ile mülakat yapılmıştır. Ayrıca bu yıllar arasında ilköğretim fen ve teknoloji öğretmen adaylarının staj dosyaları incelenmiştir. Öğretmen adaylarının staj dosyalarında uygulama öğretmenleri hakkındaki düşüncelerinin yer aldığı en az iki sayfalık doküman bulunmaktadır; öğretmen adaylarının öğretmenlik uygulaması staj dosyalarında rastgele 40 dosya seçilerek toplam 80 dosya ve yaklaşık olarak 200 doküman analiz edilmiştir. Elde edilen verilerden; fen ve teknoloji öğretmen adaylarının büyük çoğunluğunun (% 70) yapısalcılığa karşı olumsuz tutuma sahip oldukları, geri kalanların %25'inin olumlu tutuma sahipken %5'inin hem olumlu tutum hem de olumsuz tutum taşıdıkları tespit edilmiştir. Bu tutumun sergilemesinde uygulama öğretmenlerinin sınıflarda yapısalcılığı uygulamaz olduğu, kaynak gerektirdiği, sınıfların kalabalık olduğu, fakülte ve okulun farklı iki öğretim ortamı olduğu, önemli olan öğrenci başarısı gibi düşüncelerinin etkili olduğu tespit edilmiştir. Sonuç olarak öğretmenlik uygulama dersleri tekrar yeniden yapılanmalı ve özellikle uygulama öğretmenleri 2 saatlik seminerle değil uzun bir hizmet-içi eğitim sonucunda bu kapsama dahil edilerek adaylar için verimli bir uygulama haline getirilebilinir.

Anahtar sözcükler: fakülte-okul işbirliği, yapısalcı öğrenme kuramı, öğretmen adayları

PRACTICE TEACHERS EFFECT ON ATTITUDE OF PROSPECTIVE ELEMANTARY SCIENCE AND TECHONOLOGY TEACHERS DEVELOPING ABOUT CONSTRUCTIVE LEARNING APPROACH

Yrd. Doç. Dr. Sinan ÇINAR
Recep Tayyip Erdoğan Üniversitesi Eğitim Fakültesi
sinan.cinar@erdogan.edu.tr

Aim of this is to determine whether practiceteachers effect on prospective elementary science and technology teachers attitude which development about constructivist learning approach. Subjects for this study were randomly selected 40 prospective primary school science and technology teachers learning in Recep Tayyip University Primary Science and Technology Teachers Department in 20011-2013 academic year. A document analysis method was used to gather data Findings indicated that much of prospective teachers (%70) have negative attitude on constructivist education and rest of their has negative attitude. Practiceteachers possess important effective prospective teachers displaying negative attitude about constructivist approach.

Key Words: Teaching Practice lesson, Constructivist Learning Approach, Prospective Teachers.

Some Results on Cyclic Codes Over $F_2+uF_2+vF_2+uvF_2$

Evren Salkım

Department of Mathematics, Sakarya University, TR54187 Sakarya, Turkey

evren.salkim@ogr.sakarya.edu.tr

ABSTRACT: In this paper,we investigate the structure and properties of cyclic codes over the ring $F_2+uF_2+vF_2+uvF_2$ where $u^2=u, v^2=v$ and $uv=vu$. We first study the relationship between cyclic codes over $F_2+uF_2+vF_2+uvF_2$ and binary cyclic codes. We prove that cyclic codes over the ring are principally generated, and give the generator polynomial of cyclic codes over this ring.

Keywords:Cyclic code, gray map, generator matrix, finite rings.

I. INTRODUCTION

Codes over finite rings have been studied in the early 1970's [4]. Cyclic codes are important class of codes from both a theoretical and practical viewpoint. Traditionally, cyclic codes had been studied over finite fields. However, it was discovered that some good nonlinear codes over Z_2 can be viewed as binary images under a Gray map of linear cyclic codes over Z_4 and this had motivated the study of cyclic codes over finite rings in [10]. Linear codes,cyclic codes and cyclic self-dual codes over $F_2+uF_2+vF_2+uvF_2$ $u^2=v^2=0$ and $uv=vu$ were studied in [6-7-8]. In [13], they described the structure of cyclic codes and cyclic self dual codes over F_2+vF_2 where $v^2=v$. The relation between cyclic codes over F_2+vF_2 and binary cyclic codes was studied. They proved that every cyclic code over F_2+vF_2 was principally generated and obtained the generator polynomial of cyclic codes over the ring. Not much work has been done on the structure of cyclic codes over $F_2+uF_2+vF_2+uvF_2$. In this correspondence, we investigate the structure of cyclic codes over the ring $F_2+uF_2+vF_2+uvF_2$ where $u^2=u, v^2=v$ and $uv=vu$. We prove that cyclic codes over the ring are principally generated, and give the generator polynomial of cyclic codes over this ring.

In Section II, we recall some backgrounds and notations about this ring. We discuss the generator matrices and their Gray images of linear codes over $F_2+uF_2+vF_2+uvF_2$ in Section III. Section IV describes the structure of cyclic codes and cyclic self-dual codes over $F_2+uF_2+vF_2+uvF_2$, and the relationship between cyclic codes over $F_2+uF_2+vF_2+uvF_2$ and binary cyclic codes is studied.For the rest of this work, R_2 denote $F_2+uF_2+vF_2+uvF_2$ and R_1 denote the ring F_2+vF_2.

II. PRELIMINARIES

Let R_2 be the commutative ring $F_2+uF_2+vF_2+uvF_2$ where $u^2=u, v^2=v$ and $uv=vu$. Unlike other rings of order 16 , every element in this ring is idempotent. It is easy to verify that R_2 is a semi-lokal ring with four minimal ideal given by $I_1=\langle uv\rangle, I_2=\langle v+uv\rangle, I_3=\langle u+uv\rangle, I_4=\langle 1+u+v+uv\rangle$. Any element of R_2 can be expressed as $c'=a+ub+vc+uvd$,where $a,b,c,d\in F_2$. We take R_2 to be a natural extension of the ring R_1. Recall that the elements of R_1 are 0,1,v,1+v which have Lee weights 0,2,1,1 respectively. Gray map from R_1 to F_2^2 is given by $\phi(c')=(a,a+b)$, thus ϕ is a bijection in[13]. This lead to Gray map from R_2 to F_2^4 is given by $\phi(c')=(a,a+b,a+c,a+b+c+d)$. The Lee weight ϕ is a distance preserving isometry from (R_2^n, d_L) to (F_2^{4n}, d_H), where d_L and d_H denote the Lee and Hamming distance in R_2^n and F_2^{4n} respectively. This means if C is a linear code over R_2 with parameters $(n,2^k,d)$, then $\phi(C)$ is a binary linear code of parameters $[4n,k,d]$.Let $x=(x_1,x_2,...,x_n)$ and $y=(y_1,y_2,...,y_n)$ be two elements of R_2^n , the Euclidean iner product of x and y in R_2^n is defined by $x.y=x_1y_1+x_2y_2+...+x_ny_n$ The dual code of C is defined as $C^\perp=\{x\in R_2^n, x.y=0, \forall y\in C\}$. A code C is self-orthogonal if $C\subseteq C^\perp$ and self-dual if $C = C^{\perp}$ .For any [n, k] code, the generator matrix of C is a $k \times n$ matrix G whose rows generate C and the parity check matrix of C is an $(n-k)\times n$ matrix C whose rows generate $C^{\perp}$.Two codes are equivalent if one can be obtained from the other by permuting the coordinates. A cyclic code C of length n over R_2 is a linear code with property that if $c=(c_0,c_1,...,c_{n-1})\in C$ then $\sigma(c)=(c_{n-1},c_0,...,c_{n-2})\in C$.

III. LINEAR CODES OVER $F_2+uF_2+vF_2+uvF_2$

If A,B,C and D are codes, we donete that $A\otimes B\otimes C\otimes D=\{(a,b,c,d), a\in A, b\in B, c\in C, d\in D\}$ and $A\oplus B\oplus C\oplus D=\{a+b+c+d, a\in A, b\in B, c\in C, d\in D\}$ .Let C be a linear code of length n over R_2 .Define $C_1=\{a\in F_2^n | a+ub+vc+uvd\in C,$ for some $b,c,d\in F_2^n\}$

$C_2=\{a+b\in F_2^n | a+ub+vc+uvd\in C,$ for some $c,d\in F_2^n$ }.

$C_3=\{a+c\in F_2^n | a+ub+vc+uvd\in C,$ for some $b,d\in F_2^n$ }

$C_4=\{a+b+c+d\in F_2^n | a+ub+vc+uvd\in C\}$

Obviously, C_1,C_2,C_3,C_4 are binary linear codes. We have the following:

Theorem3.1: Let C be a linear code of length n over R_2. Then $\phi(C)=C_1\otimes C_2\otimes C_3\otimes C_4$, and $|C|=|C_1|.|C_2|.|C_3|.|C_4|$.

Proof:For any $(a_1,a_2,...,a_n,b_1,b_2,...,b_n,c_1,c_2,...,c_n,d_1,d_2,...,d_n)\in\phi(C)$, Let $q_i=a_i+u(a_i+b_i)+v(a_i+c_i)+uv(a_i+b_i+c_i+d_i)$, $i=1,2,...,n$. Since is a bijection, $q=(q_1,q_2,...,q_n)\in C$. By the definitions of C_1,C_2,C_3 and C_4, we obtain that any $(a_1,a_2,...,a_n)\in C_1$, $(b_1,b_2,...,b_n)\in C_2$, $(c_1,c_2,...,c_n)\in C_3$, $(d_1,d_2,...,d_n)\in C_4$, therefore, $(a_1,a_2,...,a_n,b_1,b_2,...,b_n,c_1,c_2,...,c_n,d_1,d_2,...,d_n)\in C_1\otimes C_2\otimes C_3\otimes C_4$. This implies that $\phi(C)\subseteq C_1\otimes C_2\otimes C_3\otimes C_4$. On the other hand, for any $(a_1,a_2,...,a_n,b_1,b_2,...,b_n,c_1,c_2,...,c_n,d_1,d_2,...,d_n)\in C_1\otimes C_2\otimes C_3\otimes C_4$, where $(a_1,a_2,...,a_n)\in C_1,(b_1,b_2,...,b_n)\in C_2,(c_1,c_2,...,c_n)\in C_3,(d_1,d_2,...,d_n)\in C_4$, there are $x=(x_1,x_2,...,x_n), y=(y_1,y_2,...,y_n), z=(z_1,z_2,...,z_n), w=(w_1,w_2,...,w_n)\in C$, such that $x_i=a_i+uvm_i, y_i=b_i+(v+uv)n_i, z_i=c_i+(u+uv)k_i, w_i=d_i+(1+u+v+uv)l_i$, where

$m_i,n_i,k_i,l_i\in F_2$ and $1\le i\le n$ .Since C is linear, we have, $q=(1+u+v+uv)x+(u+uv)y+(v+uv)z+(uv)w=a+u(a+b)+v(a+c)+uv(a+b+c+d)\in C$ which gives $C_1\otimes C_2\otimes C_3\otimes C_4\subseteq\phi(C)$. Therefore $\phi(C)=C_1\otimes C_2\otimes C_3\otimes C_4$. The second result is easy to verify.

Corollary 3.2:If G_1,G_2,G_3 and G_4 are the generator matrices of binary linear codes C_1,C_2,C_3,C_4 , respectively then the generator matrix C is

$$\begin{pmatrix} (1+u+v+uv)G_1 \\ (u+uv)G_2 \\ (v+uv)G_3 \\ (uv)G_4 \end{pmatrix}$$

Moreover,if $G_1=G_2=G_3=G_4$ then $G=G_1$.

Corollary 3.3:If $\phi(C)=C_1\otimes C_2\otimes C_3\otimes C_4$ then C can be uniquely expressed as

C=$(1+u+v+uv)C_1\oplus(u+uv)C_2\oplus(v+uv)C_3\oplus(uv)C_4$

Proposition 3.4:Let d_H and d_L denote the minimum Hamming and Lee weights of a linear code over R_2, respectively. Then

$d_H=d_L$=min $\{d(C_1),d(C_2),d(C_3),d(C_4)\}$, where $d(C_i)$ denotes the minimum weight of a binary code C_i.

Proof:Because ϕ is an weight-preserving map, then, $d_L(C)=d_H(\phi(\mathrm{C}))=d_H(C_1\otimes C_2\otimes C_3\otimes C_4)$, and $d_H=d_L$ is obvious.

With the similar proof of Proposition 1.1 in [14],we have the following:A nonzero linear code C over R_2 has a generator matrix which after a suitable permutation of the coordinates can be written in the form

$$G=\begin{pmatrix} I_{k_1} & A_1 & A_2 & A_3 & A_4 & B_1+uB_2+vB_3+uvB_4 \\ 0 & (uv)I_{k_2} & 0 & 0 & 0 & (uv)C_1 \\ 0 & 0 & (v+uv)I_{k_3} & 0 & 0 & (v+uv)D_1 \\ 0 & 0 & 0 & (u+uv)I_{k_4} & 0 & (u+uv)E_1 \\ 0 & 0 & 0 & 0 & (1+u+v+uv)I_{k_5} & (1+u+v+uv)F_1 \end{pmatrix}$$

where I_{k_l} is a $k_i x k_i$ identity matrix, $A_1,A_2,A_3,A_4,B_1,B_2,B_3,B_4,C_1,D_1,E_1,F_1$ are matrices over F_2.

$|C|$=$16^{k_1}2^{k_2}2^{k_3}2^{k_4}2^{k_5}$ .Hence,the generator matrix of $\phi(C)=C_1\otimes C_2\otimes C_3\otimes C_4$ is

$$\begin{pmatrix} G_1 & 0 & 0 & 0 \\ 0 & G_2 & 0 & 0 \\ 0 & 0 & G_3 & 0 \\ 0 & 0 & 0 & G_4 \end{pmatrix}$$

where

$$G_1=\begin{pmatrix} I_{k_1} & A_1 & A_2 & A_3 & A_4 & B_1 \\ 0 & 0 & 0 & 0 & I_{k_5} & F_1 \end{pmatrix}$$

$$G_2=\begin{pmatrix} I_{k_1} & A_1 & A_2 & A_3 & A_4 & B_1+B_2 \\ 0 & 0 & 0 & I_{k_4} & 0 & E_1 \end{pmatrix}$$

$$G_3=\begin{pmatrix} I_{k_1} & A_1 & A_2 & A_3 & A_4 & B_1+B_3 \\ 0 & 0 & I_{k_3} & 0 & 0 & D_1 \end{pmatrix}$$

$$G_4=\begin{pmatrix} I_{k_1} & A_1 & A_2 & A_3 & A_4 & B_1+B_2+B_3+B_4 \\ 0 & I_{k_2} & 0 & 0 & 0 & C_1 \end{pmatrix}$$

are the generator matrices of binary linear codes C_1,C_2,C_3,C_4 ,respectively. Moreover

$|C_1|$=$2^{k_1}2^{k_5}$,$|C_2|$=$2^{k_1}2^{k_4}$,$|C_3|$=$2^{k_1}2^{k_3}$ and $|C_4|$=$2^{k_1}2^{k_2}$.

Lemma 3.5:Let $C^{\perp}$ be the dual code of C .Then $\phi(C^{\perp})=\phi(C)^{\perp}$. Moreover, if C is a self-dual code, so is $\phi(C)$.

Theorem 3.6:Let C be a linear code of length n over R_2 and $\phi(C)=C_1\otimes C_2\otimes C_3\otimes C_4$, so that

$C=(1+u+v+uv)C_1\oplus(u+uv)C_2\oplus(v+uv)C_3\oplus(uv)C_4$ .Then, $\phi(C^{\perp})=C_1^{\perp}\otimes C_2^{\perp}\otimes C_3^{\perp}\otimes C_4^{\perp}$
Moreover, we have $C^{\perp}=(1+u+v+uv)C_1^{\perp}\oplus(u+uv)C_2^{\perp}\oplus(v+uv)C_3^{\perp}\oplus(uv)C_4^{\perp}$.

Proof:By Lemma 3.5, $\phi(C^{\perp})=(C_1\otimes C_2\otimes C_3\otimes C_4)^{\perp}$. Hence, we

only need to prove that $C_1^{\perp}\otimes C_2^{\perp}\otimes C_3^{\perp}\otimes C_4^{\perp}=(C_1\otimes C_2\otimes C_3\otimes C_4)^{\perp}$. Obviously, $C_1^{\perp}\otimes C_2^{\perp}\otimes C_3^{\perp}\otimes C_4^{\perp}\subseteq(C_1\otimes C_2\otimes C_3\otimes C_4)^{\perp}$. On the other hand, suppose that C_1,C_2,C_3,C_4 are $[n,k_1],[n,k_2],[n,k_3],[n,k_4]$ binary linear codes, respectively, then $C_1^{\perp},C_2^{\perp},C_3^{\perp},C_4^{\perp},C_1\otimes C_2\otimes C_3\otimes C_4$ are $[n,n-k_1],[n,n-k_2],[n,n-k_3],[n,n-k_4],[4n,k_1+k_2+k_3+k_4]$ binary linear codes,respectively, thus, $C_1^{\perp}\otimes C_2^{\perp}\otimes C_3^{\perp}\otimes C_4^{\perp}=|C_1^{\perp}\otimes|C_2^{\perp}\otimes|C_3^{\perp}\otimes|C_4^{\perp}=|(C_1\otimes C_2\otimes C_3\otimes C_4)^{\perp}|=2^{4n-k_1-k_2-k_3-k_4}$ Hence, $C_1^{\perp}\otimes C_2^{\perp}\otimes C_3^{\perp}\otimes C_4^{\perp}=(C_1\otimes C_2\otimes C_3\otimes C_4)^{\perp}$ .In light of Corollary 3.3, we obtain the last statement

IV. CYCLIC CODES OVER $F_2+uF_2+vF_2+uvF_2$

Theorem 4.1:If $C=(1+u+v+uv)C_1\oplus(u+uv)C_2\oplus(v+uv)C_3\oplus(uv)C_4$ is a linear code over R_2 ,

then C is a cyclic code over R_2 if and only if C_1,C_2,C_3,C_4 are binary cyclic codes.

Proof:For any $q=(q_1,q_2,...,q_n)\in C$, where $q_i=a_i+ub_i+vc_i+uvd_i, i=1,2,...,n$, let $(a_1,a_2,...,a_n),(b_1,b_2,...,b_n),(c_1,c_2,...,c_n),(d_1,d_2,...,d_n)$, then

$a\in C_1, a+b\in C_2, a+c\in C_3, a+b+c+d\in C_4$. If C_1,C_2,C_3,C_4 are binary cyclic codes, then $\sigma(a)\in C_1,\sigma(a+b)\in C_2,\sigma(a+c)\in C_3,\sigma(a+b+c+d)\in C_4$. Hence
$\sigma(q)=(1+u+v+uv)\sigma(a)+(u+uv)\sigma(a+b)+(v+uv)\sigma(a+c)+(uv)\sigma(a+b+c+d)\in C$

, which means that C is a cyclic code over R_2 .On the other hand, for any
$a=(a_1,a_2,...,a_n)\in C_1, b=(b_1,b_2,...,b_n)\in C_2, c=(c_1,c_2,...,c_n)\in C_3, d=(d_1,d_2,...,d_n)\in C_4$

, let $q_i=a_i+u(a_i+b_i)+v(a_i+c_i)+uv(a_i+b_i+c_i+d_i)$,then $q=(q_1,q_2,...,q_n)\in C$ .If C is a cyclic code over R_2 , we have $\sigma(q)\in C$. It follows that $\phi(\sigma(q))=(\sigma(a),\sigma(b),\sigma(c),\sigma(d))\in C_1\otimes C_2\otimes C_3\otimes C_4$, thus $\sigma(a)\in C_1,\sigma(b)\in C_2,\sigma(c)\in C_3$, and $\sigma(d)\in C_4$. Therefore, C_1,C_2,C_3,C_4 are binary cyclic codes

Corollary 4.2:If C is a cyclic code over R_2 , then the dual code $C^{\perp}$ of C is also cyclic.

Corollary 4.3: C is a cyclic self-dual code over R_2 if and only if C_1,C_2,C_3,C_4 are binary cyclic self-dual codes.

Theorem 4.4:If $C=(1+u+v+uv)C_1\oplus(u+uv)C_2\oplus(v+uv)C_3\oplus(uv)C_4$ is a cyclic code of length n over R_2 ,then C=$\langle(1+u+v+uv)g_1 \oplus(u+uv)g_2 \oplus(v+uv)g_3 \oplus(uv)g_4\rangle$ and $|C|$=$2^{\text{4n-deg}(g_1(\text{x}))\text{-deg}(g_2(\text{x}))\text{-deg}(g_3(\text{x}))\text{-deg}(g_4(\text{x}))}$,where $g_1(x),g_2(x),g_3(x),g_4(x)$ are the generator polynomials of C_1,C_2,C_3,C_4 , respectively.

Proof:In light of $C_1=\langle g_1(x)\rangle, C_2=\langle g_2(x)\rangle, C_3=\langle g_3(x)\rangle, C_4=\langle g_4(x)\rangle$ and C=$(1+u+v+uv)C_1 \oplus(u+uv)C_2 \oplus(v+uv)C_3 \oplus(uv)C_4$, it follows that

$C=\{q(x)=(1+u+v+uv)g_1(x)r_1(x)+(u+uv)g_2(x)r_2(x)+(v+uv)g_3(x)r_3(x)+(uv)g_4(x)r_4(x)|r_1(x),r_2(x),r_3(x),r_4(x)\in F_2[x]\}$

, so $C\subseteq\langle(1+u+v+uv)g_1(x),(u+uv)g_2(x),(v+uv)g_3(x),(uv)g_4(x)\rangle\subseteq R_2[x]/\text{x}^{\text{n}}-1$. For any $(1+u+v+uv)g_1(x)k_1(x)+(u+uv)g_2(x)k_2(x)+(v+uv)g_3(x)k_3(x)+(uv)g_4(x)k_4(x)\in \langle(1+u+v+uv)g_1(x),(u+uv)g_2(x),(v+uv)g_3(x),(uv)g_4(x)\rangle$, where $k_1(x),k_2(x),k_3(x),k_4(x)\in R_2[x]/\text{x}^{\text{n}}-1$, there exist $r_1(x),r_2(x),r_3(x),r_4(x)\in F_2[x]$ such that,

$$(1+u+v+uv)k_1(x)=(1+u+v+uv)r_1(x),(u+uv)k_2(x)=(u+uv)r_2(x),(v+uv)k_3(x)=(v+uv)r_3(x),(uv)k_4(x)=(uv)r_4(x)$$

so we have $\langle(1+u+v+uv)g_1(x),(u+uv)g_2(x),(v+uv)g_3(x),(uv)g_4(x)\rangle\subseteq C$. This gives $C=\langle(1+u+v+uv)g_1(x),(u+uv)g_2(x),(v+uv)g_3(x),(uv)g_4(x)\rangle$. Since C= $|C_1|.|C_2|.|C_3|.|C_4|$,we have $|C|$=$2^{\text{4n-deg}(g_1(\text{x}))\text{-deg}(g_2(\text{x}))\text{-deg}(g_3(\text{x}))\text{-deg}(g_4(\text{x}))}$.

Theorem 4.5:For any cyclic code C of length n over R_2, there is a unique polynomial $g(x)$ such that $C=\langle g(x)\rangle$,and $g(x)|\text{x}^{\text{n}}-1$,where $g(x)=(1+u+v+uv)g_1+(u+uv)g_2+(v+uv)g_3+(uv)g_4$ Moreover, If $g_1(x)=g_2(x)=g_3(x)=g_4(x)$ then $g(x)=g_1(x)$.

Proof:By Theorem 4.4, we may assume that $C=\langle(1+u+v+uv)g_1(x),(u+uv)g_2(x),(v+uv)g_3(x),(uv)g_4(x)\rangle$. Let $g(x)=(1+u+v+uv)g_1(x)+(u+uv)g_2(x)+(v+uv)g_3(x)+(uv)g_4(x)$, where $g_1(x),g_2(x),g_3(x),g_4(x)$ are generator polynomials of C_1,C_2,C_3,C_4 , respectively.

Clearly, $\langle g(x)\rangle\subseteq C$ .On the other hand, $(1+u+v+uv)g_1(x)=(1+u+v+uv)g(x),(u+uv)g_2(x)=(u+uv)g(x),(v+uv)g_3(x)=(v+uv)g(x)$ and $(uv)g_4(x)=(uv)g(x)$. This gives $C\subseteq\langle g(x)\rangle$, hence $C=\langle g(x)\rangle$. Since $g_1(x)|\text{x}^{\text{n}}-1, g_2(x)|\text{x}^{\text{n}}-1, g_3(x)|\text{x}^{\text{n}}-1$ and $g_4(x)|\text{x}^{\text{n}}-1$, there exist $r_1(x),r_2(x),r_3(x),r_4(x)\in R_2[x]/\text{x}^{\text{n}}-1$ such that $\text{x}^{\text{n}}-1=g_1(x)r_1(x)=g_2(x)r_2(x)=g_3(x)r_3(x)=g_4(x)r_4(x)$, it follows that $\text{x}^{\text{n}}-1=g(x)[(1+u+v+uv)r_1(x)+(u+uv)r_2(x)+(v+uv)r_3(x)+(uv)r_4(x)]$, hence $g(x)|\text{x}^{\text{n}}-1$.

Corollary 4.6: Every ideal of $R_2[x]/\text{x}^{\text{n}}-1$ is principal.

The next lemma 1 from [11] describes a necessary and sufficient condition for self-orthogonality of cyclic codes.

Lemma 4.7:A binary lınear cyclıc code C wıth generator polinomial g(x) contains ıts dual code iff

$$\text{x}^{\text{n}}-1\equiv 0 \bmod (g(x)g^*(x))$$

Where $g^*(x)=x^{n-k}g(1/x)$ ie. $g^*(x)$ is the reciprocal polynomıal of $g(x)$.

Now, we give a sufficient and necessary condition for cyclic code over R_2 that contains its dual.

Theorem 4.8: Suppose $C=\langle g(x)\rangle$ is a cyclic code of arbitrary length n over R_2, where

$g(x)=(1+u+v+uv)g_1+(u+uv)g_2+(v+uv)g_3+(uv)g_4$ .Then $C^{\perp}\subseteq C$ if and only if

$\mathrm{x}^{\mathrm{n}}-1\equiv 0 \bmod(g_1(x)g_1^*(x))$, $\mathrm{x}^{\mathrm{n}}-1\equiv 0 \bmod(g_2(x)g_2^*(x))$

$\mathrm{x}^{\mathrm{n}}-1\equiv 0 \bmod(g_3(x)g_3^*(x))$, $\mathrm{x}^{\mathrm{n}}-1\equiv 0 \bmod(g_4(x)g_4^*(x))$

Proof: Let $C=\langle g(x)\rangle=(1+u+v+uv)C_1\oplus(u+uv)C_2\oplus(v+uv)C_3\oplus(uv)C_4$ be a cyclic code of length n over R_2, then $C=\langle(1+u+v+uv)g_1(x),(u+uv)g_2(x),(v+uv)g_3(x),(uv)g_4(x)\rangle$, $C_1=\langle g_1(x)\rangle, C_2=\langle g_2(x)\rangle, C_3=\langle g_3(x)\rangle$ and $C_4=\langle g_4(x)\rangle$.İf

$\mathrm{x}^{\mathrm{n}}-1\equiv 0 \bmod(g_1(x)g_1^*(x)),\mathrm{x}^{\mathrm{n}}-1\equiv 0 \bmod(g_2(x)g_2^*(x))$

$\mathrm{x}^{\mathrm{n}}-1\equiv 0 \bmod(g_3(x)g_3^*(x)),\mathrm{x}^{\mathrm{n}}-1\equiv 0 \bmod(g_4(x)g_4^*(x))$

Then $C_1^{\perp}\subseteq C_1, C_2^{\perp}\subseteq C_2, C_3^{\perp}\subseteq C_3, C_4^{\perp}\subseteq C_4$.

Hence

$\langle(1+u+v+uv)h^*_1(x),(u+uv)h^*_2(x),(v+uv)h^*_3(x),(uv)h^*_4(x)\rangle\subseteq\langle(1+u+v+uv)g_1(x),(u+uv)g_2(x),(v+uv)g_3(x),(uv)g_4(x)\rangle$

Thus, $\mathrm{C}^{\perp}\subseteq C$.

Conversely,if $\mathrm{C}^{\perp}\subseteq C$, then,

$(1+u+v+uv)C_1^{\perp}\oplus(u+uv)C_2^{\perp}\oplus(v+uv)C_3^{\perp}\oplus(uv)C_4^{\perp}\subseteq(1+u+v+uv)C_1\oplus(u+uv)C_2\oplus(v+uv)C_3\oplus(uv)C_4$

Thus, $C_1^{\perp}\subseteq C_1, C_2^{\perp}\subseteq C_2, C_3^{\perp}\subseteq C_3, C_4^{\perp}\subseteq C_4$. Therefore,

$\mathrm{x}^{\mathrm{n}}-1\equiv 0 \bmod(g_1(x)g_1^*(x)),\mathrm{x}^{\mathrm{n}}-1\equiv 0 \bmod(g_2(x)g_2^*(x))$

$\mathrm{x}^{\mathrm{n}}-1\equiv 0 \bmod(g_3(x)g_3^*(x)),\mathrm{x}^{\mathrm{n}}-1\equiv 0 \bmod(g_4(x)g_4^*(x))$

This completes the proof.

Corollary 4.9:Suppose $\mathrm{C}=(1+u+v+uv)C_1\oplus(u+uv)C_2\oplus(v+uv)C_3\oplus(uv)C_4$ is a cyclic code of arbitrary length n over R_2 .Then $C^{\perp}\subseteq C$ if and only if $C_1^{\perp}\subseteq C_1$, $C_2^{\perp}\subseteq C_2$, $C_3^{\perp}\subseteq C_3$, $C_4^{\perp}\subseteq C_4$.

V. CONCLUSION

In this paper, we study cyclic codes of an arbitrary length n over $F_2+uF_2+vF_2+uvF_2$, and prove that cyclic codes are principally generated. Another direction for research in this topic is of course the generalizations $F_q+uF_q+vF_q+uvF_q$ of $F_2+uF_2+vF_2+uvF_2$, where q is a prime power.

ÖZET: Çalışmada, 7. sınıf "Canlılar ve Hayat" öğrenme alanındaki "İnsan ve Çevre" ünitesinde yer alan "Çevre Sorunları ve Etkileri" konusu içerisinde Işık Kirliliği ele alınmış ve Fen ve Teknoloji Öğretim Programındaki konuya ilişkin kazanımları gerçekleştirmeye yönelik bilgisayar destekli kavram karikatürleri hazırlanmıştır. Fen ders kitaplarında, "Çevre Sorunları ve Etkileri" konusu içerisinde pek çok çevre sorunundan söz edilmekle birlikte, Işık Kirliliğine değinilmemektedir. Oysa ki Işık Kirliliği, ekolojik ve ekonomik açıdan olumsuz sonuçlar doğuran önemli bir çevre sorunudur. Öğrencilere ışık kirliliğine ilişkin farkındalık kazandırmayı amaçlayan bu çalışmada, ışık kirliliğinin nedenleri ve etkilerine yönelik senaryolar ve bilgisayar destekli kavram karikatürleri geliştirilmiştir. Bu etkinlikler, öğrencilerin konuya ilişkin zihinsel yapılandırmalarını ve kavram yanılgılarını ortaya çıkaracak niteliktedir. Günümüzün önemli çevre sorunlarından olan Işık Kirliliğine ilişkin farkındalık yaratmayı amaçlayan bu çalışmanın, Fen öğretmenlerinin de benzer etkinlikler geliştirmelerini ve derslerinde uygulamalarını destekleyeceği düşünülmektedir.

Anahtar sözcükler: fen eğitimi, ışık kirliliği, kavram karikatürleri

ABSTRACT: This study focuses on Light Pollution within the subject of "Environmental Problems and Their Effects" in the "Human and Environment" unit in the learning field of "Living Things and Life" for the 7th grades. Computer – aided Concept Cartoons were prepared to realize the acquisitions regarding the Science and Technology Curriculum. Despite mentioning various environmental issues within the subject, Light Pollution, another serious issue, that has negative effects on ecology and economy, is somehow ignored in coursebooks. In this study, that aims at raising awareness about Light Pollution, scenarios and computer-aided concept cartoons were designed to make the reasons and effects of light pollution clearer for the students. These activities are meant to reveal students' mental constructions and misconceptions regarding the subject. This study aiming at raising awareness on light pollution, one of the serious environmental issues in the modern world, is expected to inspire science teachers to develop similiar activities for their classroom practices as well.

Key words: science education, light pollution, concept cartoons

CONCEPTUALIZATION OF PEDAGOGICAL CONTENT KNOWLEDGE (PCK) FOR TEACHING MATHEMATICS IN UNIVERSITY LEVEL

Azimehsadat Khakbaz
azimehkhakbaz@ymail.com

The aim of this study is conceptualization of pedagogical content knowledge (PCK) in the field of teaching mathematics in university level. This is a qualitative research which has done in mathematics discipline in Iranian higher education system. The data of this research were gathered through semi structured interviews with some PhD mathematics students and professors. They were analysed through coding and making themes. Data analysis showed that we could explain concept of PCK in a model with 4 main elements and 3 themes which influenced on that.

STATEMENT OF PROBLEM

Teaching and teacher's knowledge have always been a controversial field of study in education. Pedagogical content knowledge(PCK) is a familiar concept for researchers which first has introduced by Shulman(1985) as a “missing paradigm” in this field of study. Shulman(1987) described PCK as a special amalgam of content and pedagogy that is uniquely the province of teachers, their own special form of professional understanding. Although, PCK is an interesting concept which has absorbed many eyes, its nature is complicated. Besides, many research have been done about PCK in school level mathematics and specially school mathematics teachers education, but little has been done in mathematics education in university levels. While we know school mathematics teachers themselves have learned mathematics in universities. Moreover, not only mathematics students in university level, but also many students in other disciplines are learning mathematics and all these persons would be parents, teachers and members of society who will influence on mathematics education for future generation. Therefore, mathematics education in higher education level would effect on culture of mathematics education in university. Thus, the problem in this study is: what does PCK for teaching mathematics in university level mean?

THEORETICAL FRAMEWORK

The term of PCK is inherit Dewey’s(1916-1964) that teachers must learn “psychologize” their subject matter for teaching to rethink disciplinary concepts and topics to make them more accessible to students(Counts, 1999).

After introduction of PCK many researchers tried to work on that concepts. One of the most influential researchers was Grossman (1988) who introduced two overarching categories: General and Specific PCK. These categories were later modified by Fernandez-Balboa & Stiehl (1995) to generic and specific. Specific PCK is particular to instruction of a specific subject or content area; and Generic PCK is common to instruction all content areas or subjects. Generic PCK refers to the fact that every discipline in higher education could have a concept of PCK. It means mathematics as a discipline has its PCK and surely this Generic PCK consist of Specific PCK, emerged from different subjects and content area. Grossman (1990) also described four categories embodied in PCK:

- Knowledge about the purposes for teaching a given subject matter (subject matter issue);
- Knowledge about the students’ understandings about the content (students issue);
- Knowledge about the order in which subject matter should be presented (curricular issue);
- Knowledge about the instructional strategies useful for teaching content (pedagogical issue).

LITERATURE REVIEW

One of the initial studies about PCK in higher education has been done by Fernandez Balboa & Stiehl(1995). The aim of their research was to study the generic nature of PCK in higher education. To this aim they studied incorporated purposeful sampling of 10 professors from five different colleges (i.e., Arts and Sciences, Business, Education, Health and Human Sciences, and Visual and Performing Arts) at a university in the U.S.A. Data were obtained from personal phenomenological interviews. They analysed the data utilizing the method of constant comparison looking for themes that linked the reflections of the participants. The results of this study showed that although initially their reference framework for analysing generic PCK was based on the four components outlined by Grossman(1990), a few important differences with regards to these components emerged from their analysis. These components include knowledge about: the subject matter, the students, numerous instructional strategies, the teaching context, and one's teaching purposes.

Counts(1999) did a research with two purposes: to contribute to a broader conceptualization and understanding of the development of general PCK in college level teaching by generalizing Shulman's(1987) and Grossman's(1988) model of PCK to college professors and to describe how a professor's PCK was constructed. He applied a case study research on a physics professors and gathered data through semi structured participant interviews and supportive data sources. Analysis of data was by analytical induction. Results showed five major themes emerged that reflected the professor's PCK: knowledge of the purpose of teaching, knowledge of students as learners, knowledge of human communications, knowledge of curriculum and course design and knowledge of positive learning environment. Therefore these findings disclosed that the PCK conceptualization of this study was in a large congruent with Shulman and Grossman's models.

Major and Palmer(2001) described several significant aspects of faculty PCK drawing on qualitative methods at a private university in the southern United States. They found out student learning is the heart of PCK. The focus of faculty PCK is that they must consider their students, how students will learn, and what difficulties they might have in learning. To help their students learn, then, faculty members need several kinds of knowledge about student learning. They must understand who their learners are, being responsive to differences that may arise from culture, family experiences, and learning styles and processes. Faculty members must figure out what students know and believe about a topic. They must also consider how learners are likely to engage and process new ideas. They need to think about how students learn different kinds of material for different purposes. And they must decide which kinds of learning are important for different contexts. Faculty members need to be able to identify the strengths and weaknesses of different learners and develop knowledge to work with students who have specific learning disabilities or needs.

METHODOLOGY

This research is a qualitative research. Data gathered mainly from two universities in Iran. These universities were selected among comprehensive universities. They were both prominent universities in field of mathematics and both were somehow engaged in mathematics education knowledge. One of them was the pioneer of development of mathematics education as a discipline in graduate education level. The other had a big history in mathematics teacher education and also was established with the aim of training mathematics university teachers in the era of shortage of mathematics university teachers and quantitative development of mathematics discipline in higher education in Iran. Besides, they both have high influence on education of future mathematics university teachers in Iran since they educate many students in graduate level in mathematics. Therefore, It was believed that these universities were good indicators of mathematics university education in Iran.

The respondents of this study were 19 PhD students and 8 professors in mathematics discipline which were selected from these two universities. Professors and PhD students were sources of data since it was assumed that they could explain about their experiences both as students and teachers. They selected both in pure and applied mathematics and they were on a spectrum from juniors to seniors both in PhD students and professors. Data were gathered mainly through semi structured interviews about experiences of teaching from respondents. They were analysed through coding and making theme(Creswell,2008). The process of gathering data has continued until the saturation of findings from analysis of data. In total, 19 PhD students and 8 professors cooperated in this research.

RESULTS

PCK in this study could be explained in 4 main and 3 contextual themes. First theme is "mathematics syntactic knowledge". Two sub-themes have been found which would explain this theme. Respondents in this research said the main thing in teaching mathematics is encouraging students to learn mathematics and it is based on explaining what the "application of the mathematics concept" is? Analysis of data showed that application has two means for them: application in the real world, application in other disciplines and application in mathematics. Furthermore they said that they would try to make connections between students' knowledge and mathematical content through focusing on the "main idea behind a mathematics problem".

Therefore not only mathematics professors should know mathematics concepts, theorem and formula, but also they should be aware of applications of mathematics concepts and main idea behind it. To have these two knowledge, a mathematics professors should know the evolution of concepts in a coherent network and this leaded us to to conceptualize mathematics syntactic knowledge for this theme. Mathematics as a discipline has two structures: substantive structure in mathematics which refers to concepts, theorem, and formula and... in mathematics and syntactic structure in mathematics which refers to the methods of how the concepts of mathematics would be develops (Schwab, 1964).

Second theme is "knowledge about students". We found out two sub-themes which would explain this theme. One important thing that respondents referred was to know what is the "major" of their students is and which "grade" are they. Since mathematics would be taught for students in different majors (for example engineering, science, humanities, mathematics and ...), professors should engage with students with different *disciplinary culture*. One of the respondents in this study said:

> *When I am teaching, I would try to find problems which are related to their majors. For example in chemistry students class, I would try to find what the application of this concepts is in the chemistry and try to find or make problems and examples related to them.*

The other respondent said:

> *Most engineering students would like to see the application of mathematics concepts, especially mechanically and physically applications. But in humanities, like a management student would like to know what is the application of mathematics concepts in management. In mathematics, students would see themselves as the specialist of mathematics and you could teach pure theorem and talk about the historical evolution of mathematics concepts in the mathematics body of knowledge. But this is boring for engineering or humanities students.*

Respondents also referred that teaching is different in undergraduate or graduate student. One of them said:

> *Teaching in graduate level is like surfing in a large ocean because you have to introduce a broad variety of concepts to make students find different research questions. But in undergraduate level you have to teach like swimming in a deep river.*

The other sub-theme related to this theme is to encounter with "students' misconceptions and learning difficulties" which was explained by Shulman(1986,1987) too.

Third theme was "knowledge about mathematics curriculum planning". The first sub-theme which resulted in this theme was "knowledge about mathematics problems". Since the main component of mathematics content is problem, many respondents introduced this kind of knowledge. They revealed that they should have knowledge about problems which encourage students' interest to learn mathematics. To do that one of the respondent said:

> *I would try to find problems which are the historical problem in the mathematics and try to make students in a natural context to engage with that problem and create the concept.*

The other respondent said that he uses interdisciplinary problems and the other one told us she uses problems which seems complicated but the solution of them are easy and needs consideration.

After finding the elements of content, professors should integrate these elements and problems to "make a coherent and meaningful content". To do that, analysis of data showed they would try to make the content related vertically and horizontally.

About horizontal relationship, most respondents explained they would try to follow teaching a concept with a starting point of its story and to introduce why this concept is important and how this was created in the beginning and what the evolution of this concept is. They also explained they would help the students to work independently with the new concept gradually. About the vertical relationship, one of the respondents explained:

> *We have numerical analysis in 3 levels: bachelor, M. Sc and PhD. The goal of this subject is error analysis, but in bachelor we want to find a point, in M.Sc we would try to find a line and in PhD we want a function. To work on that, we need general mathematics analysis knowledge in bachelor, real analysis knowledge in M.Sc and functional analysis knowledge in PhD.*

The last sub-theme of this theme is "to make the content appropriate with students". In this sub-theme analysis of data defined two approaches: some of respondents would design the content based on the formal intended curriculum and then try to make it appropriate for students. Minority of respondents would start with students. They concentrate on the main idea and concepts of lesson and let the students to make limit of content.

The forth theme is "knowledge about creating an influential teaching-learning environment". This theme has 7 sub-theme. The first one is "knowledge about different representation approaches" like teaching from intuition to abstract, problem based teaching which starts from an unknown position, connected to application world and many different strategies in teaching. The second one is "knowledge about how to say and how to write". Since one of the most important tools in representation in a mathematics classroom is writing, it is really important to know how to write mathematics. One of the respondents introduced this sub-theme in his professor's teaching:

> *He knew how to use the board to make connection between concepts. For example he cleaned board but let to remained some central concepts, explanation or theorem. Afterwards, while we were in the middle of a problem and we did not know how to continue, he referred to that concept or explanation or theorem on the board and highlighted central concepts which helped us to solve the problem. He was really professional to use the board. It is like an art in teaching mathematics.*

The third sub-them is “knowledge about how to engage students in teaching-learning mathematics”. One of the respondents said:

> *Learning by doing is the nature of learning mathematics, so students should be engaged in this process actively otherwise they would not learn simply.*

In relationship with this sub-theme, we found out the forth one as “knowledge about giving feedback to students” and evaluate their learning which make them engaged in teaching-learning process in mathematics classroom.

The next sub-them was “knowledge about using information communication technology(ICT) in teaching”. Analysis of data announced that professors use ICT in two approaches: using from the general aspects of ICT like using Power point to make abstract concepts more visual and also using specific mathematics software like Matlab or Mathematica. One of the respondents explained:

> *One of the problem in teaching matrices to students is that they are afraid of working with huge matrices. So I use Matlab software to make an environment for students to work with them and this reduces their fear from working with those matrices.*

The sixth sub-theme is “knowledge about using aesthetic sense in teaching”. Most of respondents referred to body language as one component of this sub-theme. One of them believed that professors should be like actors on the scene. More, using some jokes, cartoons, poems, autobiographies of mathematicians and animations also were introduced by respondents. The last sub-theme of this theme is “classroom management”. The respondents referred to the proportional relationship between students and professors as one component in this sub-theme. Also time management has been referred as the other component.

Analysis of data also showed 3 contextual themes which influence on PCK: “nature of subject”, “professor’s features” and “terms of learning atmosphere”.

The nature of subject influences on teaching-learning of that. In this study respondents referred to two main nature for mathematics subjects: pure in subjects like algebra or analysis and applied in subjects like numerical analysis and general mathematics. Professor’s features, both inherent(like appearance, voice, gender, …) and acquisitive(like moral aspects, enthusiasm, hard working, ...) also consequences on teaching-learning mathematics. Furthermore, terms of atmosphere of learning, both physically and socio-culturally would influence PCK. Physically terms means the size of classroom, number of students, technological terms in class and so on which seem to be obvious. Socio-cultural terms are more complicated and it could be explained through three sub-themes. The first one is socio-cultural beliefs about teaching-learning mathematics. It means that what the society think about and need from mathematics professors? One of the respondents explained:

> *When I was a young professor, it was a belief about mathematics professors to teach without looking on the book or handout. It took me long time to memorize whole the content in my mind. Also when a teacher made mistake, students thought that he is illiterate. But now society beliefs have changed and it is a better situation. But expectations now is to solve whole the problems…*

Many of respondents referred to that there is a belief about the professor’s reputation: the more famous, the better teaching.

The second one is educational institution’s requirements. In Iran we have some governmental universities and free universities named Islamic Azad University. The difference between them is that governmental universities are supported with government but in Islamic Azad universities, students should pay for learning. Respondents of this study referred that these two academic systems needs different approaches in teaching-learning mathematics. One of the respondent said:

> *It is totally different to teach in which kind of universities. If I want to teach in governmental universities I need a higher level of content and I know I could even fail all the students of a class when they are not qualified to pass it. But in Azad universities I could not fail them because university wants me to pass them above a minimum line of being failed. And I should select easier content. So in governmental universities right is with professor unless the opposite of that would be proved but in Azad universities right is always with students unless the opposite of that would be proved.*

More we found out should consider educational institutional culture in teaching because even in governmental universities we have different kinds of universities, for example: polytechnics and comprehensive ones which each of them has its requirements.

The last sub-theme was the terms of students. Many respondents admitted that because of the development of higher education in Iran and increase of interest to technical and engineering majors, basic sciences especially mathematics gets less demand. Therefore better students in high schools would be registered in engineering majors. Mathematics students are usually those who are not interested in that. And in other majors, especially humanities there is a belief between students that they are not good at mathematics so they would reject to learn it. Because of these situations, students who are learners in mathematics classroom are not enthusiastic to learn that and this would influence on teaching-learning mathematics.

ÖZET: Bu çalışma ortaokul 7. sınıf öğrencilerinde atom kavramı hakkındaki kavram yanılgılarını ortaya çıkarmak amacıyla gerçekleştirilmiştir. Bu amaçla atom konusunda uzman görüşü alınarak 3 aşamalı 8 sorudan oluşan kavram yanılgısı testi oluşturulmuştur. Kavram yanılgısı testi Konya ilindeki 350 7. Sınıf öğrencisine uygulanmıştır. Güvenirlik uygulamasından elde edilen veriler SPSS 21 paket programında analiz edilmiştir ve KR20 güvenirliğinin 0.65 olduğu saptanmıştır. Test uygulaması sonucunda öğrencilerde atomun bölünemez, gözlemlenemez ya da mikroskop ile doğrudan gözlemlenebilir olduğu, elektronların katmanlara yerleşmiş şekilde bulunduğu, maddenin fiziksel özelliklerini(genleşme, iletkenlik, renk…) atomun oluşturduğu, atomun elektron hareketlerinden dolayı canlı olduğu yanılgıları ortaya çıkmıştır. Ayrıca atom modellerinden öğrencilerin en doğru model olarak Bohr atom modelini seçtiği tespit edilmiştir. Elde edilen verilere göre bazı önerilerde bulunmuştur.

Anahtar sözcükler: Atom, Kavram yanılgısı, Elektron

ABSTRACT: In this present study,We have seen the concept of atoms was carried out to reveal the misconceptions of secondary school grade 7 students . For this case, an expert opinion was taken , the concept of 8 questions based three –step of atoms was lead to misconceptions. The misconception test in Konya was absolvet from 350 7th grade students. Reliability on the data which were obtained, were analyzed using SPSS 21 software package.The KR20 reliability has been the results, to be 0.65. Testing the applications results of students has been viewed, that atoms are indivisible, can not be observed or with a microscope maybe observed directly. The Atom Electrons settled in layers. Physical property of atoms are expansion, conductivity, color… The way of thinking that a atom is alive, beacuse of its motion conduct to misconceptions. Mean while students has chosen the Bohr atomic model as the correct one. As a result some suggestions were Based on the data.

ÖZET: Araştırmanın amacı, ortaokul 7. Ve 8. Sınıf öğrencilerinin rasyonel sayılar konusundaki yanlış anlamalarının ve kavram yanılgılarının ortaya çıkarılmasıdır. Araştırmanın evreni Konya ilidir. Örneklemi ise evreni temsil edecek şekilde Konya'nın çeşitli bölgelerinden seçilmiş üç okulun 7. Ve 8. sınıfında okuyan 453 öğrenci oluşturmaktadır. Veriler, araştırmacılar tarafından hazırlanmış ve güvenirliği hesaplanmış üç aşamalı test ile toplanmıştır. Testteki her soru için frekans tablosu oluşturulmuştur. Araştırma sonunda öğrencilerin genellikle devirli ondalık sayıların tanımı ve rasyonel olarak yazılması, kesirlerin şekillerle ifade edilmesi ve rasyonel sayılarda dört işlem konularında kavram yanılgısı ve yanlış anlamalara sahip oldukları görülmüştür.

Anahtar sözcükler: Rasyonel sayılar, kavram yanılgısı, yanlış anlamalar, matematik eğitimi

ABSTRACT: The aim of this study is to determine the 7th and 8th grades students' misunderstandings and misconceptions about rational numbers. The universe of research is the city' Konya'. The paradigm is 453 secondary school students who were chosen from different regions of Konya with the aim of representing the universe. The data was collected by three step multiple choice questions whose reliability was counted. At the end of the research, it has been recognized that the students usually have misunderstandings and misconceptions about the definition and rational explanations of repeating decimal numbers, expressing the fractions by shapes and four arithmetical operations with rational numbers.

Key words: rational numbers, misconceptions, misunderstanding, mathematics education

SELF-CONCEPT AND SELF-EVALUATION IN THE TRANSITION FROM PRIMARY TO LOWER SECONDARY EDUCATION

Pranvera KRAJA

In this article I'll present theoretical concepts and empirical results of self-concept and self-esteem of the children in transition from primary school to lower secondary education (LSE). Through the evidences from research literature, this article, aims to provide answers to such questions: How and what aspects of self-concept and self-esteem of children develop and change during childhood and adolescence? Is there a correlation between levels of self-concept and self-assessment that the child has for him and his academic achievements? Why is it important to maintain high levels of self-concept and self-esteem of the child for the life in general, and for the school life in particular? Studies of the last two decades have shown that changes in self-concept and self-esteem of the child are strongly correlated with pupils' academic achievements. Keeping positive levels of self-concept and self-esteem, would facilitate the difficulties of the child\'s adjustment at the new school.

Keywords: school transition, self-concept, self-esteem, impact, lower secondary education.

ÇEVRİMİÇİ ÖĞRENME ORTAMLARINDA KULLANILABİLİRLİK: BİR LİTERATÜR TARAMA ÇALIŞMASI

USABILITY IN THE ONLINE LEARNING ENVIRONMENTS: A LITERATURE REVIEW STUDY

ÖZET: Bilgisayar ve internet teknolojilerindeki hızlı değişim insanların hayatlarında bir takım değişikliklere neden olmuştur. İnsanlar günlük hayatta yaptıkları işleri bilgisayar sistemleri aracılığıyla artık daha kolay ve kısa yoldan gerçekleştirebilmektedir. Tüm bu kolaylıkların yanı sıra geliştirilen sistemlerin kullanıcı odaklı olmaması, kullanıcıların bu sistemlerde sorunlar yaşamalarına sebep olmaktadır. Bu sorunlar kullanılabilirlik kavramını ortaya çıkarmıştır. Kullanılabilirlik, bir ürünün belirli kullanıcılar tarafından belirli amaçlar doğrultusunda etkili, verimli ve belirli bir kullanım çerçevesinde memnuniyetle kullanabilme derecesi olarak tanımlanmaktadır. Bu çalışmada kullanılabilirlik değerlendirme yöntemleri ve türleri ile literatürde yer alan çevrim içi öğrenme ortamlarında yapılmış olan kullanılabilirlik çalışmaları ele alınmıştır. Yapılan araştırma sonucunda, incelenen çalışmalardaki kullanılabilirlik değerlendirmelerinin birçoğunun uzman temelli ve kullanıcı testleri yaklaşımlarıyla gerçekleştirildiği görülmektedir.

Anahtar sözcükler: kullanılabilirlik, insan bilgisayar etkileşimi

ABSTRACT: Rapid changes in computer and internet technology have led to a number of changes in people's lives. People can easily complete their daily tasks through computer systems. However, users may experience problems in using these systems because of their lack of user-oriented characteristic. This problem has revealed the concept of usability. The usability is the extent to which a product can be used by certain users to achieve identified goals with effectiveness, efficiency, and satisfaction in a specified context. In this study, usability evaluation methods and types are investigated. Also, usability studies in online learning environments discussed in the literature are reviewed. As a result of this research conducted, many of usability assessments are made with expert-oriented and user testing approaches.

Keywords: usability, human computer interaction

Not: Bu çalışma, Türkiye Bilimsel ve Teknolojik Araştırma Kurumu (TÜBİTAK) tarafından desteklenen 113K302 numaralı "FATİH Projesi Uygulamalarının Teknolojik-Pedagojik-Alan Bilgisi (TPAB) Çerçevesinde Gözlemlenmesi ve Çevrimiçi Örnek Olay Kütüphanesi Oluşturulması" başlıklı proje kapsamında hazırlanmıştır. Yazarlar, bu çalışmaya desteğinden dolayı TÜBİTAK'a teşekkür eder. Bu çalışma, ikinci yazarın proje kapsamında yapılan yüksek lisans tezinden üretilmiştir.

GİRİŞ

Hızla gelişen teknoloji, insanların hayatlarını kolaylaştırmış ve bazı alışkanlıkların da farklılaşmasına sebep olmuştur. Özellikle 1990'lı yılların başında Web teknolojisinin ortaya çıkışı ile birlikte, bilgisayar günümüzün en etkili bilgi iletişim aracı olarak tüm dünyada büyük bir hızla yaygınlaşmış, eğitimden ticarete, sağlıktan kamuya kadar akla gelebilecek tüm sektörlerde hizmet anlayışında büyük bir değişime sebep olmuştur.

Web teknolojisindeki hızlı gelişmeler insanların her zaman yapmış olduğu fatura ödeme, alışveriş yapma ve para transferi gibi işleri daha farklı ve daha kolay yoldan gerçekleştirmelerine olanak sağlamıştır. Web teknolojisindeki bu gelişmeler sağladığı birçok yararın yanı sıra bazı sorunları da beraberinde getirmiştir. Bu sorunların başında bu teknolojilerin herkese ulaştırılması ve herkes tarafından kolay bir biçimde kullanabilmesi gelmektedir. Geliştirilen yazılımların sadece geliştirici kişilerin anlayacağı şekilde tasarlanması kullanıcılar açısından büyük bir sorun teşkil etmekte ve ilgili yazılımın önemini kaybetmesine neden olmaktadır. Bunun gibi sorunlar İnsan Bilgisayar Etkileşimi (İBE) ve kullanılabilirlik kavramlarının ortaya çıkmasına sebep olmuştur.

İnsan Bilgisayar Etkileşimi (İBE) ve Kullanılabilirlik

İBE, etkileşimli teknolojilerin tasarım, geliştirilme, değerlendirme ve uygulama kısmı ile ilgilenen disiplinler arası bir çalışma alanıdır. İBE'nin nihai amacı insanın teknolojiye değil, teknolojinin insana ayak uydurmasını ve üretilen ürünlerin herkes için tasarım ilkesi ile üretilmesini sağlamaktır. (Çağıltay, 2011). Web teknolojisinin hızlı gelişimi İBE'nin önemini artırmış ve bu konudaki kullanılabilirlik çalışmalarının daha yoğun bir biçimde gerçekleşmesine sebep olmuştur. Nielsen (2012)'e göre kullanılabilirlik kullanıcı arayüzlerinin ne derece kolay kullanıldığını değerlendiren; öğrenilebilirlik, etkililik, akılda kalıcılık, hata ve tatmin edicilik gibi bileşenlerden oluşan bir kavramdır. Kamu Kurumları İnternet Siteleri Standartları ve Önerileri Rehberi (2014)'ne göre ise kullanılabilirlik, bir uygulamada belirlenen işlerin, hedef kitle olarak belirlenen kullanıcılar tarafından, gerekli eğitim ve teknik desteğin verilmesiyle, uygun şartlarda kolaylıkla ve etkili biçimde kullanılabilmesi olarak tanımlanmaktadır. Kullanılabilirlik geliştirilen ürünün farklı özelliklerini içinde barındırmaktadır. Ayrıca, kullanılabilirlik ürün özelliklerin değerlendirilmesi ile anlam kazanmaktadır (Evcil ve İslim, 2012). Tablo 1'de kullanılabilirlik kavramı ile ilgilenen bilim adamları tarafından belirlenen özellikler yer almaktadır (Jeng, 2005):

Tablo 1: Kullanılabilirlik Özellikleri

Yazar	Özellikler
Booth (1989)	Kullanışlılık, etkililik, öğrenilebilirlik, tutum
Brinck ve ark. (2002)	Fonksiyonel doğruluk, etkili kullanım, öğrenme kolaylığı, hatırlama kolaylığı, hata toleransı, öznel memnuniyet
Clairmont ve ark. (1999)	Başarılı öğrenme ve bir hedefi başarmak için bir ürünü kullanma
Dumas & Redish (1999)	Çabuk ve kolay bir şekilde görevleri gerçekleştirme
Furtado ve ark. (2003)	Kullanım kolaylığı ve öğrenme
Gluck (1997)	Kullanışlılık ve faydalılık
Guillemette (1995)	Görevleri yerine getirmek için hedef kullanıcı tarafından etkili kullanım
Hix ve Hartson (1993)	İlk performans, uzun süreli performans, öğrenilebilirlik, kalıcılık, gelişmiş özellik kullanımı, ilk etki, uzun dönem kullanıcı memnuniyeti
ISO (1994)	Etkililik, etkinlik, memnuniyet
Kengeri ve ark. (1999)	Etkililik, memnunluk, öğrenilebilirlik, kullanışlılık
Kim (2002)	Arayüz etkililiği
Nielsen (1993)	Öğrenilebilirlik, etkililik, hatırlanabilirlik, hatalar, memnuniyet
Oulanov ve Pajarillo (2002)	Etki, etkinlik, kontrol, yardımseverlik, uyum yeteneği
Shackel (1984)	Kullanım kolaylığı, etkililik
Shackel (1986, 1991)	Etkililik, öğrenilebilirlik, esneklik, kullanıcı tutumu

Arayüz Değerlendirme Yöntemleri ve Kullanılabilirlik Testleri

Çağıltay (2011)'a göre kullanılabilirlik değerlendirme yöntemleri, tür ve yaklaşım olmak üzere ikiye ayrılmaktadır. Yaklaşım yöntemleri ele alındığında kullanılabilirlik değerlendirme yöntemleri; Tasarım Rehberleri Temelli, Kullanıcı Temelli, Uzman Temelli ve Model Temelli olmak üzere 4'e ayrılmaktadır. Tür açısından ele alındığında ise Süreç içi (Formative/Diagnostic) ve Süreç sonu (Summative/Metrication) olmak üzere 2'ye ayrılmaktadır. Kullanılabilirlik testleri, kullanılabilirliğinin değerlendirilmesi istenen ürünün belirli hedef kitlede belirli görevlerin yaptırılması ve bu süreçte kullanıcıdan verimlilik, etkililik ve memnuniyet değerlerinin alınması amacıyla yapılmaktadır (ODTÜ, 2014). Ürünler üzerinde uygulanan kullanılabilirlik testleri, üründe bulunan kullanım sorunlarını, tasarım problemlerini ve kullanıcıyı rahatsız eden veya karmaşıklığa yol açan unsurları ortaya çıkaran kritik uygulamalardır. Çağıltay (2011) kullanılabilirlik değerlendirme yöntemlerini şu şekilde açıklamıştır:

Kullanılabilirlik Test Türleri

Süreç içi Testler (Formative/Diagnostic): Geliştirilecek olan ürünün üretim süreci içinde yapılan değerlendirme yöntemidir.

Süreç Sonu Testler (Summative/Metrication): Ürün ortaya çıktıktan sonra yapılan testlerdir. Bu testler ile ürünün geçerliği sağlanarak genel kullanıma sunulur.

Kullanılabilirlik Test Yaklaşımları

Tasarım Rehberleri: Hazırlanan tasarımlarda tutarlılığı ve uyumluluğu sağlamak için geliştirilen rehberlerdir.

Uzman Temelli (Sezgisel): Geliştirilen ürünün bir uzman tarafından değerlendirilmesidir. 1970'den bugüne birçok sezgisel rehber önerilmiştir. Günümüz arayüzleri içinde en çok kullanılanı hiç şüphesiz Nielsen (2005) tarafından geliştirilen Jacob Nielsen'in 10 Kullanılabilirlik Sezgiseli'dir.

Kullanıcı Testleri: Bu yöntem gerçek kullanıcılara, gerçek bir arayüz sistemi karşısında, gerçek görevler verilerek gerçekleştirilir. Gerçek kullanıcılarla yapılan kullanılabilirlik testleri için farklı yöntemler kullanılabilmektedir. Bu yöntemler; kullanıcının testi yaparken sergilediği esneme, gerinme gibi gözlemlenen davranışlar olabildiği gibi kullanıcıların uygulama sırasında nasıl bir yol izlediklerini sesli düşünme yolu ile (think aloud) kullanılabilirlik uzmanlarına aktarması da istenebilir. Böylece elde edilen ses veri kayıtları diğer test verileri ile birlikte değerlendirilebilmektedir. Bir diğer yöntemde ise veriler göz-izleme (eye-tracking) cihazları kullanılarak elde edilmektedir. Bu yöntem ile çalışma alanı ile ilgili oldukça detaylı veriler elde edilebilmektedir.

Model Temelli: Bu yaklaşımda kullanıcıların bilişsel ve fiziksel davranışları modellenmeye çalışılır ve kullanıcının davranışlarının bu modele uygun olup olmadığını ve modelin daha hızlı nasıl çalıştırılabileceği gibi konular değerlendirilmektedir. Bu değerlendirme işlemini yaparken fiziksel davranışların modellenmesinde genellikle "Fitts" kanunu (Fitts, 1954), bilişsel davranışların modellenmesinde ise "Bilgi İşleme Modeli" temel alınmaktadır.

Gelişen teknoloji ile birlikte büyük bir öneme sahip olan kullanılabilirlik ile ilgili Türkiye'de ve dünyada birçok çalışma yapılmıştır. Özellikle her geçen gün çevrim içi ortamlarda birçok kullanılabilirlik çalışmaları gerçekleştirilmekte ve daha kullanılabilir web sayfaları oluşturulması için çalışmalar sürdürülmektedir. Bu araştırmada çevrimiçi ortamlarda yapılan kullanılabilirlik çalışmalarından bir kısmını içermektedir. Araştırmada yer alan yayınlar; ProQuest, SAGE Journals, Google Scholar, Taylor & Francis Online Journals ve YÖK Ulusal Tez Merkezi veri tabanlarından "web kullanılabilirlik, kullanılabilirlik, usability ve web usability" anahtar kelimeleriyle erişilen tez, makale ve bildirilerden oluşmaktadır.

Literatürde Yer Alan Çevrimiçi Ortamlarda Kullanılabilirlik Çalışmaları

Giritli tarafından 2007 yılında Işık Üniversitesi'nde yüksek lisans tezi olarak gerçekleştirilen çalışma ile Türkiye'de faaliyet gösteren bazı e-ticaret sitelerinin kullanılabilirliklerinin değerlendirilmesi yapılmıştır. Üç ayrı kategoride yer alan toplam 28 sorudan oluşan bir anket 35 kişiye uygulanmış ve toplanan veriler ANOVA istatistiksel yöntemiyle analiz edilmiştir. Çalışmanın sonucunda incelenen web sayfalarında tecrübeli bilgisayar kullanıcılarının bile bazı noktalarda zorlandıklarını ve bu yüzden sayfaların genel hatları ile çok kullanışlı olmadığı ortaya çıkmıştır.

Gürses'in 2006 yılında Hacettepe Üniversitesi'nde doktora tezi olarak gerçekleştirdiği araştırma, ulusal ölçekte ve geniş bir kullanıcı kitlesine hizmet sunan Ulusal Akademik Ağ ve Bilgi Merkezi (ULAKBİM) web sayfasında gerçekleştirilmiştir. Araştırmada öncelikle ULAKBİM web sayfasının aktif arayüzü kullanıcı algı ve tutumlarına etki eden faktörlere göre optimize edilmiş ve yeniden tasarlanmıştır. Mevcut site ve kullanıcı merkezli hazırlanan "Prototip site" kullanıcı performansı ve memnuniyeti açısından fark olup olmadığı 50 kişinin katıldığı deneysel bir araştırma modeli çerçevesinde nitel ve nicel ölçümler aracılığı ile karşılaştırılmalı olarak incelenmiştir. Yapılan analiz sonucunda katılımcıların kullandıkları site arayüzlerine göre arayüz kullanım etkinlikleri, verimlilikleri ve memnuniyetleri arasında anlamlı bir fark ortaya çıkmıştır.

Berkman'ın (2006) Bahçeşehir Üniversitesi'nde yüksek lisans tezi olarak gerçekleştirdiği çalışmada, araştırmanın yürütüldüğü dönemde en çok ziyaret edilen 20 haber sitesi, kullanılabilirlik ölçütleri ve arayüz özellikleri açısından değerlendirilmiştir. 10 kişilik uzman bir test grubu tarafından sağlanan veriler ile yapılan analizlerin yanı sıra, yine aynı test grubunun sağladığı empirik veriler ile 20 kişilik uzman olmayan bir gruptan aynı yolla sağlanan verilerin ortalamalarının dağılımları karşılaştırmalı olarak ortaya konmuştur. Çalışma sonucunda, ele alınan sitelerin bazılarında kullanılabilirlik ile ilgili problemlere rastlanmıştır. Ancak, sitelerin çoğunluğunda yinelenen ve kullanıcıları etkileyen belirgin bir sorun görülmemiştir.

İlgili literatürde bir çalışma da İşbulan'ın (2008) Sakarya Üniversitesi'nde yapmış olduğu yüksek lisans tez çalışmasıdır. Çalışma kapsamında, katılımcılar, Sakarya Üniversitesi Adapazarı Meslek Yüksek Okulu Uzaktan Eğitim Bölümü'nde öğrenim gören 1512 öğrenciden oluşmaktadır.. Çalışmaya katılan öğrencilerden üniversiteye ait uzaktan eğitim web sitesini kullanılabilirlik açısından değerlendirmesi istenmiştir. Bu değerlendirmeyi gerçekleştirmek için bir ölçek geliştirilerek öğrencilere uygulanmıştır. Değerlendirmeye uygun olan 1229 anket ile cinsiyet, yaş, bölüm, üniversitedeki yılları ve yaşadıkları coğrafi bölgelere göre anlamlı bir farklılık olup olmadığı araştırılmıştır. Bulunan sonuçlar doğrultusunda web sayfasının genel olarak öğrencilere tarafından kullanılabilir olduğunu ortaya çıkarmıştır. Çalışmada bulunan diğer bulgular şu şekilde özetlenebilir:

1. Araştırmaya katılan bayanların bazı faktörlerde erkeklere oranla,
2. Yaşları küçük olan katılımcıların bazı faktörlerde diğer katılımcılara oranla,
3. Mekatronik ve işletme bölümü öğrencilerinin diğer öğrencilere oranla,
4. Üniversitede bulunduğu yıl göz önüne alındığında ise 1. Sınıfta okuyan öğrencilerin diğer öğrencilere oranla,
5. Yaşadığı coğrafi faktörlere göre ise akdeniz bölgesinde yaşayan öğrencilerin bazı faktörlerde diğer bölgelerde yaşayan öğrencilere oranla web sayfasının kullanılabilirliğinden memnun olmadıkları bulunmuştur.

Bir diğer çalışma da ise bir e-devlet uygulaması olan Türk Sosyal Güvenlik Kurumlarının (SSK, Emekli Sandığı, Bağ-Kur) web sayfalarının kullanılabilirliği ve kullanıcı kabulünün değerlendirmesi yapılmıştır (Öndin, 2007). Bu çalışma, mevcut SGK kurumlarından birine dâhil farklı meslek, yaş, eğitim düzeyi ve bilgisayar becerilerine sahip 45 yetişkin ile gerçekleştirilmiştir. Çalışmada öncelikle katılımcıların SGK web sayfalarında serbest olarak gezmeleri istenmiş ve sonrasında belirlenen 4 görevi gerçekleştirmeleri istenmiştir. Kullanılabilirlik çalışması her katılımcıyla birebir yürütülmüş ve araştırmacı bir gözlem formu tutmuştur. Katılımcıların web sayfasındaki tüm işlemleri ve sesleri kaydedilmiştir. Katılımcılar görevleri gerçekleştirdikten sonra veri toplama araçlarını doldurmuşlardır. Katılımcıların web sayfalarıyla ilgili yararlılık ve kullanım kolaylığı algılarını ölçmek için Davis (1989) tarafından geliştirilen özgün formdan araştırmacı tarafından uyarlanan Teknoloji Kabul Ölçeği, göreve özel kullanılabilirliği ölçmek için Lewis (1991)'in geliştirdiği özgün formdan araştırmacı tarafından uyarlanan Senaryo Sonrası Anketi (SSA), katılımcıların web sayfasındaki işlemlerini kaydetmek için araştırmacı tarafından geliştirilen Gözlem Formu ve katılımcıların kişisel bilgileri ve bilgisayar kullanımları hakkında bilgi toplamak için Demografik Bilgiler ve Bilgisayar Deneyim Formu kullanılmıştır. Yapılan veri analizleri sonucunda kullanılabilirlik ve kullanıcı kabulü arasında anlamlı bir ilişki ortaya çıkmıştır. Araştırmada ayrıca kullanılabilirliğin e-devlet hizmetlerinin daha geniş kitlelere ulaştırılmasında önemli bir faktör olduğu bulgusuna ulaşılmıştır. Araştırma, e-devlet web sayfası yetkililerinin bu hizmetlerin tasarımına yönelik kararlar alırken kullanılabilirlik faktörünü dikkate almalarının gerekli olduğunu önermektedir.

Başka bir çalışmada ise çevrimiçi bir öğrenme ortamı olan Alternatif Web Kurs Yapılarının Kullanılabilirliği değerlendirilmiştir (Ingram, 2003). Araştırmacı tarafından oluşturulan çevrimiçi eğitim ortamlarının kullanılabilirliği oluşturulan görev listesi ile değerlendirmiştir. Çalışmada katılımcıların web ve internet bilgileri ve deneyimleri bir anket aracılığıyla toplanmış sonrasında rasgele bir şekilde katılımcıların belirlenen görev listesinde yer alan görevleri gerçekleştirmeleri istenmiştir. Katılımcılar tarafından uygulanan her aşama araştırmacı tarafından video kaydına alınmıştır. Çalışma temel kullanılabilirlik testinin özellikle biçimlendirici değerlendirmenin bir parçası olarak, tüm eğitim ve öğretim siteleri için büyük bir önem taşıdığını ortaya çıkarmıştır. Çalışma, web sayfalarının hazırlanırken öğrencilerin gözünden bakılarak hazırlanmasının öğrencilerin ders materyallerine olan konsantrasyonuna katkı sağladığını öne sürmektedir. Ayrıca çalışma sonucunda eğitsel sitelere kullanılabilirlik testinin nasıl uygulanacağı ve gelecekte bu tarz sitelerin oluşturulmasında hangi yolların izlenmesi gerekeceği ile ilgili öneriler sunulmuştur.

2010 yılında Rivera ve ark. popüler iki sosyal ağ sitelerinden biri olan Facebook ve MySpace'i tasarım ve kullanılabilirliğini sezgisel olarak değerlendirmişlerdir. Çalışma üç aşamadan oluşmaktadır. İlk kısımda sosyal medyanın tarihçesi, web tasarımında kullanılabilirlik, Nielsen'in (2005) sezgisel kullanılabilirlik yaklaşımından bahsedilmiştir. İkinci kısımda sezgisel kullanılabilirlik ve bunun kullanıcıların başarılarını artırmak için sosyal ağ sitelerine nasıl entegre edileceğinden bahsedilmiştir. Son olarak kullanılabilirlik sezgilerine dayalı Lund (2001) tarafından geliştirilen anket 35 katılımcıya uygulanmıştır. Uygulanan kullanılabilirlik anketi Facebook ve MySpace web sayfalarını sadelik, kullanışlılık, işlevsellik, tutarlılık, yeterlilik, tatmin, davranış bakımından değerlendirilmesini sağlamıştır. Çalışma sonunda iki web sayfası arasında önemli farklılıklar bulunmuştur. Yapılan analizler iki web sayfasının da tutarlılık ve yeterlilik açısından farklı olmadığını ancak Facebook'un 6 kullanılabilirlik faktörü açısından MySpace'e oranla daha kolay olduğunu ortaya çıkarmıştır.

Ersoy (2004) tarafından yapılan çalışmada Orta Doğu Teknik Üniversitesi (ODTÜ), Bilgisayar ve Öğretim Teknolojileri Eğitimi (BÖTE) bölümü 2003 yılı bahar döneminde "Programlama Dilleri II" dersi için geliştirilen çevrimiçi destek sisteminin kullanılabilirlik değerlendirmesi yapılmıştır. Çalışma kapsamında testin gerekliliği açıklanmış, testin planlanması ve uygulanması anlatılmış, karşılaşılan güçlükler ve izlenen stratejiler belirtilmiştir. İlgili çalışma 4 gözlemci tarafından 10 öğrenci ile birebir olarak gerçekleştirilmiştir. Katılımcılara web sayfasında gerçekleştirmeleri için 12 sorudan oluşan bir görev listesi verilerek veri toplama işlemi gerçekleştirilmiştir. Yapılan kullanılabilirlik testinin sonuçları, tasarımcıya site hakkında ve kullanıcılar hakkında önceden tahmin edemediği veya farklı düşündüğü konuları göstermiştir.

Wan Azlan Wan Hassan ve ark. tarafından 2011 yılında yapılan çalışmada Malezya Yüksek Öğretim Enstitüsü bünyesinde yer alan ve üniversite personeline yardımcı olmak (ders yönetimi, finansal bilgiler, konaklama ve diğer bilgileri bünyesinde barındıran) için geliştirilen akademik yönetim sisteminin kullanılabilirliğini; öğrenilebilirlik, verimlilik, hatırlanabilirlik ve memnuniyet açısından değerlendirilmiştir. Veriler 150 katılımcıya dağıtılan 5 kategori altındaki sorular aracılığıyla toplanmıştır. Elde edilen sonuçlar sistemin bir takım eksiklerini ortaya çıkarmış ve bu eksiklerin giderilmesi için bir takım öneriler sunmuştur. Bu tarz sistemlerin tasarım aşamasında özellikle son kullanıcının da fikirlerinin alınarak sistemin geliştirilmesi gerektiği öne sürülmüştür.

Literatürde kullanılabilirlikle ilgili başka bir çalışma da, George (2005) tarafından gerçekleştirilen Carnegie Mellon Üniversitesi Kütüphanelerinin web sayfasıyla ilgili çalışmadır. Araştırmada, web sayfasının tasarım aşaması öncesinde ve sonrasında çeşitli yöntemlerle değerlendirilerek eski ve yeni sitenin karşılaştırılması sağlanmıştır. İlgili çalışmanın uygulama boyutunda tasarım hazırlanma aşamasına geçmeden ihtiyaçların neler olduğunu öğrenmek için bir çevrim içi anket uygulanmıştır. Daha sonra tasarıma son şekli verilerek uygulanan kullanıcı testleri ile süreç tamamlanmıştır. Tasarımın güçlü ve zayıf yönlerini ortaya çıkarabilmek için katılımcılara görev listeleri verilerek bu işlemleri sesli düşünerek gerçekleştirmeleri sağlanmıştır. Çalışma bulguları, sesli düşünme sırasında verilen cevaplarda web sayfasında çok önemli bir sorunun olmadığını ortaya çıkarmıştır. Ancak tasarım yönünde bazı değişiklikler olmuş (yazı tipi, font ve renk gibi) bunlarda katılımcıların istekleri doğrultusunda düzeltilerek daha kullanılabilir bir web sayfasının ortaya çıkması sağlanmıştır.

İlgili alan yazında çalışmalardan biri de Ballard (2010) yapılan bir doktora tezidir. ABD'de bir devlet üniversitesinde uzaktan eğitim programındaki altı çevrim içi ders sayfasının kullanılabilirliği araştırılmıştır. İlgili altı ders uzman ve uzman olmayan tasarımcılar ile ayrı ayrı tasarlanmıştır. Çalışmaya 74 öğrenci katılmıştır. Çalışmadaki veriler nicel ve nitel ölçme araçları ile toplanmıştır. İlk olarak, altı dersin kullanılabilirlik standartları açısından Xerox Sezgisel Değerlendirme Kontrol Listesi (1995) ile veriler toplanmıştır. Daha sonra dersler başlamadan katılımcılara Eachus ve Cassidy (2006) tarafından geliştirilen Bilgisayar kullanım öz yeterlik ölçeği ön test olarak uygulanmıştır.

Stewart, Hong, ve Strudler (2004) tarafından geliştirilen Web tabanlı öğretimin kalitesi ölçeği dersler tamamlandıktan sonra öğrencilerin memnuniyet düzeylerini ölçmek için kullanılmıştır. 29 öğrenci ise sitenin kullanılabilirliği belirlemek için kullanılabilirlik laboratuvarında araştırmaya katılmıştır. İlgili laboratuvarda katılımcılar göz izleme yöntemi, sesli düşünme protokolleri, hata oranları ve görev tamamlama gibi teknikler uygulanmıştır. Çalışmadan elde edilen bulgulara göre, uzmanlar tarafından hazırlanan web sayfalarında kullanıcılar uzman olmayanlarca hazırlanan sitelere göre daha düşük hata oranı ve daha fazla memnuniyet düzeyine sahiptir. Ayrıca, görüşmelerden elde edilen nitel verilere göre uzmanlarca hazırlanan web sayfalarına dair daha olumlu olmuştur.

Lee (2000) tarafından yapılan çalışmada ise, coğrafik bilgi sistemleri web sayfasının kullanılabilirliği kullanıcıların verdikleri oy ve siteye giriş sıklığı açısından incelenmiştir. Veriler web ortamındaki bir anket aracılığı ile toplanmıştır. 51 katılımcı sitenin yüklenme zamanını ve kullanılabilirliğini kendilerine verilen beş görevle puanlamışlardır. Çalışma sonunda, sitede metinsel ifadelerin okunabilirliği ve aranılan bilginin kolay ulaşılabilir olmasının kullanılabilirliği olumlu yönde etkilediği bulgularına ulaşılmıştır. Elde edilen verilere göre, sitenin içeriğinin ortalama yüklenme zamanı site kullanılabilirliğine etkisi olmamıştır.

Bringula ve Basa (2011) tarafından yapılan bir çalışmada Filipinlerdeki bir üniversiteye bağlı fakülte web sayfasının kullanılabilirliğini etkileyen faktörlerin belirlenmesi amaçlanmıştır. Betimsel yöntemin kullanıldığı çalışmada veriler 82 öğretim üyesinden elde edilmiştir. Veriler çoklu regresyon ile analiz edilmiştir. Verilerden elde edilen bulgulara göre, Web sayfası tasarımıyla ilgili faktörlerden sadece bilgi içeriğinin ilgili sitenin kullanılabilirliğini etkilediği sonucuna ulaşılmıştır.

Literatürdeki başka bir çalışmada Hebb ve Adviser-Frick (2005) bir web sayfasının kullanılabilirliğini belirlemek için Ardışık Olasılık Oran Testi kullanmıştır. Çalışmada biçimlendirici değerlendirmenin amacı web sayfasındaki kullanılabilirlik sorunlarını açığa çıkarmaktır. Bununla birlikte, genel değerlendirme sırasında, birincil hedef web sayfası etkinliğini değerlendirmektir. Araştırmaya 25 lisans öğrencisi katılmıştır. Web sayfasının kullanılabilirliğini belirlemek için sesli düşünme protokolü yöntemi kullanılmıştır. Her katılımcı 120 web görevi arasından seçilen 20 görevi yerine getirmesi istenmiştir. Çalışmadan elde edilen bulgulara göre kullanılabilirlik testi yapılmadan önce siteyle ilgili temel sorunların bilinmesi gerekmektedir. Bir web sayfasındaki kullanılabilirlik sorunlarını açığa çıkarmak için daha fazla bilgiye ihtiyaç vardır.

Gülten ve ark. (2003) tarafından gerçekleştirilen çalışmada e-devlet uygulamaları kapsamında kamu Kurumlarına ait web sayfalarının geliştirilmesini sağlayacak bir grup değerlendirme kriterleri oluşturulmuştur. Değerlendirme kriterleri oluşturulurken World Wide Web Konsorsiyumunun "Web İçeriği Erişilebilirlik Rehberi Kontrol Listesi" ve Türkiye Bilimsel ve Teknolojik Araştırma Kurumu Marmara Araştırma Merkezi (TÜBİTAK-MAM) tarafından yayımlanan Kamu Kurumları İnternet Sitesi Kılavuzundan yararlanılmıştır. Araştırmada 24 Kamu Kurumunun web sitesinin ana sayfası (16 Bakanlık ve sekiz Genel Müdürlük/ Başkanlık) sekiz kategori altında toplam 30 kriter açısından değerlendirilmiştir. Araştırma bulguları kamu web sayfaları genel özellikler açısından çoğunlukla belirlenen kriterleri karşılarken, hizmet sunumu, teknik özellikler ve etkileşimli hizmetler konusunda kayda değer oranda eksiklikler göstermektedirler.

Işık ve ark. (2011) Gazi Üniversitesi Bilişim Enstitüsü web sayfasının kullanılabilirlik analizini WAMMI kullanılabilirlik anketini kullanarak 90 katılımcıya uygulamışlardır. Kullanılabilirlik analizinin yanı sıra web sayfasının tasarım ve performans analizi için "HTML Toolbox" ve "Web Page Analyzer" araçları kullanılmıştır. Verilerin analizleri SPSS'de bulunan betimlemeli istatistik, korelasyon, bağımsız örneklemeli t-testi ve tek yönlü varyans analizi teknikleri kullanılarak yapılmıştır. Yapılan analizler web sayfasının kullanılabilirliğinin orta düzeyde olduğunu ortaya çıkarmıştır. Katılımcılar, web sitesinin ilgi çekiciliği ve etkinliği hususunda olumlu yanıtlar vermişler ancak kontrol edilebilirlik, yardım etme ve öğrenilebilirlik konularında kararsız kalmışlardır. Yapılan çalışma da demografik anket bilgileri de değerlendirilmiştir. t- test analizlerine göre bay öğrencilerin bayan öğrencilere göre web sayfasını daha etkin kullandıkları sonucu elde edilmiştir. Katılımcıların internet kullanma yılı arttıkça web sayfasında istedikleri bilgiye daha kolay ulaştıkları sonucu yapılan analizlerden bulunmuştur. "HTML Toolbox" ve "Web Page Analyzer" hazır araçları kullanılarak yapılan analizler sonrasında resim sayısı, boyutlarının fazla olduğu ayrıca yazım hatalarının mutlaka azaltılması gerekliliği de vurgulanmıştır.

Karahoca ve ark. (2009) geliştirdikleri web tabanlı sınav otomasyon sisteminin öğrenilebilirlik, kontrol edilebilirlik ve tasarım faktörleri açısından sistem kullanılabilirliğini geliştirdikleri yapılandırılmış bir anket formu kullanarak tarama modelli bir araştırma ile incelemişlerdir.. Araştırma meslek liselerinin bilişim teknolojiler ve inşaat teknolojisi bölümünde öğrenim gören 52 öğrencinin katılımı ile gerçekleştirilmiştir. Çalışma sonucunda; öğrenilebilirlik, kontrol edilebilirlik ve tasarım ile memnuniyet derecesi arasında önemli ilişkiler bulunmuştur. Ayrıca kullanılabilirliğe ilişkin öğrenilebilirlik faktörü ile kontrol edilebilirlik faktörü arasında pozitif ve güçlü bir ilişkinin olduğu da ortaya çıkmıştır. Öğrencilerin okudukları bölüm ile kullanılabilirliğe ilişkin öğrenilebilirlik düzeyi arasında ($p<0.01$) dikkate değer bir ilişki de saptanmıştır.

Başka bir çalışmada ise, Dalcı ve ark. (2008) ODTÜ Kütüphanesi web sayfasının eksik yönlerini belirleyerek hedef kitle doğrultusunda seçilen 8 kullanıcıya bir takım görevler vererek ilgili web sayfasının kullanılabilirlik çalışmasını gerçekleştirmişlerdir. İlgili çalışmada arayüzde sorunlu yerleri test edebilmek için kullanıcıların nereye, ne kadar süre baktıkları bilgisini veren bir göz izleme cihazı kullanılmıştır. Ek olarak klasik kullanılabilirlik çalışması olarak adlandırılan kullanıcıların sesli düşünmesi, görevi gerçekleştirme süresi ve hata sayıları ile hatanın oluştuğu yerlerin kaydedilmesi gibi yöntemler kullanılmıştır. Çalışma sonucunda hazırlanan yeni arayüzün bazı küçük sorunlar dışında oldukça etkili ve verimli olduğu ortaya çıkmıştır. Kullanıcıların geri bildirimleri ile bu sorunlar da düzeltilmiştir.

Karacan ve Demirtel (2009) tarafından yapılan bir diğer çalışmada Türkiye Tüketici Portalı (TTP) web sitesinin kullanımındaki mevcut durumun araştırılarak ve elde edilen çıktıların kullanılabilirlik açısından değerlendirilmesi ele alınmıştır. Bu doğrultuda çeşitli yaş, cinsiyet ve eğitim grubuna dâhil 15 katılımcı ile bir kullanılabilirlik çalışması gerçekleştirilmiştir. Bu çalışmada, belirlenen 15 katılımcının web sayfasının kullanımına yönelik 5 görevi gerçekleştirmeleri sağlanarak bu süreçteki göz hareketleri incelenmiş son olarak da web sayfasına ait kişisel görüşleri alınmıştır. Katılımcıların %92'si verilen görevleri gerçekleştirirken bunlardan %60,8'lik bir kısım verilen görevleri başarıyla tamamlamıştır. Eğitim düzeyi yüksek olan katılımcıların verilen görevleri daha kısa sürede gerçekleştirdikleri saptanmıştır.

Özçelik ve ark. (2006) göz hareketleri izleme sistemlerinden faydalanarak çeşitli üniversitelerin web sayfalarını incelemişlerdir. Bu çalışma 16 katılımcının değişik üniversite web sayfalarında farklı bilgileri ne kadar sürede, hangi başarı oranında bulduklarını ve bu süreçteki örüntüleri incelemiştir. Veriler ilgili göz hareketlerini izleme cihazı ile toplanmıştır. Çalışma sonunda elde edilen veriler web sayfasında sunulan bilgilerin sunulma şeklinin ve verilen görevlerin katılımcıların davranışlarını etkilediğini ortaya çıkarmıştır.

Uçak ve Çakmak (2009) yaptıkları çalışmada, web sayfalarının tasarımında ve kullanımında hazırlanan sayfaların etkinliğini ölçmek için gerçekleştirilen kullanılabilirlik çalışmalarını incelemişlerdir. Bununla birlikte çalışmalarında, Hacettepe Üniversitesi Bilgi ve Belge Yönetimi Bölümü web sayfasının kullanılabilirliğini ölçmeyi amaçlamışlardır. Farklı bilgi ve beceri düzeyine sahip 7 katılımcı ile gerçekleştirilen çalışmada nitel ve nicel yöntemler bir arada kullanılmıştır. Katılımcıların genel bilgi düzeylerini saptamak için ilk olarak bir ön test uygulaması yapılmıştır. Kullanılabilirlik testinin uygulaması aşamasında katılımcılara web sayfasının farklı bölümlerinin kullanımını gerektiren 14 soru yöneltilmiştir. Soruların yanıtlanması sırasında sesli düşünme tekniği ile elde edilen veriler, tıklama sayıları ve yanıtlama süreleri kaydedilmiştir. Son olarak katılımcılara son test uygulaması yapılarak web sayfası ile ilgili görüşleri alınmıştır. Çalışma bulguları şu şekildedir:

1. Kullanıcıların %71,4'ünün menüleri kısmen yeterli bulduğunu, %28,6'sının da menülerin yeterli olduğunu ortaya çıkarmıştır. Ayrıca web sitesinin içeriği ile ilgili olarak kullanıcıların %57,1'i web sitesinin kısmen yeterli içeriğe sahip olduğunu ve %42,9'unun ise web sitesinin içeriğinin yeterli olduğunu ifade ettiği görülmektedir.

2. Çalışma, kullanıcıların eğitimleri ile ilgili (dersler, sınavlar, danışmanlar vb. gibi) sayfaların bilgi ihtiyaçlarını ve beklentilerini karşılamaktadır.

3. Kullanıcılar web sayfasının alt yapısından ve hızından memnun oldukları görülmektedir.

4. Bazı linklere ait renklendirme yetersizliği, duyurular kısmında eski ve yeni duyuruların bir arada yer alması, bazı bilgiler için yeterli yönlendirmenin yapılmaması, arama butonunun olmaması ve menü altında yer alan bazı başlıkların mönü başlığı ile çok bağdaşmaması kullanıcılar tarafından dile getirilen şikâyetlerdir.

Durmuş ve Çağıltay (2011) ise yaptıkları çalışma ile Türkiye'deki 33 kamu kurumun web sitesini içerik analizi yoluyla değerlendirilmiş, sekiz kamu kurumunun da web sitesinin tasarımından sorumlu kişilerle görüşmeler gerçekleştirilmiştir. Değerlendirilen kamu kurumlarının elektronik hizmetleri, kullanılırken karşılaşılan problemler ve bu problemlerin sebepleri belirlenmiştir. Çalışma iki bölümden oluşmaktadır. Birinci bölümde, kullanıcı odaklı tasarım yaklaşımı temel alınarak hazırlanmış, web siteleri değerlendirme aracıyla belirlenen 33 kamu kurumu web sitesi değerlendirilmiştir. Çalışmanın ikinci aşamasında ise sekiz kamu kurumunun web sitelerinden sorumlu birimleri ile görüşülmüştür. Web sitelerini değerlendirmek için 18 bölüm ve 102 sorudan oluşan, TÜRKSAT'ın "Kamu Kurumları İnternet Sitesi Önerileri Rehberi – KAKİS" çalışmasından faydalanılmıştır. Çalışmanın ikinci bölümünü oluşturan kamu kurumlarının web sitelerini hazırlarken kullanıcıyı sürece hangi oranla dâhil ettiğini belirlemek için 4 bölüm ve 21 sorudan oluşan bir anket oluşturulmuştur. Çalışma sonuçları tasarımcıların kullanıcı merkezli tasarımla ilgili yaklaşımı kamu web sitesinin performansını etkilediğini ortaya çıkarmıştır. Değerlendirilen 33 kamu kurumu web sitesinin %51'inde içerik örgütlenmesinin problemli olduğu ve bu sitelerinde vatandaşların faydalanacağı hizmetlerin kolay ulaşabilir yerlerde olmadığı görülmüştür. İncelenen sitelerin %30'unda arama fonksiyonunun olmaması ya da etkin olmaması da kullanıcı açısından sorun teşkil etmektedir. Değerlendirilen birçok sitede gezinim sorunları mevcut olması kullanıcıların hatalı sayfalara yönlenmesine neden olmaktadır. Açılan sayfalarda başlık bilgisinin olmaması kullanıcının web sayfasında kaybolmasına neden olmaktadır. Değerlendirilen web sayfalarının erişilebilirlik sonuçları %60,5 olarak bulunmuştur. Görüşme yapılan yetkililer de bu durumu doğrulamaktadır. Değerlendirme de ortaya çıkan erişilebilirlik sorunları şu şekildedir:

1. W3C öncelik 1 standardına uyulmamaktadır.
2. Uygun yazı büyüklüğü kullanılmamıştır.
3. Alt metin kullanılmamaktadır.
4. Betik ve küçük uygulamalar (applet) ekran okuyucu tarafından okunulamamaktadır.
5. Form kullanımı problemlidir.
6. Geri bildirimler yeterli değildir.

Bir diğer çalışmada, Akıncı ve Çağıltay (2004) 6 e-devlet web sitesinin kullanılabilirliğini değerlendirmişlerdir. Çalışmada katılımcılardan belirli görevleri gerçekleştirmeleri istenmiştir. Bu görevleri gerçekleştirirken yapılan gözlem ve ses kayıtları sonucunda web sayfalarında karşılaşılan temel sorunları; menü tasarımı, bağlantı başlıkları, ana sayfada içerik tasarımı, çalışmayan arama kutuları ve aktif olmayan bağlantıların oluşturduğu bulunmuştur.

SONUÇ ve ÖNERİLER

Yapılan çalışma ile dünyada ve Türkiye'de çevrimiçi öğrenme ortamlarında yapılan çalışmalar ve çalışmalarda uygulanan kullanılabilirlik değerlendirme yöntemleri incelenmiştir. Özellikle Türkiye'de bu alanda yapılan çalışmalara bünyesinde İnsan Bilgisayar Etkileşimi Uygulama ve Araştırma Laboratuvarı'nı barındıran ODTÜ'nün öncülük ettiği görülmektedir. Laboratuvarda bulunan teknik donanım ve yazılımlar bu alanda yapılması düşünülen birçok çalışmada araştırmacılara büyük kolaylıklar sağlamaktadır.

İncelenen çalışmalar, kullanılabilirlik test yaklaşımları ve kullanılabilirlik test türleri olmak üzere iki başlık altında toplanmıştır. Çalışmalar, kullanılabilirlik test yaklaşımları açısından ele alındığında büyük bir kısmının kullanılabilirliğinin kullanıcı testleri ve uzman temelli yaklaşımla değerlendirdiği görülmektedir. Bunun aksine birkaç çalışmada rehber temelli yaklaşım ve model temelli yaklaşıma göre kullanılabilirlik değerlendirmesi yapıldığı görülmektedir. Kullanılabilirlik test türleri açısından ele alındığında ise daha çok süreç sonu testler (Summative/Metrication)'den faydalanıldığı görülmektedir.

Yapılan inceleme sonucunda, çevrim içi ortamlarda tek bir değerlendirme yöntemi yerine birden fazla değerlendirme yönteminin uygulanmasının ilgili ortamın daha kullanılabilir hale gelmesinde önemli rol oynayacağı düşünülmektedir. Çalışmaların test türü açısından değerlendirilmesinde ise sadece süreç sonu testler değil aynı zamanda süreç içi testlerinde olabildiğince fazla uygulanmasının geliştirilen ürünün kullanılabilirlik faktörünü daha da olumlu seviyelere getireceği düşünülmektedir. Hızla gelişen internet ve web teknolojisinin kullanıcılar için daha kullanılabilir hale gelmesi için yapılan çalışmaların ODTÜ dışında başka kurumlarda da gerçekleştirilmesi bu konuda yeni laboratuvarların kurulmasının bu alanda daha kapsamlı çalışmaların ortaya çıkmasını sağlayacağı düşünülmektedir.

ÖZET: Birçok araştırmacı bireyin performansı ile bir problemi çözmesi arasında güçlü bir ilişki olduğunu savunmaktadır. Onlara göre performans, "öğrencinin açık uçlu bir problemle karşılaştığında, problemi çözmek için, çeşitli çözme yaklaşımları denemesi, sentezleme yapması ve ulaştığı sonuçları değerlendirmede ortaya koyduğu etkinlikler bütünüdür"(Shavelson, Baxter and Pine, 1991; Wiggins, 1989; Slater, 2007: s. 7 deki alıntı). Bu anlamı ile, öğrencilerin performans düzeylerinin geliştirilmesi, onların okulda sıra dışı problem çözme becerilerinin gelişim düzeyinin ve dolayısıyla gerçek hayattaki başarılarının arttırılmasına denk olarak alınabilir. Bu çalışmada, performans ölçümünde kullanılmak üzere çok sayıda rutin olmayan (sıra dışı) problem incelenmiş ve uzman görüşü alındıktan sonra ölçme aracında kullanılmak üzere seçilmiştir. Seçilen problemler oluşturulan rubrike (derecelendirmeli puanlama anahtarı) uygun olarak çözülmüştür. Daha sonra bu problemlerden oluşan ölçme aracı, İzmir İli'nde yer alan bir devlet anadolu lisesinin 9. sınıfına devam eden 29 öğrenciye uygulanmıştır. Elde edilen bulgular öğrencilerin performans düzeylerinin oldukça düşük olduğu yönündedir.

Anahtar sözcükler: performans ölçümü, rutin olmayan matematik problemleri.

ABSTRACT: Many researchers advocate that there is a strong relation between individual performance and solving a problem. According to them, when student encounters an open ended problem, to solve a problem, attempts various problem solving approaches, syntheses and evaluates reached findings. All these activities are named as a performance (Shavelson, Baxter and Pine, 1991; Wiggins, 1989; as cited in Slater, 2007: p. 7). In this sense, improvement of students' performans level, equivalently admissible as their non-routine problem solving ability improvement level and so advancement of real life achievement. In this study, to assess performance, lots of non routine problems were examined and selected after expert opinion. Then selected problems were solved according to created rubric. Subsequently, assessment tool which consisting of these problems, applied 29 high school students attending 9th grade in an anatolian high school in İzmir. Acquired findings show that students performance level is very low.

Key words: performance assessment, non- routine math problems.

GİRİŞ

Eğitim sistemlerinin ana hedeflerinden biri bireylerin " *yalnızca okul testinden başarılı olmasını değil yaşamda başarılı olmasını sağlamaktır*"(Alkan,2008). Okuldaki akademik başarı, edinilen kazanım ve beceriler, yaşamdaki olası başarının bir hazırlık dönemi ve geleceğe dönük bir gösterge olarak düşünülmelidir. Kısaca bireylerin çalışma alanlarında başarılı olması doğrudan doğruya, aldığı eğitimin düzey ve niteliğine, edindiği kazanımlara ve geliştirdiği değişik yönlü becerilerine bağlıdır. Aynı zamanda bireysel başarı, tüm bu kazanım ve edinimlerin uygulamaya dönüştürülmesi, yerinde kullanabilmesi ile de ilgilidir. Daha açık söylemek gerekirse, iş yaşamında başarılı olmak, karşılaşılan bir problem ya da çıkmaz durumunda bireyin edinimlerini doğru kullanmasını, kuramsal bağlantıları doğru kurmasını ve uygun sonuçlara ulaşmasını gerektirmektedir. Sıralananlar çalışma alanı ne olursa olsun, herkes için geçerlidir ve sıradandır. Ancak unutulmamalıdır ki en iyi, en yararlı ve en çekici olan sonuca ulaşmak, sıradan davranışların dışında bireysel farklılıkları da gerektirir. Başka bir deyişle bu noktada bireysel performans düzeyi işin içine girer.

Günümüz insanında değişik nitelik ve becerilerin birlikte bulunmasından söz edilmektedir. Bunların başında örneğin; "Problem çözme için bilgi toplama ve düzenleme becerisi", "araştırma yapma ve yönetme becerisi", "verileri analizleme ve sentezleme becerisi", "bilgiyi yeni durumlara uygulama ve uyarlama becerisi", "bireyin kendi öğrenme ve performansını izleme ve geliştirme becerisi", " değişik biçimlerde iyi iletişim kurma becerisi", "birlikte çalışabilme ve bağımsız öğrenebilme becerisi" gelmektedir (Darling-Hammond, L.&McCloskey, L.; 2008). Belki bu nedenle ve tüm işsizliğe karşın, gerek Türkiye'de, gerekse diğer dünya devletlerinde nitelikli insan ve iş gücü açığı kapatılamamaktadır. Arzulanan hem planlı eğitim sürecinde hem de meslek içi eğitim süreci boyunca, bireylerin her yönü ile verimli kimseler konumuna gelebilmesi ve gözlenen açığın kapatılabilmesidir. Kuşkusuz bu beklentiler kısa sürede gerçekleşebilecek yapıda değillerdir. Ancak uzun soluklu bilinçli ve planlı bir çalışma süreci sonunda bu alanlarda başarı sağlanabilir. Vurgulandığı gibi bu sürecin en önemli ayağı planlı öğretimdir. Daha da özelleştirirsek planlı zorunlu eğitim sürecidir. Çünkü bireylerin temel davranış ve becerileri esas bu süreçte şekillenmektedir. Bunun doğal bir sonucu olarak, günlük yaşamdaki bireysel başarı ortaya çıkmaktadır.

Özetlersek birey, eğitimi sürecinde ve meslek içi eğitimi boyunca, belli kazanım ve becerileri edinmeli ve yaşamında bunları en iyi biçimde kullanabilmelidir. Öyleyse öğrencinin eğitim sürecinde sıralanan niteliklerin tümünü ve doğru biçimde edindiğinden emin olmak gerekir. Edinimlerin göstergeleri ölçme ile ortaya konduğuna göre, eğitim süreci boyunca ölçmenin olabildiği ölçüde eksiksiz yapılması gerekir. Yani ölçme ve değerlendirmenin en az hata ile gerçekleştirilmesi zorunluluk gösterir.

Eğer okuldaki ölçme, bireyin yaşamındaki olası başarısından bağımsız gibi algılanır ya da "okul testinden başarı" akademik başarı için yeterli görülürse, korkulur ki yaşamda başarısızlık kaçınılmaz olabilir. Bu konuda, vurgulananı destekleyici birçok çalışmaya rastlanmaktadır. Örnek olarak Baker'ın çalışması alınabilir. "*Öğrencilerin okulda edindiği bilginin düzeyi ve türü sıkça tartışılmaktadır. Yapılan ulusal ve uluslar arası çalışmalar, öğrencilerin bilgi ve beceri düzeylerinin düşük olduğunu göstermektedir. Dahası, öğrencilerin iş dünyası için yeterince iyi olmadığı görüşü Amerikan iş ve sanayi hayatında daha sık tartışılır duruma gelmiştir. Bu endişeler nedeniyle, aşağı yukarı on yıldır, öğrencilere ne öğretildiği ve öğrenme düzeylerinin nasıl ölçüldüğü konusunun yeniden yapılandırılması için çaba harcanmaktadır*" (U.S Department of Labor, 1991, 1992; Baker, L., 1997: s. 1 deki alıntı).

Amerika Birleşik Devletleri'nde yapılan bu çalışma ve geliştirilen öneriler ülkemiz için de geçerli gibi görünmektedir. Ölçme aracı olarak değişik test türlerinden yararlanmayı gelenek haline getirmiş eğitim sistemimiz ile yetiştirilen öğrenciler, gerçek anlamda kapalı ya da açık uçlu bir problemi çözmeden zorunlu eğitimlerini tamamlamaktadırlar. Aynı biçimde lise eğitimleri boyunca üniversiteye giriş sınavlarına odaklanarak dört yıllarını geçirmektedirler. Dolayısı ile "çoktan seçmeli", "doldurmalı" gibi test soruları dışındaki sorular ile karşılaştıklarında sıkıntıya düşmektedirler. Oysa örneğin PISA matematik soruları öğrencilerin, gerçek yaşam ile ilgili matematiksel problemlerle yüzleşmesini gerektirmektedir. Öğrenciyi araştırma yapmaya zorlamaktadır. Bu tür problemleri çözmek için matematiksel düşünme ve belli becerileri harekete geçirmek şarttır. Çünkü öğrenci gerçek bir problemle karşılaştığında, çözüm sürecini planlayabilmelidir. Bunun için gerekli matematiksel ön öğrenmeleri belirlemeli ve ardından problemi gerçek hayat durumundan ayırarak, varsayımlarda bulunarak ve genelleme yaparak bilgiyi biçimlendirmelidir. Daha sonra değişik yolları deneyerek, problemin dili ve matematiksel dil arasındaki ilişkiyi görmeli, uygun düzen ve modelleri aramalı, bilinen yol-yöntemden de yararlanarak problemi matematiksel modellemelidir. En son oluşturduğu modelin matematiksel yapısını çözülebilirlik koşullarını belirleyerek, çözüme yatkın hale getirmelidir (Programme for International Student Assessment, 2004: 40). Görüldüğü gibi burada önerilen ölçme sorusu ve süreci ile bizim testten yararlanarak yaptığımız ölçme arasında ortak nokta hemen hemen yok gibidir. Yani bu ölçme türü bizim öğrencilerimize çok yabancıdır.

Marzano ve arkadaşları, ölçme ile ilgili yaptıkları bir araştırmada, bin dokuz yüz seksenli yıllarda, eğitimde ölçme alanında önemli değişimlere gerek duyulduğunu ortaya çıkarmışlardır (Archbald and Newmann 1988, Shepard, 1989; Marzano vd., 1993:s.9'daki alıntı). Bu çalışmaların oluşturduğu değişim tabanında ölçmenin yalnız geniş ölçekteki standardize testlerle yapılamayacağı vurgulanmaktadır. Ölçmenin, eğitim süreci boyunca ve her düzeyde yapılması gerektiği netleştirilmektedir.

Amerika Birleşik Devletleri'nde 1970'lerde başlayan eğitimde reform hareketi, öğrencilerin bilgilerini kullanmaları ve yeterlilik testlerinden başarılı olmalarının önemini vurgulamıştı. Oysa 1990'larda başlayan yeni eğitimde reform hareketi daha gelişmiş eğitim hedeflerine ve daha yüksek standartlara odaklandı. Ülkenin eğitim hedefi, Amerika Birleşik Devletleri'ni, 2000'li yıllarda dünyada en iyi konumlardan birine ulaştırmaktı (Bush, 1991; Marzano vd., 1993:s.9 daki alıntı). Bunun için eğitimde ölçme sisteminin değişmesi gerektiği öne çıktı. Çalışmalarda daha somutlaşmalara gidilerek öğrenci kazanımlarının net olarak ortaya konabildiği, performans ölçümüne geçilmesi gerektiğine vurgu yapıldı. ABD'de düzenlenen "Ulusal Eğitim Hedefleri Panelinde "(1991), yetkililer ulusal ve eyaletler düzeyinde öğrencilerin hedefe yönelik başarılarını izlemekle yükümlü kılındı. Derlenecek sonuçlara göre öğrenci gelişiminin belirlenebilmesi için öğrenme standartlarının ortaya konması istendi. Aynı zamanda tam öğrenmenin göstergeleri sayılan, tüm alanı kapsayan derin alan bilgisi, problem çözme becerisi ve bu yeterliliklerin nasıl ölçüleceğini ortaya koyan ölçme araçlarının belirlenmesi gereği netleştirildi(Niemi, 1997:247). Tüm bu sonuç ve yaklaşımlar, eğitimin istenen hedeflere ulaşılabilmesi ve bu süreçte öğrenci gelişiminin gözlenebilmesi için, öğrencinin akademik performans ölçümünün gerekliliğini netleştirdi.

Birçok araştırmacı bireyin performansı ile karşılaştığı problemi çözmesi arasında birebir ilişki olduğunu savunmaktadır. Onlara göre performans, "öğrencinin açık uçlu bir problemle karşılaştığında, problemi çözmek için, çeşitli çözme yaklaşımları denemesi, sentezleme yapması ve ulaştığı sonuçları değerlendirmede ortaya koyduğu etkinlikler bütünüdür"(Shavelson, Baxter and Pine, 1991; Wiggins, 1989; Slater, 2007: s. 7 deki alıntı). Benzer bir yaklaşımda, öğrencilerin çözümü gereken bir problemin yanıtlarını kendilerinin oluşturmaları ya da bilgi ve becerilerini sergileyerek ürün ortaya koymaları, performansları ile açıklanabilir denmektedir (OTA, 1992. 16; Elliott, 1997:s. 5'deki alıntı). Bu yaklaşımlarda bilinen problem çözme basamaklarının kullanımı yanında, strateji belirleme, modelleme ve muhakeme gibi bireysel farklılıkları öne çıkaran nitelikler de vurgulanmaktadır.

Yapılan çalışmalar salt bir ürüne ya da düşünceye odaklanmamaktadır. Tersine ürün ya da düşüncenin ortaya konması, oluşum sürecinin açıklanması ve gerektiğinde savunulması da söz konusudur. Burada olay, olgu ya da karşılaşılan bir problemin algılanmasından başlayan ve yeni bir sonuca giden her aşamanın açıklanması dile getirilmektedir. Aslında kavramları açıklama ve sürecin her basamağını doğrulama becerisi, bireyin alan bilgisinin ayrılmaz bir parçası olarak tanımlanmaktadır (American Association for the Advancement of Science, 1993; NCTM, 1989; Niemi, 1997:s. 243'deki alıntı).

Performans ölçümünde kullanılabilecek problemler sıradan(rutin) olmayan problemlerdir. Çünkü bu tür ve "Açık uçlu problemlerin" çözümü, birden çok doğru cevabı içerebilir ve öğrencinin çözüm için çok yönlü yaklaşımlar denemesine fırsat sağlar" (Hancock,1995; Chan, 2007:s.2'deki alıntı). Açık uçlu problemler ise Foong'a (2002) göre hastalıklı yapıya (ill-structured) sahiptirler. Çözümlerini garantileyen belli bir çözüm yöntemi yoktur ve bireysel varsayımlar içerirler (Foong, 2002; Chan, 2007: s.2'deki alıntı). Buna karşılık "Öğretmene, öğrencilerinin problem çözme sürecini nasıl gerçekleştirdiği konusunda anlamlı bilgi sağlarlar" (Van den Heuvel-Panhuizen, 1996; Chan, 2007: s.2'deki alıntı). Özet olarak sıradan olmayan ve açık uçlu problemlerin çözüm süreci ile bireysel performans ölçümü arasında yakın ilişki vardır.

Günümüzde bilgiye ulaşmak teknolojinin de gelişimi ile daha kolay bir hale gelmiştir. Önemli olan bireyin bilgisini nasıl kullandığıdır. Bilgisini doğru kullanan ve değişik şeyler üretenler öne çıkmaktadır. Yani, "bireysel farklılıklar" önem kazanmaktadır. Aynı problemi daha kısa sürede, daha az emekle ve daha ekonomik çözenler aranmaktadır. Bu nedenle ana amaç üst düzey verimlilik olarak ortaya konmaktadır. Bireyin verimli, okul ve gündelik yaşamda başarılı olmasının değişmez koşulu ise kendine güven duymasıdır. Beklenen, kendine güvenen kimsenin karşılaştığı problemleri de çözebileceği yönündedir. Öte yandan bir problemin çözümüne etkin olarak katkıda bulunmak öğrenciyi üst düzey düşünme ve üretkenlik konusunda yüreklendirir (Dyer & Moynihan, 2000). Bu yönü ile problem çözerek performans ölçümü bireye öz güven kazandırır. Bireysel farklılıkları öne çıkarma amaçlı performans ölçümünde, " üst düzeyde bilişsel kapsam, iletişim, gerçek yaşam uygulamaları" aranır. Buna ek olarak eğitimde, " öğrencinin kullandığı zaman ile harcadığı çaba arasındaki ilişkiler ve öğretmenin not verme sürecinde doğru karar vermesi" önemli sayılır(Palm, 2008).

Performans ölçümünde önemli olan, ölçme araçları ile performans bileşenlerinin doğru ilişkilendirilmesidir. Performans değişkenlerine en uygun ölçme aracı problemler olarak görülmektedir. Problem çözme sürecinde yer alan basamaklar, öğrencinin performansını açığa çıkarmada ideale yakın ödev üstlenirler. Özellikle problem geliştirme de ölçmeye katıldığında, tüm performans bileşenleri ile problem çözme adımları kolayca ilişkilendirilebilmektedir.

Problem çözüm basamakları doğru düzenlenir ve her basamaktaki öğrenci davranışları net tanımlanabilirse, performans ile problem çözme ilişkisi kolayca kurulabilir. Bu amaçla Marzano'nun (1993) önerdiği dört adımlı derecelendirmeli puanlama anahtarı (rubrik) kullanılabilir(bkz. Şekil 1).

Şekil 1: Problem Çözme İçin Dereceli Puanlama Anahtarı (Rubrik)

puan	**Problemi anlama, sınırlılık ve zorluklarını belirleme .**
4	Problemin ana yapısını ve sınırlamalarını tam olarak tanımlar ve açık olmayan sınırlılıkları da gösterir.
3	Problemin ana yapısını ve sınırlılıklarını tam olarak tanımlar.
2	Problemin birtakım yanını ve sınırlamalarını eksik tanımlar.
1	Problemin birçok yanını ve sınırlamalarını ortaya koyamaz.
Problemi çözebilmek için uygulanabilir ve tutarlı çözüm yolları sunma.	
4	Tartışılmakta olan problem için, yaratıcı ve kullanılabilir çözümler tanımlar. Çözümler kritik noktaları hedef alır.

3	Problemin ana kritik noktalarını içeren farklı çözüm yolları sunar.
2	Problemin bazı kritik noktalarını içeren çözüm yolları sunar.
1	Problemin kritik bölümlerini içermeyen çözüm yolları sunar.
Çözüm yollarını seçme ve yeterli miktarda deneme yapma.	
4	Seçtiği alternatif çözümleri; etkin, geçerli ve ayrıntılı biçimde dener. Kullandığı problem çözme denemeleri ile problem çözme bilgisi arasında tam bir bağlantı kurar.
3	Seçtiği alternatif çözümlerin doğru ve yararlı olduğunu ortaya koyar.
2	Tam sonuç getirmeyen çözüm yolları dener ve bu problemin bazı elemanlarını ya hiç kullanmaz ya da eksik kullanır.
1	Başarılı olmayan çözüm yolları seçmiştir.
Farklı çözüm yolları denendiğinde, neden o çözümlerin seçildiğini açıklama ve tartışma. Hangi yaklaşımın daha kapsamlı ve yararlı olduğunu ortaya koyma.	
4	İkincil çözümlerin seçimlerine yol açan muhakemenin geniş kapsamlı, net bir özetini sunar. Bu özet, seçilecek alternatifleri ve hangi alternatifin çözüm olarak kabul edileceğini gösteren kararları içerir.
3	İkincil çözümlerin yapısını tanımlar. Bu tanım farklı çözümlerin yapısını açık ve net biçimde ortaya koyan kesin seçimdir.
2	İkincil çözümlerin yapısını tanımlar. Fakat bu tanımlama ikincil çözümlerin gerçek yapısını ortaya koyamaz.
1	Farklı çözüm yollarının birbirlerine göre önemini belirlemede mantıklı yöntemler tanımlayamaz. Öğrenci denenmiş ve vazgeçilmiş alternatif çözümlerin eksik ve güçlü taraflarını sergileyen mantıklı bir açıklama sunamaz.

Bir anlamıyla önceden verilen tanımların tümünü içeren yaklaşım Baker tarafından şöyle özetlenmektedir. Performans, "*öğrencilerin hedeflere yoğunlaşmaları, ön öğrenmelerini ve edindikleri yol-yöntem becerilerini kullanarak problem çözmeleri, gördüklerini ya da ulaştıkları sonucu analiz edebilmeleri ve başkaları ile paylaşabilmeleri demektir*" (Baker,1997:248).

Görüldüğü gibi rubriğin ilk adımında öğrencinin, problemi doğru anlaması, problemin sınırlarını, açık ve kapalı taraflarını, zorluklarını görmesi istenmektedir. Bu durum öğrencinin, konu ya da kavrama ilişkin edinmiş olması gereken ön öğrenmelerini ne ölçüde içselleştirdiği ile ilintilidir. Başka bir deyişle ilk basamakta başarılı olma, olay, olgu ya da problemi doğru anlama ve belli düzeyde ön bilgiye sahip olmayı gerektirmektedir.

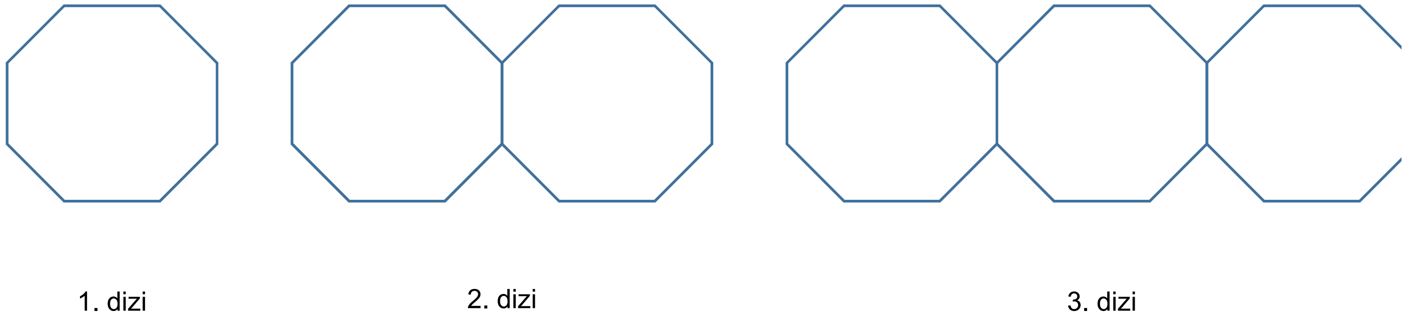
Rubriğin ikinci adımında, öğrencinin problemi çözebilmek için kritik noktaları hedef alan yaratıcı ve kullanılabilir çözüm yolları ortaya koyması istenmektedir. Bu bir yandan akıl yürütmeyi öte yandan da matematiksel bir model oluşturmayı gerektirmektedir. Çünkü öğrenci model oluşturarak, problemin kritik noktalarına vurgu yapar. Bağlantı kurarken gösterdiği yaklaşımlar da kullandığı stratejilere kanıt olur. Buna göre, öğrencinin, ikinci adımda başarılı olabilmesi, muhakeme yapabilme ve strateji geliştirebilme becerisi ile ilişkili olur.

Rubriğin üçüncü adımında, öğrencinin seçtiği alternatif çözümleri, etkin, geçerli ve ayrıntılı biçimde denemesi istenir. Deneme sonucu elde ettiği sonuçların koşullara uygun olup olmadığını değerlendirmesi ve karşılaştırması beklenir.

Dördüncü adım bireyselliğin daha çok öne çıktığı adımdır. Burada öğrenciden çözümü tartışması ve neden o çözüm ya da çözümleri seçtiğini açıklaması beklenmektedir. Buna ek olarak ulaştığı sonuçlardan çıkarımlarda bulunması istenir. Ulaştığı çıkarımlar ile problemi genişletme ve geliştirme çabaları sergilemesi arzulanır. Bu yolla, problemi günlük yaşamla ya da başka alanlar ile ilişkilendirme yolları açılabilir. Kısaca öğrencinin en azından, "eğer …olsaydı" gibi sorulara cevap arayarak çözdüğü bu problemi genişletmesi gerekir. Çıkarımda bulunma özünde, yaptıklarını açıklayabilme, yapılanları yaşama aktarabilme, bireysel yeteneklerini kullanabilme ve kendine güvenme bileşenleri ile ilişkili görülür.

Aşağıda, rubriğe uygun olarak çözülmüş bir problem örneklemesi yer almaktadır.

Problem: Aşağıda eşit uzunlukta çubuklarla oluşturulmuş sekizgen dizileri verilmiştir. Bu diziler bu şekilde devam ederse, 120. dizide kaç tane çubuk kullanılır?



Eş çubuklardan biri:

Rubrik

puan	1 - Anlama Adımı
4	**Verilen:** Sekizgen dizileri verilmiş. Birinci dizide 1 sekizgen, ikinci dizide 2 sekizgen olmak üzere, kaçıncı dizi yapılıyorsa o kadar sekizgen kullanılmış. **İstenen:** Bu şekilde diziler yapılmaya devam edilirse, 120. dizide kaç çubuk kullanıldığı soruluyor. **Koşul:** Birden fazla sekizgen yapılmışsa, yapışık sekizgenler için bir çubuk ortak kullanılıyor. **Sınırlılık:** kullanılan çubukların uzunlukları eşittir. Yani problem düzgün sekizgenlerle sınırlıdır. **Sorunun Açık Tarafı:** Verilen dizide kaç tane sekizgen bulunduğu bilinmektedir. **Sorunun Kapalı Tarafı:** 120. terimde kaç tane sekizgen ve kaç tane çubuk olduğu bilinmiyor. Bunun için bir model bulunmalıdır.
3	**Verilen:** Sekizgen dizileri verilmiş. Birinci dizide 1 sekizgen, ikinci dizide 2 sekizgen olmak üzere, kaçıncı dizi yapılıyorsa o kadar sekizgen kullanılmış. **İstenen:** Bu şekilde diziler yapılmaya devam edilirse, 120. dizide kaç çubuk kullanıldığı soruluyor. **Koşul:** Birden fazla sekizgen yapılmışsa, yapışık sekizgenler için bir çubuk ortak kullanılıyor. **Sınırlılık:** kullanılan çubukların uzunlukları eşittir. Yani problem düzgün sekizgenlerle sınırlıdır.
3	**Verilen:** Sekizgen dizileri verilmiş. Birinci dizide 1 sekizgen, ikinci dizide 2 sekizgen olmak üzere, kaçıncı dizi yapılıyorsa o kadar sekizgen kullanılmış. **İstenen:** Bu şekilde diziler yapılmaya devam edilirse, 120. dizide kaç çubuk kullanıldığı soruluyor. **Sorunun Açık Tarafı:** Her dizide kaç tane sekizgen bulunduğu bellidir. **Sorunun Kapalı Tarafı:** 120. dizide kaç tane sekizgen olduğu bilinmiyor. Bunun için bir model bulunmalıdır.
2	**Verilen:** Sekizgen dizileri verilmiş. Birinci dizide 1 sekizgen, ikinci dizide 2 sekizgen olmak üzere, kaçıncı dizi yapılıyorsa o kadar sekizgen kullanılmış. **İstenen:** Bu şekilde diziler yapılmaya devam edilirse, 120. dizide kaç çubuk kullanıldığı soruluyor. **Koşul:** Birden fazla sekizgen yapılmışsa, yapışık sekizgenler için bir çubuk ortak kullanılıyor.

2	**Verilen:** Sekizgen dizileri verilmiş. Birinci dizide 1 sekizgen, ikinci dizide 2 sekizgen olmak üzere, kaçıncı dizi yapılıyorsa o kadar sekizgen kullanılmış. **İstenen:** Bu şekilde diziler yapılmaya devam edilirse, 120. dizide kaç çubuk kullanıldığı soruluyor. **Sınırlılık:** Kullanılan çubukların uzunlukları eşittir. Yani problem düzgün sekizgenlerle sınırlıdır.
2	**Verilen:** Sekizgen dizileri verilmiş. Birinci dizide 1 sekizgen, ikinci dizide 2 sekizgen olmak üzere, kaçıncı dizi yapılıyorsa o kadar sekizgen kullanılmış. **İstenen:** Bu şekilde diziler yapılmaya devam edilirse, 120. dizide kaç çubuk kullanıldığı soruluyor. **Sorunun Açık Tarafı:** Her dizide kaç tane sekizgen bulunduğu bellidir.
2	**Verilen:** Sekizgen dizileri verilmiş. Birinci dizide 1 sekizgen, ikinci dizide 2 sekizgen olmak üzere, kaçıncı dizi yapılıyorsa o kadar sekizgen kullanılmış. **İstenen:** Bu şekilde diziler yapılmaya devam edilirse, 120. dizide kaç çubuk kullanıldığı soruluyor. **Sorunun Kapalı Tarafı:** 120. dizide kaç tane sekizgen olduğu bilinmiyor. Bunun için bir model bulunmalıdır.
1	**Verilen:** Sekizgen dizileri verilmiş. Birinci dizide 1 sekizgen, ikinci dizide 2 sekizgen olmak üzere, kaçıncı dizi yapılıyorsa o kadar sekizgen kullanılmış. **İstenen:** Bu şekilde diziler yapılmaya devam edilirse, 120. dizide kaç çubuk kullanıldığı soruluyor.

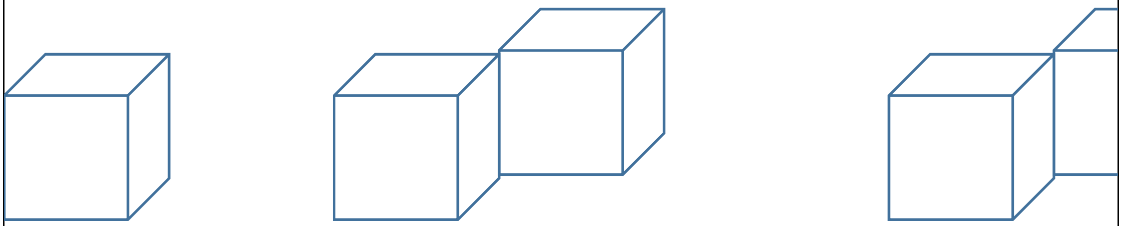
puan	
	2 – Bağlantıların Kurulması Adımı
4	 8 çubuk 15 çubuk 22 çubuk 7.**<u>1</u>**+1 7.**<u>2</u>**+1 7.**<u>3</u>**+1 Buna göre,

	n terimli dizi için 7.**n**+1 tane çubuk kullanılmalıdır.
3	Bağlantıda az eksiklikler vardır. Bağlantı tam kurulamaz.
2	Denemeler yapılır fakat bağlantı tam değildir.
1	Yaklaşım doğru değildir.

puan	**3 – Uygulama Adımı**
4	120. dizi istendiğine göre, 7.n+1 için n=120 verelim. 7.120+1=840+1=841 çubuk gereklidir.
3	Model bulunamaz, çubuklar tek tek sayılmaya çalışılır, 841'e bu şekilde ulaşılır.
2	Çubukları tek tek saymayı dener fakat tamamlayamaz.
1	İlk birkaç sekizgen için çubukları sayar.

puan	**4 – Çıkarımlar ve Geliştirme Adımı**
4	**Çıkarımlar:** 1- Doğru yerleştirme ile, az sayıda materyal kullanarak çok sayıda geometrik şekil elde edilebilir. 2- Sayı dizilerinin arasındaki ilişkiler araştırılarak, bu dizilerle ilgili bir kural bulunabilir. **Geliştirme:** **1-** Eşit uzunlukta kibrit çöpleri ile oluşturulmuş küp dizileri verilmiştir. Bu dizinin ilk üç terimi aşağıdaki gibidir. Buna göre, 100. dizide kaç kibrit çöpü kullanılır?

<table>
<tr><td></td><td>

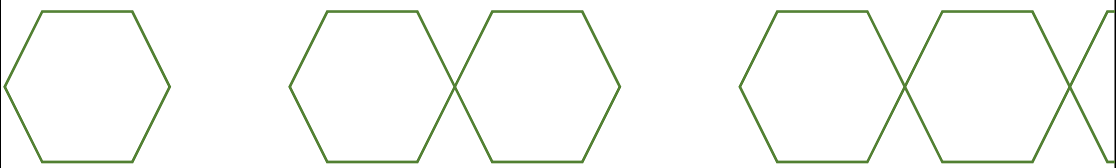


2- En az kibrit çöpü kullanmak ama yine yukarıdaki sayıda küp elde etmek isteseniz yukarıdaki küpleri sıralamak için nasıl bir yöntem bulabilirsiniz? Açıklayınız.
</td></tr>
<tr><td>3</td><td>
Çıkarım:

1- Sekizgenlerin farklı yerleşimleri ile, tüm sekizgenlerin kenar sayısından az çubuk kullanılarak çok sayıda sekizgen elde edilebilir.
2- Sekizgen dizileri arasındaki ilişkiler araştırılarak, 120. Dizide kaç çubuk olduğu bulunabilir.

Geliştirme:

1- Eşit uzunlukta kibrit çöpleri ile oluşturulmuş altıgen dizileri verilmiştir. Bu dizinin ilk üç terimi aşağıdaki gibidir. Buna göre, 100. dizide kaç kibrit çöpü kullanılır?

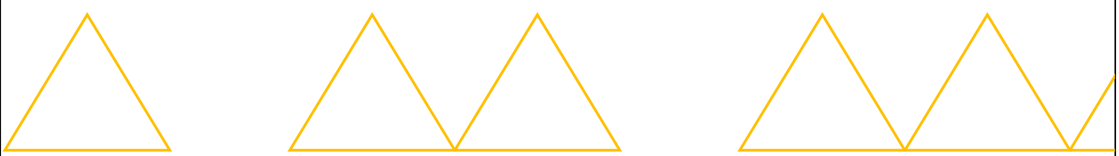


…

2- Altı tane eş uzunlukta çubuktan oluşan 7 tane düzgün altıgeni öyle bir yerleştiriniz ki, kullandığınız çubuk sayısı en az olsun.
</td></tr>
<tr><td>2</td><td>
Çıkarım: Sekizgenlerin uygun yerleştirilmesi ile, tüm sekizgenlerin kenar sayısından az çubuk kullanılarak çok sayıda sekizgen elde edilebilir.

Geliştirme: Üç adet eş çubuk ile oluşturulan 6 tane eşkenar üçgeni öyle bir yerleştiriniz ki, kullanılan çubuk sayısı en az olsun.
</td></tr>
<tr><td>2</td><td>
Çıkarım: Sekizgen dizileri arasındaki ilişkiler araştırılarak, 120. Dizide kaç çubuk olduğu bulunabilir.

Geliştirme: Eşit uzunlukta çubuklar ile oluşturulmuş kare dizileri verilmiştir. Bu dizinin ilk üç terimi aşağıdaki gibidir. Buna göre, 120. dizide kaç çubuk kullanılır?



…
</td></tr>
</table>

1	**Çıkarım:** Sekizgenlerin farklı yerleşimleri ile, tüm sekizgenlerin kenar sayısından az çubuk kullanılarak çok sayıda sekizgen elde edilebilir.
1	**Çıkarım:** Sekizgen dizileri arasındaki ilişkiler araştırılarak, 120. Dizide kaç çubuk olduğu bulunabilir.

Performans, öğrencinin bireysel farklılığını ortaya çıkarır ve bu yönüyle çok önemlidir. Eğitim psikolojisinde yapılmış bir araştırmaya göre, öğrenci geliştirilmiş çözüm yollarından birini seçmek yerine, kendi çözümünü kendisi sağladığında daha iyi öğrenir (Mayer, 1996; Baker, 1997'deki alıntı). Bu nedenle, öğrenci başarıları önceden hazırlanmış çoktan seçmeli testlerle değil, onu tamamen özgür bırakan problem çözme davranışlarıyla ölçülmelidir. Burada öğrencinin, kritik noktaları öne çıkarması ve yol-yöntem seçim becerileri gözlenebilir. Süreç boyunca öğrencinin yaratıcılığı desteklenebilir, öğrenci kalıpların dışına çıkmaya ve risk almaya yüreklendirilebilir. Dolayısıyla kendine olan güveni artırılarak performans gelişimine katkı sağlanabilir. Gerçekte, "akademik alanda kendini yetersiz hisseden ve okul ortamında kontrol edildiğini ve engellendiğini düşünen öğrencinin akademik motivasyonu azalır ve sonunda okul performansı da düşer" (Fortier ve diğerleri, 1995). Bunun engellenmesi gerekir. Bu yönü ile yaklaşıldığında, sınıfta yapılan etkinlikler öğrencinin bireysel yeteneklerini geliştirmek için fırsatlar sunabilir. Birlikte çalışmada gerçekleştirilen tartışma, akıl yürütme gibi beceriler birer örnek olarak düşünülebilir. Bu noktada öğretmenin öğrencilerine vereceği araştırma ödevleri önemli rol üstlenebilir. Bu süreçte öğrencilerden, kaynaklarda verilenleri aynen kullanma yerine, "kendilerinden bir şeyler katmaları" istenebilir. Öğretmen özellikle birlikte çalışmalarda, her öğrencinin aktif olmasını isteyerek ilk adımını atabilir. Gerçekten grup çalışmaları öğrencilerin kendi stratejilerini oluşturmaları için bir avantaj olabilir. Çünkü burada öğrenci verilen bir problemle uğraşırken, arkadaşlarının problem çözme sürecine de şahitlik edecektir. Bu durum öğrenciye yeni ufuklar açar, kendi stratejisini oluşturmasına yardımcı olur.

YÖNTEM

9. sınıf öğrencilerinin performans gelişim sürecini ortaya çıkarmayı amaçlayan daha büyük bir araştırmanın bir parçası olan bu çalışma, öncelikle rutin olmayan problemlerin seçimini ve sonrasında da öğrencilerin oluşturulan rubriklere göre bu problemleri çözüm süreçlerini ortaya koymayı hedeflemiştir. Çalışmada nicel ve nitel araştırma teknikleri birlikte kullanılmıştır.

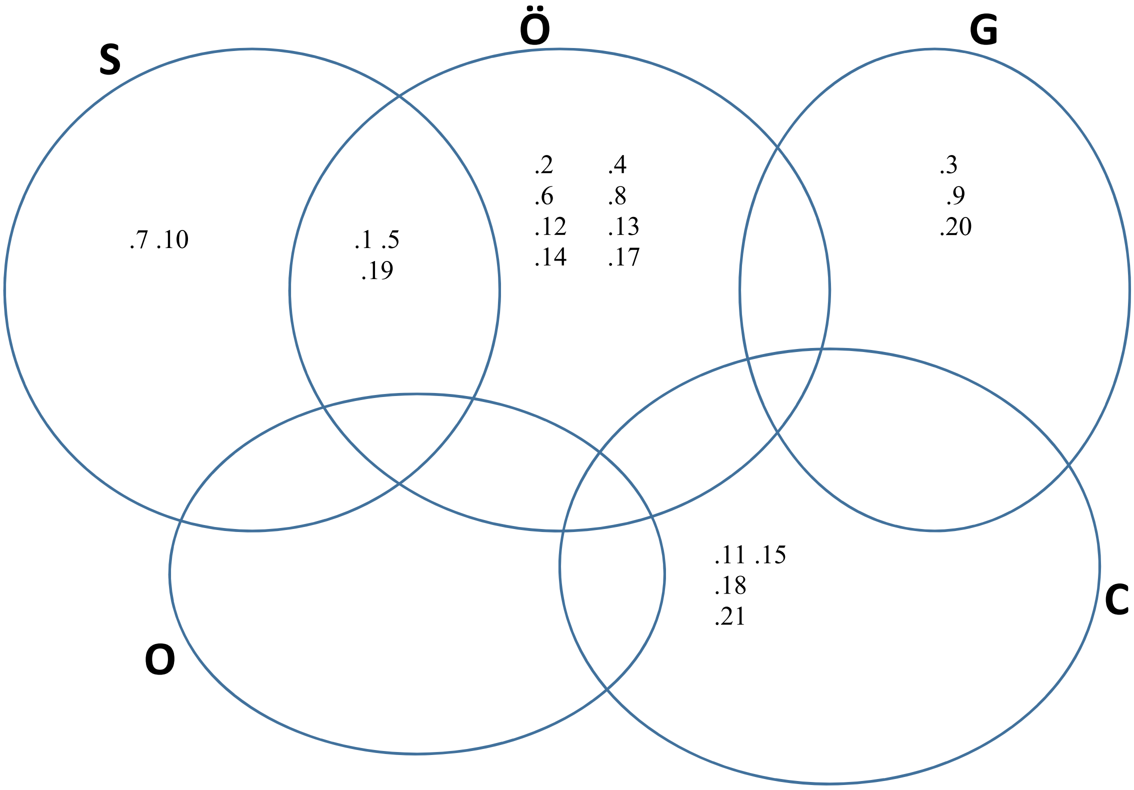
Katılımcılar

Çalışmanın katılımcıları, 2010-2011 eğitim-öğretim yılında İzmir İli sınırları içerisinde bulunan bir devlet Anadolu lisesinin 9. sınıfına devam eden 14'ü kız, 15'i erkek 29 adet öğrencidir. Uygulamayı yapabilmek için Milli Eğitim Bakanlığı'ndan izin alınmıştır. Uygulama anadolu lisesinde gerçekleştirildiği için seçilen öğrenciler, bakanlığın yaptığı SBS sınavı not ortalamalarına göre alınmıştır ve biri birine oldukça yakın düzeydedirler. Yani kayıtta kullanılan puan aralığı dar bir genlikte salınım göstermektedir. Okula kayıt yaptıran öğrencilerin aileleri de biri birine yakın sosyo-ekonomik düzeye sahiptir.

Uygulama Öncesi Yapılan Çalışmalar

Deney çalışmasına başlamadan önce ilk iş olarak, öğrencilerin 6. 7. ve 8. sınıfta girmiş oldukları seviye belirleme sınavına ait bilgileri derlenmiştir. Her öğrencinin bu sınavlardan kaç puan aldığı ve sınavların matematik bölümünde kaç doğru yanıtı olduğu belirlenmiştir. Bunlara ek olarak öğrencilerin 8. sınıftaki matematik dersi sene sonu not ortalamaları çizelgelenmiştir. Okul idaresinden sınıfların, her sınıfa her düzeyden öğrenci olacak biçim düzenleme yapıldığı derlenen bilgilere eklenmiştir. Uygulama bir Anadolu lisesinde gerçekleştirildiği için öğrencilerin liseye giriş puan aralığın dar genlikli olduğu gözlenmiş ve bu nedenle düzeyleri arasında aşırı fark olmaması beklentisine girilmiştir. İkinci aşamada, ön öğrenmelerini yoklamak ve olası eksiklerini belirlemek amacıyla, tüm öğrencilere düzey belirleme sınavı (DBS) uygulanmıştır. Geliştirilen bu sınavın soruları, Milli Eğitim Bakanlığı'nın 7. ve 8. sınıflar için gerçekleştirdiği "seviye belirleme sınavındaki" sorulardan esinlenilerek, çeşitli kaynaklardan (www.trmatematik.com, www.matematikcifatih.com, http://egitek.meb.gov.tr/Sinavlar/detay.asp? ID=21&ID2=1&ID3=44, 14.09.2011) yararlanılarak ve ilköğretim 6, 7, ve 8. programındaki tüm öğrenme alanlarını (MEB, 2005) kapsayacak biçimde titizlikle hazırlanmıştır. Sorularla ilgili uzman görüşleri doğrultusunda gerekli ekleme ve çıkarmalar yapılmış ve başlangıçta 50 soruluk test oluşturulmuştur. Geliştirilen DBS, 2009-2010 eğitim-öğretim yılında gerçekleştirilen pilot çalışmasında, 150 öğrenciye uygulanmıştır. Bu uygulamadan elde edilen verilerle, sınavın iç tutarlığı analiz edilmiş ve güvenirliği düşük maddeler testten çıkarılmıştır. Güvenirliği yüksek 23 maddelik test elde edilmiştir. Ölçeğin iç tutarlık katsayısı 0,822 olarak bulunmuştur. Buna göre ölçek yüksek düzeyde güvenilir sayılmıştır(Özdamar, 1999; Tavşancıl, 2006:s. 29'daki alıntı). Sınavın 2010-2011 eğitim öğretim yılında yapılan esas uygulamasında, 23 maddelik DBS'den, sıkıntılı olduğu düşünülen olasılık ve istatistik ünitesine ait iki soru daha atılarak 21 maddelik bir ölçek elde edilmiştir. Ayrıca sınav soruları, öğrencinin bilgisini daha iyi yansıtması amacıyla klasik sınava dönüştürülmüştür. Sınav sorularının görsel yapısı aşağıdaki şekilde verilmektedir.

Şekil 2: Öğrenme Alanları



SAYILAR: S
GEOMETRİ: G
ÖLÇME: Ö
OLASILIK ve İSTATİSTİK: O
CEBİR: C

DBS sonunda öğrencilerin ön öğrenmelerle ilgili eksiklikleri ortaya konulmuştur. Öğrencilerin en çok asal sayı kavramında hata yaptıkları, alan ve hacim kavramlarında sıkıntı duydukları belirlenmiştir. Bunların giderilmesi için konu tekrarı yapılmış ve temel kavramların kritik noktaları üzerinde durulmuştur.

Öte yandan öğrencilerin daha önce problem çözme sürecini tam olarak kullanmadıkları varsayılarak, sınıfta dört ders saati boyunca problem çözme örneklemesi yapıldı. Burada ana amaç, öğrencilerin ilk kez karşılaşacakları bu tür problemlere alışmasını sağlamaktı. Uygulamada öğrencilerle birlikte problem çözme adımları tek tek incelendi ve tartışıldı. Öğrenciden beklenenler, çözümde izlenecek yol-yöntem ve kullanılabilecek stratejiler açıklandı. Sınıfta çözülen problemler oluşturulurken, tek yönlü yaklaşımdan kaçınmak amacıyla bunların sözel, cebirsel ve geometri problemleri olmasına özen gösterildi.

Veri Toplama Araçları

Problem çözme basamakları ile performans göstergelerinin uyumluluğu göz önüne alınarak, öğrencilerin performans düzeylerini belirlemede problem çözme becerileri kullanılmıştır. Performans ölçümü için oluşturulan problemlerin hazırlanması aşamasında farklı kaynaklardan çok sayıda problem incelenmiştir (http://www.uky.edu/OtherOrgs/ARSI/www.uky.edu/pub/arsi/openresponsequestions/geometryorq.pdf, http://www.fi.edu/school/math2/index.html, http://www. webcrawler.com/webcrawler_toolbar/ws/results/Web/Mathematics%20Performance/2/0/0/Relevance/zoom=off/ qi=21/qk=20/bepersistence=true/_iceUrlFlag=7?_IceUrl=true, http://www.nku.edu/~mathed/mori.html, http://www.pdftop.com/ebook/ open+ended+math+pssa/). Belirlenen çok sayıda problem oluşturulan rubriğe uygun biçimde çözülmüş ve her birinin amaçlara uygun olup olmadığı tartışılmıştır. Bu konuda uzman görüşüne de başvurularak problemlerden bir kesimi atılmış ve bir kesimi de geliştirilerek kullanılabilir duruma dönüştürülmüştür. Başlangıçta ölçeklerin 8-10 problemden oluşması düşünülürken, pilot çalışma aşamasında öğrencilerin süre konusunda sıkıntı yaşaması nedeniyle bu sayı ölçekte 3 ile sınırlandırılmıştır. Problemler uygulanmadan önce tekrar gözden geçirilmiş ve uzman desteği ile bunlara eklemeler ve çıkarmalar yapılmıştır

Uygulama

Ölçek uygulamasına geçilmeden önce, öğrencilerin daha önce problem çözme sürecini tam olarak kullanmadıkları varsayılarak sınıfta dört ders saati boyunca problem çözme örneklemesi yapıldı. Burada ana amaç, öğrencilerin ilk kez karşılaşacakları bu tür problemlere alışmasını sağlamaktı. Uygulamada öğrencilerle birlikte problem çözme adımları tek tek incelendi ve tartışıldı. Öğrenciden beklenenler, çözümde izlenecek yol-yöntem ve kullanılabilecek stratejiler açıklandı. Sınıfta çözülen problemler oluşturulurken, tek yönlü yaklaşımdan kaçınmak amacıyla bunların sözel, cebirsel ve geometri problemleri olmasına özen gösterildi. Örnek problemler çözüldükten sonra, öğrencilere önceden hazırlanmış farklı problemleri içeren çalışma kağıtları dağıtıldı ve bu problemleri çözmeleri istendi. Yine zorlandıkları noktalarda öğrencilere rehberlik yapıldı.

BULGULAR VE YORUM

Öğrencilerin performans düzeylerini belirlemek amacıyla performans ölçme ölçeğinden aldıkları puanların ortalamaları, rubrikten alınabilecek minimum ve maksimum puanlara göre sınıflandırılmıştır. Puan aralığının 0-16 olduğu düşünülerek, 0-3.9 puan aralığı düşük, 4-7.9 puan aralığı orta, 8-11.9 puan aralığı yüksek ve 12-16 puan aralığı üst düzey performans seviyesi olarak belirlenmiştir. Seçilen aralıklara göre, uygulamanın başlangıç aşamasında, sınıftaki öğrencilerin performans düzeyleri Tablo 1'deki gibi oluşturulmuştur.

Tablo 1: Öğrencilerin PÖÖ Puanlarının Düzeyi.

	Düşük		**Orta**		**Yüksek**		**Üst Düzey**	
	0-3.9		**4-7.9**		**8-11.9**		**12-16**	
	f	**%**	**f**	**%**	**f**	**%**	**f**	**%**
	13	45	16	55	-	-	-	-

Tablodan görüldüğü gibi sınıfta yüksek ve üst düzey performansa sahip öğrenci bulunmamaktadır. Yığılma düşük ve orta performans düzeyindedir.

İçerikte bir farklılık var olabilir mi düşüncesine açıklık kazandırabilmek için öğrencilerin PÖÖ' ün alt bileşenlerinden aldıkları puanların incelenmesi düşünüldü. Bu bileşenlerdeki ortalama puanların, standart sapması ve genlikleri için Tablo 2 oluşturuldu.

Tablo 2: PÖÖ' ye Göre Öğrencilerin Her Bir Performans Bileşeninden Aldıkları Ortalama Puanların Karşılaştırılması.

Bileşen	**N**	$\bar{X}$	**SS**	**Minimum**	**Maksimum**
Anlama	29	1.6322	0.49877	1	2.67
Bağlantıların kurulması	29	1.1149	0.74682	0	2.33
Uygulama	29	0.7701	0.68489	0	2
Çıkarımlar ve geliştirme	29	0.2069	0.28749	0	1

Toplam	29	3.7241	2.21797	1	8

Puan genlikleri 1. bileşenden 4. bileşene doğru, sıfıra yaklaşacak biçimde azalma göstermektedir. Bu durum bileşenlerin yapısı gereği bize sürpriz olmadı. Çünkü öğrencinin bir şey üretmesi derin anlayış ve muhakeme becerileri gerektirir (Bahr&Sudweeks, 2008). Oysa bizim eğitim sistemimiz en azından şimdilik bu yönde kazanımlar sağlayamamaktadır.

Deney öncesi edinilen SBS, DBS ve matematik dersi sene sonu akademik başarı puanları, PÖÖ puanları ve PÖÖ'den elde edilen bileşenler bazındaki ortalama puanlar irdelendiğinde, puanların kendi aralarında uyumluluk gösterdiği bulunmuştur. Öğrencilerin hem hazır bulunuşluk düzeyinin ipucu sayılan uygulama öncesi sınav puanları hem de PÖÖ'den aldıkları puanlar biri birine çok yakındır. Hazır bulunuşluk göstergelerinden birisi olan DBS ortalama puanları ile PÖÖ puanları arasındaki ilişkinin incelenmesi için korelasyon analizi yapılmış ve bu ikisi arasında pozitif yönde bir ilişki çıkmıştır. Bu bulgu, öğrencinin hazır bulunuşluk düzeyinin yükselmesinin, performans düzeyinin yükselmesine olumlu yönde katkı sağlayacağı anlamına gelir. Diğer taraftan elde edilen bu bulgu, önceki çalışmalardan elde edilmiş olan, "bir yere giriş sınavındaki öncü başarılar matematik, fen ve psikoloji alanlarında, sonradan gelecek olan performansla ilişkilidir" (Keeley&Hurst&House, 1994; Bridgeman, 1982:361-366; House vd., 1996:s.1 deki alıntı) bulgusu ile de uyuşmaktadır. Bazı araştırmacılara göre öğrencilerin daha önceki öğrenme programından edindiği deneyim ve kazanımlar da yeni başarılar için önemli birer göstergedir. Örneğin, öğrencinin lise matematik müfredatı, üniversite matematik dersinde aldığı not için önemli bir göstergedir (House, 1995:157-167; House vd., 1996:s.2 deki alıntı)

Burada önemli olan bulgulardan birisi de, öğrencilerin performanslarının düşük ve orta düzeyde yer almasıdır. Daha önceki eğitimleri sürecinde gerçek anlamda problem çözme alışkanlığı edinmemiş olmaları bu durumun bir nedeni olarak görülebilir. Buna karşılık, üçüncü ve dördüncü bileşende bireysel farklılıklarını öne çıkarmak istememeleri, öz güven sahibi olmadıklarının bir göstergesi olarak da düşünülebilir.

SONUÇ, TARTIŞMA, ÖNERİLER

Birçok ülkedeki okullarda ve uluslar arası yarışmalarda, performansa dayalı ölçümün öne çıktığı görülmektedir. Aynı şekilde bu ülkelerde performans ölçümü ve performans gelişimi ile ilgili çok sayıda araştırma ve yayın yapılmaktadır. Buna karşılık, ülkemizdeki okullarda performans ölçümüne dayalı değerlendirme pek araştırma konusu edilmemiştir. Daha da kötüsü ülkemizde performans denilince öğretmenlerin aklına, çoğunlukla, ilköğretimde verilen dönem sonu ya da aylık süreli ödevler gelmektedir. Aslında bu ödevler genellikle el-işlem becerisini ya da belirli kaynaklardaki yazılanları birebir kes-kopyala işlemini gerektiren türdedir. Oysa performans ödevinin bunun yerine " bilimsel çalışma koşullarını değiştirmeğe ve problemi çözme sürecinde öğrencileri düşünmeye ve muhakeme süreçlerini açığa çıkarmaya odaklayan ödevler" (Solano-Flores&Shavelson'a,1997.18; Palm, 2008: s.5' deki alıntı) olarak düşünülmelidir. Bu yönden yaklaşıldığında her şeyden önce, performans kavramı ile performans ölçme konusunda ülkemizde kavram kargaşası yaşandığı söylenebilir. Performansa dayalı eğitim sistemine geçmeyi arzulayan MEB'nın öncelikle bu yanlış anlayışı ortadan kaldırması gerekir. Çünkü bu tür eksikliklerin giderilmesi uygulama sürecinin başlatılmasından daha önemlidir.

Günümüz eğitim sistemlerinde öğrenme ortamı kavramının anlamı değişmiştir. Sınıf ortamının yeniden düzenlenme ve donanımı yaklaşımlarının yanında, bu ortamın öğrenme ortamının yalnızca bir parçası olabileceği düşüncesi öne çıkmıştır. Buna göre gerçek anlamda öğrenme ortamı, bütün bilgilere ulaşılabilen, öğrencinin düşündüğünü söyleme rahatlığı sağlanmış ve bireysel farklılıkların öne çıkmasına yardımcı olan bir ortam olarak düşünülmektedir. Aynı düşüncenin bir ürünü olarak, yeğlenen öğrenme yaklaşımı, seçilen öğrenme yol-yöntemi ve kullanılması düşünülen ölçme araçlarına göre ortamın tasarımı da değişebilmektedir. Bu açıdan bakılarak öğrencinin performans gelişimini amaçlayan bir öğrenme ortamı tasarlandığında ve öğrenme etkinlikleri buna göre geliştirildiğinde, her bir konunun çok daha derinlemesine incelenmesi gereği ortaya çıkmaktadır(Darling-Hammond& Laura, 2008). Örneğin Uluslar Arası Öğrenci Başarısını Belirleme Programı (PISA) sonuçlarına göre(2006), Amerika Birleşik Devletleri, matematik alanında 40 ülke içinde 35. sırada yer almıştı. Bu olumsuz sonuç, ilgililerin özellikle PISA' da üst düzeyde başarılı olan çeşitli ülkelerin öğrenme programlarını araştırmalarını gerektirdi. Derlenen bilgi ve verilerin birleştirilip analiz edilmesi sonucunda, üst düzey başarı gösteren ülke programlarının yalnızca konunun öğrenilmesi yerine, her konunun derinlemesine ele alınmasını, öğrencilerin muhakeme becerilerinin öne çıkarılmasını ve öğrenilen bilginin uygulamada kullanılmasına önem verdikleri gerçeği ile karşılaşmışlardır(Darling-Hammond& Laura, 2008). İlişkiler doğru kurulduğunda görüleceği gibi, PISA'da öne çıkarılan değişkenler birebir performans değişkenleridir. Dolayısıyla eğer uluslar arası düzeyde başarılı olmak isteniyorsa öğrenci performansının gelişimine yönelik bir öğrenme ortamı tasarımı, yol-yöntem seçimi ve ölçme aracı geliştirilmesi kaçınılmazdır.

Performans ölçümünde kullanılan ölçme araçları, öğrencinin sahip olduğu bilgi, beceri, yol-yöntem kullanabilme yeteneği ve muhakeme edebilme becerisini ölçmek durumundadır. Başarıya ulaşmak için eğitim sistemlerinin bu değişkenleri göz önüne alması söz konusudur. Öte yandan değişik, seçmeli, tamamlamalı, salt işleme dayalı ve salt hatırlamaya dayalı vb. testler ile sıralanan değişkenlerin ölçümü çok zor hatta imkânsızdır. Yapılması gereken bu değişkenleri ölçebilecek ölçme araçlarını geliştirmek ve uygulamaya geçirmektir. Belki o zaman öğrenme ortam ve tasarımı ile seçilen yol-yöntemin de önemi daha net çizgiler ile vurgulanabilir. Özellikle matematikte, öğrencilerin bu değişkenlerin her birindeki konumunu dolayısı ile performansını ölçebilmek için en azından rutin olmayan ve açık uçlu problem çözme sürecindeki becerilerini ve muhakeme gücünü belirlemek gerekir. Üstelik bu tür bir ölçme sonunda öğrencinin, anlama, modelleme, ilişkilendirme, muhakeme etme, bilgisini kullanabilme ve bilgisini geliştirme gibi yaşamda gerekli birçok becerisini de belirleme şansı yakalanmaktadır. Başka bir deyişle bu tür ölçme yaklaşımları öğrencileri günlük yaşama da hazırlamaktadır.

Günümüz ölçme yaklaşımlarına yumuşak bir geçiş yapmak için en azından sistem değişikliğinin başlangıç aşamasında, ölçme araçları hazırlanırken öğrencilerin birkaç "kısa açık uçlu soru" ile "rutin olmayan" problemi çözme sürecindeki davranışlarını incelemekle işe başlanabilir. Ancak burada ilke olarak, öğrencilerin düşünce üretmesi önemli varsayılmalı ve değerlendirilmelidir. Buna ek olarak, kısa süreli ve uzun süreli dönem ödevleri, öğrencilerin sıralanan beceri ve davranışlarını ölçecek biçimde düzenlenebilir. Öğrenme programı bu yönde yeniden düzenlenebilir. Daha da önemlisi kuramsal olarak oluşturulabilen bu yapı sürekli denetlenerek davranış haline getirme çabaları sürdürülebilir.

Lise öğrencileri için düzenlenen uluslar arası yarışmalarda üst düzey başarı gösteren ülkelerin öğrencileri öncelikle karşılaştığı olay, olgu ve problemi tam anlamayı, analiz etmeyi öğreniyorlar. Yine görülüyor ki bu ülkelerde öğrencinin bilgiyi uygulamada kullanması ve yaptığını açıklaması, kapsamlı biçimde yazılı sunum yapması önemsenmektedir. Dahası bu uluslar; öğrencilerin araştırma yapmasını, proje üretmesini ya da projede görev almasını, yaptığı tüm çalışmalarda üst düzey verimliliği hedeflemesini amaçlamaktadırlar. Bu kapsamın içeriğinde okul ödevlerinin, araştırma projelerinin, bilimsel buluşların ve ürünlerin geliştirilmesi çabalarının rapor haline getirilerek sunulması da vardır. Öğrencilerin akademik başarı puanlarını belirlenmenin bir parçası olarak kullanılan bu ölçmeler, öğretme ve öğrenme sürecini de etkilemektedir. Aynı zamanda bu çalışmalar öğrencilerin, üst düzey becerilerini ve problemleri çözme sürecinde bilgisini etkin biçimde kullanılmasını sağlayıcı ödevler üstlenmektedir(Darling-Hammond& Laura, 2008). Çalışmada önerilen ve uygulanan, problemi genişletme ve geliştirme etkinlikleri burada sözü edilen değişkenleri karşılamaya denk gelmektedir. O nedenle de önemlidir.

ÖZET: Bu çalışmada; ilk olarak aritmetik üçgenler tanıtıldı ve aritmetik üçgenlerden Pythagorean üçgenlerinin nasıl elde edileceği verildi. Sonra bir üçgenin kenarlarının nasıl aritmetik dizi olduğu ve hangi durumda harmonik ve geometrik dizi olacağı araştırıldı. Kenarları tamsayı olan üçgenler ile $x^2+3y^2=z^2$ Diophantine denkleminin çözümleri arasındaki ilişki araştırıldı. Bu çözümlerden, kenarları tamsayı olan üçgenlerin üretilebileceği gösterildi.

Anahtar sözcükler: Heron Üçgeni, Aritmetik Üçgen, Pythagorean Üçgeni, Pell Denklemi, Bhaskara Denklemi.

ABSTRACT: By this study, firstly, we described the basic knowledge of aritmetic triangles and we gave information about how Pythagorean triangles are gained from arithmetic triangles. Then how to be a triangle sides an aritmetic progression and the case of triangle sides in geometric and harmonic progression are searched. And then the relations between triangles with integer sides and solution of diophantine equation $x^2+3y^2=z^2$ has been described. Utilization of these studies, how to triangles with integer sides being derived has been proved.

Key Words: Heronion Triangle, Arithmetic Triangle, Pythagorean Triangle, Pell Equation, Bhaskara Equation.

[1]Bu bildiri, Eşen' in (2010*); "Açıları ve Kenarları Aritmetik, Geometrik ve Harmonik Dizi Oluşturan Üçgenler İle* $x^2+3y^2=z^2$ *Diophantine Denklemi Arasındaki İlişki Üzerine Bir Araştırma"* adlı Yüksek Lisans tezinden üretilmiştir.

1.GİRİŞ

Geometride üçgenler özel öneme haizdir. Üçgenlerden de dik üçgenler daha ayrıcalıklıdır. Dik üçgenlerin, β pozitif bir reel sayı olmak üzere kenar uzunlukları $\alpha=\frac{\beta}{\sqrt{3}}, \beta$ **ve** $\gamma=\frac{2\beta}{\sqrt{3}}$ **şeklindeki özel hali iyi bilinir. Tüm bu üçgenler, açıları** $A=30^\circ$, $B=60^\circ$, $C=90^\circ$ **olan benzer üçgenlerin bir sınıfını oluştururlar. Burada üçgenin A, B, C açıları arasındaki fark;** $\varphi = 30^o$ **olacak şekilde bir aritmetik dizi oluşturdukları açıktır. Diğer çok bilinen bir benzer üçgen sınıfı ise δ pozitif bir reel sayı olmak üzere, kenarları** $\alpha = 3\delta$, $\beta = 4\delta$, $\gamma = 5\delta$ **biçiminde verilen üçgenlerin sınıfıdır. Bunların hepsi dik üçgen olmakla birlikte, onların göze çarpan diğer bir özelliği de;** α, β, γ **kenar uzunluklarının (sırasıyla),** $d = \delta$ **farkı olacak şekilde aritmetik bir dizi oluşturmasıdır.**

Şimdi de bu çalışmanın yapısından bahsedelim. Bölüm 2 de, kenarları aritmetik dizi olan Heron üçgenlerden yola çıkıp $x^2+3y^2=z^2$ Diophantine denklemine ulaşıldı. Ayrıca bilinen örnekler dışındaki diğer aritmetik dizilerden de bahsedildi. En son Heron üçgenini iki dik üçgene ayırdığımızda oluşan üçgenlerin de Heron üçgeni olduğu görüldü. Bölüm 3 te, kenarları ve açıları aritmetik dizi olan üçgenlere ilişkin birkaç sonuç ortaya koyuldu. Açıları aritmetik dizi olan üçgenler incelendi; bunu yaparken de, $x^2+3y^2=z^2$ Diophantine denkleminin pozitif tam sayılardaki parametrik çözümlerinin belirli bir alt kümesi kullanıldı ve örneklendirildi.

2. KENARLARI ARİTMETİK DİZİ OLAN HERON ÜÇGENLERİ

Bu bölümde kenarları aritmetik dizi olan Heron üçgenlerinden yola çıkarak $x^2+3y^2=z^2$ Diophantine denklemleri ve arasındaki ilişkiler verildi. Ardışık tamsayı kenarlı Heron üçgenlerinin sonsuz sayıda olduğu ve bunların nasıl üretilebileceği gösterildi. Ayrıca, daha genel olarak herhangi bir aritmetik dizi kenarlı Heron üçgenlerini bulma probleminin tam bir çözümü farklı bir metotla verildi. Kenar uzunlukları ardışık tamsayılar olan Heron üçgenlerinin varlığı gösterildi ve onların listesi verilerek özellikleri incelendi (Fleenor, 1987).

Tanım 2.1 $\alpha_1, \alpha_2, \alpha_3$ üç reel sayı olmak üzere bu dizinin, bir aritmetik dizi oluşturması için gerek ve yeter şart $2\alpha_2 = \alpha_1 + \alpha_3$; geometrik dizi oluşturması için gerek ve yeter şart $\alpha_2^{\,2}=\alpha_1\alpha_3$; harmonik bir dizi oluşturması için gerek ve yeter şart ise $\frac{1}{\alpha_1},\frac{1}{\alpha_2},\frac{1}{\alpha_3}$ dizisinin bir aritmetik dizi oluşturmasıdır (Zelator, 2008).

Teorem 2.1 d kare çarpan ihtiva etmeyen bir tamsayı olmak üzere $x^2+dy^2=z^2$ Diophantine denkleminin bütün *x, y, z* tamsayı çözümleri; aralarında asal *m* ile *n* tamsayıları için

$$x=m^2-dn^2,\quad y=2mn,\ z=m^2+dn^2$$

+formüllerinden elde edilir (Şenay, 2007)

2.1. Ardışık Tamsayı Kenarlı Heron Üçgenleri

Bir üçgenin *a, b, c* kenar uzunlukları ve alanı tamsayı ise bu üçgene Heron Üçgeni denir. Ayrıca kenar uzunlukları *a, b, c* ve $s=(a+b+c)/2$ olan bir üçgenin Heron formülü olarak bilinen alanı

$$A=\sqrt{s(s-a)(s-b)(s-c)}$$

olarak hesaplanır.

Bir üçgenin kenar uzunlukları *b–1, b, b+1* olsun. O zaman $s=3b/2$ olur ve bunu Heron formülünde yerine koyarsak;

$$A=\frac{b\sqrt{3(b^2-4)}}{4}$$

sonucuna ulaşırız. *A* nın tamsayı olması için $3(b^2-4)$ ifadesi bir kareye eşit olmalıdır. Bunu b nin durumuna göre irdeleyelim. Bu ifadede; eğer *b* tek olsaydı o zaman $3(b^2-4)$ ifadesi tek olurdu ki bu *A* nın tamsayı olamayacağını gösterir. Bundan dolayı *b* çift olacağından *b = 2z* alırsak o zaman alan

$$A=z\sqrt{3(z^2-1)}$$

olur. Burada alanın tamsayı, yani üçgenin Heron üçgeni olabilmesi için gerek ve yeter şart $3(z^2-1)$ ifadesinin bir tam kare olmasıdır. O zaman $z^2-1=3y^2$ olması gerektiğinden

$$z^2-3y^2=1$$

elde edilir. Bu *z* lerden elde edilen *b=2z* kenarlı üçgenlerin küçük bir listesi **Tablo 2.1** ile verilmiştir.

Tablo 2.1. Kenarları Aritmetik Dizi Olan Üçgenler

n	*a*	*b*	*c*	*Alan*	*n*	*A*	*b*	*c*	*Alan*
1	3	4	5	6	4	193	194	195	16296
2	13	14	15	84	5	723	724	725	226974

3	51	52	53	1170	6	2701	2702	2703	3161340

2.2 Diğer Aritmetik Dizilere Genişlemeler

Yukarıda tanımlanan üçgenlerden herhangi birisinin bütün kenarlarını bir k tam sayısı ile çarparsak, o zaman onlar da aritmetik dizi formunda olur ve alanı da k^2 ile çarpılmış hali olacağından alan da bir tamsayıdır. (15, 20, 25) veya (26, 28, 30) üçgenlerini bunlara örnek olarak verebiliriz. Ancak bu yolla elde edilemeyen aritmetik üçgenler var mıdır?

Önce, x tamsayısı $1 \le x \le b$ şartını sağlamak üzere, kenarlar $b-x$, b, $b+x$ olarak alalım. O zaman $s = 3b/2$ yarı çevre ve Heron formülünden alan da

$$A = \frac{b\sqrt{3(b^2-4x^2)}}{4}$$

bulunur. Daha önce açıklandığı üzere b çift olmak zorunda olduğundan $b=2z$ alırsak, o zaman alanı sadeleştirdiğimizde,

$$A = z\sqrt{3(z^2-x^2)}$$

olur. Tekrar bu üçgenin Heron olması için gerek ve yeter şart $3(z^2-x^2)$ ifadesinin bir tam kare olmasıdır. Burada $z^2-x^2=3y^2$ dersek o zaman denklem $x^2+3y^2=z^2$ biçiminde 2.dereceden homojen Diophantine denklemine dönüşür. Böyle denklemlerin çözülebilir olduğunu, bu çözümlerin Teorem 2.1 ile verildiğini belirtelim. Çözümlerin her zaman iki değişkenli parametrik denklemlerin bir kümesi olarak verildiği açıktır. Yukarıdaki denklemlerin bütün çözümleri, λ ile κ tamsayı ve $g = (\lambda^2-3\kappa^2,\ 2\lambda\kappa, \lambda^2+3\kappa^2)$ olmak üzere;

$$x = \frac{|\lambda^2-3\kappa^2|}{g},\quad y = \frac{2\lambda\kappa}{g},\quad z = \frac{\lambda^2+3\kappa^2}{g}$$

biçiminde verilir. Denklem homojen olduğu için, primitif çözümlerin herhangi bir katı da bir çözüm ve λ ile κ da aralarında asal tamsayılar olurlar. Primitif çözümlerin λ ile κ nin farklı değerleri için oluşan üçgenlere karşılık geldiğini söyleyebiliriz ki bunlar **Tablo 2.2** ile verilmiştir.

Tablo 2.2. Kenarları Aritmetik Olan Üçgenin Artan b Değerleri

□	□	*x*	*a*	*b*	*c*	□	□	*x*	*a*	*b*	*c*
1	1	1	3	4	5	7	3	11	65	76	87
2	1	1	13	14	15	4	3	11	75	86	97
1	2	11	15	26	37	1	4	47	51	98	145
3	7	23	29	52	75	3	8	61	73	134	195
5	3	1	51	52	53	5	4	23	123	146	169

Tablodaki değerler yukarıdaki formüllerden elde edilmiştir. Tabi ki $x = 1$ alırsak Kesim 2.1 deki kenarları $b-1$, b, $b+1$ olan üçgene dönüşür. Ayrıca x değerlerinin hepsi 12 modülüne göre 1 ya da -1 e kongrüent olduğuna dikkat çekilmelidir.

2.3 Bir Heron Üçgeninden İki Dik Heron Üçgeni Oluşturulması

Eğer kenarlar ardışık tamsayılar ise, yüksekliği h olarak aldığımızda, bu yükseklik b tabanını u ve v uzunluklarına ayırdığını **Şekil 2.1** de görürüz. O zaman Pythagorean teoreminde $b = 2z$ kullanırsak;

$$h^2+u^2 = 4z^2-4z+1$$
$$h^2+v^2 = 4z^2+4z+1$$

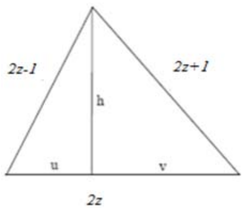
buluruz. Bu ifadelerin ikincisinden birincisini çıkarırsak,

$$(v-u)(v+u)=8z$$

elde ederiz. Burada $v+u=2z$ olduğundan $v-u=4$ sonucuna ulaşırız. O zaman üçgenin *h* yüksekliği

$$h=\sqrt{(2z-1)^2-(z-2)^2}=\sqrt{3z^2-3}=\frac{A}{z}$$

olup bu ifade bir tam sayıdır. Böylece her ikisi de Heron olup, bu üçgenlerin taban uzunlukları *z* – 2 ve *z*+2 dir. Dolayısıyla onların farkı 4 tür.



Şekil 2.1. Bir Heron Üçgeninin İki Dik Üçgene Ayrılması

Kesim 2.2 deki üçgenler için yukarıdakine benzer bir hesaplama ile yükseklik, tabanı *z – 2x* ve z *+2x* uzunluklu parçalara ayırır. O zaman yükseklik önceden olduğu gibi $\sqrt{3z^2-3x^2}$ ifadesine dönüşür ki bu durumda da $\frac{A}{z}$ ifadesi tamsayı haline gelir. Böylece kenarları *b – x, b, b + x* aritmetik dizisinden oluşan her bir Heron üçgeni, tabanları farkı *4x* olan iki dik Heron üçgenine dönüşür. Benzer bir hesaplamayla diğer kenarlardan (çift olmayan) herhangi birisinin yüksekliğinden, iki Heron üçgeninin üretilemeyeceği gösterilebilir. Gerçekten herhangi bir Heron üçgeninin en az bir kenarının çift olduğunu ve birbirine dayanan iki dik üçgene ayrılabileceğini gösterebiliriz.

3. ÜÇGENDE AÇILARIN VE KENARLARIN DİZİ OLUŞTURMASI

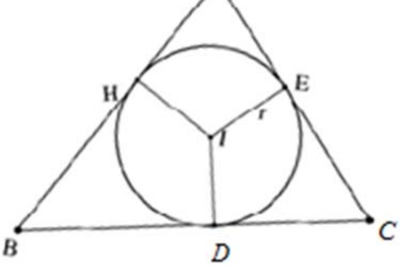
Bu bölümde bir üçgenin açılarının ya da kenarının dizi oluşturması için trigonometrik durumlarının ne olması gerektiğini vereceğiz. Daha sonra üçgenin geometrik dizili üçgen olup olmadığını konusuna değineceğiz.

Burada ABC üçgenin açılarına karşılık gelen A, B, C dizisi **(a)** ile kenar uzunluklarına karşılık gelen *α, β, γ* dizisi de **(s)** ile gösterilecektir.

Bir üçgende **(a)** nın dizi olabilmesi için B açısının 60º olması gerektiğini ve $\rho=\frac{2\tau}{\beta}$ nın oranının (2, 3] aralığına düştüğünü göstereceğiz. Özel olarak; $\rho=1+\sqrt{3}$ için bu üçgen, $A=30^0$, $B=60^0$, $C=90^0$ açılı üçgenlere dönüşür. Öte yandan, $\rho = 3$ için üçgen eşkenardır.

Teorem 3.1. Üçgeninin kenar uzunlukları *α, β, γ*, yarı çevresi *τ* ve üçgenin iç teğet çemberinin yarıçapı *r* ise; $r=\sqrt{\frac{(\tau-\alpha)(\tau-\beta)(\tau-\gamma)}{\tau}}$ olarak verilir.

İspat. Bir üçgenin çevresini *2τ* ile yani *2τ = α + β + γ* ile gösterirsek; yarı çevre *τ = (α + β + γ)/2* olur.



$|AH|=|AE|=x$ $\quad r=|IE|$

$|BH|=|BD|=y$ $\quad r=|IH|$

$|DC|=|CE|=z$ $\quad r=|ID|$

Şekil 3.1. Üçgenin İç Teğet Çemberinin Merkezi

Şekil 3.1. den,

$$2x + 2z + 2y = 2\tau\,;\; x + y + z = \tau,\; x + y = \gamma,\; y + z = \alpha \text{ ve } x + z = \beta$$

olur. Buradan

$$r = y.\tan\left(\frac{B}{2}\right) = z.\tan\left(\frac{C}{2}\right) = x.\tan\left(\frac{A}{2}\right);$$

$$r = (\tau-\alpha)\tan\left(\frac{A}{2}\right) = (\tau-\beta)\tan\left(\frac{B}{2}\right) = (\tau-\gamma)\tan\left(\frac{C}{2}\right) \tag{3.1}$$

elde edilir. İki açının toplamının tanjantının;

$$\tan(\theta_1+\theta_2) = \frac{\tan\theta_1 + \tan\theta_2}{1-\tan\theta_1.\tan\theta_2}$$

olduğunu biliyoruz. Buradan;

$$\tan(\frac{A}{2}+\frac{B}{2}) = \frac{\tan\frac{A}{2} + \tan\frac{B}{2}}{1-\tan\frac{A}{2}.\tan\frac{B}{2}} \tag{3.2}$$

ve

$$\tan = (\frac{A}{2}+\frac{B}{2}) = \tan(90^{o} - \frac{C}{2}) = \cot(\frac{C}{2}) = \frac{1}{\tan(\frac{C}{2})}$$

olacağından (3.1) ile (3.2) ifadelerinden hareketle,

$$\frac{\frac{r}{\tau-\alpha}+\frac{r}{\tau-\beta}}{1-\frac{r^2}{(\tau-\alpha)(\tau-\beta)}} = \frac{\tau-\gamma}{r} \Leftrightarrow [r(\tau-\alpha)+r(\tau-\beta)]r = (\tau-\gamma)[(\tau-\alpha)(\tau-\beta)-r^2]$$

$$\Leftrightarrow r^2 = \frac{(\tau-\alpha)(\tau-\beta)(\tau-\gamma)}{\tau}$$

veya dengi olan

$$r = \sqrt{\frac{(\tau-\alpha)(\tau-\beta)(\tau-\gamma)}{\tau}} \tag{3.3}$$

olur ki bu da aranandır. □

Teorem 3.2. Bir üçgende **(s)** dizisinin bir aritmetik dizi oluşturması için gerek ve yeter şart $\cot(A/2), \cot(B/2), \cot(C/2)$ dizisinin de bir aritmetik dizi oluşturmasıdır.

İspat. Tanım 1.2.18 den $2\beta = \alpha+\gamma \Leftrightarrow 2\cot\left(\frac{B}{2}\right) = \cot\left(\frac{A}{2}\right)+\cot\left(\frac{C}{2}\right)$

olduğunu göstermeliyiz. (3.1) i kullanarak;

$$2\cot\left(\frac{B}{2}\right)=\cot\left(\frac{A}{2}\right)+\cot\left(\frac{C}{2}\right)\Leftrightarrow$$

$$\frac{2}{\tan(B/2)}=\frac{1}{\tan(A/2)}+\frac{1}{\tan(C/2)}\Leftrightarrow$$

$$\Leftrightarrow\frac{\tau-\alpha}{r}+\frac{\tau-\gamma}{r}=\frac{2(\tau-\beta)}{r}\Leftrightarrow\alpha+\gamma=2\beta$$

elde ederiz (Zelator, 2008). □

Teorem 3.3. (s) dizisinin bir aritmetik dizi oluşturması için gerek ve yeter şart $\tan(\frac{A}{2}).\tan(\frac{C}{2})=\frac{1}{3}$ olmasıdır.

İspat. Tanım 2.1 den

$$2\beta=\alpha+\gamma\Leftrightarrow\tan\left(\frac{A}{2}\right)\tan\left(\frac{C}{2}\right)=\frac{1}{3}$$

olduğunu göstermek yeterlidir. (3.1) in ve (3.3) ün kullanılmasıyla;

$$\tan\left(\frac{A}{2}\right)\tan\left(\frac{C}{2}\right)=\frac{1}{3}\Leftrightarrow\left(\frac{r}{\tau-\alpha}\right).\left(\frac{r}{\tau-\gamma}\right)=\frac{1}{3}$$

$$\Leftrightarrow\frac{r^2}{(\tau-\alpha)(\tau-\gamma)}=\frac{1}{3}\Leftrightarrow\left[\frac{(\tau-\alpha)(\tau-\beta)(\tau-\gamma)}{\tau}\right].\frac{1}{(\tau-\alpha)(\tau-\gamma)}=\frac{1}{3}$$

$$\Leftrightarrow\frac{\tau-\beta}{\tau}=\frac{1}{3}\Leftrightarrow\frac{2\tau-2\beta}{2\tau}=\frac{1}{3}\Leftrightarrow\frac{(\alpha+\beta+\gamma)-2\beta}{\alpha+\gamma+\beta}=\frac{1}{3}$$

$$\Leftrightarrow 3(\alpha+\gamma-\beta)=\alpha+\gamma+\beta\Leftrightarrow\alpha+\gamma=2\beta$$

olur ki ispat biter (Zelator, 2008). □

Teorem 3.4. Bir üçgenin kenar uzunluklarının kareleri olan α^2, β^2, γ^2 nın bir aritmetik dizi oluşturması için gerek ve yeter şart *cosA, cosB, cosC* dizisinin bir aritmetik dizi oluşturmasıdır.

İspat. Tanım 2.1 den,

$$2\cot B=\cot A+\cot C\Leftrightarrow 2\beta^2=\alpha^2+\gamma^2$$

olduğunu göstermeliyiz. Bunun için

$$\cot\theta=\frac{\cot^2(\theta/2)-1}{2\cot(\theta/2)}$$

yarım açı formülünü kullanarak başlayalım.

$$2.\cot B=\operatorname{Cot}A+\operatorname{Cot}C\Leftrightarrow\frac{\cot^2(B/2)-1}{\cot(B/2)}=\frac{\cot^2(A/2)-1}{2\cot(A/2)}+\frac{\cot^2(C/2)-1}{2\cot(C/2)}$$

((3.1) den)

$$\Leftrightarrow\frac{\left(\frac{(\tau-\beta)}{r}\right)^2-1}{\left(\frac{(\tau-\beta)}{r}\right)}=\frac{\left(\frac{(\tau-\alpha)}{r}\right)^2-1}{2\left(\frac{(\tau-\alpha)}{r}\right)}+\frac{\left(\frac{(\tau-\gamma)}{r}\right)^2-1}{2\left(\frac{(\tau-\gamma)}{r}\right)}$$

($\beta=2\tau-(\alpha+\gamma)$) nin kullanılması ve eşitliklerin 2τ ile çarpılması sonucunda

$$\Leftrightarrow 2\tau(\tau-\beta)-2(\tau-\alpha)(\tau-\gamma)=\tau\beta-(\tau-\beta)\beta$$
$$\Leftrightarrow 2\tau^2-2\tau\beta-2\tau^2+2(\alpha+\gamma)\tau-2\alpha\gamma=\tau\beta-\tau\beta+\beta^2$$
$$\Leftrightarrow -2\beta\tau+2(\alpha+\gamma)\tau-2\alpha\gamma-\beta^2=0 \Leftrightarrow -2\beta\tau+2(\alpha+\gamma)\tau-2\alpha\gamma-\beta^2=0$$
$$\Leftrightarrow -2\beta\tau+2\tau[2\tau-\beta]-2\alpha\gamma-\beta^2=0 \Leftrightarrow -2\beta\tau+4\tau^2-2\tau\beta-2\alpha\gamma-\beta^2=0$$
$$\Leftrightarrow -4\beta\tau+4\tau^2-2\alpha\gamma-\beta^2=0 \Leftrightarrow -2\beta(2\tau)+(2\tau)^2-2\alpha\gamma-\beta^2=0$$
$$\Leftrightarrow -2\beta(\alpha+\beta+\gamma)+(\alpha+\beta+\gamma)^2-2\alpha\gamma-\beta^2=0$$
$$\Leftrightarrow -2\beta\alpha-2\beta^2-2\beta\gamma+\alpha^2+\beta^2+\gamma^2+2\alpha\beta+2\beta\gamma+2\alpha\gamma-2\alpha\gamma-\beta^2=0$$
$$\Leftrightarrow 2\beta^2=\alpha^2+\gamma^2$$

olarak bulunur ki ispat biter (Zelator, 2008). □

Teorem 3.5. Bir üçgenin hem açılarının oluşturduğu **(a)** dizisi hem de kenarlarının oluşturduğu **(s)** dizisinin aritmetik olması için gerek ve yeter şart üçgenin eşkenar olmasıdır. Yani bu aritmetik dizilerde fark sıfırdır.

İspat. $\Leftarrow$: Eğer üçgen eşkenarsa **(a)** nın ve **(s)** nin aritmetik dizi olacağı açıktır. Çünkü bir üçgen eşkenar ise, A = B = C = 60º ve $\alpha=\beta=\gamma$ olur. Buradan açık olarak; **(a)** ile **(s)** dizilerinin her ikisi de farkı sıfıra eşit olan aritmetik dizilerdir. $\Rightarrow$: Yani, **(a)** ve **(s)** dizilerinin her ikisi de aritmetik dizi ise o zaman üçgen eşkenardır. Gerçekten, Teorem 3.3 den dolayı **(s)** dizisi bir aritmetik dizi olduğunda $\tan(\frac{A}{2}).\tan(\frac{C}{2})=\frac{1}{3}$ olur.

Öte yandan, **(a)** bir aritmetik dizi de olduğundan, özel olarak B = 60º elde ederiz ve burada A + C = 120º olduğundan C = 120º – A bulunur. Böylece, Teorem 3.3 den

$$\Rightarrow \tan\left(\frac{A}{2}\right)\tan\left(60^\circ-\frac{A}{2}\right)=\frac{1}{3} \Rightarrow \tan\left(\frac{A}{2}\right).\left[\frac{\tan 60^\circ-\tan\left(A/2\right)}{1+\tan 60^\circ\tan\left(A/2\right)}\right]=\frac{1}{3}$$

ve $\tan 60^\circ=\sqrt{3}$ olduğundan

$$3\tan^2\left(A/2\right)-2\sqrt{3}\tan\left(A/2\right)+1=0 \Leftrightarrow (\sqrt{3}\tan\left(A/2\right)-1)^2=0$$
$$\Leftrightarrow \tan\left(A/2\right)=\frac{1}{\sqrt{3}} \Leftrightarrow (0^\circ<\frac{A}{2}<90^\circ)\ \frac{A}{2}=30^\circ;\ A=60^\circ$$

ifadelerine ulaşırız ki buradan B = 60º ve C = 60º olur. Böylece A = B = C = 60º olup, üçgen eşkenardır (Zelator, 2008). □

Teorem 3.6. δ bir reel sayı olmak üzere, **(s)** dizileri aritmetik dizi oluşturan dik üçgenler ise, üçgenin kenar uzunlukları $\alpha=3\delta,\ \beta=4\delta,\ \gamma=5\delta$ biçiminde verilirler.

İspat. Böyle bir dik üçgenin α, β, γ kenar uzunlukları iki şartı sağlamalıdır:

$$\left.\begin{array}{l}\gamma^2=\alpha^2+\beta^2\\ 2\beta=\alpha+\gamma\end{array}\right\}\Rightarrow 4\gamma^2=4\alpha^2+(\alpha+\gamma)^2 \Rightarrow 3\gamma^2-2\alpha\gamma-5\alpha^2=0;$$

$(3\gamma-5\alpha)(\gamma+\alpha)=0$ ve (γ + α > 0 olduğundan)

$$3\gamma-5\alpha=0 \Rightarrow \gamma=\frac{5\alpha}{3}$$

ve $2\beta=\alpha+\gamma$ dan $\beta=4\alpha/3$ elde ederiz ve δ pozitif reel sayı olacak şekilde, α = 3δ koyarsak, α = 3δ, β = 4δ, γ = 5δ ya ulaşırız (Zelator, 2008). □

Teorem 3.7. Bir üçgenin α, β, γ kenar uzunlukları dizisinin bir harmonik dizi olması için gerek ve yeter şart $\sin^2(\frac{A}{2}), \sin^2(\frac{B}{2}), \sin^2(\frac{C}{2})$ dizisinin de bir harmonik dizi olmasıdır.

İspat. Harmonik dizi tanımından

$$\frac{2}{\beta}=\frac{1}{\alpha}+\frac{1}{\gamma} \Leftrightarrow \frac{2}{\sin^2\left(B/2\right)}=\frac{1}{\sin^2\left(A/2\right)}+\frac{1}{\sin^2\left(C/2\right)}$$

olduğunu ispatlamalıyız. Sağ taraftan sol tarafa ulaşalım.

$$\frac{2}{\sin^2\left(B/2\right)}=\frac{1}{\sin^2\left(A/2\right)}+\frac{1}{\sin^2\left(C/2\right)} \quad \Leftrightarrow 2\operatorname{cosec}^2\left(B/2\right)=\operatorname{cosec}^2\left(A/2\right)+\operatorname{cosec}^2\left(C/2\right)$$

$$\Leftrightarrow 2\left[1+\cot^2\left(B/2\right)\right]=1+\cot^2\left(A/2\right)+1+\cot^2\left(C/2\right) \Leftrightarrow 2\cot^2\left(B/2\right)=\cot^2\left(A/2\right)+\cot^2\left(C/2\right)$$

$$\Leftrightarrow \frac{2}{\tan^2\left(B/2\right)}=\frac{1}{\tan^2\left(A/2\right)}+\frac{1}{\tan^2\left(C/2\right)}$$

((3.1) den)

$$\frac{2(\tau-\beta)^2}{r^2}=\frac{(\tau-\alpha)^2}{r^2}+\frac{(\tau-\gamma)^2}{r^2} \Leftrightarrow 2\tau^2-2\tau(2\beta)+2\beta^2=\tau^2-2\tau\alpha+\alpha^2+\tau^2-2\tau\gamma+\gamma^2$$

$$\Leftrightarrow 2\tau(\alpha+\gamma-2\beta)=\alpha^2+\gamma^2-2\beta^2 \Leftrightarrow (\alpha+\gamma+\beta)(\alpha+\gamma-2\beta)=\alpha^2+\gamma^2-2\beta^2$$

$$\Leftrightarrow \alpha^2+\gamma^2-2\beta^2+2\alpha\gamma-\beta\gamma-\alpha\beta=\alpha^2+\gamma^2-2\beta^2 \Leftrightarrow 2\alpha\gamma=\beta\gamma+\alpha\beta$$

$$\Leftrightarrow \frac{2\alpha\gamma}{\alpha\beta\gamma}=\frac{\beta\gamma}{\alpha\beta\gamma}+\frac{\alpha\beta}{\alpha\beta\gamma} \Leftrightarrow \frac{2}{\beta}=\frac{1}{\alpha}+\frac{1}{\gamma}$$

olur ki bu da aranandır. □

Teorem 3.8. (a) dizisinin aritmetik dizi ve **(s)** dizisinin de geometrik dizi olduğu üçgenler sadece eşkenar olanlardır (Yani farkı sıfır olan aritmetik diziler ve oranı 1 olan geometrik diziler).

İspat. Bir üçgende **(s)** dizisi bir geometrik dizi ve **(a)** bir aritmetik diziyse, o zaman üçgenin eşkenar olması gerektiğini Teorem 3.5 den biliyoruz. Gerçekten eğer durum böyle ise o zaman B=60º ve $\beta^2=\alpha\gamma$ şartları aynı zamanda sağlanması gerekirdi. Sinüs teoreminden,

$$\frac{\alpha}{\sin A}=\frac{\beta}{\sin 60^\circ}=\frac{\gamma}{\sin C}$$

olur. Böylece,

$$\beta^2=\alpha\gamma \Rightarrow \beta^2=\left(\frac{\beta\sin A}{\sin 60^\circ}\right).\left(\frac{\beta\sin C}{\sin 60^\circ}\right)$$

ve $\sin 60^\circ=\frac{\sqrt{3}}{2}$ olduğundan $\sin A.\sin C=\frac{3}{4}$ elde edilir.

Öte yandan

$$\cos(A+C)=\cos(180^\circ-B)=\cos 120^\circ \Rightarrow$$

$$\Rightarrow \cos A\cos C-\sin A\sin C=-\frac{1}{2} \Rightarrow \cos A\cos C-\frac{3}{4}=-\frac{1}{2} \Rightarrow \cos A\cos C=\frac{1}{4}$$

olduğundan

$$\Rightarrow\begin{Bmatrix}\sin A\sin C = \dfrac{3}{4}\\ \cos A\cos C = \dfrac{1}{4}\end{Bmatrix}\Rightarrow\begin{Bmatrix}\sin^2 A\sin^2 C = \dfrac{9}{16}\\ \cos^2 A\cos^2 C = \dfrac{1}{16}\end{Bmatrix}$$

$$\Rightarrow\begin{Bmatrix}(1-\cos^2 A)(1-\cos^2 C\ ) = \dfrac{9}{16}\\ \cos^2 A\cos^2 C = \dfrac{1}{16}\end{Bmatrix}\Rightarrow\begin{Bmatrix}\cos^2 A+\cos^2 C = \dfrac{1}{2}\\ \cos^2 A\cos^2 C = \dfrac{1}{16}\end{Bmatrix}$$

ifadelerini elde ederiz.

Eğer iki sayının toplamı S ve çarpımı P ise, onların x^2 $-Sx + P= 0$ biçimindeki ikinci dereceden denkleminin iki kökü olması gerektiğini hatırlayalım. Yukarıda verilenlere göre cos^2A ve cos^2C reel sayıları

$$x^2-\frac{1}{2}x+\frac{1}{16}=0\Leftrightarrow(x-\frac{1}{4})^2=0$$

ikinci dereceden denkleminin iki kökü olmalıdır. Bu ikinci dereceden denklemin 1/4 biçiminde bir katlı kökü bulunur. Dolayısıyla $\cos^2 A\ \cos^2 C=\dfrac{1}{16}$ ve $cosA > 0,\ cos\ C > 0$ olduğundan hareketle $\cos A=\dfrac{1}{2}=\cos C$ elde edilir. Burada A=60º = C olacağından üçgen eşkenardır (Zelator, 2008). □

Şimdi de kenarları geometrik dizi oluşturan rasyonel kenarlı ve rasyonel alanlı hiçbir üçgenin bulunmadığını ifade eden teoremi verelim.

Teorem 3.9. Kenarları geometrik dizi oluşturan rasyonel kenarlı ve rasyonel alanlı bir üçgen yoktur.

İspat. Burada, kenar uzunlukları geometrik dizi olan rasyonel alanlı üçgenler göz önüne alınmıştır. Kenarları a, ar, ar^2 (burada $a,\ r\ \in \mathbb{Q}$ ve $r\neq 0$) alırsak o zaman yarı çevre $s=a(1+r+r^2)/2$ olur. Heron alan formülünü kullanırsak;

$$A=\frac{a^2}{4}\sqrt{(1+r+r^2)(-1+r+r^2)(1-r+r^2)(1+r-r^2)}$$

olur ve bu sonuç bir rasyonel sayı olmalıdır, ayrıca burada $y\in\mathbb{Q}$ iken

$$(1+r+r^2)(-1+r+r^2)(1-r+r^2)(1+r-r^2)=y^2$$

olmak zorundadır.

Burada $m,n\in Z$, $(m,n) = 1$ ve $Y\in Z$ iken $r=\dfrac{m}{n}$ alalım, o zaman tam sayı denklemi

$$Y^2=(n^2+mn+m^2)(-n^2+mn+m^2)(n^2-mn+m^2)(n^2+mn-m^2)$$

olur. Bu denklemin sağındaki 4 terimin ikişer ikişer aralarında asal olduğu kolayca görülür. Bunun anlamı, buradaki her bir terimin kare olması gerektiğidir. Gerçekten de terimlerden ikisinin çarpımının da kare olacağı görülür. Bu yüzden

$$Y'^2=(n^2+mn+m^2)(n^2-mn+m^2)=n^4+m^2n^2+m^4$$

denklemini elde ederiz.

Bu denklemin tek çözümü $mn = 0$ iken ki çözümdür. Burada $n\neq 0$ olduğundan sadece $m = 0$ yani $r = 0$ olur. Böylece teoremi ispatlamış oluruz (Buchholz & MacDougall, 1998). □

3.1 Açıları Dizi Olan Üçgenler

(a) dizisinin bir aritmetik dizi olması için gerek ve yeter şartın B = 60º olması gerektiği hemen görülür. Bu 2B = A + C ve A + B + C = 180º şartlarından çıkar. Üstelik kosinüs teoreminden;

$$\beta^2=\alpha^2+\gamma^2-2\alpha\gamma\cos 60^{o} \Leftrightarrow \beta^2=\alpha^2+\gamma^2-\alpha\gamma \Leftrightarrow (\alpha+\gamma)^2=\beta^2+3\alpha\gamma$$

elde ederiz.

Şimdi de, iki pozitif β ve τ reel sayıları verildiğinde $0<\alpha\le\beta\le\gamma$ olacak şekilde B = 60º açılı bir tek üçgen tanımlandığında $\rho=\dfrac{2\tau}{\beta}$ oranı (2, 3] yarı kapalı aralığına düştüğü görülecektir. Gerçekten $\beta>0$, $\tau>0$ ve $2<\rho\le 3$ şartlarından, tam olarak(gereklilik ve yeterlilik), B = 60º açılı bir tek üçgen belirlenir. Başka bir deyişle, $\rho=\dfrac{2\tau}{\beta}$ için $2<\rho\le 3$ olacak şekilde, iki pozitif β ve τ reel sayıları verildiğinde yukarıdaki koşulları sağlayan Euclides geometrisinde bir tek üçgen oluşturulabilir. Şimdi niçin böyle olduğunu görelim. Eğer α ve γ nın toplamı S ile çarpımları da P ile gösterilirse; yukarıda elde ettiğimiz bağıntıda $(\alpha+\gamma)^2=\beta^2+3\alpha\gamma$ olacağından $S^2=\beta^2+3P \Leftrightarrow P=\dfrac{S^2-\beta^2}{3}$ olduğu sonucuna ulaşılır.

Öte yandan *α* ve *γ* reel sayıları, $X^2-SX+P=0$ ikinci dereceden denkleminin kökleridir. *α* ve *γ* reel kökler olduklarından, bu ikinci dereceden denklemin diskriminantı negatif olamaz. Buradan;

$$(-S)^2-4P\ge 0 \Leftrightarrow S^2-4P\ge 0 \Leftrightarrow S^2-4\left(\frac{S^2-\beta^2}{3}\right)\ge 0 \Leftrightarrow 4\beta^2\ge S^2$$

(*β* ve *S* nin her ikisi de pozitif olduğu için) $2\beta\ge S$ ve $S=2\tau-\beta$ olduğundan,

$$2\beta\ge 2\tau-\beta \Leftrightarrow 3\beta\ge 2\tau \Leftrightarrow (\beta>0 \text{ için}) \ \frac{3\beta}{\beta}\ge\frac{2\tau}{\beta}$$

elde ederiz; buradan da (açık olarak), $2\tau>\beta$; $\dfrac{2\tau}{\beta}>1$ olur. Böylece $1<\dfrac{2\tau}{\beta}\le 3 \Leftrightarrow 1<\rho\le 3$ ifadesi bir gerek şart olarak ortaya çıkar.

Öte yandan $X^2-SX+P=0$ denklemine geri dönersek ; *α* ile *γ*, $\alpha\le\gamma$ olacak şekilde denklemin kökleri olduğundan (ikinci derece denklem formülünden),

$$\alpha=\frac{S-\sqrt{S^2-4P}}{2},\ \gamma=\frac{S+\sqrt{S^2-4P}}{2}$$

elde ederiz. Daha önceden $P=\dfrac{S^2-\beta^2}{3}$ ve $S=2\tau-\beta$ olarak verilen ifadeler kullanılırsa;

$$\alpha=\frac{2\tau-\beta-\sqrt{\dfrac{(3\beta-2\tau)(\beta+2\tau)}{3}}}{2},\ \gamma=\frac{2\tau-\beta+\sqrt{\dfrac{(3\beta-2\tau)(\beta+2\tau)}{3}}}{2}$$

ifadesini veya denk olan,

$$\alpha=\frac{\beta\left(\dfrac{2\tau}{\beta}-1\right)-\sqrt{\dfrac{\beta^2(3-\frac{2\tau}{\beta})(1+\frac{2\tau}{\beta})}{3}}}{2},\quad \gamma=\frac{\beta\left(\dfrac{2\tau}{\beta}-1\right)+\sqrt{\dfrac{\beta^2(3-\frac{2\tau}{\beta})(1+\frac{2\tau}{\beta})}{3}}}{2}$$

ifadesini elde ederiz ve ayrıca $\rho=\dfrac{2\tau}{\beta}$ eşitliğini kullanarak,

$$\alpha=\frac{\beta}{2}\left[\rho-1-\sqrt{\frac{(3-\rho)(1+\rho)}{3}}\right],\ \gamma=\frac{\beta}{2}\left[\rho-1+\sqrt{\frac{(3-\rho)(1+\rho)}{3}}\right] \qquad (3.4)$$

sonucuna ulaşırız. Fakat ek bir şart olarak; (3.4) den dolayı $\alpha > 0$ olması (β > 0 olduğundan)

$$\rho - 1 - \sqrt{\frac{(3-\rho)(1+\rho)}{3}} > 0$$

olmasına denk olduğundan;

$$\Leftrightarrow \ \rho - 1 > \sqrt{\frac{(3-\rho)(1+\rho)}{3}} \Leftrightarrow (1 < \rho \le 3 \, için) \ 3(\rho-1)^2 > (3-\rho)(1+\rho)$$

$$\Leftrightarrow 3\rho^2 - 6\rho + 3 > 3 + 2\rho - \rho^2 \ \Leftrightarrow 4\rho^2 - 8\rho > 0 \Leftrightarrow 4\rho(\rho-2) > 0;$$

sonucunu elde ederiz. Ayrıca 1 < ρ ≤ 3 olduğundan hareketle 2 < ρ ≤ 3 elde edilir ki bu da aranandır.

Sinüs teoreminden $\frac{\alpha}{\sin A} = \frac{\beta}{\sin 60^\circ} = \frac{\gamma}{\sin C} = 2R$ olduğunu hatırlayalım (Burada R, çevrel çemberin yarıçapıdır). Burada $B = 60^\circ$ alırsak, $\sin 60^\circ = \frac{\sqrt{3}}{2}$ olduğundan hareketle $\frac{\alpha}{\sin A} = \frac{2\beta}{\sqrt{3}} = \frac{\gamma}{\sin C}$ ifadesine ulaşırız. Bunu (3.4) ile birleştirirsek,

$$\sin A = \frac{\sqrt{3}}{4}\left[\rho - 1 - \sqrt{\frac{(3-\rho)(1+\rho)}{3}}\right], \qquad \sin C = \frac{\sqrt{3}}{4}\left[\rho - 1 + \sqrt{\frac{(3-\rho)(1+\rho)}{3}}\right]$$

sonuçlarına ulaşırız. Ayrıca,

$$0 < \alpha \le \beta \le \gamma \Leftrightarrow 0^\circ < A \le B \le C < 180^\circ \ \Leftrightarrow \ (A + B + C = 180^o \text{ olduğundan})$$

$$0 < \sin A \le \sin B \le \sin C \le 1 \Leftrightarrow 0 < \sin A \le \sin 60^o \le \sin C \le 1 \Leftrightarrow$$

$$0 < \sin A \le \frac{\sqrt{3}}{2} \le \sin C \le 1 \Leftrightarrow$$

$$0 < \frac{\sqrt{3}}{4}\left[\rho - 1 - \sqrt{\frac{(3-\rho)(1+\rho)}{3}}\right] \le \frac{\sqrt{3}}{2} \le \frac{\sqrt{3}}{4}\left[\rho - 1 + \sqrt{\frac{(3-\rho)(1+\rho)}{3}}\right] \le 1$$

olur.

Eğer ilk eşitliğin işareti doğruysa, o zaman ikincisinin ve tersinin de doğru olması gerekir; burada *ρ = 3* olması durumu tam olarak eşkenar üçgen olması durumuna karşılık gelir (yani, *A = B = C = 60º*). Üstelik dördüncü eşitsizlikte, aynı işaretli olması durumu tam olarak $\rho = 1 + \sqrt{3}$ için sağlanır ki, bu $A = 30^0$, $B = 60^0$, $C = 90^0$ olması durumuna karşılık gelir. Eğer cebirsel işlemler yapılırsa son eşitsizliğin $\left[\rho - (1+\sqrt{3})\right]^2 \ge 0$ olduğu görülür.

Tersine olarak $2 < \rho \le 3$ olmak üzere (3.4) ün kullanılması ve sinüs teoremiyle birlikte B = 60º olarak belirleyebiliriz.

Son olarak ta *α + β > γ; α + γ > β; β + γ > α* şeklindeki üç üçgen eşitsizliğinin sağlandığını kolayca gösterebiliriz; üçüncü eşitsizlik, *γ ≥ β ≥ α > 0* dan dolayı hemen görülür; ikincisi ise *α + γ = 2τ – β* dan kolaylıkla bulunur. Gerçekten $\alpha + \gamma > \beta \Leftrightarrow 2\tau - \beta > \beta \Leftrightarrow 2\tau > 2\beta \Leftrightarrow$ (*β > 0* olduğundan) $\frac{2\tau}{\beta} > 2$ ifadesinden $\rho > 2$ olur ki bu geçerlidir. Çünkü ρ nun, $2 < \rho \le 3$ şartını sağladığını varsaymıştık.

Şimdi *α + β > γ* üçgen eşitsizliğini ispatlayalım. (3.4) den dolayı

$$\alpha + \beta > \gamma \Leftrightarrow \ (\beta > 0 \text{ olduğundan})$$

$$\Leftrightarrow \frac{\sqrt{3}}{4}\left[\rho+1-\sqrt{\frac{(3-\rho)(1+\rho)}{3}}\right]+1>\frac{\sqrt{3}}{4}\left[\rho+1+\sqrt{\frac{(3-\rho)(1+\rho)}{3}}\right]$$

(Bu eşitsizliğin her tarafını 4 ile çarparsak)

$$\sqrt{3}(\rho+1)+4-\sqrt{3}(\rho+1)>2\sqrt{(3-\rho)(1+\rho)} \Leftrightarrow 2>\sqrt{(3-\rho)(1+\rho)} \Leftrightarrow 4>(3-\rho)(1+\rho)$$

$$\Leftrightarrow \rho^2-2\rho+1>0 \Leftrightarrow (\rho-1)^2>0$$

olur ki bu eşitsizlik $\rho \neq 1$ olduğunda doğrudur. Çünkü $2 < \rho \leq 3$ dür. Buna göre şu sonuçları elde ederiz.

1. Açıları A, B, C; kenar uzunlukları α, β, γ olan bir üçgende açıların **(a)** dizisinin bir aritmetik dizi oluşturması için gerek ve yeter şart B = 60º olmasıdır. Burada $\rho = \frac{2\tau}{\beta}$ olmak üzere $2 < \rho \leq 3$ olacak şekildeki bir üçgende çevre uzunluğu 2τ dur.

Tersine olarak $2 < \rho \leq 3$ olacak şekilde iki pozitif reel sayı 2τ ve β verildiğinde B = 60º açılı ve B açısını oluşturan kenarları;

$$\alpha = \frac{\beta}{2}\left[\rho-1-\sqrt{\frac{(3-\rho)(1+\rho)}{3}}\right] \quad \text{ve} \quad \gamma = \frac{\beta}{2}\left[\rho-1+\sqrt{\frac{(3-\rho)(1+\rho)}{3}}\right]$$

biçiminde olan bir özel üçgen inşa edilebilir. Ayrıca bu üçgende;

$$\sin A = \frac{\sqrt{3}}{4}\left[\rho-1-\sqrt{\frac{(3-\rho)(1+\rho)}{3}}\right] \quad \text{ve} \quad \sin C = \frac{\sqrt{3}}{4}\left[\rho-1+\sqrt{\frac{(3-\rho)(1+\rho)}{3}}\right]$$

olarak bulunur.

2. Üçgende $\rho = 1+\sqrt{3}$ olduğu zaman, açıları A = 30º, B = 60º, C = 90º olan bir dik üçgen bulunur. Öte yandan $\rho = 3$ için üçgen eşkenardır.

3.2 Açıları Aritmetik Dizi Oluşturan Tamsayı Kenarlı Üçgenlerin Tanımlanması ve Belirlenmesi

Açıkça görüleceği gibi, kenar uzunlukları tamsayı olan ve açılarının **(a)** dizisi bir aritmetik dizi oluşturan bütün üçgenleri parametrik olarak tanımlayabilmek için, üç değişkenli $x^2 + 3y^2 = z^2$ Diophantine denkleminin genel çözümüne ihtiyacımız olacaktır. Burada $x^2 + ny^2 = z^2$ (n verilen pozitif bir tamsayıdır) biçimindeki üç değişkenli Diophantine denkleminin iyi anlaşıldığını ve genel çözümlerinin uzun zamandır bilindiği belirtelim. Fazla ayrıntıya girmeksizin, $x^2 + 3y^2 = z^2$ Diophantine denkleminin pozitif tamsayılardaki bütün çözümleri; d, κ, λ pozitif tamsayılar ve κ ile λ aralarında asal (yani $(\kappa, \lambda) = 1$ için) olmak üzere;

$$x = \frac{d\,|3\kappa^2-\lambda^2|}{2}, \qquad y = d\kappa\lambda, \qquad z = \frac{d\,(3\kappa^2+\lambda^2)}{2}$$

biçiminde tanımlandığını ifade edelim.

3.3 Örnekler

Aşağıda kenar uzunlukları tamsayı, **(a)** dizileri aritmetik dizi, $1 \leq \lambda, \kappa \leq 5$ eşitsizliklerini sağlayan λ ve κ farklı ikili olduğunda d parametresi 4 e eşit, λ ile κ nın her ikisinin de tek olduğu durumda $d = 1$ olacak şekildeki bütün üçgenlerin listesini veriyoruz. Aşağıdaki veriler; önceki bölümdeki formüllerden A açısının değerini yaklaşık olarak belirlemek için ve bilimsel hesap makinesi kullanılarak elde edilmiştir. Aşağıda on iki üçgen vardır.

Burada tüm benzer üçgenler sınıfı λ ve κ yı sabitleyerek ve d yi değiştirmek suretiyle elde edilmesine rağmen, aşağıdaki örnekler bu sınıfların birbiriyle bağlantılı olmadığını göstermektedir. Bunun nedeni; λ, 3 ün katı alındığı için üçgenin her bir kenarının 3 ün katı olmasıdır.

Örnek 3.3.1 $\kappa=\lambda=1,\ d=1,\ \alpha=\beta=\gamma=1,\ \rho=3,\ \sin A=\frac{\sqrt{3}}{2},$

$A=60^{\circ}$, $\varphi=0^{\circ}$, $B=60^{\circ}$, $C=60^{\circ}$

Örnek3.3.2 $\kappa=2,\ \lambda=1,\ d=4,\ \alpha=8,\ \beta=13,\ \gamma=15,\ \rho=\frac{36}{13}\approx 2.769230769,$

$$\sin A=\frac{4\sqrt{3}}{13}, A\approx 32.2042275^{\circ},\ \varphi\approx 27.7957725^{\circ},\ B=60^{\circ},\ C\approx 87.7957725^{\circ}$$

Örnek 3.3.3 $\kappa=3,\ \lambda=1,\ d=1,\ \alpha=3,\ \beta=7,\ \gamma=8,\ \rho=\frac{72}{28}=\frac{18}{7}\approx 2.57142851,$

$$\sin A=\frac{3\sqrt{3}}{14}, A\approx 21.7867893^{\circ},\ \varphi\approx 38.2132107^{\circ},\ B=60^{\circ},\ C\approx 98.2132107^{0}$$

Örnek 3.3.4 $\kappa=4,\ \lambda=1,\ d=4,\ \alpha=16,\ \beta=49,\ \gamma=55,\ \rho=\frac{120}{49}\approx 2.448979592,$

$$\sin A=\frac{8\sqrt{3}}{49}, A\approx 16.4264214^{\circ},\ \varphi\approx 43.5735786^{\circ},\ B=60^{\circ},\ C\approx 103.5735786^{\circ}$$

ÖZET: Bu çalışmada ilk olarak, α,β,γ kenarlı bir ABC üçgeninin kenar uzunluklarına bağlı olarak $\rho_\alpha,\rho_\beta,\rho_\gamma$ yarıçaplarının alternatif basit formülleri bulundu. Bunu yaparken, kosinüs teoremi ve trigonometrik özdeşlikler kullanıldı. Sonra Pythagorean üçgenleri için $\rho_\alpha,\rho_\beta,\rho_\gamma$ yarıçap formülleri verildi. Son olarak tamsayı kenar uzunluklu ve tamsayı alanlı bütün ikizkenar üçgenlerin ailesi incelendi.

Anahtar sözcükler: İkizkenar Heron Üçgeni, Dış Yarıçap, İç Yarıçap, Pythagorean Üçgeni, Diophantine Denklemi.

ABSTRACT: By this study, firstly, we present an alternative simple derivation of the formulas for the radii $\rho_\alpha,\rho_\beta,\rho_\gamma$; in terms of triangle ABC 's side lengths α,β,γ. To do so, we employ the Law of Cosines and two simple trigonometric identities. Than, This we do, in order to give formulas for the radii $\rho_\alpha,\rho_\beta,\rho_\gamma$, for triangles which are Pythagorean. Finally, to we examine the family of all isosceles triangles with integer side lengths and integral area.

Key words: Heron Isosceles Triangles, Pythagorean Triangles, External Radius, Internal Radius, Diophantine Equation.

[1]Bu bildiri, Eşen' in (2010*); "Heron Üçgenlerinin İç ve Dış Teğet Çemberlerinin Yarıçapları ile* $x^2+2y^2=z^2$ *Diophantine Denklemi Arasındaki İlişki Üzerine Bir Araştırma"* adlı Yüksek Lisans tezinden üretilmiştir.

1.GİRİŞ

Euclides düzlemindeki her bir üçgen için, dört karakteristik çember vardır. Bunlardan biri üçgenin iç teğet çemberi, diğer üç tanesi ise dış teğet çemberleridir. Bu dış teğet çemberlerinin her biri üçgenin kenarlarından birine teğettir ve aynı zamanda bu çemberlerin her biri, kenarların kendisine olmasa da diğer iki kenarı içeren doğruların uzantısına da teğettir. Bu üç çemberin her birinin merkezleri, üçgenin iki dış açıortayları ile bir iç açısının açıortayının kesim noktasıdır.

Bu çalışmanın iki amacı vardır. Birinci amaç; α,β,γ kenarlı bir ABC üçgeninin kenar uzunluklarına bağlı olarak $\rho_\alpha,\rho_\beta,\rho_\gamma$ yarıçaplarının alternatif basit formüllerini ortaya koymaktır. İkinci amaç ise; $\rho_\alpha,\rho_\beta,\rho_\gamma$ yarıçapları tam sayı olan bütün ikizkenar Heron üçgenlerinin ailesini parametrik olarak bulmaktır.

İkizkenar bir Heron üçgeninin eşkenar olamayacağı da açıktır. Çünkü eşkenar bir üçgenin tamsayı kenar uzunlukları $\alpha=\beta=\gamma$ olacağından, bu üçgenin alanı $E=\dfrac{\alpha^2.\sqrt{3}}{4}$ olarak bulunur ki alan irrasyonel bir sayıdır. Dolayısıyla bir eşkenar üçgen, Heron üçgeni olamaz.

Çalışmamız, giriş dışında üç bölümden oluşmaktadır. İkinci bölümde; ikizkenar Heron üçgenlerinin ailesi parametrik olarak elde edildi. Burada parametrik olarak ikizkenar Heron üçgenlerinin bir S alt kümesi oluşturuldu ki bu ikizkenar Heron üçgenleri için; $\rho_\alpha, \rho_\beta, \rho_\gamma$ değerleri de tamsayılardır. Bu bölüm, bu üçgenlerle ilgili sayısal örnekleri içeren iki tablo ile bitirildi. Üçüncü bölümde; bir üçgenin çapları $2\rho, 2\rho_\alpha$, $2\rho_\beta, 2\rho_\gamma$ olan iç ve dış teğet çemberleri incelendi. Bir ABC üçgeninin, A köşesindeki açısı 90º olan bir dik üçgen olduğu zaman

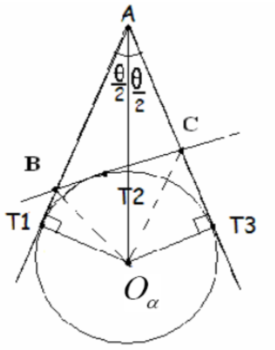
$$2\rho = \beta + \gamma - \alpha, 2\rho_\alpha = \alpha + \beta + \gamma, 2\rho_\beta = \alpha + \beta - \gamma, 2\rho_\gamma = \alpha + \gamma - \beta$$

olduğu gösterildi (bu durumda α, hipotenüs uzunluğudur). Devamında, Pythagorean üçgenleri verildi. Sonra Pythagorean üçgenlerinin ailesindeki $2\rho, 2\rho_\alpha, 2\rho_\beta, 2\rho_\gamma$ ifadeleri m ve n parametrelerine bağlı olarak verildi. Ayrıca $(x, y) = 1$ olan $x^2 + 2y^2 = z^2$ şeklindeki Diophantine denkleminin tüm çözümlerini üreten parametrik formüller verildi. Bir dik kenarı bir tamsayının karesi olan sonsuz sayıda primitif Pythagorean üçgeninin mevcut olduğu belirtildi. Buradan hareketle; bir kenar uzunluğu tam sayının karesi olan Pythagorean üçgenlerinde $2\rho, 2\rho_\alpha, 2\rho_\beta, 2\rho_\gamma$ şeklindeki dört tam sayıdan hangisi veya hangilerinin kare olacağı sorusuna cevap arandı. Ayrıca konuyla ilgili, sayısal örneklere de yer verildi. Son olarak bölüm, $x^2 + 2y^2 = z^2$ Diophantine denkleminin genel çözümünün verilmesiyle kapatıldı.

2. DIŞ YARIÇAPLARI ρ_α, ρ_β, ρ_γ TAM SAYILARI OLAN İKİZKENAR HERON ÜÇGENLERİ

3.

2.1 Kosinüs Teoremi ve İki Trigonometrik Özdeşlik



$$|AB| = \gamma, |BC| = \alpha, |AC| = \beta$$
$$|O_\alpha T_1| = |O_\alpha T_3| = \rho_\alpha$$

Şekil 2.1. **Bir Üçgenin Dış Teğet Çemberinin Merkezi**

Şekil 2.1 ile verilen ABC üçgeninde A iç açısını θ ile gösterirsek, kosinüs teoreminden

$$\alpha^2 = \beta^2 + \gamma^2 - 2\beta\gamma.\cos\theta$$

olur. Buradan,

$$\cos\theta = \frac{\beta^2 + \gamma^2 - \alpha^2}{2\beta\gamma} \tag{2.1}$$

$$\tan\left(\frac{\theta}{2}\right) = \sqrt{\frac{1-\cos\theta}{1+\cos\theta}} \quad \text{ve} \quad \tan\left(\frac{\theta}{2}\right) = \sqrt{\frac{(s-\beta)(s-\gamma)}{s(s-\alpha)}} \tag{2.2}$$

bulunur.

2.2 ABC Üçgeninin $\rho_\alpha, \rho_\beta, \rho_\gamma$ Dış Yarıçapları İçin Formüller

Yukarıda verilen **Şekil 2.1** de;

$$|AB| = \gamma, |BC| = \alpha, |AC| = \beta, |O_\alpha T_1| = \rho_\alpha = |O_\alpha T_3|$$

olsun ve ABC üçgeninin bir dış teğet çemberinin değme noktaları da sırasıyla T_1, T_2, T_3 ile gösterilsin. Burada $x = |BT_1| = |BT_2|$ ve $y = |T_2C| = |CT_3|$

olsun. Yukarıda $|AT_1| = |AT_3|$ olduğundan, $\gamma + x = \beta + y$ veya eşdeğeri

$$x - y = \beta - \gamma \tag{2.3}$$

olarak bulunur. Fakat aynı zamanda $|BT_2| + |T_2C| = |BC|$ olduğundan

$$x + y = \alpha \tag{2.4}$$

dır. Buradan

$$x = \frac{\beta - \gamma + \alpha}{2}, \; y = \frac{\alpha + \gamma - \beta}{2} \tag{2.5}$$

olur ki bu ifadelerden ve $O_\alpha T_I A$ dik açısından,

$$\rho_\alpha = | AT_1 | . \tan\left(\frac{\theta}{2}\right) \tag{2.6}$$

olarak buluruz. Burada

$$| AT_1 | = \gamma + x = \frac{\gamma + \beta + \alpha}{2} = s$$

olup buradan

$$\rho_\alpha = s \tan\left(\frac{\theta}{2}\right) \tag{2.7}$$

olarak bulunur. (2.7) ifadesinde (2.2) ifadesini kullanırsak;

$$\rho_\alpha = \sqrt{\frac{s(s-\beta)(s-\gamma)}{(s-\alpha)}} \tag{2.8}$$

formülüne ulaşırız. Eğer, Heron alan formülünü ve (2.8) u kullanırsak, $\rho_\alpha = \dfrac{E}{s-\alpha}$ denklemini elde ederiz. Benzer şekilde ρ_β ve ρ_γ yı da; $\rho_\beta = \dfrac{E}{s-\beta}$, $\rho_\gamma = \dfrac{E}{s-\gamma}$ olarak buluruz.

ABC üçgeni, θ = 90º olan bir dik açılı üçgen olduğunda (2.7) den kolaylıkla $\rho_\alpha = s$ olarak bulunur. Bu durumda $\beta^2 + \gamma^2 = \alpha^2$ olacağından, alan da $E = \dfrac{\beta\gamma}{2}$ olur. Burada *E* değeri yukarıdaki ρ_α, ρ_β, ρ_γ da yerine yazılır ve gerekli hesaplamalar yapılırsa,

$$\rho_\beta = \frac{\beta - \gamma + \alpha}{2} \quad \text{ve} \quad \rho_\gamma = \frac{\alpha + \gamma - \beta}{2} \tag{2.9}$$

olarak elde edilir.

Tersi de doğrudur. Yani, $\rho_\alpha = s$ ise, o zaman $\theta = 90^\circ$ dir. Böylece "$\rho_\alpha = s$ olması için gerek ve yeter şart $\theta = 90^\circ$ olmasıdır." ifadesini ispat etmiş oluruz (Bell, 2006: 341).

2.3 Bir Pythagorean Üçgeninin $\rho_\alpha, \rho_\beta, \rho_\gamma$ Dış Yarıçapları

Her Pythagorean üçgeni, bir dik açılı Heron üçgenidir. ABC bir Pythagorean üçgeni olduğu zaman, $\alpha^2 = \beta^2 + \gamma^2$ olacak şekilde α, β, γ pozitif tamsayıları vardır. Dolayısıyla $\theta = 90^\circ$ ve aynı zamanda

$$\beta = \delta(2mn), \; \gamma = \delta(m^2 - n^2), \; \alpha = \delta(m^2 + n^2) \tag{2.10}$$

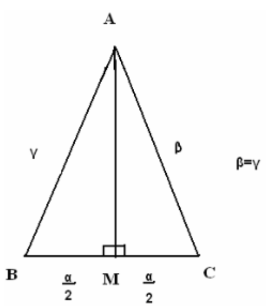
olmasını veya alternatif olarak $\beta = \delta(m^2 - n^2)$, $\gamma = \delta(2mn)$ olmasını gerektirir. ABC bir Pythagorean üçgeni olduğu zaman (2.9) ve (2.10) den

$$\rho_\alpha = \delta m(n+m), \quad \rho_\beta = \delta n(m+n), \quad \rho_\gamma = \delta m(m-n) \tag{2.11}$$

olarak bulunur.

2.4 İkizkenar Heron Üçgenlerinin Durumu

İkizkenar heron üçgenleri β, γ, α kenarları; $\beta = \gamma \neq \alpha$ olacak şekilde tamsayılar ve E alanı da tamsayı olan üçgenlerdir. Böyle üçgenleri tanımlayabilmek için, aşağıda verilip ispatlanacak olan Önerme 2.1 den faydalanacağız



Şekil 2.2. İkizkenar Üçgenin Yüksekliği

Önerme 2.1. ABC, kenar uzunlukları $\gamma = |AB| = \beta = |AC| \neq \alpha = |BC|$ olan bir ikizkenar üçgen olsun. ABC ikizkenar üçgeninin; E alanı ile α ve $\beta = \gamma$ kenarlarının her biri pozitif tamsayılar olarak verilsin. Ayrıca A köşesinden $|BC|$ kenarına inilen yükseklik h olsun. O zaman α bir çift tamsayı ve h bir tamsayıdır (Zelator, 2008a: 7).

Aşağıdaki önerme, bütün ikizkenar Heron üçgenlerinin ailesini ifade etmektedir. Ayrıca; her bir ikizkenar Heron üçgeninin, iki eş Pythagorean üçgenini birbirine yapıştırarak (üçgenlerin dik kenarlarından biri ortak olacak şekilde) elde edilebileceğini göstermektedir.

Önerme 2.2. Kenar uzunlukları $\gamma = |AB| = \beta = |AC| \neq \alpha = |BC|$ olacak şekildeki bir ABC ikizkenar üçgeninde; α, β, γ kenar uzunlukları ve E alanı tamsayı olsun. Ayrıca A köşesinden $|BC|$ kenarına inilen yükseklik h olsun. O zaman

$$\alpha = 2\delta(m^2 - n^2),\ \ h = \delta(2mn),\ \ \gamma = \beta = \delta(m^2 + n^2)$$

veya alternatifi

$$\alpha = 4\delta mn,\ \ h = \delta(m^2 - n^2),\ \ \gamma = \beta = \delta(m^2 + n^2)$$

olur ki burada $m > n$, $(m, n) = 1$ (yani m ile n aralarında asal) ve $m + n \equiv 1 (\text{mod } 2)$ (yani m ve n'nin birisi tek diğeri çift) olacak şekilde δ, m, n tamsayılardır.

Karşıt olarak; $m > n$ olacak şekilde bazı δ, m, n tamsayıları için bir ABC üçgeninin α, β, γ kenar uzunlukları yukarıdaki formüllerden birini sağlarsa o zaman sırasıyla

$h = \delta(2mn)$ veya $h = \delta(m^2 - n^2)$

olur ve h bir tam sayıdır (Zelator, 2008a: 9).

Not: Burada $(m, n) = 1$ ve $m + n \equiv 1$ (mod 2) şartları, karşıt durumun geçerli olması için gerekli değildir.

Bu önermemiz ile ilgili sayısal örnekler aşağıdaki tablodaki gibidir.

Tablo 2.1(a): Önerme 2.2 de $\alpha = 2\delta(m^2 - n^2), h = \delta(2mn), \gamma = \beta = \delta(m^2 + n^2)$ ile ilgili örnekler (Eşen 2010)

m	*n*	□	□	□=□	*h*	*m*	*n*	□	□	□=□	*h*
2	1	1	6	5	4	4	1	1	30	17	8
3	2	1	10	13	12	5	2	1	42	29	20

Tablo 2.1(b) Önerme 2.2 de $\alpha = 4\delta mn, h = \delta(m^2 - n^2), \gamma = \beta = \delta(m^2 + n^2)$ ile ilgili örnekler (Eşen 2010)

m	*n*	□	□	□=□	*h*	*m*	*n*	□	□	□=□	*h*
2	1	1	16	5	3	4	1	1	32	17	15
3	2	1	48	13	5	5	2	1	80	29	21

Şimdi; bütün ikizkenar Heron üçgenlerinin tam bir parametrik tanımlaması mevcut olduğuna göre, buradan hareketle böyle üçgenlerin $\rho_\alpha, \rho_\beta, \rho_\gamma$ dış teğet çemberlerinin yarıçaplarının da tamsayılar olduğunu verebiliriz.

Teorem 2.1. İkizkenar Heron üçgenlerinin kümesi S olsun. Yani bütün ABC üçgenlerinin kenarları; $\gamma = |AB| = \beta = |AC| \neq \alpha = |BC|$ olacak şekildeki α, β, γ lar tamsayılar ve E alanı da tamsayı olsun. Ayrıca $\rho_\alpha, \rho_\beta, \rho_\gamma$ dış teğet çemberlerinin yarıçapları da tamsayılar olarak verilsin. O zaman S aşağıdaki iki ailenin birleşimidir. Bu aileler;

$$S_1 : \beta = \gamma = Kn(m^2 + n^2), \quad \alpha = 2Kn(m^2 - n^2)$$

ve bu ailede yarıçaplar

$$\rho_\alpha = Km(m^2 - n^2), \quad \rho_\beta = \rho_\gamma = 2Kmn^2$$

biçiminde veya

$$S_2 : \beta = \gamma = L(m - n)(m^2 + n^2), \quad \alpha = 4L(m - n)mn$$

ve bu ailede ise yarıçaplar

$$\rho_\alpha = 2Lmn(m + n), \quad \rho_\beta = \rho_\gamma = L(m + n)(m - n)^2$$

olarak verilir. Burada K ile L keyfi seçilen pozitif tamsayılar ve m ile n tamsayıları aralarında asal (m ile n biri tek iken diğeri çift) olup, $m > n$ dir (Zelator, 2008a: 10).

Parametreler için $1 \leq n < m \leq 6$, $L = K = 1$, $(m, n) = 1$ ve $m + n \equiv 1$ $(mod\ 2)$ kısıtlamaları altında; yarıçapları $\rho_\alpha, \rho_\beta, \rho_\gamma$ tamsayıları olan ikizkenar Heron üçgenlerinin S_1 ailesi için bazı örnekler Tablo 2.2 ile S_2 ailesi için bazı örnekleri ise Tablo 2.3 ile verilmiştir.

Tablo 2.2 S_1 ailesinin *m* ve *n* elemanları için bazı sayısal örnekler (Eşen 2010)

K	*n*	*m*	□	□=□	$\rho_\beta = \rho_\gamma$	ρ_α	*K*	*n*	*m*	□	□=□	$\rho_\beta = \rho_\gamma$	ρ_α
1	1	2	6	5	4	6	1	2	5	84	58	40	105
1	1	4	30	17	8	60	1	3	4	42	75	72	28
1	1	6	70	37	12	210	1	4	5	72	164	160	45
1	2	3	20	26	24	15	1	5	6	110	305	300	66

Tablo 2.3 S_2 ailesinin *m* ve *n* elemanları için bazı sayısal örnekler (Eşen 2010)

L	*n*	*m*	□	□=□	$\rho_\beta = \rho_\gamma$	ρ_α	*L*	*n*	*m*	□	□=□	$\rho_\beta = \rho_\gamma$	ρ_α
1	1	2	8	5	3	12	1	2	5	120	87	63	140
1	1	4	48	51	45	40	1	3	4	48	25	7	168
1	1	6	120	185	175	84	1	4	5	80	41	9	360

3. BİR ÜÇGENİN İÇ TEĞET VE DIŞ TEĞET ÇEMBERLERİNİN ÇAPLARINI İÇEREN PYTHAGOREAN ÜÇGENLERİNİN BELİRLİ ÖZELLİKLERİ

Bu bölümde; çalışmamızın esas konusu olan Pythagorean üçgenlerinin ailesini üreten *m* ile *n* tamsayı parametrelerine bağlı iç ve dış teğet çemberlerinin çapları olan $2\rho, 2\rho_\alpha, 2\rho_\beta, 2\rho_\gamma$ ifadeleri için basit formüller verildi. Sonra, bir dik kenarı bir tamsayının karesi olan sonsuz sayıda primitif Pythagorean üçgeninin mevcut olduğu belirtildi. Sonra $(x, y) = 1$ olan $x^2 + 2y^2 = z^2$ şeklindeki Diophantine denklemlerinin tüm çözüm ailesini tanımlayan parametrik formülleri ifade edildi. Ayrıca bu denklemin genel çözümünün elde edilmesiyle ilgili bir taslak verilerek bölüm kapatıldı.

3.1 Üçgenlerin Genel Özellikleri

Üç pozitif α, β, γ tam sayıları verildiğinde, iki boyutlu Euclides düzleminde, üç kenar, $\alpha + \beta > \gamma$, $\alpha + \gamma > \beta$, $\beta + \gamma > \alpha$ üçgen eşitsizliklerini sağladığı sürece, kenarları α, β, γ olan üçgenler mevcut olacaktır. Buradan hareketle, α, β, γ tam sayılarına bağlı olarak; cetvel, pergel ve bazı diğer aletler kullanılarak böyle bir temsili üçgen (eş üçgenler ailesi denilen) oluşturulabilir. Böyle bir üçgen; cetvel veya pergel gibi geleneksel araçları kullanarak yapılamasa bile, kuşkusuz matematiksel anlamda var olacaktır.

Bir kenar uzunluğu bir tam sayının karesi olan ve $\alpha + \beta + \gamma (Çevre)$, $-\alpha + \beta + \gamma$, $\alpha - \beta + \gamma$, $\alpha + \beta - \gamma$ şeklindeki dört pozitif tamsayıdan birisi de bir tam sayının karesi olan tam sayı kenarlı sonsuz sayıda üçgen olduğunu görmek de kolaydır. Gerçekten, herhangi bir *k* pozitif tamsayısı için $\alpha = k^2$ ve bir *l* pozitif tamsayısı için $\alpha + \beta + \gamma = l^2$ olsun. Buradan $l >$ k ve $\beta + \gamma = l^2 - k^2 > k^2$ olacak şekilde β ve γ sayıları seçilebilir. Böylece *l* ve *k* pozitif tamsayılarının $1 > k\sqrt{2} \Leftrightarrow 1^2 > 2k^2$ şartını sağlaması gerektiği ve $-k^2 < \beta - \gamma < k^2$ veya eşdeğer şekilde $|\beta - \gamma| < k^2$ olması gerektiği ortaya çıkar. Kolayca görüleceği üzere; her bir $t = -k^2 + 1, -k^2 + 2, ..., 0, 1, 2, ..., k^2 - 2, k^2 - 1$ değeri için

$$\alpha = k^2, \beta = \frac{1^2 - k^2 + t}{2}, \quad \gamma = \frac{1^2 - k^2 - t}{2}$$

ifadelerinden kenar uzunlukları tam sayılar olan üçgenleri oluşturulur ki burada üç üçgen eşitsizliğinin her biri sağlanır.

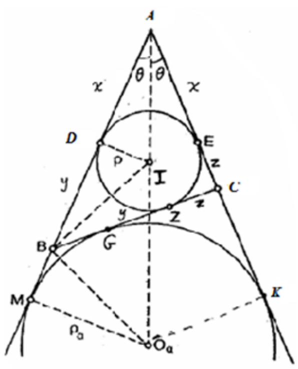
Dört tane $\alpha + \beta + \gamma$, $-\alpha + \beta + \gamma$, $\alpha - \beta + \gamma$, $\alpha + \beta - \gamma$ reel sayıları, üçgenin alanı için Heron alan formülündeki köklü ifade altında çarpanlar olarak belirlenir.

Bu çalışmanın 2. kesiminde göreceğimiz gibi; eğer üçgenin alanını, her bir $\alpha + \beta + \gamma$, $-\alpha + \beta + \gamma$, $\alpha - \beta + \gamma$, $\alpha + \beta - \gamma$ sayısı ile iki kez bölersek, sırasıyla $2\rho, 2\rho_\alpha, 2\rho_\beta, 2\rho_\gamma$ değerlerini elde ederiz. Bunlar dört önemli çemberin çaplarıdır. Bu çemberler; biri üçgenin içinde veya içine çizilen çember ve diğer üç çemberin her biri ise, bir kenara ve diğer iki kenarı içeren doğruların uzantısına teğet olan (fakat diğer iki kenarın kendisine teğet olmayan) çemberlerdir. Bu üç dış çemberin merkezlerinin her birisi, bir iç açıortay ve iki dış açıortayın kesim noktasıdır.

3.2 Bir ABC Üçgeninin α, β, γ Kenar Uzunlukları Cinsinden $2\rho, 2\rho_\alpha, 2\rho_\beta, 2\rho_\gamma$ Çapları İçin Formüller

Bir ABC üçgenine ilişkin bilgiler aşağıdaki Şekil 3.1 ve devamında verilmiştir.

$|AB| = \gamma, |BC| = \alpha, |CA| = \beta$
$|AD| = x = |AE|$
$|BD| = y = |BZ|$
$|CZ| = z = |CE|$
$|DI| = |IZ| = |IE| = \rho$
$|O_\alpha M| = \rho_\alpha$



Şekil 3.1 Bir ABC Üçgenin İç Teğet ve Dış Teğet Çemberlerinin Yarıçapları

Şekil 3.1 den

$$\left.\begin{array}{l} A(\overset{\Delta}{ABI}) = \frac{1}{2}\rho\gamma \\ A(BIC) = \frac{1}{2}\rho\alpha \\ A(AIC) = \frac{1}{2}\rho\beta \end{array}\right\} \Rightarrow A(ABC) = \frac{1}{2}\rho(\alpha + \beta + \gamma)$$

dir. Aynı zamanda,

$$\begin{Bmatrix} x + y = \gamma \\ y + z = \alpha \\ z + x = \beta \end{Bmatrix} \Leftrightarrow \begin{Bmatrix} x = \dfrac{\beta + \gamma - \alpha}{2} \\ y = \dfrac{\alpha + \gamma - \beta}{2} \\ z = \dfrac{\alpha + \beta - \gamma}{2} \end{Bmatrix}$$

olduğunu da kolaylıkla görebiliriz.

Sonra $|AM| = |AK|$ dan (*M* ve *K*, [*AM*] ve [*AK*] nın uzantılarının O_α merkezli çemberin teğet noktalarıdır) $\gamma + |BM| = \beta + |CK|$ olur. Aynı zamanda $|BG| = |BM|$ ve $|CG| = |CK|$ dır. Burada $|BG| + |CG| = \alpha$ olduğundan $|BM| + |CK| = \alpha$ çıkar. Bunu $|BM| - |CK| = \beta - \gamma$ ile birleştirerek,

$|BM| = \dfrac{\beta + \alpha - \gamma}{2}$ ve $|CK| = \dfrac{\alpha + \gamma - \beta}{2}$

olarak elde edilir. Üstelik *IDA* dik üçgeninde $\tan\theta = \rho / x$ olduğundan hareketle

$$\tan\theta = \frac{\rho_\alpha}{|AM|} = \frac{\rho_\alpha}{(\beta + \alpha + \gamma)/2}$$

bulunur. Yukarıdan

$$|AM| = \gamma + |BM| = \gamma + \frac{\alpha + \beta - \gamma}{2} = \frac{\alpha + \beta + \gamma}{2}$$

olur ve bu sonucu ADI üçgeninden de elde ederiz. Böylece

$$\frac{\rho_\alpha}{(\beta + \alpha + \gamma)/2} = \frac{\rho}{x}$$

olarak bulunur. Burada

$$x = \frac{\gamma + \beta - \alpha}{2} \text{ ve } \rho = \frac{2.A(ABC)}{\alpha + \beta + \gamma}$$

olması durumunu kullanarak,

$$2\rho_\alpha = \frac{4.A(ABC)}{-\alpha + \beta + \gamma}$$

ifadesine varırız. Benzer şekilde diğer iki çap için de

$$2\rho_\beta = \frac{4.A(ABC)}{\alpha-\beta+\gamma},\ 2\rho_\gamma = \frac{4.A(ABC)}{\alpha+\beta-\gamma}$$

ifadelerine ulaşırız. Böylece dört çap için

$$2\rho = \frac{4.A(ABC)}{\alpha+\beta+\gamma},\ 2\rho_\alpha = \frac{4.A(ABC)}{\beta+\gamma-\alpha},\ 2\rho_\beta = \frac{4.A(ABC)}{\alpha-\beta+\gamma},\ 2\rho_\gamma = \frac{4.A(ABC)}{\alpha+\beta-\gamma} \quad (3.1)$$

formüllerini elde ederiz.

3.3 Dik Üçgenlerin Durumu

Eğer ABC bir dik üçgen ve A köşe açısının ölçümü 90º ise, o zaman α kenarı hipotenüs, β ile γ da diğer iki dik kenar olur. Buradan

$$\alpha^2 = \beta^2+\gamma^2 \Leftrightarrow 2\beta\gamma = (\beta+\alpha+\gamma)(\beta-\alpha+\gamma)$$

bulunur. Ayrıca dik üçgende alandan

$$4.A(ABC) = 2\beta\gamma$$

olacağından dolayı ve (3.1) deki ilk iki formül birleştirildiği zaman

$$2\rho = \beta+\gamma-\alpha \text{ ve } 2\rho_\alpha = \alpha+\beta+\gamma$$

elde edilir. Burada $2\rho_\alpha$ nın dik üçgenin çevresine eşit olduğu açıktır.

Benzer şekilde, cebirsel işlemler sonucunda

$$2\beta\gamma = (\beta+\alpha-\gamma)\left[\alpha-(\beta-\gamma)\right];$$

bulunur.

$$4.A(ABC) = 2\beta\gamma$$

olduğundan ve (3.1) deki son iki formül birleştirildiği zaman

$$2\rho_\beta = \alpha+\beta-\gamma \text{ ve } 2\rho_\gamma = \alpha+\gamma-\beta$$

yı elde ederiz. Bu sonuçlar birleştirilirse,

$$2\rho = \beta+\gamma-\alpha,\ 2\rho_\alpha = \alpha+\beta+\gamma,\ 2\rho_\beta = \alpha+\beta-\gamma,\ 2\rho_\gamma = \alpha-\beta+\gamma \quad (3.2)$$

olarak buluruz.

3.4 Pythagorean Üçgenlerinin Durumu

Pythagorean üçgenlerinin veya üçlülerinin tüm ($\alpha,\ \beta,\ \gamma$) ailesi, iyi bilinen

$$\alpha = \delta(m^2+n^2),\ \beta = \delta(2mn),\ \gamma = (m^2-n^2) \quad (3.3)$$

parametrik formülleri ile verilir ki burada *m, n, δ* pozitif tamsayılar, (*m, n*) = 1, *m* > *n* ve $m+n \equiv 1(\mathrm{mod}\,2)$ olacak şekilde pozitif tamsayılardır (yani *m* ve *n* nin birisi çift iken diğeri tek olmak üzere).

$\delta = 1$ için (3.3) ifadesi

$$\alpha = m^2+n^2,\ \beta = 2mn,\ \gamma = m^2-n^2$$

olur ki burada

$$(m,n) = 1,\ m+n \equiv 1(\mathrm{mod}\,2),\ m,n \in \mathbf{Z}^+ \text{ ve } m>n \quad (3.4)$$

olacağından bu ($\alpha,\ \beta,\ \gamma$) Pythagorean üçgeninin veya üçlüsünün Tanım 1.2.6 ya göre primitif olduğu açıktır (Zelator, 2008b: 8).

Eğer ($\alpha,\ \beta,\ \gamma$) bir primitif Pythagorean üçlüsüyse, (3.2) ve (3.4) formüllerinin birlikte uygulanmasıyla $2\rho, 2\rho_\alpha, 2\rho_\beta, 2\rho_\gamma$ çapları

$$2\rho = 2n(m-n),\ \ 2\rho_\alpha = 2m(n+m),\ \ 2\rho_\beta = 2n(m+n),\ \ 2\rho_\gamma = 2m(m-n) \quad (3.5)$$

olarak verilir.

Örnek 3.5.1 $m = 2, n = 1 \Rightarrow \alpha = 5,\ \beta = 4, \gamma = 3$ ve $2\rho = 2,\ 2\rho_\alpha = 12,\ 2\rho_\beta = 6,\ 2\rho_\gamma = 4$ olur.

3.5 Bir Dik Kenarının Uzunluğu Kare Olan Sonsuz Sayıdaki Primitif Pythagorean Üçgenleri

Bir Pythagorean üçgeninin kenar uzunluklarından sadece bir dik kenarının tam kare olabileceği daha önce verilmişti. Öte yandan Fermat tarihte, sonsuz iniş yöntemini ilk kullanan matematikçidir (Zelator, 2008b: 11). Fermat; bu yöntemi $x^4+y^4=z^2$ Diophantine denkleminin pozitif tamsayılarda çözümü olmadığını göstermek için kullanmıştır. Bu, birçok sayılar teorisi kitabında bulunabilen ve iyi bilinen bir sonuçtur. Öte yandan; "her iki dik kenar uzunluğu da bir tam sayının karesi olan Pythagorean üçgenlerinin bulunmadığı", bu çözümün doğal bir sonucudur. Aşağıda, bir dik kenar uzunluğu kare olan tüm Pythagorean üçgenlerinin elde ediliş yöntemi iki farklı yolla verilmiştir.

Teorem 3.1. (*i*) β dik kenarı çift ve kare olan sonsuz sayıda $(\alpha,\ \beta,\ \gamma)$ primitif Pythagorean üçgenleri veya üçlüleri vardır. Bu sonsuz aile parametrik olarak,

$$\alpha\ =\ m^2+n^2,\ \beta\ =\ 2mn,\ \gamma\ =\ m^2-n^2$$

biçiminde verilir. Burada β nın tam kare olabilmesi için $(t_1,\ t_2) = 1$ olacak şekilde t_1 ve t_2 tamsayılarına bağlı olarak $m = 2t_1^2$ ve $n = t_2^2$ veya $m = t_1^2$ ve $n = 2t_2^2$ olur. Ayrıca ilk durumda t_2 nin, ikinci durumda t_1 in tek olacağı ve aynı zamanda yazılış sırasıyla $2t_1^2 > t_2^2$ veya $t_1^2 > 2t_2^2$ olması gerektiği açıktır.

γ dik kenarı tek ve kare olan sonsuz sayıda $(\alpha,\ \beta,\ \gamma)$ primitif Pythagorean üçgenleri veya üçlüleri vardır. Bu sonsuz aile parametrik olarak,

$$\alpha\ =\ m^2+n^{2,},\ \beta\ =\ 2mn,\ \gamma\ =\ m^2-n^2$$

biçiminde verilir. Burada γ nın tam kare olabilmesi için t_1 ve t_2; $(t_1,\ t_2) = 1$, t_1 ile t_2 nin birisi tek diğeri çift (Yani $t_1+t_2\equiv 1(\mathrm{mod}\,2)$) ve $t_1 > t_2$ olacak şekildeki tamsayılar için $m = t_1^2 + t_2^2$, $n = 2t_1t_2$ olur (Bu $t_1 > t_2$ kabulü $(\alpha,\ \beta,\ \gamma)$ üçlüsünün tekrarlanmamasını garantiler) (Zelator, 2008b: 12).

Teorem 3.1 (*i*) için sayısal örnekler Tablo 3.1 de, Teorem 3.1 (*ii*) için sayısal örnekler Tablo 3.2 de verilmiştir.

Tablo 3.1 Teorem 3.1 (*i*) örnekler (Eşen 2010)

t_1	t_2	m	n	□	□	□
1	1	2	1	5	4	3
2	1	8	1	65	16	63
3	1	18	1	325	36	323

($m=2t_1^2\ ,n=t_2^{\ 2}$)

t_1	t_2	m	n	□	□	□
2	1	4	2	20	16	12
3	1	9	2	85	36	77
3	2	9	8	145	144	17

($m=t_1^2\ ,n=2t_2^{\ 2}$)

Tablo 3.2 Teorem 3.1 (*ii*) de $m=2t_1^2\ ,n=t_2^{\ 2}$ için örnekler (Eşen 2010)

t_1	t_2	m	n	□	□	□	t_1	t_2	m	n	□	□	□

3. 6 Sayılar Teorisinden Bazı Sonuçlar

Bu kesimde sayılar teorisi ile ilgili konumuz için gerekli olan bazı sonuçlar verilmiştir.

Sonuç 3.1. $x^2+2y^2=z^2$ Diophantine denkleminin pozitif tamsayılarda $(x,\ y) = 1$ olan bütün $(x,\ y,\ z)$ çözümlerinin kümesi parametrik olarak;

$$x=\left|k^2-2\lambda^2\right|,y=2k\lambda,z=k^2+2\lambda^2$$

biçiminde verilir ki burada k ile λ parametreleri aralarında asal olan pozitif tamsayılar ($k,\lambda\in\mathbf{Z}^+$ $(k,\ \lambda) = 1$) ve k tek ($k \equiv 1$ (mod 2)) olur. Bu durumda x ile z nin her ikisi de tektir (Dickson, 1971: 225).

Sonuç 3. 2. $x^2+y^2=2z^2$ Diophantine denkleminin pozitif tamsayılarda $(x,\ y) = 1$ olan bütün $(x,\ y,\ z)$ çözümlerinin kümesi parametrik olarak;

$$x=\left|k^2+2k\lambda-\lambda^2\right|,y=\left|-k^2+2k\lambda+\lambda^2\right|,\ z=k^2+\lambda^2$$

olarak verilir (simetriden dolayı, eğer $(x,\ y,\ z)$ bir çözümse, böylece $(y,\ x,\ z)$ nin de bir çözüm olduğu açıktır). Burada k ile λ; $(k,\ \lambda) = 1$, $k + \lambda \equiv 1$(mod *2*) olacak şekilde pozitif tam sayılardır (Böylece, $(x,\ y) = 1$ olan herhangi bir çözümdeki $x,\ y,\ z$ tamsayıları tek olmalıdır) (Dickson,1971: 250).

3. 7 Bir Dik Kenarı ile $2\rho,2\rho_\alpha,2\rho_\beta,2\rho_\gamma$ Çaplarından Birisi Kare Olan Primitif Pythagorean Üçgenleri

Eğer $(\alpha,\ \beta,\ \gamma)$ üçlüsü; $(m,\ n) = 1$, $m+n\equiv 1(mod2)$ ve $m > n$ şartlarını sağlayan $m,\ n$ pozitif tamsayıları için

$$\alpha\ = m^2+\ n^2,\ \beta\ = 2mn,\ \gamma\ = m^2-\ n^2$$

olacak şekildeki bir primitif Pythagorean üçlüsü ise, o zaman bu pythagorean üçgeninde bir dik kenar uzunluğu ile dört çapından birisi de kare olacak şekilde aşağıda verilen tam olarak sekiz kombinasyon vardır. Bunlar;

1) β kare, 2ρ kare; **2)** β kare, $2\rho_\alpha$ kare; **3)** β kare, $2\rho_\beta$ kare; **4)** β kare, $2\rho_\gamma$ kare;

5) γ kare, 2ρ kare; **6)** γ kare, $2\rho_\alpha$ kare; 7) γ kare, $2\rho_\beta$ kare; 8) γ kare, $2\rho_\gamma$ kare;

Aşağıda Teorem 3.2 de görüleceği üzere, 6 ve 8 kombinasyonları gerçekte gerçekleşemez. Yine Teorem 3.3 de verileceği üzere, geri kalan kombinasyonlar gerçekleşir ve her bir durumda (kombinasyonda) her bir üçlünün tüm ailesi, parametrik olarak tanımlanır.

Teorem 3.2 (i) γ dik kenar uzunluğu bir tek sayının karesi ve $2\rho_\alpha$ çapı (aynı zamanda üçgenin çevresi) da kare olan hiçbir Pythagorean üçgeni yoktur.

(ii) Tek sayılı γ kenar uzunluğu bir tek sayının karesi ve $2\rho_\gamma$ çapı da kare olan hiçbir Pythagorean üçgeni yoktur (Zelator, 2008b: 15).

Teorem 3.3 (*i*) β dik kenar uzunluğu bir çift sayının karesi ve $2\rho_\alpha$ çapı (aynı zamanda üçgenin çevresi) da kare olan primitif $(\alpha,\ \beta,\ \gamma)$ Pythagorean üçlüleri; $\kappa \equiv 1 (\mathrm{mod}\, 2)$, $(\kappa,\lambda)=1$ olacak şekildeki $\kappa,\lambda \in Z^+$ için $t_2 = \left|\kappa^2 - 2\lambda^2\right|$, $t_1 = 2\kappa\lambda$ olmak üzere $\alpha = m^2+n^2, \beta = 2mn,\ \gamma = m^2-n^2\ ve\ m = 2t_1^2, n = t_2^2,\ 2t_1^2 > t_2^2$ olarak bulunur ve F_1 ailesi ile verilir.

(ii) β dik kenar uzunluğu bir çift sayının karesi ve $2\rho_\beta$ çapının da kare olduğu primitif $(\alpha,\ \beta,\ \gamma)$ Pythagorean üçlüleri; $\kappa \equiv 1 (\mathrm{mod}\, 2)$, $(\kappa,\lambda)=1$ olacak şekildeki $\kappa,\lambda \in Z^+$ için $t_1 = |\kappa^2 - 2\lambda^2|$, $t_2 = 2\kappa\lambda$ olmak üzere $\alpha = m^2+n^2, \beta = 2mn,\ \gamma = m^2-n^2$ ve $m = t_1^2, n = 2t_2^2,\ t_1^2 > 2t_2^2$ olarak bulunur ve F_2 ailesi ile verilir.

(iii) β dik kenar uzunluğu bir çift sayının karesi ve $2\rho_\gamma$ çapının da kare olduğu primitif $(\alpha,\ \beta,\ \gamma)$ Pythagorean üçlüleri; $\kappa+\lambda \equiv 1 (\mathrm{mod}\, 2), (\kappa,\lambda)=1$ olacak şekildeki $\kappa,\lambda \in Z^+$ için $t_1 = \kappa^2 + \lambda^2$, $t_2 = |-\kappa^2 + 2\kappa\lambda + \lambda^2|$ olmak üzere $\alpha = m^2+n^2, \beta = 2mn,\ \gamma = m^2-n^2$ ve $m = 2t_1^2, n = t_2^2,\ 2t_1^2 > t_2^2$ olarak bulunur ve F_3 ailesi ile verilir.

(iv) γ dik kenar uzunluğu bir tek sayının karesi ve 2ρ iç çapının (aynı zamanda üçgenin çevresi) da kare olduğu primitif $(\alpha,\ \beta,\ \gamma)$ Pythagorean üçlüleri tam olarak; $(\kappa,\lambda)=1, \kappa+\lambda \equiv 1(\mathrm{mod}\, 2)$ olacak şekildeki $\kappa,\lambda \in Z^+$ için $t_1 = \kappa^2, t_2 = \lambda^2,\ t_1 > t_2$ olmak üzere $\alpha = m^2+n^2, \beta = 2mn,\ \gamma = m^2-n^2$ ve $m = t_1^2 + t_2^2, n = 2t_1t_2$ olarak bulunur ve F_4 ailesi ile verilir.

(v) γ dik kenar uzunluğu bir tek sayının karesi ve $2\rho_\beta$ çapının da kare olduğu primitif $(\alpha,\ \beta,\ \gamma)$ Pythagorean üçlüleri, tam olarak **(iv).** şıktaki F_4 ailesinin elemanları ile verilir. Yani γ kare olduğundan dolayı, 2ρ nın bir kare olabilmesi için gerek ve yeter şart $2\rho_\beta$ nın da bir kare olmasıdır.

(vi) β dik kenar uzunluğu bir çift sayının karesi ve 2ρ iç çapının da bir kare olduğu primitif $(\alpha,\ \beta,\ \gamma)$ Pythagorean üçlüleri tam olarak; $\kappa \equiv 1 (\mathrm{mod}\, 2)\, ve\, (\kappa,\lambda) = 1$ olacak şekildeki $\kappa,\lambda \in Z^+$ için $t_1 = \kappa^2 + 2\lambda^2$, $t_2 = 2\kappa\lambda$, $t_1^2 > 2t_2^2$ olmak üzere $\alpha = m^2+n^2, \beta = 2mn,\ \gamma = m^2-n^2$ ve $m = t_1^2, n = 2t_2^2$ olarak bulunur ve F_6 ailesi ile verilir (Zelator, 2008b: 16).

Aşağıda Teorem 3.3 ün her bir şıkkında verilen formüllere bağlı örnekler yrı ayrı tablolarla verilmiştir.

ABSTRACT: By this research it is aimed to determine the factors which have effects on the wishes of five-class students to become scientists in the future. At the end of the study it is understood that the things told by the teachers about the scientists and "the figure of asocial and mad scientist continuously studying in the lab" formed by the visual and written media have caused some girl and boy students to wish to become scientists in the future. However, the findings obtained from this study disprove the claim that the preference of the girls taking place in the literature to draw male scientist has been caused by the apprehension that girl students cannot become scientists and so they do not want to be scientists in the future. The girl students specified that they do not sympathize with the thought of being a scientist in the future because of their various interests or of the "figure of asocial and mad scientist continuously studying in the lab".

Key Words: Scientist Perception, Television, Five-class students, Written Media, Visual Media

GİRİŞ

Mc Comas, bilimin doğasının 'Bilim nedir ve hangi metotlarla çalışır?', 'Kimleri bilim insanı olarak adlandırırız ve onlar çalışmalarını nasıl yaparlar?', 'Sosyal ve kültürel içeriklerin bilime etkisi nedir?' gibi pek çok soruyu bünyesinde barındırdığını belirtmektedir. Öğrencilerin bilim insanları hakkında sahip oldukları algılar üzerine odaklanılan araştırmaları incelediğimizde, kız öğrencilerin bilim insanı çizerken çoğunlukla erkek bilim insanı çizmeyi tercih etmelerinin nedeninin, kız öğrencilerin kadınların bilim insanı olamayacağını düşünmelerinden ve bu yüzden gelecekte bilim insanı olma fikrine sıcak bakmamalarından kaynaklanıyor olabileceği ihtimalinden bahsedilmektedir (Mead ve Metraux,1957; Chambers, 1983; Fung, 2002; Kaya, Doğan ve Öcal, 2008; Losh, Wilke ve Pop, 2008; Moeller, Krough ve Lykkegaard, 2013). Ancak Steinke' nin (2007) de belirttiği gibi, burada sadece bir olasılıktan bahsedilmektedir. Kız öğrencilerin çoğunlukla erkek bilim insanı çizmeyi tercih etmelerinin nedenlerine yönelik veriler mevcut değildir. Bu araştırmada, ortaokul beşinci sınıf öğrencilerinin bilim insanları hakkındaki görüşlerinin, gelecekte bilim insanı olma konusundaki isteklerine etkisi olup olmadığına ışık tutmak amaçlanmıştır.

ARAŞTIRMANIN YÖNTEMİ

Araştırma, nitel bir çalışma olup, Konya ilinde ve İl Milli Eğitim Müdürlüğü'nün belirlediği Meram, Karatay ve Selçuklu bölgesinden ikişer olmak üzere toplam altı ortaokulda yürütülmüştür. Belirlenen okullardan, 101 erkek ve 86 kız olmak üzere toplam 187 gönüllü beşinci sınıf öğrencisi seçilmiş ve onlara Mead ve Metraux (1957) tarafından önerilen ve Chambers (1983) tarafından geliştirilen 'Bir Bilim İnsanı Çiz Testi (DAST)' uygulanmıştır. Öğrencilerden gözlerini kapatıp, bilim insanı hayal etmeleri ve zihinlerinde canlanan şeyi tarafımdan dağıtılan çizgisiz A4 kâğıtlarına çizmeleri istenmiştir. Ardından, tarafımdan verilen ikinci kâğıtlara anne ve babalarının mesleklerini, eğer televizyon izliyorlarsa bilimsel içerikli olduğunu düşündükleri televizyon programlarını, çizimlerindeki bilim insanının cinsiyetini ve nedenini, gelecekte bilim insanı olmayı isteyip istemediklerini ve nedenini belirtmeleri istenmiştir. Öğrencilerin verileri içerik analizine tabi tutulduktan sonra, daha spesifik cevapları olan öğrenciler tespit edilerek bu öğrencilerle ses kayıt cihazı eşliğinde yüz yüze görüşmeler gerçekleştirilmiştir.

BULGULAR

1. Öğrencilerin Ebeveynlerinin Mesleklerinin, Öğrencilerin Gelecekte Bilim İnsanı Olma Konusundaki Görüşlerine Etkisinin İncelenmesi

Araştırmaya katılan öğrencilerin annelerinin %65'inin ev hanımı, %13'ünün öğretmen, %1'inin akademisyen, %2'sinin bankacı, %1'inin avukat, %1'inin yönetici, %3' ünün hemşire, %1'inin polis, %1'inin tasarımcı, %1'inin gazeteci yazar, %2'sinin memur, %3'ünün esnaf, %2'sinin kasiyer, %2'sinin aşçı, %1'inin fabrika işçisi, %1'inin temizlikçi olduğu belirlenmiştir. Öğrencilere sorulan 'Gelecekte bilim insanı olmak ister misiniz?' sorusunu yanıtlayan öğrencilerin annelerinin meslekleri incelendiğinde, annelerinin mesleki durumları ve sosyoekonomik düzeyleri ile çocukların gelecekte bilim insanı olma istekleri arasında doğrusal bir ilişki tespit edilememiştir. Örneğin annesi ev hanımı olan çocukların yanıtlarını incelediğimizde, ister kız ister erkek olsun, çeşitli nedenlerden ötürü kimisi bilim insanı olmak istediğini belirtirken, kimisi olmak istemediğini belirtmiştir. Akademisyen annelerin çocuklarının yanıtlarını incelediğimizde, hem annesi hem de babası biyoloji bölümünde akademisyen olan bir kız öğrenci, mimar olmayı çok istediği için gelecekte bilim insanı olmak gibi bir düşüncesinin olmadığını belirtmiştir. Diğer taraftan, annesi genetik mühendisliğinde akademisyen olan başka bir kız öğrenci, annesine hayran olduğunu, onu bilim insanı olarak gördüğünü, bu yüzden gelecekte bilim insanı olmayı çok istediğini belirtmiştir. Benzer durum, diğer meslek gruplarında da mevcuttur.

Araştırmaya katılan öğrencilerin babalarının %17' sinin esnaf, %14'ünün serbest meslek sahibi, %11'inin öğretmen, %5'inin mühendis, %2'sinin akademisyen, %1'inin avukat, %1'inin savcı, %1' inin iş adamı, %4' inin polis, %2'sinin yönetici, %3' ünün subay, %3' ünün doktor, %1' inin eczacı, %1'inin mali müşavir, %1' inin müteahhit, %1' inin imam, %1' inin makinist, %1' inin reklamcı, %1' inin spiker, %1' inin laborant, %7' sinin memur, %1' inin emlakçı, %1' inin bankacı, %1' inin müzisyen, %1' inin dergi editörü, %2' sinin kuaför, %1' inin gardiyan, %2' sinin aşçı, %3' ünün işçi, %3' ünün hizmetli ve %6' sının işsiz olduğu belirlenmiştir. Öğrencilere sorulan 'Gelecekte bilim insanı olmak ister misiniz?' sorusunu yanıtlayan öğrencilerin babalarının meslekleri incelendiğinde, babalarının mesleki durumları ve sosyoekonomik düzeyleri ile çocukların gelecekte bilim insanı olma istekleri arasında doğrusal bir ilişki tespit edilememiştir. Öğrenciler ister kız, ister erkek olsun, çeşitli nedenlerden ötürü kimisi bilim insanı olmak istediğini belirtirken, kimisi olmak istemediğini belirtmiştir. Aynı durum işsiz babaların çocukları için de geçerlidir.

2. Öğrencilerin Çizimlerindeki Bilim İnsanlarının Cinsiyetleri İle Öğrencilerin Gelecekte Bilim İnsanı Olma Konusundaki Görüşleri Arasında İlişki Olup Olmadığının İncelenmesi

Tablo 1. Bilim İnsanı Cinsiyeti-Bilim İnsanı Olma İsteği Frekans

Toplam Öğrenci Sayısı N= 187		İnsanı Olmak İsteyenler (N=)		İnsanı Olmak İstemeyenler (N=)		(N=)		nler (N=)	
		Kız Öğrenci	Erkek Öğrenci	Kız Öğrenci	Erkek Öğrenci	Kız Öğrenci	Erkek Öğrenci	Kız Öğrenci	Erkek Öğrenci
Çizimdeki Bilim İnsanı Cinsiyeti	Kadın	6	0	0	0	0	0	0	0
	Erkek	45	65	16	20	2	2	12	13
	Kadın ve Erkek	4	1	1	0	0	0	0	0

Tabloyu incelediğimizde, 101 erkek öğrenci içerisinde sadece 1 öğrencinin çiziminde kadın bilim insanı mevcut olduğunu; 86 kız öğrenci içerisinde sadece 11 öğrencinin çiziminde kadın bilim insanı mevcut olduğunu ve geriye kalan 175 öğrencinin tamamının erkek bilim insanı çizdiğini görmekteyiz. Gelecekte bilim insanı olmak isteyen öğrencilerin frekanslarına baktığımız zaman, sadece kadın bilim insanı çizen 6 kız öğrencinin

tamamının gelecekte bilim insanı olmak istediğini, sadece erkek bilim insanı çizen 75 kız öğrencinin 45' inin gelecekte bilim insanı olmak istediğini, 16' sının olmak istemediğini, 2'sinin kararsız olduğunu, 12'sinin yanıt vermediğini görmekteyiz. Hem kadın hem de erkek bilim insanı çizen 5 kız öğrenciden 4'ünün gelecekte bilim insanı olmak istediğini, 1'inin istemediğini görmekteyiz. Erkek bilim insanı çizen 100 erkek öğrencinin 65'inin bilim insanı olmak istediğini, 20'sinin bilim insanı olmak istemediğini, 2'sinin kararsız olduğunu, 13'ünün yanıt verdiğini görmekteyiz.

2.1. Erkek Bilim İnsanı Çizen Erkek Öğrencilerin Erkek Bilim İnsanı Çizmelerinin Nedenlerinin Analizi

Erkek bilim insanı çizen erkek öğrencilerin yanıtları incelendiğinde, 'Dünyada erkek bilim insanı sayısı, kadın bilim insanı sayısından fazladır. Öyle olmasaydı, Televizyonda ve kitaplarda kadın bilim insanlarından çok erkek bilim insanlarını görmezdim.' yanıtının frekansının çok yüksek olduğu (N=62) görülmektedir. Öğrencilerden sadece 5' i kendisini hayal ettiği için erkek bilim insanı çizdiğini ifade etmiştir. Verilen diğer yanıtları incelediğimizde ise; öğrencilerin bilim insanlarına yönelik algılarına televizyonda izledikleri programların, okudukları kitapların ve dergilerin, öğretmenlerinin etki ettiğini görmekteyiz. Örneğin bir öğrencinin, ‘İzlediğim filmde zombiye çeviren virüsü erkek bilim insanları geliştiriyordu.’ yanıtı görsel medyanın etkisini gözler önüne sermektedir.

2.2. Erkek Bilim İnsanı Çizen Kız Öğrencilerin Erkek Bilim İnsanı Çizmelerinin Nedenlerinin Analizi

Erkek bilim insanı çizen kız öğrencilerin yanıtları incelendiğinde, ‘Dünyada erkek bilim insanı sayısı, kadın bilim insanı sayısından fazladır. Öyle olmasaydı, Televizyonda ve kitaplarda kadın bilim insanlarından çok erkek bilim insanlarını görmezdim.’ yanıtının frekansının çok yüksek olduğu (N=40) görülmektedir. ‘Ben bilim insanı değil, bilim adamı çizmek istedim.’ yanıtına baktığımızda, bu yanıtı veren öğrencinin bilim insanı ile bilim adamı kavramlarının farklı anlamlara geldiğini düşündüğünü görmekteyiz. Verilen diğer yanıtları incelediğimizde ise; öğrencilerin bilim insanlarına yönelik algılarına televizyonda izledikleri programların, okudukları kitapların ve dergilerin, öğretmenlerinin etki ettiğini görmekteyiz. ‘*Kadın bilim insanı hiç görmedim.’ diyen öğrencilerden birinin hem annesi, hem de babası akademisyendir. Kendisiyle yüz yüze görüşme yaptığımızda, anne ve babasının icatları olmadığı için, onları bilim insanı olarak görmediğini belirtmiştir. Gelecekte bilim insanı olmak istemediğini ama bunun nedeninin hiç kadın bilim insanı görmemiş olması değil, binaların yapılışının çok ilgisini çekmesi ve bu yüzden mimar olmak istemesi olarak ifade etmiştir.

2.2. Kadın Bilim İnsanı Çizen Kız Öğrencilerin Kadın Bilim İnsanı Çizmelerinin Nedenlerinin Analizi

‘Öğretmenimiz geçen hafta Newton’u anlatmıştı. Bu yüzden kadın bilim insanı çizdim.’ yanıtını veren öğrenciyle yaptığımız görüşmede, Newton’un kadın bilim insanı olduğunu düşünmesinin nedenini sorduğumda, kitaplardaki resimlerde uzun saçlı ve sakalsız olduğu için kadın bilim insanı olduğunu düşündüğünü ifade etmiştir. ‘Kadın bilim insanı çizdim çünkü çizimimdeki bilim insanı tıpkı annem gibi GDO ile mücadele ediyor. Ben, kadınların doğayı daha çok güzelleştireceğine inanıyorum.’ yanıtını veren öğrenci, yaptığımız görüşmede, annesinin akademisyen olduğunu ve uzmanlık alanının genetik mühendisliği olduğunu belirtmiştir. Annesinin bilim insanı olduğunu düşünmektedir ve kendisi de bilim insanı olmak istemektedir.

2.2. Kadın ve Erkek Bilim İnsanı Çizen Öğrencilerin Kadın ve Erkek Bilim İnsanı Çizmelerinin Nedenlerinin Analizi

‘ *Bence bu işte önemli olan zekâdır. Ben zekâ konusunda kadın ve erkeklerin birbirlerine üstün olduklarını düşünmüyorum. Kadın ve erkeklerin eşit olduğunu vurgulamak için, ekip halinde çalışan kadın ve erkek bilim insanları çizmek istedim.’ yanıtını veren kız öğrenciye (kod adı Sanem) bilim insanı olmayı isteyip istemediği sorulduğunda, polis veya sporcu olmak istediğini ama televizyonda ve kitaplarda sadece erkek bilim insanlarının gösterilmesinden rahatsız olduğunu, kadınlara haksızlık yapıldığını düşündüğünü söylemiştir. Verilen diğer yanıtları incelediğimizde ise; öğrencilerin bilim insanlarına yönelik algılarına televizyonda izledikleri programların etki ettiğini görmekteyiz. Hepsi, ‘Çünkü filmlerde, erkek bilim insanları asistanlarıyla birlikte çalışıyorlar ve asistanlarının cinsiyeti kadındır.’ yanıtını vermişlerdir. Kendisini bilim insanı olarak hayal ettiği için kadın bilim insanı çizen öğrencinin ‘Kendimi hayal ettim. Önce asistan olup, daha sonra profesör olmak istiyorum. Çizimimde, asistan olacağım dönemi çizdim. Ama asistan olduğum için, erkek bilim insanı da çizmek zorunda kaldım. Çünkü filmlerde, erkek bilim insanları asistanlarıyla birlikte çalışıyorlar ve asistanlarının cinsiyeti kadındır.’ yanıtını incelediğimizde, izlediği televizyon programlarının etkisi açıkça gözlenmektedir.

3. Bilim İnsanı Olmak İsteyen Öğrencilerin Yanıtlarının Analizi

3.1. Bilim İnsanı Olmak İsteyen Ve Erkek Bilim İnsanı Çizen Erkek Öğrencilerin Yanıtlarının Analizi

‘ *Deney yapmayı çok seviyorum.’ yanıtını veren öğrencilerden biri, ünlü olmayan, hiç kimse tarafından tanınmayan gizli bir bilim insanı olmak istediğini söylemiştir. Bunun nedenini sorulduğunda, ‘Ünlü olursam, gazeteciler beni rahat bırakmazlar; özel hayatım olmaz. Herkes her şeyimi öğrenir. Bu yüzden gizli bilim insanı olmak istiyorum.’ yanıtını vermiştir. ‘ ** Fen ve teknoloji dersi öğretmenimi örnek alıyorum.’ diyen öğrenci, fen ve teknoloji dersi öğretmenini bilim insanı olarak gördüğünü belirtmiştir ve öğretmeninin cinsiyeti, kadındır. Diğer yanıtları incelediğimizde, icat yapmak için bilim insanı olmak istiyorum yanıtının frekansı çok yüksektir (N=37).

3.2. Bilim İnsanı Olmak İsteyen Ve Hem Kadın Hem de Erkek Bilim İnsanı Çizen Erkek Öğrencilerin Yanıtlarının Analizi

Bilim insanı olmak isteyen ve hem kadın hem de erkek bilim insanı çizen erkek öğrenci, zaman makinesi icat etmek istediği için bilim insanı olmak istediğini, bu yüzden kendisini hayal ederek çizim yaptığını belirtmiştir. Ardından kadın bilim insanı çizmesinin nedenini ‘Önce erkek bilim insanı çizdim çünkü kendimi hayal ettim. Daha sonra, kadın bilim insanı çizdim çünkü filmlerde, erkek bilim insanları asistanlarıyla birlikte çalışıyorlar ve asistanlarının cinsiyeti kadındır.’ Şeklinde açıklamıştır.

3.3. Bilim İnsanı Olmak İsteyen Ve Erkek Bilim İnsanı Çizen Kız Öğrencilerin Yanıtlarının Analizi

Bilim insanı olmak isteyen ve erkek bilim insanı çizen kız öğrencilerde, icat yapmak için bilim insanı olma isteği ön plandadır (N=12). Bu yanıtı sırasıyla ünlü olmak istediğim için (N=7), deney yapmayı çok sevdiğim için (N=7) yanıtları takip etmektedir. Bir öğrencinin 'Bilim insanı olup, zombiye dönüştüren virüsün geliştirilmesine engel olmak istiyorum.' yanıtı yine görsel medyanın etkisine işaret etmektedir.

3.4. Bilim İnsanı Olmak İsteyen Ve Kadın Bilim İnsanı Çizen Kız Öğrencilerin Yanıtlarının Analizi

Bilim insanı olmak isteyen ve kadın bilim insanı çizen kız öğrenciler, gelecekte bilim insanı olmak isteme nedenlerini 'icat yapmak için, bilimsel konular ilgisini çektiği için ve bilime katkıda bulunmak için' olarak ifade etmişlerdir.

3.5. Bilim İnsanı Olmak İsteyen Ve Hem Kadın Hem de Erkek Bilim İnsanı Çizen Kız Öğrencilerin Yanıtlarının Analizi

Bilim insanı olmak isteyen ve hem kadın hem de erkek bilim insanı çizen kız öğrenciler, bilim insanı olmak isteme nedenlerini 'Bilimsel konular ilgimi çekiyor. Bilimsel konuları araştırmak ve okumak, bana çok zevkli geliyor.' ve 'Faydalı şeyler icat ederek, insanlara yardım etmek istiyorum.' şeklinde açıklamışlardır.

4. Bilim İnsanı Olmak İstemeyen Öğrencilerin Yanıtlarının Analizi

4.1. Bilim İnsanı Olmak İstemeyen Ve Erkek Bilim İnsanı Çizen Erkek Öğrencilerin Yanıtlarının Analizi

Bilim insanı olmak istemeyen ve erkek bilim insanı çizen erkek öğrencilerin yanıtlarını incelediğimizde, farklı bir meslek seçtiği için bilim insanı olmak istemediğini belirten erkek öğrenciler ön plandadır (N=13). Ayrıca öğretmenleri, bu öğrencilerin okul ilgilerinin yüksek olduğunu belirtmiştir. Diğer öğrencilerin yanıtlarını incelediğimizde ise, yine medyanın etkisi ön plandadır. Örneğin bir öğrenci, 'Bilim insanı olmak istemiyorum çünkü Iron Man (Demir Adam) filminde olduğu gibi, casuslar beni kaçırıp öldürmek isteyebilirler.' yanıtını vermiştir. Başka bir öğrenci, 'Bilim insanı olmak istemiyorum çünkü laboratuvarda çalışmaktan eve gidemem. Laboratuvarda uyumak istemiyorum. Filmlerde de hep öyle oluyor.' yanıtını vermiştir.

4.1. Bilim İnsanı Olmak İstemeyen Ve Erkek Bilim İnsanı Çizen Kız Öğrencilerin Yanıtlarının Analizi

Bilim insanı olmak istemeyen ve erkek bilim insanı çizen kız öğrencilerin yanıtlarını incelediğimizde, farklı bir meslek seçtiği için bilim insanı olmak istemediğini belirten kız öğrenciler ön plandadır (N=9). Ayrıca öğretmenleri, bu öğrencilerin okul ilgilerinin yüksek olduğunu belirtmiştir. Diğer öğrencilerin yanıtlarını incelediğimizde ise, öğretmenlerin ve medyanın etkisi ön plandadır. Örneğin bir öğrenci, 'Bilim insanı olmak istemiyorum çünkü bilim insanları çalışmaktan çıldırıyorlarmış; öğretmenimiz öyle anlatmıştı. İnsanların bana deli demesi hoşuma gitmez.' yanıtını vermiştir. Başka bir öğrenci, 'Bilim insanı olmak istemiyorum çünkü televizyonda görmüştüm; bilim insanları asosyal oluyor. Benim bir sürü arkadaşım var. Onları kaybetmek istemem.' yanıtını vermiştir. Ancak kız öğrencilerin kadınların bilim insanı olamayacağını düşünmeleri ve bu yüzden gelecekte bilim insanı olmak istememeleri ile ilgili hiçbir bulgu yoktur. Tam tersine, kadınların da bilim insanı olabileceklerini ama izledikleri programlarda, okudukları kitap ve dergilerde sürekli erkek bilim insanı figürleriyle karşılaşmaları yüzünden erkek bilim insanı çizdiklerini belirtmişlerdir.

Bilim insanı olmak istemeyen ve hem kadın hem de erkek bilim insanı çizen tek bir kız öğrenci (kod adı Sanem) vardır. Polis veya sporcu olmak istediği için, bilim insanı olmak istemediğini belirtmiştir.

5. Hem Kadın Hem de Erkek Bilim İnsanı Çizen ve Bilim İnsanı Olma Konusunda Kararsız Olan Öğrencilerin Yanıtlarının Analizi

		Yanıtlar	**N=**
Öğrenci Cinsiyeti	**Kız**	Hem istiyorum hem istemiyorum. İstiyorum çünkü bilim insanı olmak çok gurur verici bir şey. İstemiyorum çünkü bilim insanları deli oluyor. Televizyonda öyle gördüm.	**1**
		Hem istiyorum hem istemiyorum. İstiyorum çünkü ışınlama makinesi icat etmek istiyorum. İstemiyorum çünkü müzik söylemeyi de çok seviyorum. Müzisyen olmak istiyorum.	**1**
	Erkek	Hem istiyorum hem istemiyorum. İstiyorum çünkü kimyayı çok seviyorum. İstemiyorum çünkü deney yaparken patlama olur da ölürsem, ailem çok üzülür.	**1**

SONUÇ

Araştırmanın sonucunda; öğretmenlerin bilim insanları hakkında anlattığı şeylerin ve görsel ve yazılı medya tarafından oluşturulan 'devamlı laboratuvarda çalışan asosyal ve çılgın bilim insanı' figürünün bazı kız ve erkek öğrencilerin gelecekte bilim insanı olmak istememelerine neden olduğu anlaşılmıştır. Ancak bu çalışmadan elde edilen bulgular, literatürde yer alan 'kız öğrencilerin bilim insanı çizerken çoğunlukla erkek bilim insanı çizmeyi tercih etmelerinin, kız öğrencilerin kadınların bilim insanı olamayacağını düşünmelerinden ve bu yüzden gelecekte bilim insanı olmak istemediklerinden kaynaklandığı' iddiasını çürütmektedir. Ancak bu konuyla ilgili, boylamsal çalışmaların yapılmasına ihtiyaç vardır.

ysaglam@gantep.edu.tr

ABSTRACT: One of the basic function of the science is explaining the phenomenon, concept, and occasions in a scientific point of view (Türkmen ve Yalçın, 2001). Scientist has been trying to explain not only "whys" but also "in which situation" and "how" in the framework of reason-result relationship (Rudoplh ve Steward, 1998; Yaşar, 1998). When considered from this point, it is essential to state why and how the phenomenon, concept, and occasions to be explained has occurred. Because of this reason, in the researches that has been done recently related with science education, it has been put emphasis on teaching how the explanations of events and occasions taking place around us are made (Osborne and Dillon, 2008). Moreover, it was stressed in not only international reports related with education (American Association for the Advancement of Science [AAAS], 2009; National Research Council [NRC], 1996) but also in national curriculums (MEB, 2007; 2013) that instead of giving simple answer to the questions asked students in science education, it is necessary for students to gain the ability of scientific explanation that students make broader explanations. However, it was found that students in our country are inadequate about making scientific explanations. When evaluated from this point of views, in the teaching and learning activities that take place at schools, it comes into prominence that the idea of using some techniques in order to develop students' skills to explain the scientific concepts. Initially, to improve students' ability to make scientific explanation, it can be said that what the scientific explanation is must be taught to them. From this point, it is thought that socio-cultural dialectic method might be effective in teaching the concept of scientific explanation. Socio-cultural dialectic method, claiming that to form theorical concepts in the mind not only the interaction with the environment but also presenting the new perspectives to individuals by experienced people is necessary, consists of three dimensions; *context, contextual action*, and *labelling*. The aim of present study is introducing socio-cultural dialectic method and discussing how to teach the concept of scientific explanation by using this method.

Key words: scientific explanation, socio-cultural dialectic method, teaching concepts

ÜÇ AŞAMALI YÜZME-BATMA TANI TESTININ GELIŞTIRILMESI

Developing a three tier diagnostic test releated with sinking and floating

ÖZET: Öğrencilerin yaygın kavram yanılgılarına sahip olduğu konulardan bir tanesi de yüzme-batma konusudur. Bu nedenle bu araştırmada öğretmen adaylarının yüzme-batma konusundaki kavram yanılgılarını ortaya çıkartmak için bir ölçme aracı geliştirmek amaçlanmıştır. Bu amaçla Türkiye deki iki üniversitenin fen bilgisi öğretmenliği anabilim dalında öğrenim gören 400 öğrenciye uygulanmıştır. Üç aşamalı tanı testi şeklinde geliştirilen ölçme aracının geçerliliği faktör analizi, false pozitif, false negatif değerleri arasındaki korelasyon katsayı hesaplanarak ve uzman görüşü alınarak sağlanmıştır. Ölçme aracının KR-20 güvenirlik katsayısı 0,71 olarak hesaplanmıştır.

Anahtar kelimeler: yüzme-batma, yoğunluk, basınç, kaldırma kuvveti

ABSTRACT: One of the subjects in which students have common misconceptions is the floating and sinking. For this reason, this study is aimed to develop a measurement instrument to reveal preservice teachers' misconceptions about sinking and floating. The test developed for this purpose was applied to 400 preservice science teachers at two universities in Turkey. The reliability of measurement instrument developed as a three tier test was provided by factor analysis statistics, calculating false positive and false negative correlation coefficient. Also, two experts reviewed the test. The KR-20 reliability coefficient of the pre-service teachers' scores was calculated and found to be 0, 71.

LITERATURE ON META-ANALYSIS METHOD

Ayse KOK

Ismail SAHIN

Literatüre kazandırılan her yeni çalışma; kuşkusuz, alanına hizmet etmekte ve bilimin ilerlemesine katkıda bulunmaktadır. Ancak, herhangi bir konuda yargıya varmak için tek bir çalışma sonucuna güvenmek bizi yanıltabilir. Farklı koşullarda, farklı ortamlarda ve farklı zamanlarda yapılmış çok sayıdaki çalışma sonuçlarının birleştirilmesi daha geçerli ve güvenilir sonuçlar verecektir. Bugüne kadar araştırmaların sentezlenmesinde literatür derlemeleri ve oy sayma tekniği gibi istatistiksel olmayan çeşitli yöntemler kullanılmıştır. Son yıllarda giderek yaygınlaşan meta-analiz yöntemi bu alanda önemli bir boşluğu doldurmaktadır. Meta- analizi, belirli bir konuda yapılmış, birbirinden bağımsız, birden çok çalışmanın sonuçlarını birleştirme ve elde edilen araştırma bulgularının istatistiksel analizini yapma yöntemidir. Meta- analiz diğer analizlerin analizidir. Daha önce yapılmış çalışmalardan elde edilen özet niteliğindeki verileri, nicel yöntemler kullanarak birleştirir. Bu çalışmanın amacı meta-analiz yöntemi hakkında bilgi vermektir. Bu kapsamda; etki büyüklüğü, istatistiksel model seçimi, meta-analiz türleri, kullanılan tablo ve grafiklerle ilgili yorumlamalar gibi meta-analizle ilgili temel konulara değinilecektir. Bu sayede bir meta-analiz çalışmasının; yürütülmesi, raporlanması ve yapılmış bir meta-analiz çalışmasının değerlendirilmesi aşamalarında ışık tutacağı düşünülmektedir.

Anahtar Kelimeler: Meta-analysis, literature review, systematic review

ÖZEL GEREKSİNİMLİ BİREYLERİN EĞİTİMİNDE BİLGİ İLETİŞİM TEKNOLOJİLERİNİN KULLANIMI

Ülkemizde 2012 yılında yapılan eğitim reformundan sonra her alanda olduğu gibi özel eğitim alanında da teknoloji tabanlı uygulamalarının çoğaldığını ve hızlandığını görmek olasıdır. Günlük yaşam alanlarında bireylerin hayati ihtiyaçlarını karşılamada büyük kolaylık sağlayan bilgi iletişim teknolojileri eğitimcilerin işlerini de oldukça kolaylaştırmaktadır. Normal gelişim gösteren bireylerde kullanılan bilgi iletişim teknolojileri (ICT) aynı zamanda özel gereksinimli bireyler için de kullanılmaktadır. Ancak özel gereksinimli bireylerin eğitiminde bu teknolojilerin etkin kullanılabilmesi için ortam düzenlemeleri ile ilgili uyarlamaların yapılması gerekmektedir. Özel eğitim alanında çalışanların çoğu teknoloji destekli uyarlamalar yapmayı tercih ederken teknoloji destekli uygulamaların her gecen gün özel eğitim alanında kullanım oranının arttığı gözlenmektedir. Teknoloji temelli uygulamalar bireysel farklılıklara göre planlanan programlarındaki eğitim süreçlerinin yapılandırılmasına önemli katkılar sağlamaktadır. Teknoloji destekli uygulamalar aynı zamanda değerlendirme ve yönetim süreçlerinde de katkı sağlamaktadır. Ancak ülkemizde özel eğitim kurumlarındaki öğretim süreçleriyle ilgili etkinliklerde bilgi iletişim teknolojilerin beklendik düzeyde kullanılmadığı gözlenmektedir. Dolayısıyla bu çalışmanın amacı; 1) özel gereksinimli bireylerin eğitiminde kullanılan mevcut bilgi iletişim teknolojilerinin kullanılmasıyla ilgili stratejileri ve öneminin ne olduğunu belirlemek ve 2) bu alanda yapılacak araştırmalara kuramsal bilgi sağlamaktır. Bu araştırma kaynak tarama yöntemi kullanılarak tamamlanmıştır.

Anahtar Kelimeler: Özel Eğitimde Kullanılan Bilgi İletişim Teknolojileri, Teknoloji Destekli Özel Eğitim Uygulamaları, Etkili Özel Eğitim Uygulamaları

USE OF INFORMATION COMMUNICATION TECHNOLOGIES (ICT) IN EDUCATION OF INDIVIDUALS WITH SPECIAL NEEDS

In our country, after the Educational Reform in 2012, technology -based applications has accelerated in special education as it is in every field of education. Information and communication technologies (ICT) which ease the daily life of individuals also ease the educators' job. ICT used in individuals with normal development is also used for individuals with special needs. However, for effective usage of these technologies individuals with special needs, some environment adaptations should be made. More and more teachers in the field of special education prefer technology-based applications day by day. Technology-based applications prepared according to the individual differences provide important contributions for structuring the educational process. Technology – based applications also contributes the process of evaluation and management. But, in our country the usage of information and communication technologies in special education are limited. Hence the aims of this study is; 1) to determine the existing information and communication technologies and important strategies used in the education of individuals with special needs and 2) to provide theoretical knowledge for further researches in this area. This research was completed by using literature review method.

Otizmli bireylerin eğitim sürecini daha işlevsel hale getirmek amacıyla bazı yardımcı teknolojiler kullanılmaktadır. Bunlardan en yaygın olarak kullanılanlardan biri de tablet bilgisayarlarda kullanılabilen eğitim uygulamalarıdır. Uluslararası düzeyde özellikle otizmli bireylerin eğitiminde oldukça yaygın kullanım alanlarına sahip olan bu uygulamalar ülkemizde her geçen gün daha da yaygınlık kazanmaktadır. İlgili alanyazını incelendiğinde görsel ve işitsel öğelerin eğitim sürecinde kullanıldığı zaman daha işlevsel davranış değişliklerine sebep olduğu ile ilgili çalışmalar mevcuttur. Ancak ülkemizde otizmli bireylerin eğitiminde kullanılan tablet uygulamalarıyla ilgili çalışmaların sınırlı düzeyde olduğu görülmektedir. Bu çalışmanın amacı; 1) Otizmli bireylerin eğitiminde kullanılan tablet uygulamalarının kullanım alanlarının belirlenmesi ve 2) mevcut uygulamakların derlenerek özel eğitim öğretmenlerinin kullanımına sunulmasıdır.

Anahtar Kelimeler: Otizm, Otizmde Kullanılan Tablet Uygulamaları, Yardımcı Teknolojiler

TABLET APPLICATIONS USED IN EDUCATION OF INDIVIDUALS WITH AUTISM

Arş. Gör. Kürşat ÖĞÜLMÜŞ

Some assistive technologies are being used in order to make the education process of individuals with autism more functional. One of the most widely used is tablet applications designed for educational purposes for individuals with autism. At the international level, especially in the education of individuals with autism these applications are quite common. In our country it is becoming increasingly more widespread. When the related literature analyzed, it is seen that the audio-visual images used in the educational processes is more functional than other methods. However, this kind of technologies seems to be limited in our country. The purpose of this study is; 1) to identify the usage areas of tablet applications for individuals with autism and 2) to compile the existing applications for the use of special education teachers.

DESIGNING OF A CNC TRAINING SET

Res. Asst. Selahattin ALAN[1]
Selçuk University, Technical Education Faculty, Department of Electronics and Computer Education
salan@selcuk.edu.tr

Prof. Dr. Faruk ÜNSAÇAR
Selçuk University, Technical Education Faculty, Department of Electronics and Computer Education
funsacar@selcuk.edu.tr

ABSTRACT: Computer Numerical Control (CNC) is a system in where computer numerical control codes determine machining and sizing process of a work piece. Today, most of the products in manufacturing sector are produced by CNC lathes. Therefore, CNC lathes are indispensable parts of the manufacturing sector. In order to bring up operators who use CNC lathes, related courses are offered in our educational institutes. In different vocational high schools, faculties and vocational college, some knowledge such as basic lathe system, lathe usage, lathe programming, way of thinking three dimensional and work piece machining are offered to students who are candidates of being employed in this sector with the aim of reliable, effective and correct usage of these sensitive lathes that are so important for manufacturing. But, these learnings will be permanent and education will reach the target if and only if theoretical knowledge is followed by practical training session. In this study a training set that is low-cost, completely prepared in Turkish and educational has been designed and manufactured (produced) for the students who are getting CNC education. Training set consists of an electronics book that includes theoretical knowledge, a multimedia environment that includes usage, programming and structure of CNC, an editor that is used as programming environment, a simulation environment where written program‘s results can be viewed and a mini CNC lathe which has same functionality of original lathe and has the capability of processing work piece. Combination of all these materials made up training set and let the student to see the work piece from draft to production.

Key words: CNC, Computer Based Numerical Control, Training Set, CNC Machine Training

INTRODUCTION

Metal parts of the many tools and machines we use in our daily life have been manufactured through metal cutting processes such as turning, milling and drilling. Producing manufactured products, which we use so frequently in every parts of our life, makes this sector one of the most important sectors operating in the industry. Because of its importance, this sector has to renew itself parallelly to other sectors and development of the technology.

Especially turning, milling and drilling are frequently used processes in manufacturing operations. These operations are performed by using turning, milling and drilling machines. Conventional machines which were used in past are still used in some areas, but today, in general, computer controlled machines have replaced them. The use of Numerical Control (NC) and Computer Numerical Control (CNC) machines has become fairly widespread parallelly to developments witnessed in 20th century.

Thanks to their some features such as high cutting and drilling capacities, high speed, precise and productive operating properties; CNC machines have become indispensable elements of the sector. These machines’ being so popular in the industry has brought a demand for qualified employee. Because, while a basic level of turning and milling training is enough for conventional machine operators, and it can be learnt through master-apprentice relationship, for CNC operators beside these basic skills; some higher level skills such as basic computer knowledge, CNC code reading, writing and interpreting skills are required. When the conditions such as diversity, size, sensitivity and the high cost of machines are considered qualified employees gain more importance.

The most important places in which employees can acquire knowledge and skills to use these machines are; CNC departments of Anatolian Technical High Schools, Anatolian Vocational High Schools, Industrial Vocational High Schools and Technical High Schools in high school level, and graduate schools and vocational schools in higher education level.

With this study; a CNC training set will be introduced for institutions and organizations who aims to give in-service training to their employees to help them to enhance their knowledge and skills .For CNC training in training courses; CNC machines or costly foreign origin CNC training sets have been used. A minor mistake

[1] Bu çalışma ilk yazarın yüksek lisans tezinden üretilmiştir.

that an operator may do may cause great troubles, and this situation may put training institutions into trouble about repairment and replacement of the machines which are hard to be owned because of their high costs.

Within the scope of the designed CNC training set, there is an electronic book media by which theoretical information on use of the machines and their programming can be acquired, and there is an editorial environment in which tentative programme codes can be written and there is also a simulation media on which a simulation of a prepared simulation can be seen. Thanks to this training set; training institutions will have an opportunity to have a complete training set which is cheap, made in our own country, enables individual learning and covers all environments required all in one for CNC training.

EDUCATION - TRAINING AND TECHNOLOGY

Erturk, (1979) states that education is individual's practicing voluntary behavior process through his own life intentionally. With respect to this definition there are three main characteristics of education. First; behaviors of an individual must be modified in the intended direction, secondly, behavior modification occurs through individual's own experiences (as a result of coordinated knowledge and communication with the environment), and third, education is a planned and programmed process (Özdemir & Yalın, 1999). As it is clearly seen, the most emphasized point in education is behavior modification. If behavior modification takes place in the intended direction it means education is successful.

Education is not only limited to school and school periods, it continues at any time and every aspects of life. Everything a human being does in his life brings him knowledge, experience, change in attitude and behavior, and this makes some changes on him. In short, as some behavioral changes can be achieved through education process, in order to educate people in the direction of desirable qualifications people are required to have experiences that provide desired properties them, and by this way some behavioral changes must be achieved.

A society which consists of educated people means a society with high workforce level and a better society. In the society formed on which education is applied in various areas almost all sections of the society need for education in order to step forward. For institutions and organizations which aim to get into competition technically, economically, socially and commercially, and want to be the best providing adequate and high quality education has become a necessity.

Every individual, institution and organization who comprehends the importance of education minds not only how technical knowledge or product is important but also how education on these products and the profit they will have are important. Today, in purchasing process of the best machines, programs and technical devices that are produced, people don't only search for their uses and functions; they also search if they can make use of it with its educative way and the technical support that will be taken in the use of these products. All of these mentioned above present the importance education.

Technology that brings great conveniences to all areas of our lives and that serves as a bridge between practice and science also brings great conveniences in the area of education. The educational technology including all aspects of human learning case, systematically analyze problems, all the relevant elements to develop their solutions (manpower, information, methods, techniques, tools, editing, etc.) is the work that is developed by running the appropriate designs, implements, evaluates and manages a complex process (Yalın, 2004).

One of the largest reflections in educational technology is also the use of computers. The computer, due to the high initial cost of purchasing, even though it seems a little expensive for education to keep the students active, to provide student-centered education, to present the information in the required format, when all of these are taken into account is an affordable training tool in the long term. Thanks to computers and educational software specially designed for educational purposes in education, in order to make an effective education the required principles can be applied more easily.

MACHINE TOOLS AND CNC

Obtaining as raw material in a desired shape, form and appearances to obtain a suitable material in the means of production used is called machine tools. By machine tools especially metal, wood, plastic and other materials and marble can be processed. Raw materials that are fastened to the machine tools for the purpose of the counter, task, and the function and thanks to the moves of transactions in certain parts of the machine tools pass through a series of operations. The manufacturing that will be made through these lathes is divided into two as with sawdust and without sawdust. Manufacturing with sawdust from the work piece surface gets its name it's being made through lifting. The process of turning, milling, drilling, shaping, broaching, grinding, honing, lapping is made in the sawdust manufacturing process, on the other hand casting, forging, pressing, rolling, drawing, extrusion, bending, welding, gluing, soldering is made in without sawdust manufacturing process. The common feature of all these processes is based on the trio of team piece and the process. Generally, in the past the without sawdust manufacturing process was used but today mostly the sawdust manufacturing process has been used.

For Soysal (1991), the first appearance of the machine tools goes back to the 16th century. In 1540, an Italian called Torriano, in the manufacture of a clock that would be presented to the Spanish King Charles V, has used the first sample of milling machine. This machine consisted of an adjustable cutting rotary index table with a hole cutter. The ancestor of modern machines is taught to be used in 1775 by John Wilkinson as a horizontal boring machine. The first turning machine was made around 1780s by Henry Maudstay (Özdeveci, 2001).

In line with technological developments to improve the quality of machines, to ensure easier reproducibility, low cost and in order to replace easier working conditions, it was automated. Thus, the part of the processing of the information data after they were operated given by the human made conventional lathes, was found out that the data were composed of the numerical program code that the lathes can understand.

The Numerical Control (NC) can be named such: to control a movement of numerically, to control a movement numerically or in other words, according to a particular number system to control a system of coded input signal and the implementation to the appropriate logic and finally the desired output is achieved according to the commands within a tolerance (Koçlu, 2002). NC is written to the control unit according to the features of the desired part to be produced and the shape of the piece. In line with the data on the lathe the move command is sent to the active pieces and making the parts that are needed active the pieces are processed. Again, in line with technological developments, with the introduction of computers in our lives, as a result of the integration with the computer program code storage on NC lathes, CNC came into being (Computer Numerical Control). The CNC lathe is a machine that composes certain letters, numbers, symbols and that is connected to the counter depending on the encoded commands to a particular logic. Working with the CNC lathes in the various stages of the metalworking methods has great advantages. In parallel with the development of technology, the structure of the CNC lathes has increasingly developed and begun to be used in different areas. Generally, today the CNC lathes are manufactured and being used. Even in small numbers, the conventional lathes have been used and manufactured.

The CNC lathes, through the integration of control unit of the lathe with the computer, along with the programs stored in memory it is possible that the software stops at every stage of piece manufacturing, may be necessary to make changes in the program, to continue the program again from thick, and it is also possible to be able to keep the program in memory with the final form. Thus, once installed the program control unit is sufficient. The transfer of the program to the lathes can be in two ways, one is via the vertical panels and the other is the codes can be produced on the computer and the digitized data through a cable (Dinçel, 1999).

In today's world the CNC is being used in the area of industrial manufacturing sawdust. Today's CNC was emerged as a result of the problems that are encountered in this field mentioned above. When three-axis milling lathe was first operated in 1952, it was perfect as providing the solution of that day's some manufacturing problems. Those systems applied to the lathes was later also applied to turning and grinding lathes. Today, CNC has been used in almost every field of manufacturing facilities (Dinçel, 1999). CNC technology has been used in some areas such as; lathes, milling machines, drilling and grinding machine tools, measuring machines and tools, bending-bending machines, pipe bending machines, shaping machines, welding machines, dyeing machines, woodworking machines, drawing machines.

The primary and the biggest benefit of CNC lathe is its allowing automation. By the use of CNC machines, the intervention of the operator during the manufacture of the work pieces can be minimized or eliminated completely. During machining process, most CNC machine tools can operate without of any outside intervention, so that the operator has a chance to find time to deal with other works. This enables CNC operator to minimize his errors, and minimize errors caused by human being, machining time to be determined in advance and completely. Since the machine will be running under program control, when compared with the operator of a conventional machine who made the same parts, the level of basic skill experience of CNC operators are considerably reduced (Mamur, 2005).

The second major benefit of CNC technology, sensitive parts of the business come out equally and are constantly. Today's CNC lathes have incredible positioning and repeat capacities. This case, after the program has been checked; enables two, or ten thousand in the work piece to work in the same precision and dimensional accuracy (Mamur, 2005). Moreover, when compared with other lathes it can save the data and consistently write programs (even if the electricity goes off, will not be affected) can be stored in lathes' memory, later can be used at any time was called back. Adjusting these lathes in the program and adding new information process is very easy. Thanks to the sub programs, the programs used mostly are always with you. The calculation process of compensation values is made automatically by the lathe, and this provides a number of advantages. Thanks to the simulation appears on the screen of the program, the operator is able to have information momentarily about the operations performed. Being able to find out the faults of the lathes can be found out in the control is another advantage of the lathe. Automatic changing cutters provide users with great amenities. Thanks to the memory of the lathe can be accessed by an external computer, the users are able to send the programs directly to the lathe, and use the program in a different computer.

CNC TRAINING

The CNC training in Turkey in high school level has been taught in Anatolian Technical High School, Anatolian Vocational High School, the Vocational and Technical High School and the School at tertiary level and in vocational schools. The CNC departments of these schools have CNC courses and on the other hand it has been also taught in other departments.

The CNC courses taught in high school level to vocational and technical schools are such in the following due to small difference.

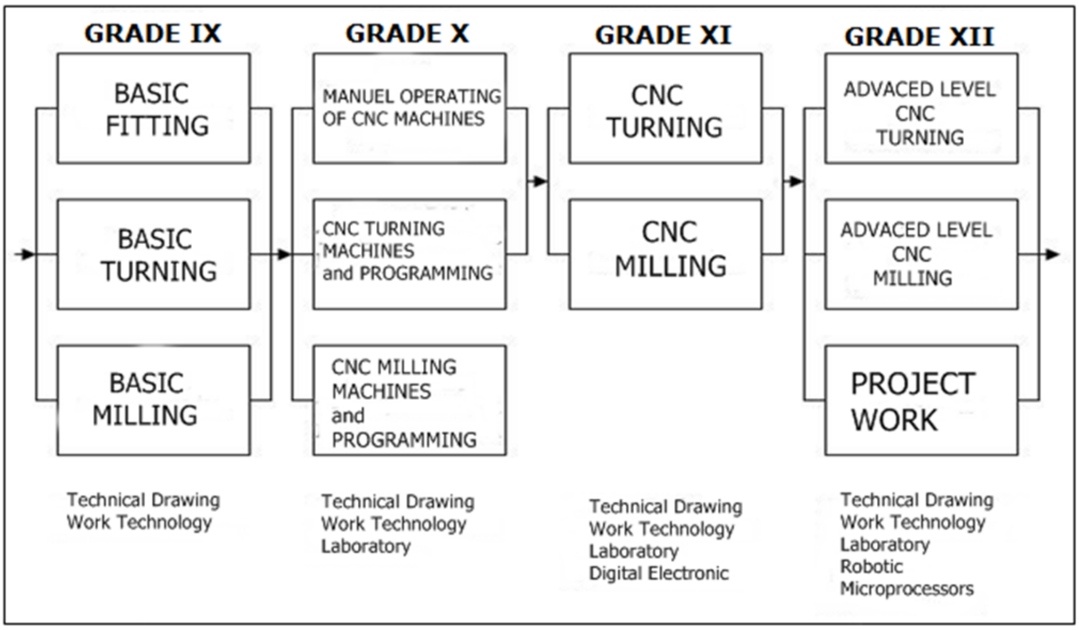

Figure 5: Numerical Control (CNC) Course Modular Program Structure (MEB, 1996)

Moreover, in the following departments the CNC courses have been taught: Hydraulic and Pneumatic Technology Department, Mold Division, Department of Mechanical, Micro technology Department of Mechanical Model Department, Furniture-Interior Department, Wooden Boat Building Division, Department of Plastic Arts, Shoes Department of Computer Aided Industrial Modeling Department, Industrial Casting Department and Leveling Department of Plastic Processing Department. In the table below there is given the name of the courses that are related with the CNC course which are taught in vocational and technical education in high schools connected to the Ministry of Education.

The CNC training, as seen in our country has been given in many educational institutions. To make the training more qualified given in this course, each step that will be taken concerns thousands of students studying in these schools and the teachers. So, thousands of students and teachers are affected by the CNC training. In order to get a better quality education of the students, the self-supporting and facilitating the work of teachers with training materials, and by using the modern teaching methods, in terms of quality personnel it is important train graduates that it will serve the country's industry.

To be able to remain standing today and create employment is only possible with competitive strength. One of the main economic indicators of competitiveness is efficiency. The most important factor that increases the productivity undoubtedly is the educated workforce. Education is an important need to be there today. Education, industry and service sector increases the efficiency and effectiveness; increases the employability of the workforce. The industrial organizations who are aware of this situation, they organize courses to improve the efficiency and effectiveness of the employees such training in various courses.

The CNC lathes can be used in many different sector of industry such as, aerospace, automotive, bottle and glass, molding, modeling, shoes, jewelry, souvenirs, coins and badges, health, rapid prototyping, billboards, white goods and toys. And there are thousands of personnel working in these sectors. Number of people are earning thanks to CNC machines. Every business that operates in this sector has lower costs compared to the others, is in the efforts to provide better service. For this reason, every business needs a more knowledgeable and experienced staff on the CNC or is willing to provide training to staff on hand.

For example, there are only about 10,000 CNC machines in Konya. The staffs using these lathes and business owners who have these lathes are affected by the related facilities. Therefore, the development of new methods for the training of CNC machines the search of opportunity is important for many people working in the industry.

MATERIAL AND METHOD

Taking the benefits CNC provides to the industry and the present situation of CNC Trainings in our country into consideration, it was concluded that design and production of a CNC Training Set will be a profitable endeavor. The design and production logic of the CNC Training Set is based on the fact that the learning process of CNC usage is similar to that of driving an automobile. Just like a person who wishes to learn to drive first receives theoretical (structure and working process of the engine, units that constitute the automobile, systems of the vehicle, etc.) and practical information (rules to be followed at traffic, meanings of traffic warning signs, necessary deeds to ensure a safe drive etc.) and then proceeds to practice at an appropriate field with an accompanying driving trainer; a person who wishes to be knowledgeable of CNC usage should first receive theory and then exercise it. Note that a driver candidate is due to trainer's control during the practice; if s/he happens to make a mistake the mentor is there to intervene. The intervention gradually lifts as the driver candidate progresses at practice. After a certain amount of time taken for exercise, the driver candidate becomes an actual driver; able to use the automobile by him/herself. Teaching on another hand, is neither an easy job. Teaching how to use a CNC is moreover a hard work since a CNC machine is a mechanism formed of various systems, some of which are interconnected while some others are totally independent. Each of these systems, the 'metabolism' of the machine in operation, how it can be controlled, how a workpiece should be put into process, how the programming should be made are all to be taught to the learner. In order for the information to permanently settle in student's mind and become applicable, theory should be supported by practice. Let alone the rest of the education, teaching how to write a compatible program is quite a difficult work itself since a dense crowd of resembling codes are due to creating contradiction in terms. Writing the program therefore holds a specific part in the training; bearing a particularly complicated character, program writing requires a distinct amount of time to practice. The teaching model at driving courses is taken as basis in preparation of the CNC Training Set since the learning process of CNC usage is similar to that of driving. Taking these necessities of the particular learning process of CNC Usage into consideration, the Set was developed on the base of respective educational principles. A teaching method in which practical lessons are in correspondence with basic learning rules was followed.

CNC Training Set is designed as a desktop training package that aims to ensure a more efficient CNC training and enables all CNC-related processes to be exercised on the same media. The Set is made up of two main sections, software and hardware section. The hardware section constitutes of a mini-CNC machine. Set up in Turkish, this mini-machine is an ordinary CNC, only with smaller dimensions. The software part meanwhile, consists of programs that are meant to operate in a specific computer which will be placed in the hardware part. The software body includes an interface that lets the user to reach any information regarding the CNC and the production process. The interface also enables access to sub-sections. By clicking the links or buttons on this interface; the user can reach various sections such as the e-book, the multimedia-supported narration or the simulation; each of which are rich in content. Below is a list of features that are ready to function at the CNC Training Set:
1. The screen enables the user to study CNC programming commands. User can summon detailed information pertaining to these commands and see relevant examples. Therefore, any time the user wishes to review or consolidate his knowledge on programming commands, he will have ready service with this Set.
2. The user can follow audio and video records where machine components, working principles and general information on CNC usage are explained in detail by a professional.
3. Programming codes can be entered through the panel. A real-time simulation of the production can be summoned to the screen. All changing values, the process that will operate on basis of the entered codes and the eventual shape that the workpiece will take can all be watched at the simulation.

As soon as the hardware section is added to the Set, which is set to happen in a short period, below functions will also be applicable:
1. The user will be able to connect a real workpiece to the machine. In other words, an actual production will be possible. Witnessing the production stages, seeing the functions of the machine throughout the process and observing the mechanical movements conducted by these functions will all be achieved with the joining of the hardware section.

2. The machine's user-friendly ergonomy will enable the user to easily control the CNC process through a control panel which will be right next to him. The user will have the chance to intervene from where he sits.

Learning how to use a CNC Machine is a multi-staged process. Theoretical information on the machine should first be obtained. Then programming should be learned and the learner should write programs. This is essential because in this stage the learner receives the chance to see the mistakes he is inclined to make during formatting the machine. The corrected program should then be entered to instruct the CNC. Eventually, the workpiece should be connected to the machine and the program should start to run for the candidate operator to watch and learn. This particular CNC Training Set does contain sections which sequentially follow these stages. The learner first receives theoretical information from the information screen; that is general information on the CNC and the command structures. He then proceeds to program writing; this stage is accompanied by simulation. The simulation helps him to see if he has made any mistakes and if any, to correct them. As mentioned before however, the hardware section through which a real application on the workpiece can be made is not materialized and added in the Training Set yet, due to high costs. Subsections of the software section are shown and explained below.

Figure 6: Interface of the Software

Electronic Book Section: This part of the software is prepared as an e-book where the user can reach theoretical information. From machine programming commands to utilization types, all sorts of information regarding CNC usage can be found in this part. As a topic is selected from the list on the left hand side, its content displays on the right. The menu is prepared in shape of a concept map with a tree-like appearance, this enables easy access to the requested topic from anywhere in the media. CNC Machines, Basic CNC Codes, Operational Codes, Computer Supported Piece Programming and Direct Numeric Control are the topics that are explained in this section.

Multimedia-Supported Explanatory Section: This is a multimedia (vocal and visual) supported environment where various titles such as parts, systems or segments of the CNC Machine or usage of the control panel are lectured by a professional operator. The narration can both be listened and watched through a video that displays on the screen. The multimedia environment consists of ten episodes, namely “CNC Machines from Programmer's View”, “Information on Writing Basic CNC Programs”, “Movement Types”, “Compensation Types”, “Structure of a CNC Program”, “Features to Contribute Programming”, “CNC Machines from Operator's View”, “Machine Process Modes”, “Procedures” and “Principles of Writing a Safe Program”.

Simulation Section: This is the part where the written program codes can be simulated into a virtual manufacturing process. The user is therefore able to see how the process will look like once he passes on to actual production. This environment includes an editor program with which the user writes program codes. A simulation of the production is displayed on the screen, enabling the user to observe the phases of the operation through which the workpiece is processed towards its planned shape. At this section, a new program can be written, the written ones can be saved to computer's memory, and if any, previously saved programs can be summoned and edited. Program codes are written with an on-screen keyboard. Use of an external keyboard has been avoided deliberately with respect to the goal of ensuring the simulation to be wholly realistic.

As “Show Simulation” button is clicked after the completion of coding, a particular simulation program initializes. The written program shall then open within this simulation program. Clicking on “Show Simulation” enables the user to review various values of the planned production before the actual commencement of the process: What form shall the workpiece take on basis of the written program codes, which tools shall be used, how the workpiece shall be processed, which steps will be followed during processing. These will all be available to reviewing at the simulation. If a mistake that sources from the written programme is noticed during the simulation, the software warns the user on the type of the error. The user will have the means to see the error of the written program and correct it before writing the code on an actual CNC Machine.

It has not been deemed necessary to write an original program for the simulation part since several simulation programs are available and accessible on the internet. A free software called CNC Simulator 4.44f from Microtech company is used in this project. The software simulates the workpiece according to the commands that are written in pursuance with the standard ISO (International Organization for Standardization) codes.

Mini CNC Lathe Section: Due to cost-related reasons, all designed sections of the CNC Training Set are yet to complete. It is planned to complete the rest of the design by conceptualizing the unfinished sections and obtaining financial support for those. The Mini CNC Lathe will take Fanuc Machine system as basis and work with the codes given in pursuance with ISO (International Organization for Standardization) Standards.

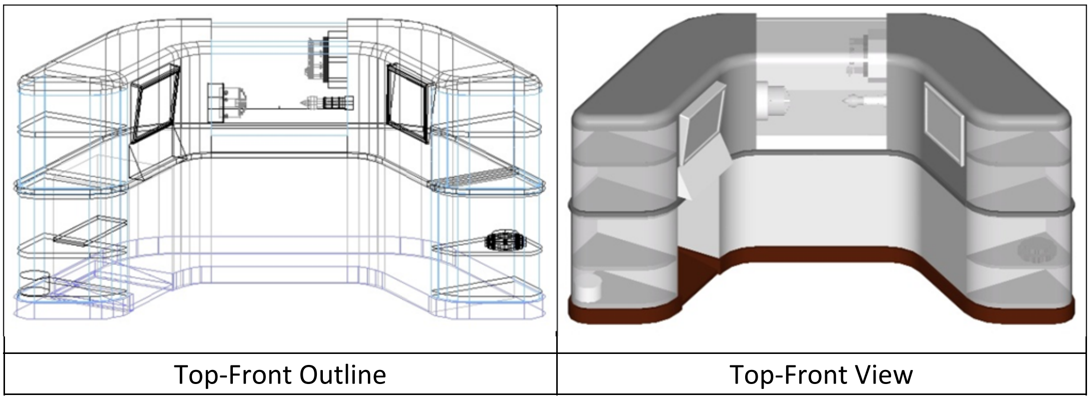

Figure 7: Views of the designed CNC Training Set

Various electrical/electronical circuits will be used at the production of this section's electronic components. Elements such as engine, drivers, and sledges will be used for the mechanical division that processes the parts. Control panel and control unit elements will be used for machine control. After all parts are compiled together on a metal plain, a base software which is prepared in Turkish language shall be uploaded to function as the operating system. Latter to the production of the Mini CNC Machine, the software section of the training set will be incorporated to the machine in a form that it shall be available to be viewed and controlled from another monitor on the machine. The schematic structure of the CNC Training Set is as follows:

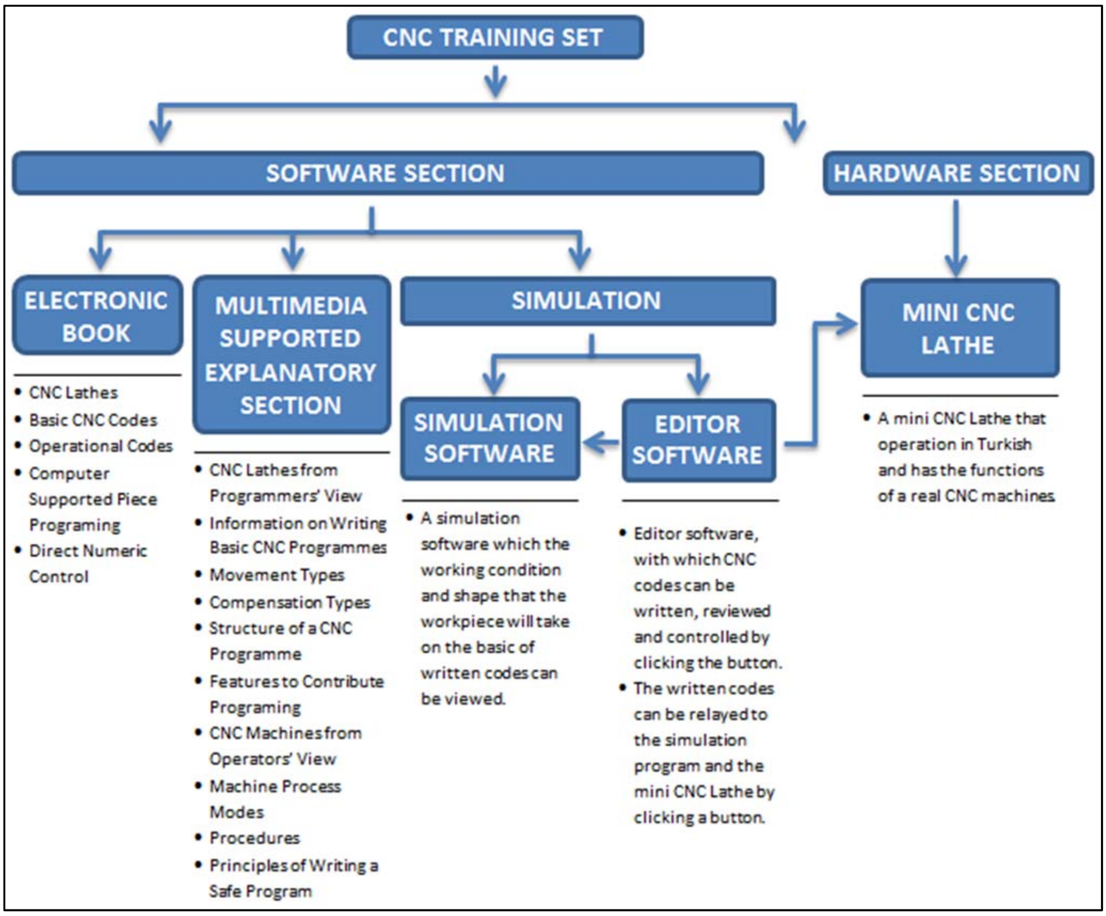

Figure 8: CNC Training Set Design Scheme

Borland Delphi 7.0 Programming Language from Borland Company was used at the development of the software part. The editor program at the simulation section and the e-book section are prepared with this software. This specific program was especially preferred as it is a very elastic and easy-to-use programming language that is eligible to work at various computer types without requiring an additional file. Multimedia Builder 4.9.7 from MediaChance Company is used at the interface of the software part and the multimedia supported narration part to ensure easier visualization. This program is particularly used in developing multimedia supported interfaces and has a simple script language. In addition to those, Adobe Photoshop CS2 for image programming; Macromedia Flash 8.0 for animations, Sony Vegas 6.0 for video editing and Techsmith Snagit 8.0 for screenshots were used. Benefits that can be expected from the CNC Training Set are;

• **A Faster and More Qualified Training:** In comparison with the present classic training types, the training with the CNC Training Set provides a more qualified education with its vivacious and practice-based structure. Lecturing is far easier since the trainer is able to show the machine parts, functions and results of the written codes on the machine. The trainee has the means to receive training with a maximum level of comprehensiveness instead of a training that remains in theory and is tendentious to be forgotten in time.

• **Reduction of Accidents and Malfunctions at CNC Machines:** With the CNC Training Set, the student is able to write the codes on the information screen and see the simulation of the process before forming the part. With this technology, accidents like crashing that would occur as a result of false coding can be foreseen and correction becomes possible. Furthermore, the training made with this set is easier to learn in comparison with a theory-based course as this one provides means to practice. Given the chance to see his mistakes, correct them and re-exercise; the student will naturally make less mistakes during the actual operation.

• **Means to Re-train the Learner:** This set appeals to students from various levels of knowledge. Any student from any level, from a beginner level learner to an actual CNC operator can be trained with this set. A person who has previously received a CNC training or a user who actively operates CNC Machines can take advantage of this training as they can study the topics which they feel they should develop themselves at. In other words, this set provides means to be trained over again on any needed topic whenever deemed necessary. All students, regardless of their knowledge level, can obtain benefits from this designed Set.

• **Positive Approach of the Student and Therefore Easier Concentration on the Lesson:** There will be an actual machine at the lessons with the CNC Training Set. This practice-based methodology, by which a real machine is ready to serve to the learning process, increases the attention towards the lesson. This is a remarkable difference that reinforces the quality of the overall training. The student furthermore, will have a mindset that he will better comprehend the lesson when he first sees the set. A positive approach towards the lesson will develop by itself, enabling the learner to better concentrate on the course.

• **Cost Saving:** This desktop type CNC Training Set with smaller dimensions naturally has a lower cost in comparison with an industry-type CNC. Purchase of one industrial CNC Machine that will serve educational purposes at schools can be replaced by purchase of several CNC Training Sets.. The training set furthermore shall provide more benefits in comparison with an industrial CNC as it is specifically designed for training.

CONCLUSION AND SUGGESTIONS

Aiming to render CNC trainings more influential and efficient, a specific CNC Training Set was designed in this study to meet educational needs at institutions that provide CNC Training and at industrial establishments that wish to bring in-service training to their employees. The Set is produced except for a few specific sections. Due to cost-related reasons, certain sections of the CNC Training Set could not yet be manufactured. This deficiency will be remedied by project conceptualizing on these sections. As soon as the project proposals presented to particular establishments are accepted and support is obtained, the incomplete parts will also be produced and added to the training set. Presently, the software part that will run on the computer is wholly produced and ready to serve.

Production of the hardware section will further increase the efficiency of the education. At the moment, operation is applicable with simulation. Even though the current simulation media is very similar to the actual production environment, joining of the hardware part shall render the training set quite more efficient as means to sustain a real production will materialize.

With this training set, the overall understanding on CNC Usage Education will upgrade to a more qualified level. Qualified CNC Operators needed by the production industry shall be raised through a practice-based methodology. This designed CNC Training Set is open to further development. Being formed of a modular system, the Set is formed of different and independent sections, enabling third party professionals to add to it or upgrade its current sections. Copyrights of other books can be obtained for e-book section and their electronic versions can be added to this part, for instance. To the multimedia environment on the other hand; vocal, animation or graphic containing features from various sources can be added to achieve a more efficient narration.

Current CNC Training Sources bear various disadvantages such as excluding Turkish language options, being sold at high prices or having other purposes than training. In this study, a low-cost Training Set in Turkish language, designed only for educational purposes is developed throughout which educational principles have been taken into account.

With its advantages mentioned above, the presence of the CNC Training Set at the learning environment will bring remarkable benefits to the educational process in means of reaching its goals. Educational institutions that provide CNC Training and corporations that aim to train their employees on CNC usage will earn significant advantages by using this Training Set.

THE REVIEW OF THE PERCEPTIONS OF SOCIAL SCIENCES TEACHERS ON TECHNOLOGY INTEGRATION

Ozkan AKMAN
Namık Kemal of Secondary School
akmanozkan@hotmail.com

There are numerous factors in the integration of the technologies within the processes of learning and teaching. Numerous dynamics such as the IT instruments, teachers, students, school administrations, education programs and school cultures have effects on providing the technological integration. From the point of the effectiveness of this process, it is important to cooperatively handle the technology applications and the sociocultural context which includes it. The purpose of this study is to determine the perceptions of social sciences teachers on the technology integration. In this research, focus group discussion technique, one of the qualitative research techniques. This study was formed with the question of "What sort of skill does a social sciences teacher need about the technology integration in the classroom environment?" In order to clarify the matter, different questions were asked in addition to the given responses and provided a deeper explanation to the question. According to the results of the research, it was concluded that there were numerous variants on the technology integration (the crowded classrooms, deficiency of infrastructure, administrative problems, etc.), the significance of the competence among the teachers was huge and inter-relations among the teachers were also significant. Such factors determined according to the responses of the participants of this study were discussed and suggestions were made related to those problems.

Key words: technology integration, focus group discussion, teacher competencies.

THE OPINIONS OF THE SOCIAL SCIENCES TEACHERS ABOUT FATIH PROJECT

Ozkan AKMAN
Namık Kemal of Secondary School
akmanozkan@hotmail.com

The FATİH Project is a project prepared in order to provide the most productive courses by furnishing all the schools with technology infrastructure through a contract between the Ministry of National Education and the Ministry of Communications signed in 2010. Using this project, drastic changes are aimed in Turkish teaching system. This study was executed in order to determine the opinions of the social sciences teachers through this project. It was executed through preparing semi-structured interview forms among the qualitative research technique. According to the results of the research, the teachers stated that awareness was created in the teaching environment, an effective teaching was obtained since it addressed more sense organs, provide savings of time since it enabled the information transfer faster and thanks to it, technology literacy increased among both teachers and students. Nevertheless, they also stated that discipline problems in the classroom increased and they had problems in managing the classroom. Since the biggest effect in achieving the success for this project, the success depends on the teachers who continuously adapted themselves during the in-service training.

Key words: FATİH Project, Social Sciences Education, Semi-structured Interview.
