PREFACE

Greetings!

We are congregating scientists, researchers and students who keep on involving their studies on education all over the world via International Conference on Education in Mathematics, Science and Technology which took place on May 16 - 18, 2014, at Necmettin Erbakan University in Konya, Turkey. We are honored to organize this event at Necmettin Erbakan University. By this opportunity, all the participants were able to develop scientific knowledge and scientific exchange through this well organized conference. In addition, they were able to spend a few restful days on the rich historical and cultural ambiance of Konya.

About 400 people from 30 different countries participated in the conference. A total of 359 academic works were presented at this event. We would like to acknowledge by expressing our deepest gratitude to keynote speakers, Prof. Dr. Paul ERNEST from University of Exeter-UK, Prof. Dr. William F. MCCOMAS from University of Arkansas-USA, Prof. Dr. Mack SHELLEY from Iowa State University-USA, Assoc. Prof. Dr. Jacqueline T. MCDONNOUGH from Virginia Commonwealth University-USA, and Prof. Dr. Lynne SCHRUM from West Virginia University-USA, for accepting our invitation to present a keynote speech in our conference. We thank to the panelists, Prof. Dr. Giray BERBEROGLU from Middle East Technical University-Turkey and Assoc. Prof. Dr. Gultekin CAKMAKCI from Hacettepe University-Turkey, for their valuable presentations. We also would like to thank to the members of the organization committee who contribute with their intense efforts for this conference and our sponsors, Private Genclik Schools, Private Basak College,Yargi Academy, Egitim Publication, and TUBITAK for their support.

The Organization Committee

ABSTRACT: Integration of computer and Information Communication Technology (ICT) in education has changed the conventional method of "Chalk and Talk" to "e-Learning and e-Teaching". While ICT equipment has provided opportunities in open access to a wide variety of digitalized teaching- learning materials as well as speeding up communication and sharing of views among educators, it is yet to reach the desired level due to the current issues and challenges. This study analyses the challenges and issues faced by teachers in public primary schools while using computer and ICT-based teaching equipment in their daily classes. Three hundred (300) teachers in public primary schools in Kuala Selangor district of Selangor, Malaysia, were used as the sample for this study. A self-developed questionnaire which contains 4 different sections including (1) Background of Respondents, (2) The level of computer skills and use of ICT, (3) Barriers on the Use of Computers and ICT, and (4) Suggestion to overcome the barriers was used for data collection. Descriptive statistic and correlation analysis were used for data analysis. The findings indicate that computer and ICT operating skills of the teachers are still in satisfactory stage. Teachers tend to use computer and ICT for their own use rather than uses for teaching and learning process. Time, attitude, training and facilities were found to be among the main influential factors in ICT usage by the teachers. Suggestions to overcome the issues and challenges had been also included in this study that is significant in educational management especially managing ICT in schools.

Keywords: ICT integration, E-teaching & E-learning, Primary education

INTRODUCTION

Nowadays, Information and Communication Technology (ICT) has become an important part of the most organizations including those in education. ICT refers to the study on use of computers, the Internet, video, and other technologies as a subject in schools (Oxford Advanced Learner's Dictionary). The term "ICT" was first introduced to education system over two decades ago and since then its rapid growth has become one of the most important topic discussed by scholars. This is due to the potential of ICT to support education and create opportunities to enhance the quality of teaching and learning outcomes (Bingimlas, 2009; Hussain et al., 2011).

Today, ICT literacy is the prerequisite for the 21st century's appropriate knowledge and skills. This is due to the fact that through ICT, one can explore useful information to be able to overcome the modern life's obstacles. The rapid global technological advancement and development of ICT has placed traditional teaching and learning to *e-teaching and e-learning.* In this regard, using computer has shift teaching and learning process into a more challenging profession, where teachers are required to integrate ICT in their daily classes instead of using only the traditional teaching-learning methods (Hamidi et al., 2011). Accordingly, e-Teaching and e-Learning techniques are preferably replacing the traditional method of *Chalk and Talk* with the intention to make the teaching and learning environment more interactive and proactive.

The other advantage of ICT integration in education system is to enhance teaching and learning quality and accessibility as well as cost-efficiency of the delivery of education. Moreover, using ICT in education also will help in networking of the learning communities with the aim of being equipped to face the challenges of global competition (Bruniges, 2003, p.1). In addition, the main benefit of the modern technologies is to offer relevant tools and equipment that can be used in daily classrooms to improve teaching–learning process (Lefebvre, Deaudelin & Loiselle, 2006).

Integrating ICT in education system does not mean that computer is able to replace the teachers completely, but it means using computer tools, equipment, and applications as an enabler to help the teachers to improve students' learning and better pedagogical practices. In this regard, ICT can be used to deliver information to students in order to help them to complete their learning tasks. If modern technologies integrated with the conventional methods, it will then results in a robust and effective outcome for teaching and learning process. Moreover, learning technologies help students to develop their skills, while boost up their motivation and widen their knowledge (Bransford, Brown & Cocking, 2000; Grabe & Grabe, 2007).

However, as the first stage of formal education, primary level of schooling is important and using ICT in teaching and learning can help students and teachers to develop their competencies that are needed for the global society. This is because "by teaching ICT skills in primary schools, the pupils are prepared to face future developments based on proper understanding" (Grimus, 2000, p.362).

ICT Integration in the Malaysian Education System

During the past decades, there has been a growing interest, attention and investment towards the use of ICT in education system globally. Similarly, the integration of ICT into the education system has been one of the major attempts by the Education Ministry of Malaysia in the recent years. This is because ICT offers new potentials that lead to significant changes in the educational organization. Moreover, promoting new technologies and innovative changes to power national competitiveness is a growing challenge to higher education in Malaysia (Hamidi, 2011; Aida Suraya, 2009; Hussain et al., 2011). Correspondingly, to achieve the country's aspiration of Vision 2020, higher education institutions face the challenge to train and educate "competent, productive and knowledgeable" human resource (Malaysia, 2001, p. 8). This is in order "to transform the nation into a progressive economy capable of "sustaining high economic growth "(p. 7), and "to meet the impact of globalization and peruse "environmentally sustainable development to reinforce long-term growth" (p. 8).

In the previous five-year plan for the year 2006-2010, the new ICT policies have been launched by the Ministry in order to bring technological change to the Malaysian education system (Banjunid, 2001; Puteh & Vicziany, 2004; Suhaimi et al., 2007). These policies were included to ensure ICT accessibility and literacy for all students, prioritizing the ICT's role and function as a teaching and learning tool in education, and ensuring the use of ICT to enhance productivity, effectiveness and efficiency in management system (Ministry of Education, 2006).

Recently, the element of ICT has been included as one of the main transformation shifts in the Malaysia's latest *Education Blueprint* so called 'MEB' for the years 2013-2025 as the national education future development focus. It was first introduced by the Ministry of Education Malaysia on September, 2012. The plan outlines 11 shifts needed to transform the Malaysian education system on par with systems owned by developing countries. The program will be implemented in phases, which will be in 3 phases for a period of 13 years. The program is more on the development of teachers and students in terms of access, quality, equity, solidarity and efficiency.

The transform shift of ICT named as "Leverage ICT to Scale up Quality Learning across Malaysia" emphasizes three aspects:

i) By 2013, the government aims to establish and provide more internet accessibility in the national schools to create virtual learning environment via education development programme called "1BestariNet" for all 10,000 schools

ii) Augment online best practices content starting with video library of best teachers delivery lessons in critical subjects in 2013

iii) Maximize the use of ICT for distance learning and self-paced learning to expand capacity of learning outcome and allow for more customized learning requirements

Under the ICT transform focus (The seventh shift), the MOE is trying to strengthen ICT capacity in different stages to enhance the quality of teaching and learning in the country. Accordingly, the use of ICT among teachers should be optimized so that they can make a difference in the quality of teaching and learning in their schools. This is due to teachers' key role in motivating and encouraging students to utilize ICT in their learning process.

In the first wave of reform, the Ministry reviews the current ratio of teacher-student for ICT devices allocations, ICT innovations on distance learning to determine the best suggestion to give the Malaysian students access to the full spectrum of the curriculum and achieve the best outcome of their learning. While for the second wave of reform, the Ministry of Education will introduce a few ICT education programs to create interactive during teaching and learning process, culturally-relevant content for indigenous students, and improve the accessibility of online quality learning resources for students included those schools which located in remote areas (Education Blueprint, 2013, Chap 4, pp.13-15).

The intention of government is to upgrade the quality of ICT skills among schools especially school in remote area such as Sabah, Sarawak, and Pahang. Furthermore, it also trying to narrow down the gaps of ICT capacities both in terms of quantity and quality between urban, rural and remote area in whole nation. Moreover, it could enhance the quality of teaching and learning once the quality and quantity of ICT capacities being improve. However, the ICT integrating at different stage or wave in education will be the most challenging task undertaking due to the possibility of failure to achieve the learning target . In addition, it would bring a further widening and even serious of the knowledge gap between students in remote areas and developed city and then creates the deepening inequalities in economic and social for the whole nation (Tinio, 2003).

The Malaysian Education Ministry should handle all the computer services as tools, application and information supply. In this new era, ICT applications become necessary in all dealing. Some teachers provided with laptops and some are not. Is this the reason why teachers never using computer in the classroom teaching? Is ICT facilities in schools are used to the maximum? The finding indicates that the use of ICT in schools is not performed optimally and not showing its effectiveness in accordance with the government's education policy. According to a study carried out by the Ministry in 2012 , the use of information and communication technology (ICT) in schools is limited. The study also showed that only one third of teachers regularly use ICT in their classrooms (MEB 2013 - 2025, p. 142). Furthermore, about 80% of teachers use ICT less than one hour a week. The research shows that teachers are more interested in using the traditional method of using books in their teaching and learning process. Hence, the ICT facilities in some schools are not used as effectively and efficiently as they should be. Therefore, it is important to analyze the key factors that contributed to this phenomenon in order to overcome the current issues. Therefore, this study aims to identify key issues and challenges that influence in ICT integration among teachers in schools.

Research Objectives

The objective of this study is:

1. To identify teachers level of computer skills and technique in teaching and learning process in classroom.

2. To identify the barriers in using ICT in teaching and learning in classroom.

3. To identify the way to overcome barriers in computer and ICT application among teachers.

Research Questions

Based on the research objectives, below are the research questions of this study:

1. What is level of teachers' computer skills and technique in teaching and learning process in classrooms?

2. What are the barriers in using ICT in teaching and learning in classrooms?

3. What are the ways to overcome barriers in computer and ICT application among teachers?

Besides research question, five selected hypotheses were tested using Bivariate Correlation in SPSS V.21. Below are five hypotheses tested:

The Study Hypothesis

Hypothesis 1: Correlation between the frequency of teacher uses ICT in classrooms and year of employed

Hypothesis 2: Correlation between the frequencies of teacher knows computers and its functions and year of employed

Hypothesis 3: Correlation between the frequency of teacher knows how to repair own computers and year of employed

Hypothesis 4: *Correlation between the frequencies of teacher knows how to create teaching aids with computers and year of employed.*

Hypothesis 5: Correlation test between the frequency of teacher uses internet for their personal purpose and year of employed.

METHODOLOGY

Research Sample

Majid Konting (2000) defines population as a set of features which shows the specific measurement on a group of individuals or objects. Individual or object which was observed must have minimal one feature in common between others. First task in sampling is to identify and define specifically the sampled population (Azizi et al., 2007). Population of this research consists of 300 teachers that have been selected randomly from the public primary schools in Kuala Selangor district, Malaysia.

Research Instrument

The research instrument that were used in this study were survey questionnaire that has been developed and modified by the researchers based on the factors that ;a) Provide ample time for respondents to answering the question, b)The questionnaire was easy to answer because the answer has been provided and c) Save time, energy and researchers expenses. However, the questionnaire is included four parts as follows:

Part A: Background of respondents (5 items)

In this section the researchers only focused on the demographic variables such as gender, age, race, academic qualification, teaching experience and subject were teaches in schools. Respondents must indicate (√) in the option they choose. Simple open question should completed by respondents.

Part B: The level of skills and ICT usage (15 items)

For items in sections B, the statement and the question were created is to find out level of skills and the way teachers apply the ICT in teaching and learning process.

Part C: Barriers in using computer and ICT (7 items)

Items related to computer and ICT usage were found in part C, where the respondent will choose the barrier that they face to use the computer and ICT. The options given is generalized and mostly mentioned in most of the researches, particularly in Malaysian context.

Part D: Limitation on the use of computers and ICT/ The suggestions and ways to overcome the issues (7 items)

In this section there are seven questions that need to be filled in by the respondents based on their opinion.

Pilot Study

In this research, a pilot study was conducted on 100 respondents from 5 of the selected schools. Selection of respondent was randomly chosen.

This pilot study was conducted to ensure the instrument for this study (questionnaire) was suitable in term of language and terms that easily can filled by the respondents and the most important was to determine the reliability of the questionnaire. Reliability value of the questionnaire was tested using Cronbach Alpha to show how suitable are the items as a set of questionnaire. Result of the study gives the alpha value 0.91. This shows that the designed questionnaire has the good reliability. According to Rowntree(1981), classifying 0.7 to 1.0 is the best study. This means that the questions can be used for the pilot study.

Data Analysis

Background analysis

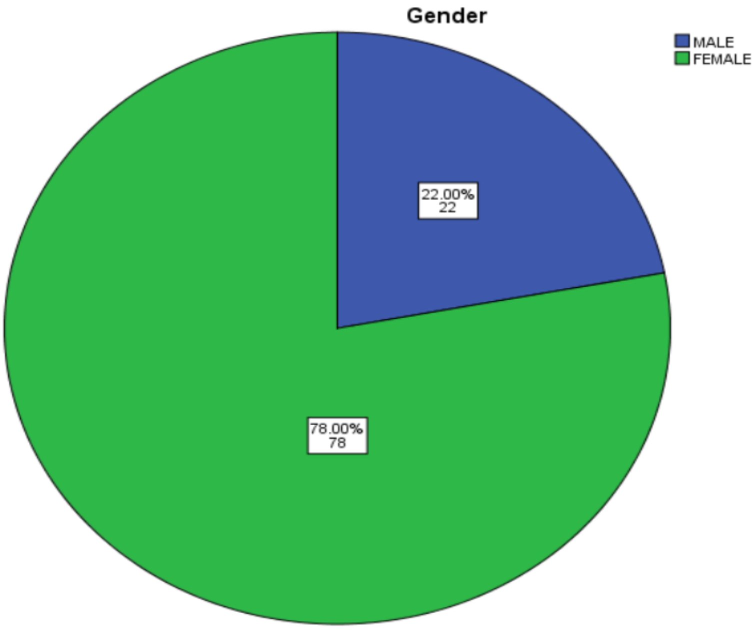

Figure 1.Respondents' Gender Distribution

Figure 1 shows the pie chart of male and female distribution where by 78% of respondents are female and the rest (22%) are male.

[redacted]

Figure 2. Respondent's Year of Employment

Above histogram shows, most of the samples (about 23%) have 10 to 13 years of experiences, with the mean value of 13.59.

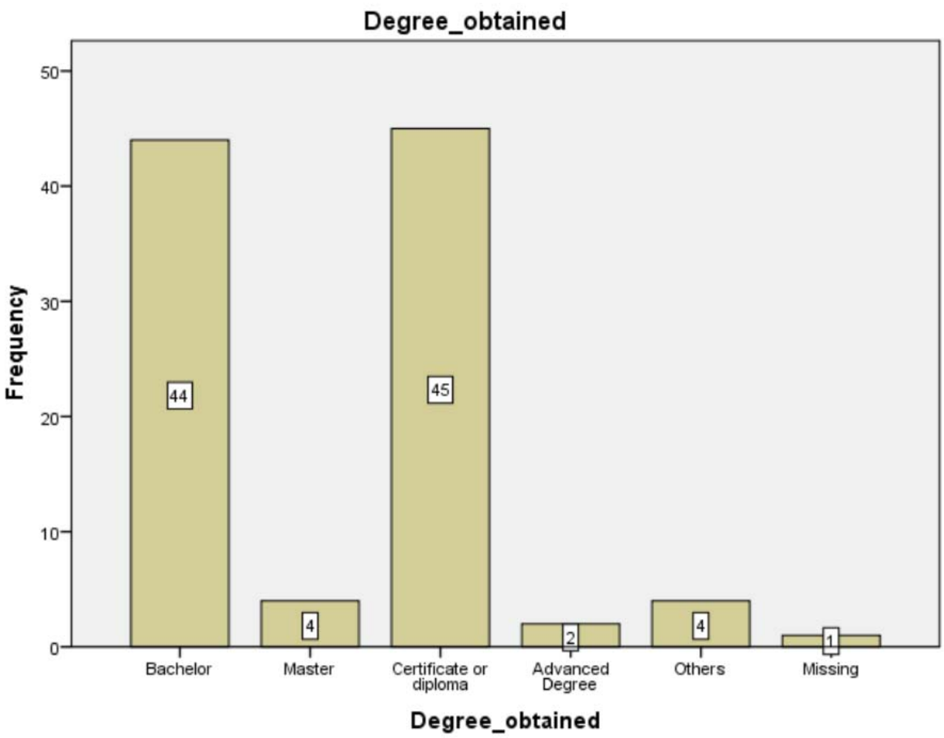

Figure 4. Educational Background of the Respondents

There were more teachers with Bachelors and Certificate or Diploma. There were no PhD holders and Master holders were very rare in schools especially in primary level.

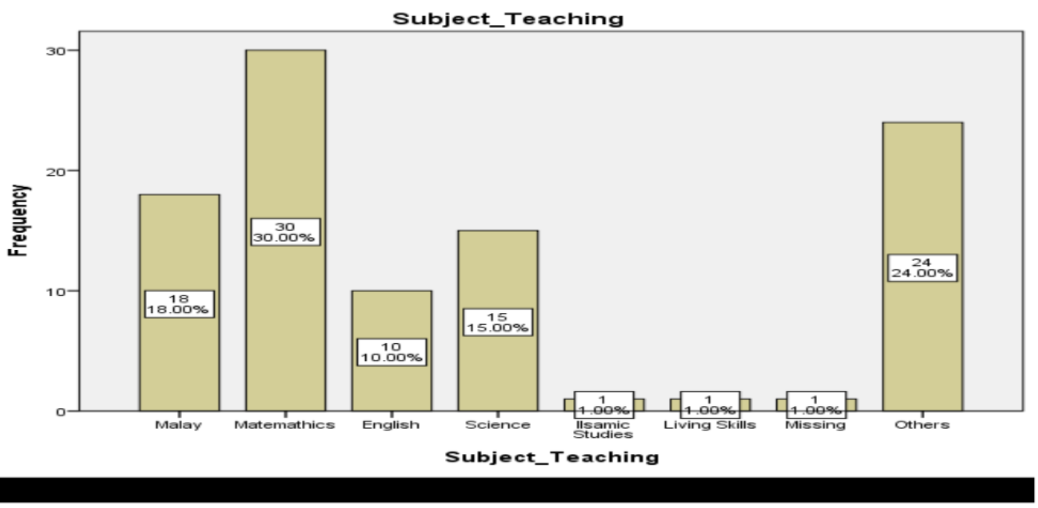

Figure 4. Frequency by Subject Teaching

About 30% of teachers teach Mathematics and only 1% is teaching rare subjects like Islamic studies and Living Skills.

Table 1. Frequency (%) And Mean Table for Skills in Using Computers and ICT

Item	Statement	SD	D	NS	A	SA	Mean
B1	I know computers and its functions	0	1	45	49	5	3.58

B2	I repair my own computer	0	3	48	38	11	3.57
B3	I install software on my own	0	10	23	38	28	3.90
B4	I search teaching aids from internet	3	12	36	37	11	3.47
B5	I use computer to prepare lesson plan	0	7	32	47	14	3.68
B6	I can create teaching aids with computers	3	9	54	29	5	3.24
B7	I can construct a learning web site	3	9	43	39	5	3.40
B8	I prepare notes for my students with internet	4	31	41	22	2	2.87
B9	I find questions for my students from internet	2	14	43	35	6	3.29
B10	I always use computer in my classroom	2	50	39	7	2	3.63
B11	I always look for latest additional information through internet	1	49	40	8	2	3.66
B12	I use internet lively in classroom	1	5	14	63	15	3.98
B13	I use internet in computer lab with my students	3	1	28	51	15	3.86
B14	I teach my students on how to find information in internet	1	1	28	52	14	4.01
B15	I use internet for my personal purpose	0	9	44	35	8	3.66

Note:

1. Strongly Disagree (SD)
2. Disagree (D)
3. Not Sure (NS)
4. Agree (A)
5. Strongly Agree (SA)

Table 1 shows the distribution of respondents by percentage and mean in terms of the frequency and nature use during the process of teaching and learning. Highest mean in the table was 4.01 at item 14 statement in which the majority of respondents agreed that they often teach their students on how to find information in internet for use in teaching and learning in the classroom. The lowest mean is 2.87, for item B8 which means they hardly prepares notes for their students in internet. In addition, a total of 28% of respondents are very sure that they can install their own software. 63% of teachers agree that they use internet lively in their classroom. There are also teachers who say never to use computers for the purpose of teaching and learning which were 50%.

Table 2. Frequency (%) And Mean Table of Obstacles in Using ICT in Classrooms

Item	Problems	SD	D	NS	A	SA	Mean
C1	Hardware and software problems often disrupt lessons	0	1	18	59	21	4.96
C2	Not enough time to use ICT	0	1	20	57	21	4.94
C3	I'm more confident without ICT in classroom	0	3	20	59	17	4.86
C4	Insufficient access to the resources	0	5	25	51	18	4.78
C5	Restricts the content of the lessons	0	5	22	55	17	4.80
C6	ICT makes preparing the lessons more difficult	0	2	19	60	18	4.90
C7	I don't know how to use ICT	0	1	18	59	21	4.96

Table 2 shows Frequency (%) and mean for obstacles in using ICT in classrooms. All the respondents agreed that there are problems faced by them in using ICT in classes, which can be known with zero indicator in SD column. More than 50% are agree with all the problem or obstacles faced by teachers in classroom. This can be shown with all the mean is above 4.00. 60% of the teachers felt that ICT makes preparing the lessons more difficult.

Table 3. Frequency (%) And Mean Table of How to Overcome the Obstacles

Item	Method	SD	D	NS	A	SA	Mean
D1	Create a special fund for the provision of ICT infrastructure for the teacher.	0	2	53	39	6	3.49
D2	Held information technology courses for teachers.	0	4	54	36	6	3.44
D3	Teachers must be ready to accept the changes the paradigm shift to the use of ICT in T&L.	0	3	39	37	21	3.76
D4	Providing incentives and rewards to teachers who are creative and dynamic.	0	6	45	35	14	3.57
D5	To place an ICT expert in each school	0	6	45	38	11	3.34
D6	CDs and Software for more subjects	0	12	53	26	9	3.32
D7	Counselling for teachers	0	13	49	33	5	3.30

Table 3 shows frequency (%) and mean for how to overcome the obstacles mentioned above. All the teachers are agree with all the overcoming options as no one has ticked 'Strongly Disagree'. However, most of them are not sure about the efficiency of recommended options, as we can see the 'NS' ticked by 54 teachers in item D1. The mean 3.76 indicates that teachers must be ready to accept the changes the paradigm shift to the use of ICT in T&L. Counseling for teachers is least preferred by teachers with the lowest mean (3.30).

Testing Hypothesis

Table 4 (Hypothesis 1). Correlation Test between the Frequency of Teacher Uses ICT in Classrooms and Year of Employed

Correlations

		B10	Year employed
B10	Pearson Correlation	1	-.097
	Sig. (2-tailed)		.338
	N	300	300
Year_employed	Pearson Correlation	-.097	1
	Sig. (2-tailed)	.338	
	N	300	300

There was a significant correlation between the frequency of teacher uses ICT in classrooms and year of employed, $r = -.097$, $n = 300$, $p>.01$, two tails. Negative correlation (not strongly correlated) shows, less experienced teachers uses ICT more frequently in their classroom.

Table 5 (Hypothesis 2). Correlation Test Between the Frequencies of Teacher Knows Computers and Its Functions and Year of Employed

Correlations

		Year employed	B1
Year_employed	Pearson Correlation	1	-.030
	Sig. (2-tailed)		.764
	N	300	300

B1	Pearson Correlation	-.030	1
	Sig. (2-tailed)	.764	
	N	300	300

There was a significant correlation between the frequency of teacher knows computers and its functions and year of employed, r = -.030, n = 300, p>.01, two tails. Negative correlation (not strongly correlated) shows, less experienced teachers knows better about computers.

Table 6 (Hypothesis 3). Correlation Test Between the Frequency of Teacher Knows How to Repair Own Computers and Year Of Employed

Correlations

		Year employed	B2
Year_employed	Pearson Correlation	1	-.079
	Sig. (2-tailed)		.435
	N	300	300
B2	Pearson Correlation	-.079	1
	Sig. (2-tailed)	.435	
	N	300	300

There was a significant correlation between the frequency of teacher knows how to repair own computers and year of employed, r = -.079, n = 300, p>.01, two tails. Negative correlation (not strongly correlated) shows, less experienced teachers highly repairs computers.

Table 7 (Hypothesis 4). Correlation Test between the Frequencies of Teacher Knows How to Create Teaching Aids with Computers and Year of Employed

Correlations

		Year employed	B6
Year_employed	Pearson Correlation	1	-.084
	Sig. (2-tailed)		.404
	N	300	300
B6	Pearson Correlation	-.084	1
	Sig. (2-tailed)	.404	
	N	300	300

There was a significant correlation between the frequency of teacher knows how to create teaching aids with computers and year of employed, r = -.084, n = 300, p>.01, two tails. Negative correlation (not strongly correlated) shows, less experienced teachers uses more computers to prepare teaching aids.

Table 8 (Hypothesis 5). Correlation Test between the Frequency of Teacher Uses Internet for Their Personal Purpose and Year of Employed

Correlations

		Year employed	B15
Year_employed	Pearson Correlation	1	-.102
	Sig. (2-tailed)		.315
	N	300	300
B15	Pearson Correlation	-.102	1
	Sig. (2-tailed)	.315	
	N	300	300

There was a significant correlation between the frequency of teacher uses internet for their personal purpose and year of employed, r = -.102, n = 300, p>.01, two tails. Negative correlation (moderate correlated) shows, less experienced teachers are using internet for their own purpose.

DISCUSSION AND RECOMMENDATION

In the recent years, using computer and ICTs tools and applications in schools have brought many positive impact in teaching and learning processes (Hussain & et al.,2011). Hence, ICT integration has become the core of teaching and learning in the 21st century as e-teaching and e-learning (Lloyd, 2005). Specifically, integration of ICT in primary school teaching and learning is inevitable that the full advantage of ICT and its great potential to enhance teachers' teaching quality and students' learning achievement should be considered.

The results of this study indicates that although in some schools teachers are using ICT in their classrooms, but there is no doubt that still many teachers who are working in rural schools does not have inhale of skills and knowledge on ICT. Hence they are using less computer and ICT application in their classroom, although, they have computer infrastructure in their schools. These findings is similar with the result of a study by Shelly (2004), on the relationship between use of computer application and ICT skills.

In line with previous research (Anderson , 2010; Bovee, Voogt, & Meelisen, 2007; Rosnaini et al., 2008) this study has emphasis on the importance of skills for teachers to apply computer and ICT in their teaching and learning. In this regard, teachers should take initiatives to enhance their computer and ICT skills. The result of this study shows that while the form of computer application among teachers is in the moderate level, application of computer and ICT in teaching and learning to communicate with students is in the low level. It means that teachers are more tend to use computer to prepare paper works and examination questions, analyzing students' achievement and make notes preparation rather than using it for teaching purposes. Meanwhile, internet usage among teachers to get teaching resources is also in low level. Researchers feel that teachers must master various form of computer and ICT application due to nowadays education system experiencing various technological developments. This idea was supported by Peeraer & Van Petegem (2012) that suggested utilizing ICT in education can help teachers to collect, store, process, distribute and disseminate information faster. This will result in time and cost effectiveness of teaching and learning process.

To increase the use of ICT in schools the Ministry and the school management can perform various steps. One of them is to change the teacher's perception and mentality by providing counseling and lectures. Changes in attitudes and values of teachers needed in the face of new challenges in education (Ambigapathy & Shanthi, 2010b). Principals as school leaders should continue to monitor teaching and learning to ensure that teachers use ICT daily. The school management can also take the initiative to provide teachers with intensive use of ICT in their learning.

Also, the use of ICT in schools can be enhanced by improving the existing infrastructure. It can be done by improving ICT infrastructure, replacing new equipment and ongoing maintenance. The school management should also put ICT infrastructure in a safe place so that teachers ensure the safety of consumers. The management of the District Education Office (DEO) needs to frequently monitor the usability of ICT infrastructure to be repaired or replaced easily. Sometimes the DEO should be ready to provide new infrastructure if the ICT infrastructure in schools has become obsolete and is no longer safe to use.

ICT use can be improved by ensuring that all teachers and officers of ICT are literate. According to Brosnan (2001), if the teachers do not develop basic ICT skills and willingness to experience with ICT is not worth it. Thus, the Ministry of Education (MOE) should provide short-term skills training. Teachers must be trained in the use of new technology to be applied in the classroom (Ambigapathy & Shanthi, 2005). In addition, the MEB (2013 - 2025) strategically outlined to ensure that all teachers ICT literate. Among the regulation was, teachers were required to pass an online diagnostic test by 2014. Those who did not pass this test are required to complete a series of online training modules and reoccupation basic diagnostic tests at the end of 2015.

It is the government's responsibility to ensure the rapid use of ICT in schools is to provide adequate funding. Government should allocate sufficient funds for ICT in the budget after analyzing the allocation of funds to the sector / less important parts. In this case the school authorities should also take the initiative to seek sponsorship from the outside to reduce government spending and increase access to ICT. Next, another proposal to increase access to ICT in schools is to integrate the language and context of ICT subjects. It can be performed by holding competitions in ICT innovation. Also, introduce the development of specific ICT to develop ICT materials that match the language and context. Moreover the integration can be done by setting up ICT applications or to a bilingual trilingual.

In addition, the Ministry should also put an ICT teacher in every school. This way can be implemented by introducing ICT options in Teaching Institutions. This option will be called ICT teacher, similar as the teacher counseling, special remedial teachers there now. They should be trained in ICT not only in handling ICT tools as well but in terms of repairing. The availability of ICT specialist teachers in their schools then can ease the repair and replace equipment is happening quickly. Finally, the public and private institutions can encourage research on the use of ICT in school management. With this the school will recognize the importance of ICT in teaching and learning process in schools.

CONCLUSION

This study found that the mean frequency and form of using ICT among teachers who are working in rural schools remained within the moderate level. Moreover, time constrains become major issue for the teachers to use computer in their classroom teaching. In addition, the mean level of skills among teachers also was in moderate level. This shows that fewer rural teachers were given training and courses associated with the use of computer and ICT. Issues and challenges that arise on the use of computer and ICT in the classroom are related to time factor, training factor and attitude and more. This study also found that there are some rural teachers who are not directly interested in using this advanced technology. It is hoped that all teachers regardless of the place of their service, can change their perceptions on using computers and ICT application to facilitate the process of their teaching and learning.

It is undeniable that the use of computer and ICT tools and application in schools aimed to improve the quality of teaching and learning. By understanding the factors that barriers the use of ICT among teachers, we can make recommendations that are believed to increase the use of ICT among teachers more effectively and efficiently. Effective use of ICT tools and application in schools will help the government to achieve the aspirations of the latest Education Blueprint (MEB)from 2013 to the year 2025, especially in terms of knowledge and bilingual skills. In this regard, the main goal is to produce students who are competent and skill-full in the current digital era. School management plays a vital role in ensuring the implementation of ICT in classrooms is well-planned and well-organized. School management led by principals and principals' leadership style, are key factors in convincing teachers to use ICT in their daily classroom. Hence, further research on principals' role in ensuring the implication in ICT in daily lessons is suggested. More future studies suggested to be conducted on comparing ICT utilization in schools in rural and urban areas.

ACKNOWLEDGEMENT

This research was supported by the research grants BK034-2013(BKP) from University of Malaya, also with co-operation of principals and teachers from public primary schools in Kuala Selangor District , Malaysia .

ABSTRACT:Infants learn new things through interaction with other children at home or a crèche where others are kept for safety by parents as they attend to various careers. Even though most parents may not know exactly the degree to which infants learn as they stay together at the crèche, this guides their development with proper facilities put in place by daycare centres. The crux here is the provision of safety facilities in the crèche for proper infant development during the first six months of child care in the crèche. The major question here is what is a crèche? Are crèches safe and reliable? What would the child do at the crèche? Finding out what infants learn and the safety of being a client at the daycare centre requires an understanding of the practice in the centre as regards the child ability to develop with reference to their stages of development which form coherence to a baby's world. Studying how crèche and safety facilities facilitate infant development needs an understanding of how crèches are run to stimulate baby's cognitive and social abilities for proper integration into the human world. The babies, toddlers and young children can play, learn, enjoy meals and rest under a safety facility provision with absolute strangers in a completely new environment with a feel of comfort and confident at the crèche.

Keywords*:* Crèche, Safety facilities, infant development, learning and social interaction, physical development.

INTRODUCTION

Intellectual, emotional, physical, cognitive and social development correlates with baby's development as they interact at the crèche in a safety environment. A crèche is a formal daycare or nursery childcare centre where babies, toddlers and young children are cared for in a safe and stimulating surrounding. Crèches cater for the children of parents with either full or part time jobs or activities to perform outside the home. Shatter (2011). This concept though new in the Nigerian education system, is picking up quickly with the ever-increasing number of nuclear families and working parents. It can be tasking and sometimes even heart breaking to leave one's little ones with absolute strangers in a completely new environment. For parents, they need to feel assured, comfortable and confident before leaving their children at the crèche or daycare. For making a choice of daycare or crèche, some key issues must be considered by parents; where is the location? Is it close to the home or work place? Some parents even check and verify the qualifications and experiences of the staff and the persons who primarily run it. Ideally the expectation is to be run by educated, experienced and trained professional who have a valid operating license. The ratio of caregivers to number of children to ensure a child's individual attention is preferred. (Schacter, Gilbert & Wegner 2009, 2011). A crèche should be a place where children are happy and secured away from home as parents go for livelihood. This breeds a child's wellbeing, emotional and physical development.

A child starting a childcare makes a new stage of family life and requires family getting use to it in terms of preparation for both the parent and child. Parents worry about how children will cope in their absence and whether a caregiver's care would substitute parent's care. Schultzer and Schultzer & Duane (201) is of the view that it is only natural if children miss a bit of their parents at first as they get admitted in crèche.

Both parents and children have suggested ways on how they can prepare for a change of life as the child goes to resume in crèche. Steel and Piers (2007) suggest that following on how parents chose the right childcare crèche for their children. The best approach is either to consider a range of childcare options to find one that suits the needs of you and child, look into day nurseries, child minders nannies or ask a relative to look after the baby. List also your favourite options, the ones that suits your working hours and budget and look at them in more details; what is the adult to child ratio? If the baby is still tender, there should be at least one carer to every three babies. What are the carer's qualification and experience in looking after babies and you may want to know if you can trust them. Are there activities, books and toys that are right for the child's age? There should be plenty to do that engages the child and stimulates the child's development. What are the facilities like? The toilets, space indoors and outdoors for the children to play. If meals are provided they should be nutritious and suitable for the child's age.

Where is the childcare situated? Somewhere close to the home or workplace should be most convenient. An easy journey to childcare means you and your child can both start your days feeling relaxed. In the unlikely event of emergency, you can be there quickly. It is also worth talking to other parents too. They may have firsthand experience of childcare in your area.

When decision have been made about the preferred childcare for the child, the next step is to help the child get to know his/her new carer because the more familiar the child is with the carer, the happier he or she will feel being left with them. Arrange a number of visits, at least an hour long with the new carer. This will give the child a chance to relax and enjoy the time with the new person in his or her life with the support of the parents presence. It may also be useful if the child is to be looked after by a grandparent, toddler play groups or other relative a few times before parents go back to work. This will get the child used being away from parents and will learn that parents will always come back to them. A child's crying is unlikely to mean that he or she is unhappy at childcare or that the carer aren't doing their jobs properly but that he or she needs some time to adjust to the new environment through more support from other children, parents and carers in crèche. (Steel, Piers and Konig, 2006). As parents, when you are at crèche with the child, make an effort to show the child that you and her caregiver get along. This will assure the child of the parents' trust of the carer.

Crèche Policy Guidelines for Child Development

There are usually policies for parents, caregivers and play equipment at the crèche. The centre welcomes parents participation in the activities or operations of the centre to be discussed with the supervisor, who in turn can advice them on what opportunities available for the child. There is a complaint and suggestion book kept in the crèche in case of any dissatisfaction parents can enter their feelings on the book. But parents must refrain from being angry with the crèche staff in front of the children to upheld the morale of the centre. Crèche meetings are fixed with parents as scheduled. Parents are required to discuss their unhappiness in any regard and they should not feel it will be used against the child for this help in the service improvement. Parents are requested to encourage their children to listen to simple instructions given by the crèche staff (Xiang, Bride & Guan, 2004, Ole Frode, Kurt & Terri, 2010). Most issues are dealt with affectionately and redirected to other activities in perfection. Parents also are required to leave clear instructions on medication for proper administration of prescribed drugs if it is required during the day. Parents would always be consulted on where to seek medical attention if need be. No toy from home is allowed in the centre unless the child cannot stay without them. Looking after children is an enormous responsibility; let the caregiver not worry about toys. If such items must be sent the crèche staff are not held liable for damage (Ryan, Rich, Edward & Deci, 2000).

The belongings of each child need to be checked by parents at the end of the day during pick up time. In case of missing items, parents are to inform staff as soon as possible. Clear instructions are required if parents are travelling during the day and contact number particularly for any emergency. If children are sick or have an infectious illness, the child should stay at home within that period. Fees requirements by children must be paid appropriately as a responsible obligation by parents.

Care givers or carers are expected to wear smart cotton clothes, hair plaited or made into bun. Very essential jewellery are allowed, no long earrings and glass bangles for the glass bungles tend to break and may hurt the children hence best avoided. Working hours is not a time for chat with friends and family (Wigfield, Guthries, Tonks & Perencevich, 2004) Care givers should always remember that children are God's gift, they come into being and are much dependent on them and have a chance to learn social skills and appropriate behaviours. They are to be nurtured with love, patience and pleasantly. Foul language should be avoided in childcare for the children are quick to initiate and unlearning is always more difficult. Even distribution of work should be done to avoid confusion and resentment. Caregivers are expected to be truthful and honest as role models for the children. The children are expected to be attended to except when sleeping, even then, periodic checks on the infant for safety. The day care needs to be swept and moped as many times as required as otherwise ants may trouble the children. Also, dust all surfaces and remove cobwebs. The children are not to be compared as each is unique and will be gifted in one area or other. The kids need to be appreciated as often as possible for each small task taken. While arranging the furniture keep the children's safety in mind. Toys and linen need to be washed every week. Curtains need to be washed once a month. Play is essential for children to learn and grow. What kids learn while playing need to be watched. Werier & Bernard (2012) posits that when children play, they figure out how things work, pick up new words and ideas, build strong muscles they can control, use their imagination solve problems, learn to cooperate with others. Note that as these children play, remember safety first, safe toys for young children are well made with no sharp parts of splinters and do not pinch, painted with non-toxic, lead free paint and easily cleaned and they should be frequently checked for safety.

Play equipment could be outdoor or indoor. Out door equipment like jungle gym, sea-saw, slides, sand pit, soft balls, swing, rope ladder are used by children under the supervision of carers according to their ages and requirements to prevent being hurt by themselves or other infants and children in the centre. Children catch a lot of fun as they play with these equipments but special attention must be given to where they are placed. Barneister & Vobs (2004) feels that slides should be placed under shady places to avoid sun burns during swing weather and sieved pebbles in sand pits to prevent stone being put in the mouth by smaller kids and small wooden horses arouse children socialization as they enter small spaces and have imaginary family living. Indoors hand's on toys like rattles, squeeze toys, balls, puzzles, bends and bound or card games build eye hand coordination, encourage ideas about how things work and faster cooperation and problem solving. Books and recorders are sources of joy for children and adults. Chose some to build on children's interest such as animals or silky words. Children who are read to in their early years usually become better readers. Art materials foster creativity and build skills that lead to reading, writing and seeing beauty in life. Infants who can grasp a maker will delight in the motion of scrubbing. Construction items like blocks building sets, and wood making are excellent sources that contribute to muscle strength and coordination. Experimental materials like sand, water day and musical instruments are ideal learning tools because children have much control over them as they relish their feeling and sound (Jones & Ishmael, 2008). Sleeping schedule for babies under one year is followed by their body clock while toddlers under 18 months to 2 years gradually the mid morning nap will be discontinued as they progress. Favoured sleep posture needs to be reported to parents. Some sleep on their tummy, some on their back and some sleep only if patted when sung to or rocked.

Toilet training is always a stress process but is usually complete only when the child independently is able to hold on till he/she gets to the bathroom. Toilet visits is built into daily schedule for young children while older children will be encouraged to use the toilet before leaving the crèche for outdoor activities or field trips.

Safety Facilities for Infant Development in Crèche or Day Care Centres

One of the most viable ways for proper infant and toddlers development in a crèche is to provide safety facilities or be safety conscious in the provision of facilities, every child is provided with a warm and secure environment and plenty of attention from a caring adult (Murphy & Jim, 2009 & Carvone, Shadil, Smith, Ronald, Fiori & Marina, 2006). Personalized schedules and tender interactions throughout the day encourages children to learn, develop and grow in their unique way. The following ideal crèche facilities would increase proper functioning of the infants and toddlers at their later years in their various fields of endeavour.

- Adequate room: Avoid overcrowding, which gives free movement and play, decrease chances of disease transmission and good ventilation reduces sweating.
- Adequate ventilation: Enough windows for free flow of fresh air, reduce air borne disease transmission
- Adequate lighting: Sunlight rooms usher in bright and happy mood, sunlight kills flies, mosquitoes, bacterial and viruses
- Adequate care givers: A ratio of one to three children
- Good general hygiene: Change clothes immediately on soiling. Change diapers when suited, wash children after feeding and teach children to wash their hands after toileting.
- Appropriate nutrition: Children under six months reformation far expressed breast milk, complementary feeds for infants above six months, prepared food to be heated slightly before feeding, fresh food be hygienically prepared, raw fruits and vegetables to be washed and care givers must wash their hands before feeding the kids.
- Timely medical care: There should be first aid for small injuries, abrasions, cuts, immunization should be strictly followed and contact a doctor for emergencies.
- Accident prevention: Avoid slippery floors, keeping sharp edged toys, furniture in the play areas, children should not be allowed alone in the toilet. The following must be kept out of he reach of children; blade, knife, scissors, nails, nuts, beads, small rubbers, pills, peanuts, beans, glass items, liquid medicines, kerosene, toilet-cleaning liquids, paints etc.
- Psychosocial stimulation: Small infants should be provided physical warmth and tenderness while older infants should be talked to and sung to, story telling session should be held, pictures and flash cards can be made for older children, children should not be beaten or threatened, older children should be encouraged to help in taking care of infants and children must feel secure in the crèche.

- Counselling to parents regarding breast feeding and use of expressed breast milk: Avoid bottle feeding, psychosocial stimulation that have interaction, child spacing and accident prevention at home
- Cost effective management: Crèche facilities should be affordable by parents.
- Idea of community crèche for women: Crèche near the work place should be a choice of parents. Parents could contribute toys and other stuff for psychosocial stimulation.

CONCLUSION

Good day care centres include a nice mix of activities during day to teach different skills such as singing, dancing and story telling. In the recent years, a lot of importance has been rightly placed on early childhood stimulation. Every effort is made to provide the children a rich environment with carefully chosen educational toys, books and music. Every child is provided with a warm and secure environment and plenty of attention from a caring adult called caregiver. A good crèche runs on open door policy and encourage parents to drop-in unannounced and become part of the day care community by helping with activities. Crèche focus in development and learning though play is a valued concept and day care owners would like to follow current official curriculum guidance in the way that they organize their day. A crèche is a place where children are secured and happy while away from home set up. It contributes to a child's well being, emotional and physical development. When children make a fuss at the end of the day on return, parents need be patient and give a chance for absence or being missed and they may want some hugs and attention and not a minus for criticisms or apportioning of blames yet.

TCARTSBA :This study explored the attitudes of teachers towards the use of interactive whiteboards (IWBs) in English Language teaching and learning contexts, and also sought insights into teachers' actual use of IWBs in English language classes. The study also investigated possible factors affecting teachers' positive and negative attitudes towards IWB technology. Data were collected through questionnaires distributed to 82 teachers in different institutions across Andimeshk, Iran, from Secondary schools. Questionnaire results revealed that teachers have positive attitudes towards the use of IWBs in Math instruction and are aware of the potential of this technology. Responses given in interviews indicated that all Math teachers are supportive of IWB technology in their classes, and observations revealed that IWBs are used with their basic functions in Math classes. The statistical analysis revealed that the more teachers use IWBs, the more they like this technology.

Key words: Interactive whiteboard (IWB), attitude, Mathematic Teachers, Math Instruction.

INTRODUCTION

With the introduction of computer facilities into the education system, traditional teaching techniques are increasingly being enhanced or even replaced by techniques relying more on technology. Once concentrated in math and science classes, technology has also begun providing benefits to language teaching and learning. One recent popular computer based technology that has emerged is interactive whiteboards (IWBs). IWBs were initially developed for presentations in office settings, but over the last decade, starting from higher education, educational institutions have begun using them. According to some studies and reports based primarily on research in science, math or other content-based classrooms, the use of IWBs makes the learning and teaching atmosphere more enjoyable, creative, and interesting. There are also numerous claims about the benefits and positive impact of IWBs on learning, but these remain largely anecdotal (Levy, 2002).

With the incorporation of IWBs in teaching and learning settings, important changes have been observed in education, such as engaging more students in the lesson, using multimedia sources flexibly, and motivating learners easily. IWBs could be useful supplementary tools for education, providing the opportunity to bring in different kinds of multimedia resources, to access Internet sources with ease, and to increase student interest; however, maximum benefit from this technology, especially in language teaching and learning settings, requires further background knowledge and research (Anderson, 2007). Although there are many descriptive reviews and reports about the use of IWBs, it is beneficial for teachers and students to be familiar with the actual potential of this technology through empirical studies, including gathering the opinions of students and teachers, exploring its actual use in the classroom, and providing pedagogical advice for effective use of this technology.

Background of the Study

In recent years, computers and computer-related technologies, such as IWBs, have increasingly begun to be used in language teaching and learning settings. Technologically developed countries such as the UK, the USA, and Australia have invested a great deal of money in such technological equipment. With respect to IWBs in particular, a national survey in England in 2005 found that nearly half (49%) of primary school teachers had used IWBs, and in secondary schools, 77% of math teachers, 67% of science teachers and 49% of English teachers said they had used IWBs (BECTA, 2005). There is increasing interest in the potential of this technology worldwide (Hodge & Anderson, 2007), including in countries like Iran, where, though this technology is quite new, it is attracting educators' attention day by day.

Interactive whiteboards have been argued to provide certain benefits for students. Firstly, using IWBs has been claimed to increase student motivation and enjoyment (BECTA, 2003a).

Secondly, they have been shown to enable greater opportunities for participation and collaboration, thus developing students' personal and social skills (Levy, 2002). Thirdly, they may eliminate the need for students to take notes, through the capacity to save and print what appears on the board (BECTA, 2003b). Another benefit is arguably that, with the help of an IWB, teachers can make clearer and more dynamic presentations and in turn the students can manage to deal with more complex concepts (Smith, 2001). It has also been argued that IWBs allow teachers to accommodate different learning styles and to choose materials according to the particular needs of students (Bell, 2002). Moreover, IWBs seem to enable students to be more creative and self-confident in presentations to their classmates (Levy, 2002). Finally, Bell suggests using IWBs for a variety of reasons. Since IWBs are colorful tools, they attract the attention of students and they may be useful not only for visual intelligent students, but also for kinesthetic learners because they allow touching and marking on the board.

IWBs may provide benefits for teachers as well. First of all, IWBs have been shown to provide teachers with a way to integrate Information and Communication Technology (ICT) into their lessons while teaching from the front of the class (Smith, 2001). Secondly, they may allow for spontaneity and flexibility, and for teachers to benefit from a wide range of web-based resources (Kennewell, 2001).

Thirdly, they permit teachers to save and print the notes they or their students write on the board (Walker, 2002). Furthermore, IWBs allow teachers to share materials with their colleagues via intranet at schools and use them again later, which saves time in preparing materials (Glover & Miller, 2001). Finally, interactive whiteboards have been argued to serve as encouraging devices for teachers to change their pedagogical approaches and use more ICT, which in turn can facilitate professional development (Smith, 1999).

Even though there are many reports claiming to show the advantages of IWBs, there are also a few studies pointing out the drawbacks of this technology. In a study conducted by Gray, Hagger Vaughan, Pilkington and Tomkins (2005), researchers found that some teachers complained that IWB-based lesson preparation and planning is time-consuming. Other teachers stated that too much PowerPoint use could lead to a "show and tell" style of teaching that may result in changing the role of the teacher into one of just a presenter of the topic in the classroom. In this case, the teacher may be seen as more passive and as less involved in the teaching process.

Smith, Higgins, Wall and Miller (2005) revealed that in order to use IWBs to their full potential and avoid such problems, there is a tremendous need for training and technical support for teachers. Teachers should be confident in using this technology, which can only be achieved by special training. Without training, the claimed benefits may not be experienced by the learners and teachers. Glover and Miller (2001) conducted another study that supports this idea, emphasizing many teachers' lack of overall ICT competence. Yet another problem that may arise with the introduction of IWB technology is a financial one. Schools have to spend a considerable amount of money in order to equip classrooms with this technology.

Since the late 1990s there has been an increasing use of technology in educational settings worldwide. Computer facilities such as wireless net, interactive whiteboards, and multimedia devices have started to enhance teaching and learning processes. Interactive whiteboards (IWBs) are a relatively recent technology, so there is not a great deal of scholarly literature relating to attitudes towards their use. The articles in the educational press and newspapers offer only anecdotal evidence and advice and the existing small-scale studies do not provide a full picture – particularly with respect to IWB use in the area of language instruction.

Various studies have investigated the attitudes of students and teachers towards CALL (Arkın, 2003; Bebell, O'Conner, O'Dwyer, & Russell, 2003) and several studies have looked at the student and teachers attitudes towards the use of interactive whiteboards in particular (Armstrong, Cardini, Castle, 2007; Schmid, 2006; Wall, Higgins, Smith, 2005). Of the latter studies only two looked specifically at IWB use in language learning contexts (Gray et al., 2005; Schmid, 2006), and of these, both were small-scale qualitative studies looking at specific groups of ESL learners and teachers.

The literature lacks therefore large-scale studies surveying specifically language teachers', learners', and administrators' views about the use of IWBs in EFL contexts and exploring the possible factors affecting these stakeholders' positive or negative attitudes towards IWB technology.

In Iran, Andimeshk, IWB technology is fairly new and there are not many institutions that use it currently for language teaching purposes. Since research studies may be helpful to educators deciding whether or not to invest in this new technology, this study will be a starting point to show the overall picture of IWB use in Iran, Andimeshk, student and teacher openness to their use, and their overall potential for language instruction. This study will include all of the stakeholders in language instruction settings by exploring teachers', students', and administrators' attitudes both qualitatively and quantitatively, so that educators may decide whether they should incorporate this technology into their teaching process or not.

Research Questions

1) What are the attitudes of Iranian EFL teachers towards interactive whiteboards?
4) How are IWBs used in EFL classrooms in Iran, Andimeshk?
5) What factors may influence Iranian students' and teachers' attitudes towards the use of IWBs in EFL classrooms?

Significance of the Study

IWB technology is becoming more and more widespread day by day since it appears to offer teachers and students opportunities to facilitate teaching and learning. Although there are many claimed benefits of IWB technology, it is the teachers who will have to exploit the features of IWBs and integrate them with their current teaching methodologies, and students who will be expected to be ready for such changes. Effective integration can be achieved once it is understood how much training is needed, how open teachers and students are to the idea of IWB use, and how much support can be expected from administrators. Since the literature lacks broad empirical studies investigating students' and teachers' attitudes towards IWB technology in language instruction, this study might provide more empirical results, including both qualitative and quantitative data, showing how language teachers and EFL students perceive IWB technology, and ultimately may help both teachers and students maximize the benefits of IWB technology.

This is the first study that will investigate the attitudes of students, teachers, and administrators towards the use of IWBs in language instruction settings in Iran, Andimeshk. Before deciding on whether to invest in any new technology, educators need to understand how much this technology may contribute to their particular teaching and learning process, and need to be aware of opinions of the people who are using this technology currently. This study will enable Iranian educational institutions in the language teaching field to make informed decisions about whether to invest in this technology, and to better understand what they need to do if they decide to make this commitment.

Methodology

Since this study was limited by the number of educational institutions that use IWB technology, there could not be equal distribution of the types of institutions. This study was conducted, therefore, in thirteen different educational institutions where IWB technology is used in Andimeshk.

Some of the students who participated in the study were preparatory class students in universities and high schools, others were in language schools taking English courses at different levels, and others were primary school students taking English classes at least two days a week. In any one institution, not all classrooms using IWBs in English classes were necessarily surveyed. In any institution, if there were more than three classrooms where IWBs were installed, the three classes in which IWB had been used most often were surveyed.

If the students' IWB exposure was the same, one sample from each grade and level was chosen at random. The age of students ranged from 6 to mid-40s since there were educational institutions ranging from primary school to language school. The highest student population in this survey belongs to university students (45%).

The teachers surveyed also came from these thirteen different educational institutions, and therefore ranged from primary school teachers to university instructors. They had varying degrees of experience in teaching English, with the majority (83%) having between 1-10 years experience. Among all English teachers in any institution, only the ones with actual experience using this technology were involved in the survey. In order to see the actual use of IWBs in English classes, three hours of English lessons were observed. Two of these classes were observed in one university, and the other was observed in a secondary school. The criterion for choosing the lesson to be observed was the amount of the teacher's experience in using this technology.

Lastly, three administrators were interviewed to investigate their attitudes towards the use of IWBs. All administrators were from universities and they were chosen because they had either had enough knowledge about IWB technology or had participated in the decision-making process to purchase the IWB technology.

Instruments

Survey techniques and instruments were used in order to collect data in this study. Two questionnaires were employed in this study in order to collect data about the attitudes of students and teachers towards IWBs in language teaching and learning settings. Both the student and teacher questionnaires included five point Likert-scale items, open-ended and multiple-choice items, and apart from primary and secondary school students, the rest of the participants signed a consent form.

The first questionnaire elicited information about the attitudes of students towards IWB use in English lessons. The other questionnaire explored the attitudes of EFL teachers towards IWB use in the classroom settings. While writing the questions in the questionnaire, the researcher was inspired by Moss et al (2007) questionnaire on teacher and student perceptions of IWBs in core subjects.

Some teacher and student responses in Levy's (2000) study were also used to prepare the questionnaire items for this study. After the writing of the final version of the student's questionnaire in English, the questions in the student's questionnaire were translated into Iranian by the researcher and checked by a fellow English teacher, in case student participants would not understand some of the statements in English.

However, the teacher's questionnaire was written in English because it was felt that EFL teachers would easily understand the questionnaire items. In order to improve the questionnaires, a pilot study was conducted in Middle East Technical University's Foreign Languages Department. Forty students and five teachers participated in the study in total. After the study, two vague items in the teacher's questionnaire were changed in order to be clearer.

The reliability check with Cronbach Alpha resulted in the score of 0.79 for student's questionnaire and 0.78 for teacher's questionnaire. In the teacher's questionnaire, three opposite items were excluded before the reliability check.

In order to explore the attitudes of administrators towards the use of IWBs, an interview protocol was used. I conducted these interviews with the heads of the Foreign Languages Departments in three different universities. They were the administrators of the preparatory programs. The reason for including administrators in this study is that their attitudes are also important while deciding to purchase this technology and provide additional support for teachers. There were six questions in total, exploring the factors influencing their institutions' decision to purchase IWBs, their opinions about the benefits of IWBs, the most common problems stated by the EFL teachers, and general background information about the institution.

For the last research question, a video recording procedure was conducted. The purpose of this procedure was to observe the actual ways in which of EFL teachers used or benefited from IWBs in language classes.

PROCEDURE

It was learned that approximately seventy different institutions possess this technology, but only about twenty of them use it in language classes. I phoned the administrations of the institutions that use IWB in language classes to learn whether they actually use this technology or not. I found out that even though some of these institutions had purchased IWBs, they were not using them actively, maybe due to the need for training.

Some of the institutions requested official permission from the director of education in different cities, so I excluded those institutions from my list since it would take a long time to get that permission. At the end of this initial searching step, I made a list of fifteen institutions that use IWBs in EFL classrooms, and which consented to take part in this study. Two of the institutions ultimately did not send back the questionnaires, leaving a total of thirteen institutions surveyed. The return rate, in this case, is approximately 80% with student's questionnaire and 19% with teacher's questionnaire.

A preparatory classroom was selected randomly, taking into consideration that they had some degree of IWB use experience. Two teachers who had been using this technology for one year were selected for the piloting. The student questionnaires were distributed to the EFL students in the preparatory class and all the students completed the questionnaires.

The other questionnaire, which was designed for the teachers who use IWBs in English classes, was distributed to the teachers and five teachers completed this questionnaire. The researcher requested the students and the teachers to comment on unclear statements and to express their thoughts about the questions and the survey itself. The time spent for each questionnaire was also recorded. After the piloting, minor changes to improve the questionnaires were made with the help of the teachers' oral and written comments and the students' feedback.

After the minor changes in the questionnaires were made, the questionnaires were distributed to fifteen institutions by post. Three interviews were then held with the heads of three institutions. Six questions were asked to learn their beliefs about this technology. Three hours of English classes were recorded in different institutions, using a digital video camera. After the recording, the tapes were analyzed using a checklist to define the ways in which English teachers used this technology. The checklist, which was compiled on the basis of uses mentioned in the literature on IWBs, consisted of different activities and ways of IWB use, such as bringing in materials from the Internet.

Data analysis

All the items in the questionnaires were analyzed using the Statistical Package for Social Sciences (SPSS), with the exception of the two open-ended questions at the end of both the teachers' questionnaire and students' questionnaire.
In the interview with the administrators, there were six questions and they were analyzed through categorization of the responses in terms of positive and negative opinions. For every item statistically analyzed, frequencies and percentages were calculated. In terms of mean scores and standard deviations, the researcher excluded the option "No idea" from the variables in order to see only the degree of actual agreement and disagreement among the participants expressing a clear opinion.

Therefore, the calculation of mean scores ranged from 1.00 to 4.00. In this case, the scores between 1.00 and 1.75 meant that the participants showed their strong disagreement with a certain statement, 1.76-2.50 indicated disagreement, 2.51-3.25 showed agreement, and 3.26-4.00 corresponded to strong agreement.

In order to find whether there was a significant relation between different variables such as age, hours of IWB use/exposure and students' and teachers' having positive or negative attitudes towards IWBs, one-way ANOVA tests were performed. Interviews with the administrators were taped and transcribed by the researcher.

The transcript data were categorized according to administrators' positive or negative attitudes towards the use of IWB technology. The video records were analyzed and categorized according to the ways that teachers use IWBs in the literature. In addition, the open-ended responses from the students were first translated into English, and then categorized according to the sections in the analysis of the questionnaire data gathered from the students. Later, after each section of the analysis of the student questionnaire results, the related responses were added to the relevant sections in order to support or contradict with the students' or teachers' Likert-scale responses.

Results and Discussion

With the exception of section three, in which there were two open-ended response items, all sections in the questionnaires were analyzed statistically. The Statistical Packages for Social Sciences (SPSS) Version 11.5 was used to compute frequencies and percentages of each Likert-scale question.

All the Likert-scale items consisted of a 5-point format: strongly agree, agree, no idea, disagree, and strongly disagree. While calculating means and standard deviations, the option "No idea" was excluded from the variables in order to see only the degree of actual agreement and disagreement among the participants. ANOVA tests were also calculated to see whether there was a significant relationship between attitudes and various participant factors, including age, years of teaching experience, hours of IWB exposure, and type of the institution worked in. In addition, responses from the two open-ended questions were grouped according to the similar questions in the second section of the questionnaire and were discussed after each statistical analysis.

The interview transcript data were analyzed according to the responses of interviewees for each of the six questions. The researcher examined all the responses for each question in order to find similarities and differences between the attitudes of the administrators.

Finally, the observation data were analyzed in order to reflect the actual use of IWBs in English lessons and to what extent the potential of IWBs is exploited.

The results obtained from the analysis of the questionnaires are presented in four parts below. In the first part, the analysis of questions in the student questionnaire is presented according to six categories: learning, technical issues, affective factors, motivation, time/organization, and differences between IWBs and traditional whiteboards. In the second part, the responses given to the questions in the teacher's questionnaire are shown according to four categories: teaching, attitudes, motivation, and training. In the third part, the data gathered from the interviews are presented according to the six questions asked, and the similarities and differences between the interviewees' responses for each question addressing attitudes towards the use of IWBs are analyzed. The final part of this chapter is devoted to a presentation of the various ways of actual IWB use in English classes as seen during the class observations.

Part 2: Teachers' Attitudes towards the Use of Interactive Whiteboards

Section 1: Teachers' Attitudes Related to IWBs as Teaching Tools

The nine questions in this section of the teacher's questionnaire investigated teachers' attitudes towards the use of IWBs as teaching tools. Generally, the proclaimed benefits of IWBs such as saving time, enabling teachers to reach different sources, saving and printing students' work or examples, easing review, and allowing the opportunity to interact with the class face to face were included in the questionnaire statements to learn the teachers' feelings about these features of IWBs. The researcher also wanted to learn whether the teachers feel that they are more effective, efficient, and better managers of their classes when using IWBs.

Q1: Using the IWB resources reduces the time I spend writing on the board.
Q2: When using IWBs in the classroom, I spend more time for the preparation of the lesson.
Q3: I think using IWBs makes it easier to reach different sources and display them to the whole class immediately.
Q4: IWBs are beneficial for saving and printing the materials generated during the lesson.
Q5: I can give explanations more effectively with the use of IWBs.
Q6: With the help of using the IWB, I can easily control the whole class.
Q7: I think IWBs can be a good supplement to support teaching.
Q8: Using IWBs makes me a more efficient teacher.
Q9: Using IWBs makes it easier for a teacher to review, re-explain, and summarize the subject.

According to the mean scores in this table, except for the statement that using IWBs requires more preparation time, the teachers agreed with all statements in this category. The highest mean score belongs to question seven, which indicates that nearly all of the teachers (90%) agree or strongly agree that IWBs can be a good supplement for the language teaching process.

The questions in this section can be categorized into two subcategories:
Questions related to the benefits of IWBs and questions related directly to the opinions of teachers. Q7 and Q8 can be included in the category of teachers' opinions about IWBs and the rest could be mentioned in the category of benefits and drawbacks of IWBs. Of the second group, the results of the third item show that a majority of the teachers responded positively that IWBs make it easier for them to reach different sources and show them to the whole class at the same time.

Regarding the responses related to the ninth question in this section, it can be seen that a majority of the teachers believe that IWBs enable them to review, summarize, and reexplain a subject in an easy way. If we look at the results of the fourth question, we see that 73% of the teachers agreed that IWBs are useful for saving and printing out their students' work. Nearly two thirds of the teachers believe that they can give explanations more effectively by using IWBs. The results of the first question reveal that 78% of the teachers agreed or strongly agreed that using IWB-based resources reduces time spent in writing on the board during the lessons. Looking at the responses given for the sixth question, 72% of the teachers agreed that they could easily control the whole class from the front of the class.

For the second question, which has the lowest mean score in this category, 59% of the teachers disagreed with the idea that preparing for IWB-based lessons takes more time than for a regular lesson. This may indicate that these teachers use special software programs designed for certain textbooks because these programs provide a lot of different activities, exercises, and tests for the teachers, which eases the teachers' job in preparing extra materials. On the other hand, the results also reveal that 32% of the teachers agree with this idea, which suggests that these teachers try to prepare their materials by themselves, so they have to look for special materials and create appropriate materials for IWBs.

In terms of the results of the two questions related to teachers' opinions, nearly two thirds of the teachers agreed with the notion that using IWBs makes them more efficient teachers in the classroom. It is also seen that 90% of the respondents believe that IWBs can be used for supplementing the lessons, resulting in the highest mean score for any question.

Taking the open-ended responses into consideration, three teachers stated that using IWBs saves time for the teacher. Two teachers also reported their feelings that IWB-based lessons are more interesting for the students and therefore the teacher can teach more effectively. In the words of one of these teachers:

I think this technology is a great opportunity for the students and the teachers because my lessons become more interesting by using IWBs and I can include a great variety of sources (Teacher 7).
On the other hand, one teacher complained that the IWB software that was designed for the course book does not contain anything different from the units of the textbook, so he suggested generally that these supplementary materials should be improved.

Section 2: Teachers' General Attitudes toward the Use of IWBs

These seven questions aimed to investigate teachers' general attitudes towards the use of IWBs. The questions can be divided into subcategories of positive attitudes/feelings and negative attitudes/feelings. Q10 and Q12 may be thought of as positive attitudes because they directly looked at whether the teachers like using this technology and whether they have positive attitudes towards it. On the other hand, Q11, Q13, Q14, and Q16 can be considered as negative attitudes since they explored the negative feelings of the teachers while using IWBs, their negative attitudes towards this technology, their concerns about their students' readiness to use this technology, and doubts about their own readiness to use IWBs. Q15 is directly related to the preference of a traditional way of teaching over IWB technology, so it can be included in the negative category as well.

Q10: I like using IWB technology in my lessons.
Q11: I feel uncomfortable using IWBs in front of my students.
Q12: I have positive attitudes towards the use of IWBs in language instruction.
Q13: I have negative attitudes towards the use of IWBs in language instruction.
Q14: I do not think my students are ready for this technology.
Q15: What I do in class with traditional methods is sufficient for teaching English.
Q16: I am not the type to do well with IWB-based applications.

In terms of mean scores calculated, the teachers strongly agreed with questions ten and twelve, whereas they disagreed or strongly disagreed with the rest of the questions in this category. As is seen in Table 11, these remaining questions were actually expressing negative opinions, so the teachers' disagreement with them shows an overall positive attitude, and thus a consistency among the participants' responses is evident.
The results show that the majority of the teachers agreed that they like using IWBs in their lessons, and that they have positive attitudes towards them. Supporting this finding, only 6% of the teachers responded that they have negative attitudes.

There is a more mixed response when it comes to the question of whether there is a need for IWBs. Although 61% disagree that their traditional methods are sufficient to teach English, 25% agreed with this statement, which indicates that some teachers do not see the necessity of introducing this new technology into the teaching process. By disagreeing with question 11, the majority of teachers made it clear that using IWBs does not make them uncomfortable in front of their students, and most teachers (72 of the 82 surveyed) were confident that they themselves were suited to using this new technology.
Finally, in terms of what the teachers' attitudes towards their students' readiness for IWB use, more than two thirds of the teachers (79%) agreed that their students are 'ready' for this kind of technology.

Section 3: Teachers' Attitudes in terms of Motivational Issues

The questions in this section intended to investigate teachers' attitudes in terms of motivational issues. This section consisted of four questions in total. The questions aimed to gather information about teachers' opinions whether they think that using of IWBs makes lessons more enjoyable and interesting, helps keep the students' attention longer, and increases interaction, motivation, and participation of the students during the lessons.

Q17: I think IWBs make learning more enjoyable and more interesting.
Q20: I can keep my students' attention longer with the help of IWB technology.
Q21: I think IWBs increase the interaction and participation of the students.
Q22: I think my students are more motivated when I use an IWB in my lessons.

The mean scores and low standard deviations calculated show that the teachers agreed or strongly agreed with all the statements in this category. The mean score of question seventeen is the highest (M=3.46), which indicates that nearly all of the teachers (almost 88%) agreed that IWBs make lessons more enjoyable and interesting. Nearly 80% of the participating teachers agreed that the use of IWBs increases the interaction and participation of the students, and nearly two thirds of the teachers believe that their students are more motivated when an IWB is used in the classroom.
The responses given for the 22nd question in this category show that 78% of the EFL teachers agreed that they can keep their students' attention longer when they use IWBs during the lessons.

Two of the participants wrote in positive extra comments, stating that IWBs attract the students' attention and increase student participation.

On the other hand, two other teachers observed that when the classroom lights are dimmed, some of the students lose attention:

When the classroom is a bit dark, my students start to sleep and lose their concentration. I think only the curtains near the IWB should be closed and the back of the classroom might get light from outside so that students do not tend to sleep (Teacher 19).

In order to avoid loss of attention when the lights are dimmed, the curtains at the back of the classroom can be opened or the lights could be switched on at the back of the classroom so that darkness of the classroom does not affect the students negatively.

Section 4: Teachers' Attitudes Related to the Issue of Training

The last category of the teacher's questionnaire contained two questions addressing the specific issue of training for the use of IWBs: whether it is necessary and whether without it, they still feel comfortable using IWBs (see Table 12).

Q18: I believe that training is required to teach with IWB technology.
Q19: If I do not get sufficient training, I do not feel comfortable with using IWBs in the classroom.

The mean scores reveal that the teachers believe in the need for training, but are much more divided over whether such training is absolutely necessary in order for them to feel comfortable using IWBs.

According to the responses given for the 18th question, 63% of the participants agreed that training is necessary for the use of this technology. For question 19 however, there is a more mixed response. Although 34% of the EFL teachers report that they feel comfortable without any training while using an IWB, 51% of the respondents agreed that they do feel uncomfortable, if they do not get sufficient training.

Since the agreement score is higher than the disagreement rate, it can be said that the need for training is accepted as an important issue.

One of the teachers made the point that teachers themselves have a role to play in getting ready to use IWBs:

I agreed with the training requirement, but this is a skill that teachers must develop themselves, make time to explore this technology and it's potential. If they do not make time, they will not use it effectively (Teacher 16).

This opinion indicates that it is the teachers' responsibility in part to learn to use this technology, but the administrators should also encourage teachers and plan training sessions for them. The comment may suggest that if a teacher does not have positive attitudes towards this technology or believe in its benefits, it might be difficult for him/her to become accustomed to using it.

Section 5: Factors Affecting Teacher Attitudes towards IWB Use

In this section, one-way ANOVA tests were performed to explore the relation between teacher attitudes and different variables such as age, experience, and hours of IWB use. The researcher wanted to check whether hours of IWB use, age differences, and experience of teachers can be connected to positive attitudes or negative attitudes. Correlations were sought between hours of IWB use, age, and experience variables and questions 10 (I like using IWB technology in my lessons), Q12 (I have positive attitudes towards the use of IWBs in language instruction), Q13 (I have negative attitudes towards the use of IWBs in language instruction), and Q15

(What I do in class with traditional methods is sufficient in teaching English). After ANOVA tests were performed, none of the relations were found to be significant except for that between hours of IWB use and liking the use of IWB technology.

The result in Table 13 shows that there is a significant relationship between the hours of the teachers' IWB use and the degree of liking the use of IWBs. Specifically, post hoc tests reveal a significant difference between the group with the lowest exposure (1-2 hours) and the group with the highest exposure (11+ hours).

In general, what this suggests is that as the number of hours of using IWBs increases, teachers' rating of how much they like using this technology increases as well. This is an important finding because as the teachers explore this technology day by day, its potential and difference from traditional whiteboards are seen by the teachers and they want to use it more often. It is also related to the feedback coming from the students because when the teachers hear positive feedback, they want to use this technology more enthusiastically, as one of the administrators noted in the interview.

CONCLUSION

The results in this study revealed that a majority of the students agreed that when audio and visual materials are used with IWBs, they can understand lessons better and feel that they learn more.

Regarding the teachers' responses related to teaching, the teachers strongly agreed that IWBs are a good supplement for teaching and that IWBs make it easier to show different kinds of materials to the class. In Levy (2002) and Lee and Boyle (2004), the teachers reported that IWBs make it easier to draw on a greater number and wider variety of information and learning sources and these sources can be used flexibly and spontaneously in response to different pedagogical needs. The findings in the current study agree with this notion that it is easier to reach different sources with IWBs and that the whole class can benefit from these sources at the same time.

Teachers in the current study also strongly agreed with the idea that the use of IWBs makes it possible to review, re-explain, and summarize a topic easily and effectively, since the saved or ready examples from the previous lessons and a great variety of other sources make it easier for the teacher to re-present the subject. This is similar to points raised in earlier studies. Most of the students in Glover and Miller's (2001) study, for example, reported that with the help of IWBs, their teachers were able to review things if they needed to study them again. More than two thirds of the teachers in that study also agreed with the idea that the opportunity to save and print out the students' work and other materials is a very useful facility of IWBs, and is in fact a feature unique to IWBs, a point noted in both Walker (2002) and Lee and Boyle (2004).

The only statement in this category that the teachers disagreed with was one suggesting that preparation of IWB-based lessons takes more time than for a regular lesson.

This finding contradicts with a participant's comment in Glover and Miller's (2001) study that IWBs require earlier and better preparation from teachers. Levy's (2002) study also revealed that most of the teachers felt that initial lesson planning and materials preparation such as nice flipcharts take a long time to prepare.

According to the findings in Moss et al. (2007), teachers reported preparing their own resources 78% of the time, and 42% of the time using commercial software. Although the findings in that study indicate that the teachers mostly spend a long time to prepare their own materials, this study may indicate that Iranian EFL teachers are either using commercial software or are finding prepared IWB materials on the Internet since they report that it is not time consuming to prepare IWB-based materials. Although in the observations I conducted, there were not any teachers who used a software program, but the researcher knows that some teachers use software programs specially designed for certain course books, such as Face2Face. Since the number of observations is limited to three, it was not possible to verify the use of software programs in English classes.

The results of this study suggest that simply providing IWBs in some or all classrooms does not guarantee their use in language instruction as it was found out during the research. The students in the institutions where there is only one IWB equipped classroom complain that they have experienced this technology only once or twice a semester.
This lack of exposure may come from concrete problems such as lack of time or inability to schedule access to the IWB classroom, or it may come from the teachers' unwillingness to try this new technology and therefore reluctance to bring his/her students to the IWB classroom.

In especially crowded schools with one IWB classroom, it will be very difficult to schedule who will use it when. The solution to this problem can be installing IWBs into more classrooms or administrators' planning equal schedules to make it possible for every class to benefit from this technology. In addition, teachers may not only face some first-order barriers such as lack of equipment and time, but also second-order barriers such as lack of confidence (Lane, Ross and Woods, 1999).

Through professional guidance and assistance, these second-order barriers can be overcome and teachers may feel more confident and eager to benefit from this technology. Thus, administrators should arrange focus meetings with experienced teachers in using IWBs, establish a kind of sharing network among teachers in terms of materials, resources, and advice on IWB use, and encourage teachers to exploit this technology on their own with the help of experienced colleagues.

Another important and related issue is the need for training. As Hall and Higgins (2005) stated in their study, training sessions should be regular and should be viewed as a continuous process so that teachers can improve their ICT skills in order to use IWBs efficiently. This issue is also mentioned in Smith et al. (2005), where they note that in order to use IWBs to their full potential, there is a need for adequate training because inexperienced manipulations of IWB features decrease the value of this technology. Additional coaching personnel and time could be beneficial on a one to one basis and administrators can arrange training sessions that could be helpful for teachers to overcome their barriers and be more confident in using IWB technology. However, my research findings indicate that more than one third of the teachers responded that they can teach with IWBs without special training.

This may show that the teachers who are interested and good at ICT skills can easily adapt themselves to IWB technology. Therefore, training could be provided by administrators according to the individuals' technological knowledge, experience, and their individual needs to exploit this technology in education. Since most of the teachers in this study agreed that IWB technology is a good supplement for teaching, and both students and teachers have positive attitudes towards this technology, it can be argued that IWBs should be involved in the teaching process as much as possible. Although it depends on the institutions' budgets, once the decision is made to use IWBs, ideally it is advisable to install them in every classroom so that students do not have to change classrooms for IWB-based lessons. If this is not financially possible, there can be at least two or three classrooms that are equipped with IWBs.

In this case, it should be ensured that students be able to find the opportunity to go to those classrooms as much as possible. Students in this study complained that they can only rarely go to the "smart class", which prevents them from experiencing and benefiting from this technology. It should also be reminded that some publishers prepare IWB-based materials and there are a wide variety of free resources on the Internet suitable for IWB use.

Teachers and administrators may wish to contact the publishers for IWB-based materials, on the condition that they choose certain course books whose materials are ready for IWB use, or search the Internet to find extra materials. On a cautionary note, since in most cases a committee, not individual teachers, decides on the books to be used in an institution, a teacher who wants to use this technology with readymade materials may not find this opportunity. Another potential problem with using ready-made materials is that not many books are prepared with software programs, which would limit the teachers' choice if they want to benefit from these software programs. If they find the opportunity to choose course books provided with IWB software programs, teachers may get help in the exhausting process of preparing extra materials for the class and save time by using these materials.

As a last point, educators and administrators should not simply rush to buy IWBs before purchasing one. They should search for and be informed about the different features of each IWB. Although most IWBs share similar features, some of them have distinctive functions and allow more interactive opportunities during the lessons, a particularly important aspect for language teaching. After the comparison of different trademarks, the cost of this technology should also be considered. If more classrooms are intended to be equipped with IWBs, low cost IWBs could be appropriate, whereas if this technology is going to be installed in just a few classrooms, more functionally active IWBs can be chosen. It should also be noted that the size of the IWBs is also important, for instance, in large classrooms, bigger sizes would be more appropriate.

In this study, thirteen educational institutions were surveyed, ranging from primary schools to universities. Although there are several more institutions currently using IWB technology in Iran, Andimeshk, time, travel constraints, and willingness to take part in this study reduced the number of institutions involved. In addition, in some institutions, there were IWBs, but they had not been installed yet, so those institutions were not included in this study.

In one of the institutions surveyed, IWBs have been used for more than four years, but the rest of the institutions have been using this technology for only one year on average. This meant that in some cases students and teachers were basing their opinions on only limited exposure – a fact which no doubt led to the high "no idea" response rate for some questions. It should also be taken into consideration that in many institutions in Iran, Andimeshk, IWBs are used more in subject classes such as math, science, and geography. Restricting the study to institutions in which IWBs are used in language classrooms also meant that the number of institutions included in this study is far fewer than the total number of institutions currently using IWBs.

Apart from one private primary school and one high school surveyed, all the institutions in this study have this technology installed in just one or two classrooms.

This limited accessibility again may have negatively influenced the extent to which IWBs are used since teachers find it difficult to share the same classroom among them. As noted above, this also meant that students and teachers in many cases did not have a great deal of exposure to lessons with IWBs, and at times could not comment on this technology appropriately. If all the participants in this study had had more experience with IWBs, they might have agreed or disagreed with the statements more easily.

The number of lessons observed in different institutions to see the actual use of IWBs in English classes was also limited. Again, time and travel constraints did not make it possible to include more observations in this study. In addition, some institutions did not consent to having their teachers observed during the lessons and did not allow video recording. Similarly, the study is limited by the few interviews with administrators, but time constraints did not allow for more.

This study investigated the attitudes of students, administrators, and teachers towards the use of IWBs, factors affecting their attitudes, and the ways that EFL teachers use IWBs. Although this study includes some qualitative data, more classroom observations can be carried out to investigate to what extent teachers' benefit from the potential of this technology as claimed in the literature. Such a study, if conducted in a longitudinal manner, could attempt to confirm the finding in this study that greater use correlates to more positive attitudes.

As one administrator in this study pointed out, IWBs may help improve classroom interaction because the teachers do not need to turn their backs on the class. Given the importance of interaction in language learning settings, it could be the particular focus of a classroom-based research study to look at whether or how IWB use contributes to classroom interaction specifically.

The effectiveness of this technology in language instruction settings should also be examined. Although IWBs are claimed to have an impact on learning in the short term, this has not yet been confirmed. It should be checked and seen what are exactly the real contributions of this technology through experimental studies in language learning settings. If not much contribution to learning is found, investment in this technology could be questioned and investors might rethink before purchasing this expensive technology.

THE EFFECT OF USING SMART BOARD TECHNOLOGY ON IRANIAN EFL

Morteza BAKHTİARVAND

Reza GOLMORADİ

Mehdi KEYHANİ

Related literature indicates that the use of technology including the Smart Board has an important role in foreign language learning. It is also obvious that attitudes of learners including their motivation affect learning processes significantly. This study aimed to investigate if there is any significant relationship between the use of Smart Board technology in Iranian EFL university classes and the students' motivation to learn English. To test this hypothesis a questionnaire developed by Binnur (2011) was distributed among a group of 60 Iranian EFL university students. Data gathered were analyzed statistically. The result indicated that Iranian EFL university students had a positive attitude towards the use of Smart Board technology in their English classes.

ABSTRACT: Faculty of Economics and Business (University of Maribor) offers complex and useful knowledge in the field of statistics, so among other things the SPSS (Statistical Package for the Social Sciences) is part of students' courses. SPSS is the most widely used statistical package that is applied by professionals as well as by higher education institutions, and it represents the important IT support. For that reason in this paper we present conceptual model of the usability of IT SPSS support, which was tested on a sample of 300 undergraduate and postgraduate students of economics and business. The basis for conceptual model developed in this paper represents the expanded TAM model (Technology Acceptance Model). The conceptual model was verified using structural equation modeling (SEM). Based on the set of basic models, we examined connections between formed constructs of the TAM model and in this way we presented the results of the conceptual models. The study reveals that there is a positive relationship between perceived usefulness of statistics and perceived usefulness of SPSS, perceived ease of use of SPSS, and attitude towards using the SPSS. Research model was analyzed by using the SmartPLS and WarpPLS approaches. The examination of the usefulness of statistical information support for educational institutions represents a starting point for further pedagogical and software development, and it also provides an opportunity to increase the value of SPSS in planning of IT support.

Key words: TAM model, usefulness of SPSS, statistics, student, structural equation modeling (SEM)

INTRODUCTION

Students of economics and business sciences acquire differentiated knowledge of statistical methods and analyses in educational programs that the Faculty of Economics and Business (FEB) offers, which graduates can use in further education or at the workplace. Research shows that students perceive statistics as a field of study that is tedious and difficult and usually they study it against their will (Morton & Booth 1997, Gordon 2004). But the acquisition of knowledge of statistics is the basis for understanding the complex quantitative analyzes, which are used in the context of differentiated statistical software support. The teachers of statistics want the students to acquire understanding of statistical methods as well as to be able to apply statistical methods in solving the real-life business problems or scientific research questions. Garfield (2005) emphasizes that students have to learn about statistical approaches in the most practical manner, with the help of computer and application of the statistical software support. Students learn statistics better if they have experience in the implementation of the ideas in new situations. With the help of statistical software support students can change various assumptions and parameters of the models, analyze data and thus improve understanding and application of statistical software support.

Statistical software packages are designed for the explicit purpose of performing statistical analyzes. Different statistical packages such as SPSS, SAS, S-plus, Minitab, STATA, R, and others are available on the market over a long period of time. While development of these packages has focused on industry users' needs, they have also evolved into more menu-driven packages that are more user friendly for students and as a result students of economics and business studies in the educational process often discover the usefulness of SPSS statistical software support, which allows them to use a number of quantitative methods and statistical approaches for data analysis. To this end, we wanted to know how the usefulness of statistics is perceived by students and how it affects the use of the SPSS statistical software support.

The field of SPSS use in the educational process has not been studied extensively. Researchers tend to study the use of software tools and rather choose to focus on different software solutions and technologies which students acquire during the educational process. In particular, they focus on the study of computer use of information and communication technologies, e-learning, m-learning, accounting software, e-portfolio system and similar (Park

2009, Zafar - Kumah & Achampong 2010; Shroff et al. 2011, Edmunds et al. 2012, Sriwidharmanely & Syafrudin 2012, Mahat et al. 2013). Some researchers study the attitudes of students towards statistical software adoption, within the context of study process, especially in an online version (Yang et al. 2007, Hsu et al. 2009). Also the students' conceptual understanding of statistics has been recently researched by analyzing the perception of statistics, characteristics of students and their attitudes towards statistics (Bond et al. 2012, Lalayants 2012, Dempster et al. 2009). Since the researches that focus on the usefulness of statistical software support for students is in deficit, and since a greater emphasis is laid on teaching and learning of statistics (Adams et al. 1999), we have decided to study the usefulness of SPSS software support that is perceived by students of economics and business sciences.

The designing of the conceptual model was based on the Technology acceptance Model (TAM). The TAM is an adaptation of the TRA (Theory of Reasoned Action) which is conceived as a general structure designed to explain almost all human behavior and is based on the importance of an individual's beliefs for the prediction of his / her behavior (Fishbein & Ajzen 1975, Ajzen & Fishbein 1980). TAM model comprises external variables, perceived usefulness, perceived ease of use, attitude toward using, behavioral intention to use and actual system use (Devis et al. 1989). The TAM is extremely widespread and used to determine the usefulness of IT solutions, software support, and technologies in various fields of science. The TAM attempts to explain why individuals choose to adopt or not a particular technology when performing a task. The purpose of our paper is to verify the applicability of the TAM model to explore the applicability of SPSS software support in the field of education and at the same time expand it with some new factors, in our case, with the usefulness of statistics.

LITERATURE REVIEW

Conceptual Research Model

Development of the conceptual model was based on the usefulness of statistics as a basis for understanding the use of any statistical software, especially the obtained results. "Statistics is the science of the planning studies and experiments, obtaining data and the organizing, summarizing, presenting, analyzing, interpreting, and drawing conclusions based on the data" (Triolet 2011). Despite the fact that statistics grant us many benefits which derive from basic definitions of it, several researches analyze attitudes to statistics by the students (Roberts & Bilderback 1980), and only few are analyzing the perceived use of statistics. Some studies also found out, that there is only a small proportion of students who believe that statistic will be useful and important in their chosen career, even after the implementation of additional organized trainings (Hagen et al. 2013). Chiesi and Grab (2009) have studied the perceived importance of statistics among students and their findings were exactly the opposite from the expected – namely they expected the positive opinion of students regarding worth of statistics; but after additional training the decrease in perceived importance of statistics in students' personal and professional life was detected, and also students' feelings concerning statistics were less positive. Lo and Stevenson (1991) found that there was a positive correlation between the perceived importance of statistics and computer experiences among students. It was also found that the learning of statistics would be enhanced by more exposure to computer printouts to assist and to interpret of results. In addition to the computing experience, scientists stress that the students' attitude to statistics is mainly the consequence of their experiences in statistical or mathematical classes in the past course of education (Zhang et al. 2012). "Students learn statistics only if they actually practice statistics through a whole range of statistical activity supported by an appropriate computer package and discussion" (Petocz & Reid 2001). It was also suggested that using statistical software programs in the introductory statistics course would be one of the important ways to improve student knowledge of statistics and to positive attitudes of students towards statistics (Baştürk 2005).

The area of statistics also influences the extent and the nature of the needed computing expertise (Gentle 2004). In literature review we found that there was only few researches done on the usefulness of the SPSS statistical software support for students based on the concept of the TAM. For example Yang et al. (2007) have studied the usage of statistical software support by using the TAM model and they found that learning experience had some effect on the attitudes towards using statistical software. Based on the regression model, they showed that usefulness and ease of use had significant impacts on attitudes towards the statistical software support by students. Their research results revealed that the relationship between the usefulness, ease of use, and attitude was significant.

Hsu et al. (2009) examined the SPSS software support by using the TAM model, which involves external variables such as: computer attitude, statistical software self-efficacy, and statistics anxiety. The study found that there was a positive relationship between perceived ease of use and perceived usefulness of SPSS, but the research was limited to behavioral intentions regarding the use of the SPSS (Hsu et al. 2009). Some researchers have also focused on the study of the SPSS and other support software (e.g. Excel) for better comprehension of statistics (Proctor 2002).

The development of the conceptual model in this paper was based on the TAM model, which in the early stages of development included two constructs, namely perceived usefulness and perceived ease of use of technology. Perceived usefulness is defined as "the degree to which a person believes that using particular system would enhance his or her job performance." Perceived ease of use, in contrast, refers to "the degree to which a person believes that using particular system would be free of effort" (Davis 1989). Both constructs represent cognitive response, which is reflected in the attitude toward using representing affective response (Davis 1993). The TAM model is a good indicator of the success or failure of a system implementation (Turban & Volonino 2010). The key purpose of the TAM is to provide a basis for discovering the impact of external variables on internal beliefs, attitudes, and intentions (Lu et al. 2003). The researchers did extend the TAM with several external variables, which could be classified as technology factors, social factors, economic factors, individual factors, and behavior factors (Lu et al. 2003, Alshare & Alkhateeb 2008). Based on the theoretical platform of TAM model and its' expansion with the multidimensional variable "usefulness of statistics", we have designed the following hypotheses, which are presented in the conceptual model in Figure 1:

H1: The higher the perceived usefulness of statistics, the higher on overage is the student's perceived usefulness of SPSS.
H2: The higher the perceived usefulness of statistics, the higher on overage is the student's perceived ease of SPSS use.
H3: The higher the perceived ease of SPSS use, the higher on overage is the student's perceived usefulness of SPSS.
H4: The higher the perceived usefulness of SPSS, the higher on overage is the student's perceived positive attitude towards SPSS.
H5: The higher the perceived ease of SPSS use, the higher on overage is the student's perceived positive attitude towards SPSS.

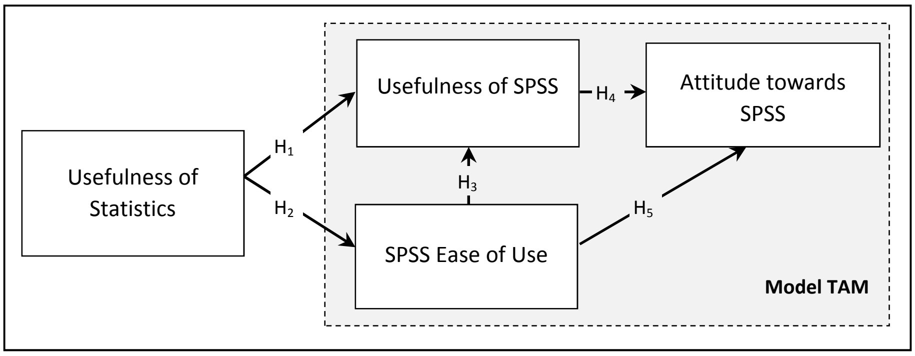

Figure 1 Conceptual Research Model

METHODS

Survey instrument

The questionnaire was designed in three phases; in the first phase we reviewed the literature, which has enabled us to develop a research model multidimensional variables - constructs. An important stage in the development process of the measuring scale represents the preparation of the statements (items) with which we explain several components of constructs of the research model. The research design consisted of three constructs arising from the TAM model (Usefulness of SPSS, SPSS Ease of Use and Attitude to SPSS) and one external construct (Usefulness of Statistics), that we formed and included into the expanded TAM model.

The construct "Usefulness of SPSS" was explained with five items (Davis 1989, Venkatesh & Davis 1996, Saad & Bahl 2005, Letchumanan & Muniandy 2013), the "SPSS Ease of Use" with five items (Davis 1989, Venkatesh & Davis 1996, Letchumanan & Muniandy 2013), the "Attitude toward the SPSS" with four items (Nah et al. 2004, Yi et al. 2006, Letchumanan & Muniandy 2013) and "Usefulness of Statistics" with six items (Davis 1989, Venkatesh & Davis 1996, Letchumanan & Muniandy 2013). In the second phase, we designed an online questionnaire, which was pre-tested on a sample of 10 students. This phase resulted in a total of 21 items in the questionnaire. In the final third stage an online questionnaire was sent to students. All items were assessed using a five-point Likert scale from 1 = "Strongly disagree" to 7 = "Strongly agree". The questionnaire included two questions gathering basic demographics, i.e., gender and field of study.

Data collection

The data was collected with an online questionnaire from 26th November 2013 to 17th December 2013. The study included a total of n = 300 undergraduate and postgraduate students who were acquainted with the SPSS statistical software support during their studies. Online questionnaire was sent to the students of various courses of economics and business sciences. All online questionnaires were duly completed. In the total sample, 33.9% were females, and 66.1% were males; 62.6% were students of undergraduate studies and 37.4% of postgraduate studies.

Data analysis

Statistical Package for the Social Sciences (SPSS), SmartPLS and WarpPLS software were used to analyze the reliability and validity of the data and to conduct structural equation modeling (SEM). The analysis of the data set was based on exploratory factor analysis (EFA) and confirmatory factor analysis (CFA). In the first phase we performed EFA, in which the principal component analysis and Varimax method were used. The Bartlett's Test of Sphericity (BTS), the Kaiser-Meyer-Olkin statistics (KMO > 0.5) and the statistically significant ($p < 0.05$) were calculated. In the context of EFA, we have examined factor loadings ($\eta \geq 0.5$), communality of variables ($h > 0.4$) and eigenvalues of factors ($\lambda \geq 1.0$).

In the second phase we conducted the CFA which was used to ascertain the efficiency of the measurement models, and SEM was used to test the conceptual framework and assumptions. To test the model the following rules were applied: average path coefficient (APC), average R-squared (ARS), average adjusted R-squared (AARS), average block VIF (AVIF < 5.0), average full collinearity VIF (AFVIF < 5.0), Sympson's paradox ratio (SPR ≥ 0.7), the R-squared contribution ratio (RSCR ≥ 0.9), statistical suppression ratio (SSR ≥ 0.7), nonlinear substantiated by an association causality direction ratio (NLBCD ≥ 0.7) and goodness-of-fit (GoF ≥ 0.5) (Schepers et al. 2005, Kock 2013). The quality of the measurement model was measured by the index of communality ($C > 0.5$) and index of redundancy (R). Based on the indices of cross-validated communality ($Q^2 > 0$), cross-validated redundancy ($H^2 > 0.5$) and variance explained by the model for a particular endogenous variable (R^2), we examined the predictability value of the structural model (Cohen 1988, Stone 1974).

In the next phase, we examined the reliability and validity of the measurement instrument, keeping in mind the Cronbach's alpha ($\alpha > 0.7$), index of communality and redundancy. Scale validity was analyzed by focusing on convergent validity, discriminant validity and nomological validity. As part of the convergent validity, we examined average variance extracted (ρc^{AVE}) and composite reliability coefficients ρc^{CR}, keeping in mind the criterion (Hair et al. 2010, Fornell & Larcker 1981, Bagozzi & Yi 1988): $\rho c^{\mathrm{AVE}} > 0.5$ and $\rho c^{\mathrm{CR}} > 0.7$ and the criterion by Byrne (2001) $\rho c^{\mathrm{CR}} > \rho c^{\mathrm{AVE}}$. To verify the validity of discriminants we considered maximum shared variance (MSV) and average shared variance (ASV). In discriminant force, we took into account two criteria (Hair et al. 2010): MSV < ρc^{AVE} and ASV < ρc^{AVE}. Nomological validity is established when the correlations between the construct and question and theoretically related constructs are significantly greater than zero (Campbell 1960). In order to check multicolinearity, we used the variance inflation factors VIF < 3.3 (Cenfetelli & Bassellier 2009). For hypothesis testing, we used the path coefficient associated with a causal link in the model (β or γ), t-value, statistically significant ($p < 0.05$) and indicator of Cohen's effect (f^2) with size as 0.02, 0.15 and 0.35 for small, medium and large effect sizes (Cohen 1988).

RESULTS AND FINDINGS

Validity and reliability analysis

The results of the factor analysis for each construct indicate that it is meaningful to use EFA: Usefulness of Statistics (KMO = 0.914; BTS = 1420.622; $p < 0.001$), Usefulness of SPSS (KMO=0.908; BTS = 1301.402; $p < 0.001$), SPSS Ease of Use (KMO = 0.866; BTS = 961.837; $p < 0.001$) and Attitude to SPSS (KMO = 0.858; BTS = 829.737; $p < 0.001$). The EFA showed that all four constructs were one-dimensional whose own values were greater than 1.0. All the factors weights of the variables we used to measure individual constructs were higher than the value of 0.5. Therefore we excluded no items out of the individual constructs. 80.1 % of total variance was explained by the "Usefulness of Statistics" factor; 77.4 % by "Usefulness of SPSS"; "SPSS Ease of Use" explained 78.0 %; and "Attitude toward SPSS" explained 84.4 % of the total variance.

Next, we employed confirmatory factor analysis (CFA). Four factors were created and used as latent variables. Item factor loadings were high, ranging from 0.790 to 0.942; and all were significant at the 0.001 level. To estimate the reliability of observed items, the R^2 values were used. The value of reliability of observed items were high, ranging from 0.624 to 0.887. As revealed in an examination of their values, all items did meet the 0.5 criterion.

Table 1. Convergent and discriminant validity of measurement models

Construct	**Cronbach's α**	ρ_c^{CRa}	$\rho_c^{AVE\ b}$	**MSV**[c]	**ASV**[d]	**VIF**[e]	**Results of convergent validity** $\rho_c^{CR} > \rho_c^{AVE}$ $\rho_c^{AVE} > 0.5$	**Results of discriminant validity** $\rho_c^{AVE} > MSV$ $\rho_c^{AVE} > ASV$
US	0.950	0.960	0.801	0.652	0.460	3.007	yes	yes
U	0.941	0.959	0.812	0.516	0.544	3.946	yes	yes
EU	0.929	0.946	0.779	0.516	0.379	2.096	yes	yes
AT	0.938	0.956	0.844	0.602	0.534	3.405	yes	yes
Average	0.940	0.955	0.809	0.572	0.479	3.114	yes	yes

Notes: [a] ρ_c^{CR} refers to the composite reliability ($\rho_c=(\Sigma\lambda_i)^2 var(\xi)/[(\Sigma\lambda_i)^2 var(\xi)+\Sigma\theta_{ii}]$; (Bagozzi & Yi 1998)), [b] ρ_c^{AVE} refers to the average variance extracted ($\rho_c=(\Sigma\lambda_i^2 var(\xi))/[\Sigma\lambda_i^2 var(\xi)+\Sigma\theta_{ii}]$; (Fornell & Larcker, 1981)), [c] MSV refers to the maximum shared variance, [d]ASV refers to the average shared variance; [e]VIF is the full indicator variance inflation factor; US is Usefulness of Statistics; U stands for Usefulness of SPSS; EU is SPSS Ease of Use; AT is the Attitude to SPSS.

To check the reliability of the constructs we tested convergent, discriminant and nomological validity. The ρ_c^{AVE} values for this model exceeded 0.5 for the reflective constructs (Hair et al. 2010), thus indicating convergent validity for all constructs. Composite reliabilities ρ_c^{CR} for the four reflectively measured constructs ranged from 0.946 to 0.960, exceeding the minimum requirement of 0.7. Table 1 shows the construct reliability for all four constructs: Usefulness of Statistics (ρ_c^{CR} = 0.960, ρ_c^{AVE} = 0.801); Usefulness of SPSS (ρ_c^{CR} = 0.959, ρ_c^{AVE} = 0.812); SPSS Ease of Use (ρ_c^{CR} = 0.946, ρ_c^{AVE} = 0.779); and Attitude to SPSS (ρ_c^{CR} = 0.956, ρ_c^{AVE} = 0.844). Since all the values ρ_c^{CR} values were higher than ρ_c^{AVE} values, we confirmed the convergent validity for all studied constructs. The internal consistency of the items in relation to the single trait within the instrumental was tested using Cronbach's α, ranging from 0.929 to 0.950. The discriminant validity of the measurement model was totally confirmed, where we kept in mind the suggested criteria (AVE > ASV and AVE > MSV). All values ρ_c^{AVE} of individual constructs were higher than the maximum value of shared variance (MSV) and average shared variance (ASV). The results of the discriminant validity are shown in Table 1. The interconstruct correlations are all positive and significant. The results in Table 2 indicate that the model has complete nomological validity.

Table 2. Construct correlations and indicators of quality of research model

Notes: [a]The means and standard deviations are based on simple composites of the constructs,[*]Indicates square root of AVE; C-index of communality; R-index of redundancy; R^2-variance explaned by the model for a particular endogenous variable; H^2-cross validated communality; Q^2-cross validated redundancy; US-Usefulness of Statistics; U-Usefulness of SPSS; EU-SPSS Ease of Use; AT-Attitude to SPSS.

Structural model assessment

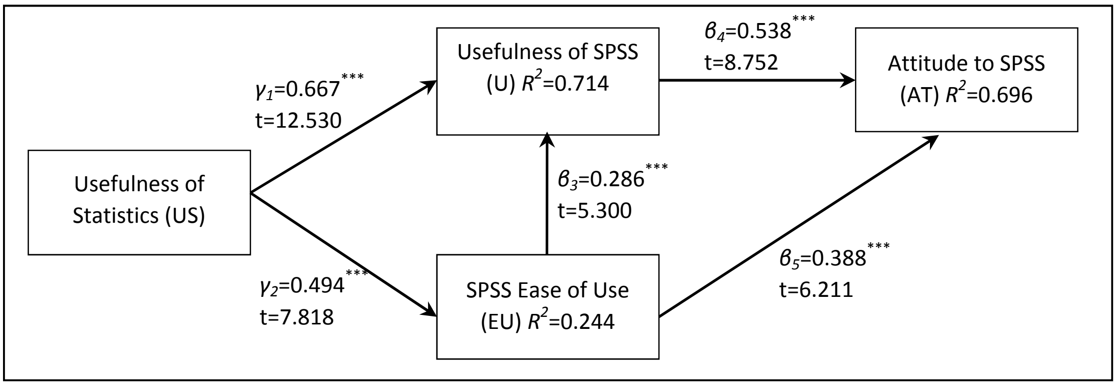
After the construct measures had been confirmed as reliable and valid, the next step was to assess the structural model results. Before interpreting the path coefficients, we examined the structural model for collinearity. The VIF values of these analyses ranged between 2.096 and 3.946, providing confidence that the structural model results were not negatively affected by collinearity. Explained variation R^2 for the endogenous latent variables is provided by Cohen (1988), where the value of 0.26, 0.13 and 0.02 represent strong, medium or low impact. The examination of the endogenous constructs' predictive power (Figure 2) shows that "Attitude toward SPSS", which is the primary outcome measure of the model, has a substantial R^2 value 0.696. Prediction of "Usefulness of SPSS" is higher with an R^2 value of 0.714, whereas the prediction of "SPSS Ease of Use" is comparably weak (R^2 = 0.244). The average value of R^2 is 0.551, which explains a large part of the variance of the endogenous variables. The quality of the measurement model was tested with the guarantee of communality (*C*) and the index of redundancy (*R*). The values of communality are all positive, ranging between 0.779 and 0.844. the average of its value is 0.809 and is higher than the threshold 0.5 (Henseler & Ringle 2009). Its value tells us that the quality of the measurement model for each block is at a satisfactory level. Values of redundancy are ranging between 0.190 and 0.342. Its average value is 0.250. The index of redundancy explained to us that the quality of the structural model for each endogenous block was at a satisfactory level. As for structural model, we have evaluated the guarantee of cross-validated communality (Q^2) and the index of cross validated redundancy (H^2). The values of Q^2 are ranging between 0.189 and 0.580. The average value of Q^2 is 0.443. The values of H^2 are ranging between 0.779 and 0.812 and are higher than the prescribed value of 0.5. The average value of H^2 is 0.797. All values of Q^2 and H^2 are positive, confirming the good predictability value of our measurement model.

Here we examined how the data fit the research model. One of the criteria that WarpPLS offers us is the coefficient of goodness-of-fit (GoF). A criterion of goodness of fit (GoF) for PLS was proposed as geometric mean of the average communality and the average R^2 by Tenenhaus et al. (2005). GOF is defined as small (0.35), medium (0.50) and large (0.61) (Zlatan & Ghozali 2012). The model in this study had a GoF value of 0.668; this indicates that the model fit was good. WarpPLS provided us with additional criteria for verifying data consistency within the research model. This assesses the model fit with the data, it is recommended that the *p*-values for both the average path coefficient (APC = 0.475) and the average R-squared (ARS = 0.552) both be lower than 0.05. Both coefficients are at the level of statistical significance of $p < 0.05$. Average values of the variance inflation factor (AVIF = 1.470) and average full colinearity VIF (AFVIF = 3.114) were lower than 5.0. The values of Sympson's paradox ration (SPR = 1.000) and R-squared contribution ration (RSCR = 1.000) achieve the ideal value, which was proposed 1,000. For additional research model fit the data values contribute statistical suppression ration (SSR = 1.000) and nonlinear causality bivariate direction ration (NLBCDR = 1.000), as both indicators exceed the suggested value 0.7 (Kock 2009).

Hypothesis testing

After verifying the adequacy of based conceptual model, we examined all hypotheses. All of our hypothesized relationships have been found significant at $p < 0.001$. In Figure 2 we present the relationships between individual constructs. Structural path coefficients of the proposed model, that are presented in Table 3, support the hypotheses formed.

Research results suggest that perceived "Usefulness of Statistics" by students has a positive and significant effect on perceived "Usefulness of SPSS". The findings also provide support for H_2, showing that the "Usefulness of Statistics" has a positive effect on the "SPSS Ease of Use". We found that students perceived the important role of statistics in the use of the SPSS, as it provides a basis for understanding the SPSS. The SPSS gives us analytical approaches that require knowledge of statistics, which is a prerequisite for the efficient use of the SPSS. In addition, "Usefulness of Statistics" effect on "Usefulness of SPSS" is higher than its effect on "SPSS Ease of Use".



Note: ***$p < 0.001$; Based on t(499); t(0.05; 499) = 1.967; t(0.01; 499) = 2.594; t(0.001; 499) = 3.320).

Figure 2. Results of structural model analysis

Results revealed that, as expected, the "SPSS Ease of Use" had a positive effect on "Usefulness of SPSS", supporting H_3. Hypothesis H_4 and H_5 indicate the effects of "Usefulness of SPSS" and "SPSS Ease of Use" on "Attitude to SPSS" exist: the "Usefulness of SPSS" had a positive effect on the "Attitude to SPSS, supporting H_4. Besides that similarly also "SPSS Ease of Use" showed a significant positive impact on "Attitude toward SPSS", supporting H_5. Hypothesis H_1-H_5 were therefore all supported in this study.

Impact assessment f^2 (effect size) was used to assess the impact of latent variables in structural level model. The average f^2 0.331, represents a strong effect of latent variables. The strongest effect is perceived regarding the independent variable "Usefulness of Statistics", which affects the dependent variable "Usefulness of SPSS". Low-impact is perceived regarding the impact of independent variables "SPSS Ease of Use" on the dependent variable "Attitude toward SPSS" (see Table 3). From the results of the research, we can conclude that statistics has an important role in the use of the SPSS statistical software support. Students who perceive sufficient usefulness of statistics may understand more successfully the usage of the statistical software and perceive it as easy to use. From this we can further assume that students with higher perceived ease of use of statistical software SPSS on general perceive also a more positive attitude toward statistical software SPSS.

Table 3. Structural path coefficients for proposed model

Connection	γ/β	f^2	S.E.	t-value	p-value

CONCLUSION

In this paper, we addressed the usefulness of SPSS for students of economics and business. We have developed a conceptual model which we derived from the TAM model. The TAM model was expanded with multidimensional variable "Usefulness of Statistics". Although there were numerous studies about the use of IT solutions and technologies found in the literature, we detected a lack of research about the use of statistical software support for students, especially about the perceived usefulness of the SPSS. Therefore this represented a shortfall in this area of study that certainly called for further research.

In this study we have found that the perceived usefulness of statistics is important and definitely is a key factor for high perceived usefulness of SPSS and perceived ease of its use. It is not enough that students acquire knowledge of statistics they also have to learn statistics and perceive it as useful so as to efficiently use the SPSS. This certainly requires changes in the teaching process, in particular the use of real business cases. We have found relationship between the perceived ease of use of the SPSS and the perceived usefulness of SPSS, which is consistent to the conceptual model of Hsu et al. (2009). In this way, we found that among students who perceived the ease of use of the SPSS also perceived usefulness of the SPSS tends to increase. Next, we found that students who perceived the usefulness of the SPSS, had a more positive attitude toward the SPSS. At the same time, we found that students who increasingly perceived the ease of use of the SPSS also had a more positive attitude toward the SPSS. However, the connection between usefulness and attitude towards SPSS is significantly stronger, compared to the correlation between the ease of use and the attitude towards the SPSS. From the findings we can conclude that students placed greater emphasis on the usability of the SPSS and its practical application, both in the study, as later in business practice. Our findings are thus consistent with the findings of Garfield (2005), who stresses the need for the students to learn about statistical approaches in the most practical manner. The TAM model is therefore also useful for determining the applicability of statistical software such as the SPSS.

As already described the constructs "Usefulness of SPSS", "SPSS Ease of Use" and" Attitude toward SPSS" were included based on the TAM model; besides them additional external variable, i.e., "Usefulness of Statistics" was included and expanded TAM model for the use of the SPSS statistical software support was formed. We performed our research on a sample of 300 Slovenian undergraduate and postgraduate students of economics and business sciences, and therefore we cannot generalize the findings to the entire population. Since the usefulness of statistical software support represents a deficient area of research, we perceive there are more opportunities for future research. The conceptual model could include additional constructs such as "satisfaction of use of SPSS" and "future intention of the use of the SPSS". The TAM model could be expanded to the other external variables such as educational support, compliance use of statistical software support with their studies in general or to the course of study, and also observed significant differences between undergraduate and postgraduate students, or between foreign and domestic students of economics and business studies regarding the perceived use of statistical software support. The scope of applicability of statistical programming support has a lot of potential for the use of experimental studies, in particular the verification of the effects of different pedagogical approaches.

RECOMMENDATIONS

Based on the findings of the research recommendations are formed for both the designers of statistical software support as well as for faculties and teaching staff that teach and use statistical software support. For the effective use of the SPSS students need an appropriate level of understanding of statistics, which is almost a precondition for the effective use of the SPSS. For the students to perceive the usefulness of statistics teachers should focus more on the preparation of study aids, which contain statistical simulation and real business cases that are actually prepared based on real-life business situations. Therefore the future research should also be oriented towards the study of pedagogical support for the use of the SPSS, as it is seen that the use of statistics and SPSS both require an adequate level of motivation in order to reduce statistics anxiety. For the students it is necessary to gain the insight about where and how to effectively use statistics and the SPSS in business practice. Organizations that are engaged in the development of statistical software support should consider developing friendly and simple, but innovative and useful enough SPSS software. It would certainly be appropriate to prepare the SPSS with appropriate additional explanations of statistical parameters and additional useful applications that are frequently used in business. This will definitely increase the perceived usefulness of SPSS for students of different study fields and create a more positive attitude towards SPSS.

COMPARISON OF DIFFERENTIATED APPROACH DEVELOPED WITH PURDUE MODEL IN TERMS OF ACHIEVEMENT

Esra ALTINTAŞ

Ahmet Ş. ÖZDEMİR

The aim of the research is to compare the differentiated approach developed by the researchers according to the mathematics education of gifted students who are at 5th grade with Purdue model developed for gifted students by Feldhusen and Kolloff and made its applications by the researchers according to the mathematics education of gifted students in terms of achivement of gifted students. The problem sentence of the study is as follows: Is there any effect of differentiated approach developed according to the mathematics education of gifted students on the achievement of gifted students compared with Purdue model? The subproblems of the research:

1. Is there any significant difference between achievement pre test scores of gifted students in control and experimental group?

2. Is there any significant difference between achievemet post test scores of gifted students in control and experimental group?

In the present study it was used pre test -post test model with control group. The universe of the study consists of 5th grade gifted students who study at secondary schools included in Maltepe district of Istanbul. The sample of the study consists of 27 5th grade gifted students who study at a private school in Maltepe district of Istanbul. The data collecting tools are achievement test and multiple intelligence test.

It was concluded that there was a significant difference between pre test post test scores of gifted students in control group and experimental group. There was an increase both in cotrol group and experimental group. But the increase in achievement scores are higher in the differentiated approach than Purdue model.

EDUCATION AND THE CHALLENGES OF SUSTAINABLE LIVELIHOOD IN EMERGING ECONOMIES: FOCUS ON RURAL ADULT EDUCATION FOR POVERTY REDUCTION IN NIGERIA

Peter A BETIANG

Elızabeth Anıah-BETIANG

S I AKPAMA

Merely asserting that education occupies the centre space in overall development of the individual and community is not only an understatement, but it is stating the obvious. It is known that the socio-economic imbalances and bondages that condemn a large percentage of the world population (80% for Nigeria) to live below the poverty line derives directly from the type, quantity and quality of skills acquired through education. The Education for All (EFA) initiative of UNESCO, sets out among other things to encourage the provision of a "Basic Education" for all citizens. This basic education is expected to stimulate an attitude of sustainable livelihood among its recipients, hence attempting to break the cycle of poverty –which is an inevitable accompaniment of a poor education. This paper examines the issues, problems and prospects of education for sustainability among rural poor illiterate and neo literate adults while attempting to chart a possible course for considered action in making adult basic education more meaningful and sustainable in the fight against poverty in Nigeria

Keywords: Education, Education for all, Adult basic education, sustainable livelihood, poverty reduction, illiterates and neo-literates

ROLE OF HISTORY OF MATHEMATICS ON EDUCATION OF MATHEMATICS

Saeed Seyed Agha BANIHASHEMI
School Of International Realtions
ihusaied2001@yahoo.com

ABSTRACT: In this article we are going to discuss how new and old mathematics are related on works of Islamic mathematician and how history of mathematics can help education of mathematics to improve and motivate it.

INTRODUCTION

In history of mathematics we must study history of mathematics of all civilization because without study in this way we may do mistake .on basis of my project in Iran we collected about 6000 of mathematical manuscript of different libraries of about 1600 author. With these manuscript we came to know that fifth century of hijry was maximum activity of Islamic mathematician in the Islamic empire(indaex1) % 30 of these are number theory and %30 is geometry and %30 is algebra and ten percent is application of mathematics. Intelligent people faced a religion, which in this religion science are most important phenomena
" If today and tomorrow of Muslim are same they are not Muslim "

That means evry day Muslim must learn new things .So they studied Greek and Indian manuscript so a dry land was watered by Greek and Indian mathematics. In this condition Benmusa and their brothers employed Harni to translate these manuscript . So in other way they did history of mathematics the best one was Phage nasradin Tusi which in their manuscript we can see he state weakness and power point of Greek and Indian manuscript.

Role of history of mathematics on education of mathematics : -1

One of the basic fact of history of mathematics it teaches to student that science is works of all -1-1
civilization what ever we have are task of all civilization so nice feel comes to them that all people have cooperate in what we have now .Students with help of history of mathematics learn that big mathematician has done mistake so if they have done mistake can try again look to mistake of ferma on claim that $F_n = 2^{2^n} + 1$,n=1,2,3,……..

Is a prime number uler proved that 641 are a factor of F_5 .

Most important of education of mathematics aim is make a quite and interesting class we have very nice and interesting story in greek, Indian, and Islamic mathematics which can help teachers to control the classes
Some example:
Example –1- Abolvafa Bozjani one of the famous mathematician of 328 of Hejry (940 .A.D) he had very nice books which all translated in English and French . In his book with the name geometry operation there is very beautiful problem can make student interest and better thinking as follow:

"How we can make with three equal square a new square "

Let the student thinks for few minutes and compare their work with Bozjani method
Solution: Let a,b,c three equal square we divide two of them into two parts by diameter as follow:

Example –2

Division of a line o equal part :If we want to divide AB into three part we continue from A and B in different direction we call $BB' = a, AA' = 2a$ so BM = (1/3)AB.

Another important aim of education of mathematics is to learn better thinking history of mathematics have this tools. I think best problems for student for thinking is problems of all civilizations like trisection of angle, squaring circle,

trisection of triangle -2-1

In this section we see two method of trisection of angle from different civilization.

1-2-3-Hippas method .

When the given angle BAF is trisected as follow s:

Construct a square ABCD on AB such that ray AF lies in the interior of <BAD. -1

Draw the quadratix DE and let X be its point of intersection with AF. -2

Draw XC parallel to BA . -3

Construct the point H on Ad such that $AH = \frac{1}{3}AG$. -4

Draw HY parallel to AB -5

Draw AY . -6

Then <ABY is the required angle .

1-2-4- abosahl Kohi method.

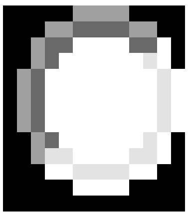
He is one of the most importan mathematicians of fourth century(hejry) from south of Caspian Sea . He was magician he was interesting on central of gravity because of his job then he became interest to mathematics.

He start with following lemma:

Suppose we have semi circle AZD with diameter AD an center H with angle ABG we want to find E such that EZ parallel with BG then $EZ^2 = EH \cdot ED$

Now we consider method of Kohi for trisection of angle .

Continue AB up to D which length of BD is optional.Draw a semi circle with diameter AD which H is middle of AD .

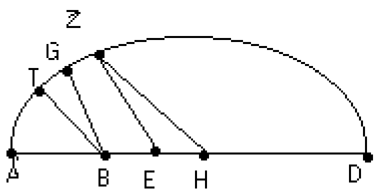


EZ is parallel such that $EH \cdot ED = EZ^2$ then draw EZ, ZD ,BT parallel to ZH in this case <ABT=2<TBG. So <ABG=<ABT+<TBG=2<TBG+<TBG =3<TBG.

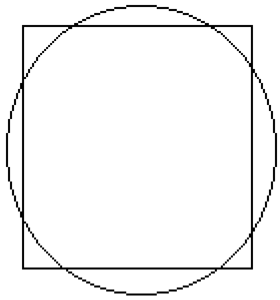
He prove above state as follow :

We have $EH \cdot ED = EZ^2 \Rightarrow \frac{ED}{EZ} = \frac{EZ}{EH}$ Since two triangle HEZ,ZED are common on E so these two are analogous therefore <EZH=<D but two arm ZH, HD of triangle ZHD are equal though <HZD=<D, <EZH=<HZD but <EHZ is external angle of triangle ZHD. So

<EHZ=<HZD+<D=2<HZDbut <BEZ is external of triangle ZEH we have <BEZ=<EZH+<EHZ=<HZD+2<HZD=<HZD therefore <EHZ=(2/3)<ABG because BT is parallel ZH we have <ABT=(2/3)<ABG in other way <TBG=(1/3)<ABG.



Squaring the circle is another problem which different civilization was interested.
It is seems very simple according to idea of students but when they start to calculate they will see it is not possible because



Area of a circle with diameter 1 is equal to $A = \pi R^2 if R = 1 \Rightarrow A = \pi$
$A = x^2 \Rightarrow \pi = x^2 \Rightarrow x = \sqrt{\pi}$

Since π is unknown never we can find x . But different mathematician from different civilization tried to find a system to do drawing one these mathematician are Ramrujan from India though he had very short life but it was full so success.
Let PQR be a circle with center O of which a diameters PR . Bisect PO at H and let T be the point of trisection of OR near R. Draw TQ perpendicular PR and place the chord RS=TQ.Join PS and draw OM and TN parallel to RS .Place a chord PK=PM and draw the tangent PL=MN .Join RL,RKand KL. Cut off RC=RH .Draw CD parallel to KL meeting RLat D.

Then the square on RD will be equal to the circle PQR (in area) approximately . For $RS^2 = \frac{5}{36}d^2$

Where d is diameter of the circle.

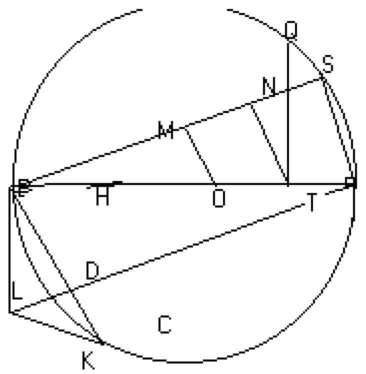
Therefore $PS^2 = \frac{31}{36}d^2$. But PL and PK are equal to MN and PM respectively. Therefore $PK^2 = \frac{31}{144}d^2, PL^2 = \frac{31}{324}d^2$ and hence

$RK^2 = PR^2 - PK^2 = \frac{113}{144}d^2$ and $RL^2 = PR^2 + PL^2 = \frac{355}{324}d^2$. But

$\frac{RK}{PL} = \frac{RC}{RD} = \frac{3}{2}(\frac{113}{325})^{1/2} and RC = \frac{3}{4}d.$

Therefore $RD = \frac{d}{2}(\frac{355}{113})^{1/2} = r\sqrt{\pi}$.

3- Another effect of the history of mathematics on education of mathematics especially for teacher is that they can understood the right root of formula in following we look to a list formula which named rungly :



Correct	rung

Ghyathedin Kashany (8 Hejry)	Febunaji
$$\sqrt[n]{T^n + r} \approx T + \frac{r}{(T+r)^n + T^n}$$	$$\sqrt{a^2 + r} \approx a + \frac{r}{2}$$ $$\sqrt[3]{a^3 + r} \approx a + \frac{r}{(a+1)^3 + a^3}$$
Mahvira (900A.D) $$C_r^n = \frac{n!}{(n-r)!r!}$$	Herigeone (1634)
Aryabatai(499 A.D)	Pell(1685)

$$Nx^2 + 1 = y^2$$

and so on .

ABSTRACT: This paper is a part of our investigations related to the effect of silver ion substituted by cations of different size on microstructure and ionic conductivity of the compound $CsAg_2I_3$. This attempt is to find out the suitable structure in order to improve the ionic mobility. Here, the Iso-valent cation Tl^+ is replace by silver ion in this compound. The X-ray diffraction data of the samples analyzed using Willamson-Hall method. The peaks of X-ray profile have been determined with more accuracy using PeakFit program. The results say that the lattice strain increases with increase of Tl^+ cation content. As well as, the ionic conductivity enhances due to the increase in the lattice strain. Unit cell parameters have been also refined and obtained using Chekcell software.

Key words: X-ray diffraction, ionic conductivity, PEAKFIT program

INTRODUCTION

The superionic conductor materials often have rather special structure that there are open tunnels or layers through which the mobile ions can move [1]. AgI is the most prominent superionic conductor which has the highest ionic conductivity in its α-phase that is stable above 420 K. Extensive efforts have been made to improve the conduction properties of this material by several methods [2, 3]. One of them is to modify the microstructure of the compound by introducing an iso- or an alio-valent cation into its lattice [4-6].
The microstructure of the solid is an important factor that determines its ionic conductivity in addition to the bonding characteristic of the material [7, 8].The influence of the microstructure on the ionic conductivity of solids was studied by several techniques such as Impedance Spectroscopy (IS)[9], Transition Electron Microscopy (TEM) [10], and X-ray Powder Diffraction (XRPD) [11]. XRPD was found to be a powerful technique for the study of microstructure of materials [12], and has been used to investigate the relationship between the microstructure of the material and its ionic conductivity [13].
In this work, the microstructure properties of $CsAg_{2-x}Tl_xI_3$ (x=0, 0.1, 0.2, 0.3 and 0.4) samples were studied by XRPD. X-ray data were analyzed using different programs and software such as CHEKCELL program in order to refine the unit cell parameters, PEAKFİT software to identify and refining the peaks positions. The simple Williamson-Hall method was used to determine the crystal size and lattice strain. The relation between the microstructure of samples and their ionic conductivity was investigated.

Experimental
1. Sample Preparations

Silver iodide was prepared by precipitation from ammonical silver nitrate solution using ammonium iodide. Cesium and thallium iodides were obtained from Sigma-Aldrich, USA, with stated purity of 99.9%. The required amounts were mixed thoroughly using agate mortar and pestle to produce the series $CsAg_{2-x}Tl_xI_3$ (x=0, 0.1, 0.2, 0.3 and 0.4). The mixtures were then heated in an electrical furnace at 470K for 3 days with intermittent grinding. The final materials, white colour, were crushed to fine powders.

2. Conductivity Measurements

Conductivity measurements, at room temperature, were performed for rectangular pellets pressed under pressure of 4 tonnes/cm^2, with carbon painted on two opposite surfaces of the pellets. The measurements were carried out using HIOKI3532-50 LCR meter in the frequency range 40 Hz-5 MHz. The bulk conductance was obtained from Cole-Cole plots of impedance spectra.

3. X-ray Diffraction Pattern

The X-ray diffraction pattern of the sample was recorded using RIGAKU /MAX-B diffractometer employing X-ray radiation (λ for Cu Kα. =1.54059Å) provided with copper anode. The recorded data of X-ray diffraction lines were performed by step scanning method in 2θ in the range 5^o – 100^o in steps of 0.05^o. Figure (1) shows the scan of X-ray diffraction profile obtained from the sample and this profile was used for estimating the microcrystalline parameters of the ionic conductors $CsAg_{2-x}Tl_xI_3$ (x=0, 0.1, 0.2, 0.3 and 0.4) samples.

METHODS

It is well known that what causes peak broadening, resulting in the peak shapes [14]. If the sample is perfect and a perfect diffractometer have been used the diffraction peaks would be extremely sharp. So the broadening arises from two sources: instrumental contributions and sample contributions. In the last 50 years ago, the line-broadening theory of plastically deformed metals and alloys was developed. It recognizes two main types of sample contributions broadening: the size and strain components. The size depends on the size of coherent domains and the second factor is caused by any lattice imperfection [15]. Because of the nanocrystalline state of the studied samples, the Physical (sample contributions) broadening of the profiles was much higher than the instrumental broadening; therefore, instrumental correction was not applied in the evaluation [16]. There are many computer codes have been used to analysis x-ray line profile. We have used the residual-peak fitting software [17]. This program helps to detect, separate, quantify hidden peaks that standard instrumentation misses and background correction. PeakFit also includes 18 different nonlinear spectral application line shapes. There are three AutoFit Peaks options offered by PeakFit software. We have selected one of these options. In this option, the hidden peaks are detected by the "sharpening" achieved by deconvolving a Gaussian instrument response with the raw data. Baseline is also fitted with a Gaussian deconvolution procedure. Fitting procedure also ensures a good convergence factor. Figure (2) shows the snapshot of several individual reflections identified by peak fit procedure. We have used the standard cell parameters for $CsAg_2I_3$ [18] as starting values for “CHEKCELL” program to identify the Bragg reflections [19]. CHEKCELL program is a powder Indexing software.

Williamson-Hall method

This method relies on the principle that the approximate formulae for size broadening, β_L, and strain broadening, β_e , vary quite differently with respect to Bragg angle, θ:

$$\beta_L = \frac{K\lambda}{Lcos\theta} \tag{1}$$

$$\beta_e = 4\varepsilon\ tan\theta \tag{2}$$

where K is the crystallite shape constant(≈ 0.89), ε lattice strain and *L* crystallite size. First contribution varies as *1/cosθ* and the other as *tanθ*. The first contribution of crystallite size was measured by the Scherrer method as given in equation (1)[20,21]. If both contributions are present then their combined effect should be determined by convolution. The simplification of Williamson and Hall is to assume the convolution is either a simple sum or sum of squares. Using the sum of these we get:

$$\beta_{total} = \beta_L + \beta_e = \frac{K\lambda}{Lcos\theta} + 4\varepsilon\ tan\theta \tag{3}$$

If we multiply this equation by *cosθ* we get:

$$\beta_{total}cos\theta = \frac{K\lambda}{L} + 4\varepsilon\ sin\theta \tag{4}$$

and comparing this to the standard equation for a straight line (*m* = slope; *c* = intercept). We see that by plotting $\beta_{tot}cos\theta$ versus *sinθ* we obtain the strain component from the slope (*4ε*) and the size component from the intercept (***K****λ/L*). Such a plot is known as a Williamson-Hall plot.

RESULTS AND FINDINGS

Figure(3) shows the variation of ionic conductivity of the sample as a function of Tl^+ content. Ionic conductivity increases almost regularly with rising Tl^+ ratio and appears to follow a linear trend. This is expected from the point of view that the planting of larger size cation into the lattice of $CsAg_2I_3$ creates additional available free volume in the lattice which facilitates the high mobility of Ag^+ ions [22]. Moreover, the substitution by "wrong" size cation may cause local lattice distortion that affects the ionic mobility in the lattice of the solid [23].
However, we can give quantitative description for the structural changes arose due to the replacement of Ag^+ by Tl^+ that has been performed with the help of X-ray analysis of the samples. The cell parameters of the samples

have been refined using CHEKCELL PROGRAM and given in table (1). This table shows that there is a decreasing in c direction as Tl^+ content increasing. It is noted also fractional increasing of *a* parameter of the unit cell of the samples with increasing of Tl^+ content. This result has been illustrated in Figure(4). It has been found that the jumps of silver ions in AgI based ion conductors occur mainly in the direction [110] [24, 25], therefore these relative modifications in cell parameters may enhance the ionic conductivity by facilitating the ionic mobility in this direction.

By using PEAKFIT program, we have selected only permanent reflections for our analysis. The width at half maximum was determined for every reflection in all samples. The R^2 values for obtained widths approach from unity (≈0.99) which reflects the accuracy of the values. Then the equation of Williamson-Hall has been applied to compute the average of crystallite size and lattice strain of samples from the plot. Assuming one of the components in Williamson-Hall equation is neglected, we have calculated both parameters crystallite size and lattice strain for approximately 13 reflections in all samples. The anisotropic property has been noted clearly in the calculated values of crystallite size and lattice strain. One can say that the crystallite size in pure sample has high value in [0 4 0] direction, whereas the maximum lattice strain is at [3 2 1] direction. These maximum values for crystallite size and lattice parameters have been slightly shifted as doping Tl^+ inside the smple. The crystallite size has been influenced by Tl^+ content in the other directions. The results show that the increasing of Tl^+ content is changing the lattice strain in various directions with different values. The relationship between the average crystallite size and lattice strain with Tl^+ content of the samples have been plotted in Figure 5 and Figure 6. These figures explain the effect of doping with Tl^+ on the average of crystallite size and lattice strain. The lattice strain is incremented with rising of Tl^+ content in a similar that is observed with electrical conductivity. This result is consistent with previous expectations that the replacement with "wrong size" cation has led to increase of lattice strain of the solid and enhancing the structural disorder, which is one of effective factors responsible for ionic diffusion in solids [26].
Generally, the average of crystallite size slightly decreases with Tl^+ content. We have projected the crystallite shape into a plane so that a comparison could be made between the crystallite shapes of sample [27], using the equation

$$\left(\frac{2}{D_{hkl}}\right)^2 = \left(\frac{\cos\varphi}{Y}\right)^2 + \left(\frac{\sin\varphi}{X}\right)^2 \quad . \tag{8}$$

Here ϕ is the angle between (hkl) planes. This ϕ can be determined using the cell parameters. The resulting crystallite shapes were given in Figure (7). It is evident from this figure that the volume of the crystallite shape ellipsoid in $CsAg_2I_3$ comparatively more than that of others. From the crystallite shapes, one can say, that the average crystallite size decreases with Tl^+ content (as shown in Figure 5). In comparing Figure 5-a with Figure(3), one can conclude that the enhancement of ionic conductivity is associated with decreasing of crystallite size. This relationship can be explained by the increase of grain boundary and dislocation density in with decreasing crystallite size, which can provide a high diffusivity path for Ag^+ ions [28, 29].

CONCLUSION

X-ray powder diffraction has been applied successfully to study the relationship between ionic conductivity and microstructure of the ion conducting $CsAg_{2-x}Tl_xI_3$ system. The variation trends of cell parameters. Lattice strain and crystallite size of the material has been obtained by refining X-ray data and connected with those of electrical conductivity. The results indicated that there is coincidence between the increments of in ionic conductivity with increasing Tl^+ content is associated with increase in unit cell volume and lattice strain and with decrease of crystallite size.

& Rozalina Khalid M. Ed
School of Education and Modern Languages, Universiti Utara Malaysia
m.nor@uum.edu.my

ABSTRACT: This research aims to identify the impact of computer-aided learning (CAL) on the level of achievement in the subject of science-physics among high school students. The findings of the research showed the main effect of the CAL teacher-presence (no teacher and with teacher) and performance level (low and high) is significant. CAL teacher-presence (no teacher and with teacher) give different effects on performance in science-physics. The mean post-test for students with teacher group (74.79) was significantly higher than the mean for student with no teacher group (71.25). Similarly, the mean for the upper level students (75.35) is higher than the mean for the lower level students (71.67). Two-way ANOVA test showed the presence of CAL teacher-interaction (no teacher and with teacher) and the level of achievement (low and high) are not significant. Simple correlation test is carried out to find out the relationship between learning skills and attitudes towards learning in science-physics performance. The correlation analysis achievement and learning skills were shown positive and significant at the 0.05 level. Similarly, the relationship between students' attitudes and their performance shows a positive and significant at the 0.05 level. The findings of this research also showed that students perceived CAL as positive. Students also felt convenient and fun due to the effectiveness of science-physics learning using CAL. Based on these research findings, CAL should be promoted in science education, particularly for students with low achievement. CAL can be done in the classroom with the teacher as facilitators alone, or even at the high school open-learning organized by the students themselves. CAL is claimed as effective towards learning among students either with no teacher or with teacher.

Keywords: Computer-Aided Learning, science-physics, students' attitudes, achievement performance.

INTRODUCTION

Science-physics is a study about the phenomena of the world which existed through deep meaningful thinking and scientific research. According to Trowbridge dan Bybee (1990) science was known as a part of three basic facts namely the extent body of scientific knowledge, the value of science and; the methods and processes of science. Based on this science concept, it is claimed that science-physics is one discipline which contains dynamic relationship, experimental planning, observation, hypotheses, classification, measurement, data interpretation, summarization, making predictions and communicating learning output.

The performance achievement of science-physics in the Republic of Indonesia is at number 36 out of 45 countries in the world (Republika online, Koran Pendidikan, Jumaat 24 Disember 2004). This low achievement is claimed to be due to either the students' academic ability or the teachers' teaching ability. According to Zamroni (2001) the low achievement in science-physics is due to teachers' method of teaching. Teachers' lack in teaching methods can influence students' achievement because according to Sharma dan Mc Dermott (1990) the quality of science-physics depends greatly on the teaching quality and teachers' professionalism.

This research is done to identify the effectiveness of using computers in science-physics teaching and learning which in this study is known as CAL. CAL can make the students more active, build interaction among students, and learn to criticize or being analytical. CAL is used in the teaching and learning process and between students and teachers. The teachers, however, are expected to act as the facilitators and are able to become source of knowledge and as a consultant (Tabrani, 1994:181).

Teaching and learning using CAL also can increase students' motivation to learn the subject science-physics. The increase in learning motivation is able to encourage students to become more active and effectiveness in the teaching and learning will enable the students to achieve a higher performance in achievement (Dimyati, 1994:78-79).

Science-physics lesson using CAL can provide students with the important concepts and the natural happenings of the world can become more interesting and meaningful for the students.

This is due to the fact that through students' activities using CAL, students are able to see in concrete the abstract concepts. This will help students grasp the concepts easily (Clard dan Mayer 2003). Making the abstract concepts concrete can be done through the preparation of updated and suitable audio visual aids for each lesson. Audio and graphics like pictures and video clips which have been programmed in the computer make teaching and learning easy. These teaching aids are contructed to make lesson more meaningful and can help increase students' understanding towards the science-physics materials. Teaching and learning that is more effective can increase students' understanding of concepts with reflection and the learning process all programmed in the computer (Dubinsky and Tall, 1991: 235).

PROBLEM STATEMENT

The education vision in Acheh is that all education is IT-based. In Acheh, at present, 20% of the schools are equipped with ICT facilities (Anas, 2007). Teaching and learning using computers or CAL is aimed to help students to make learning more effective. The problem is that although after seven years of implementing teaching and learning using IT, the students' performance and achievements in science-physics at the Sekolah Menengah Pertama in Acheh is still below the expected national level which is 70 to 100 percent.

RESEARCH OBJECTIVES

1. To identify the effect of teacher-presence towards the performance and achievement of students in science-physics lesson using computers.
2. To identify the effect of no teacher-presence towards the performance and achievement of students in science-physics lesson using computers.
3. To identify the relationship between science-physics learning skills and the performance and achievement of students with teacher-presence.
4. To identify the relationship between students' attitudes and the performance and achievement of students with teacher-presence.

RESEARCH METHODOLOGY

This research design is using the Control Group Posttest Only (Ary, 2007). It involves two independent variables and one dependent variable. The first independent variable is teacher-presence that is in two categories namely with teacher and with no teacher. The second independent variable is the level of academic achievements of the students in two categories namely the upper and lower levels. Meanwhile, the dependent variable in this research is the students' achievement and performance in science-physics

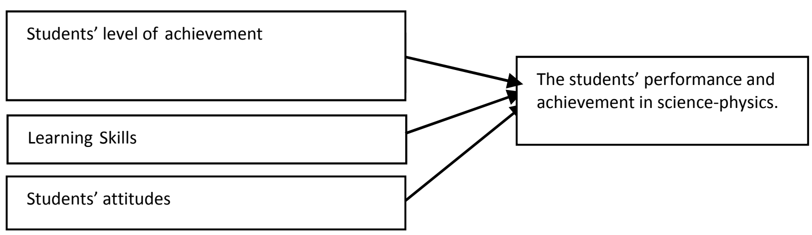

Figure 4.1: Research Framework

The factorial design 2 x 2 has produced four groups of students who are treated similarly that is learning with the aid of computers (CAL) to identify the effects of both independent variables. The categorisation of the groups is based on lower and upper levels of achievements which are sort from upper to lower levels for each selected class sample. The lower level group is identified through the value with is lower than the average value, whereas, the upper level group is identified by the value that is larger than the average value (Suharsimi, 2000). The four experimental groups are shown in Table 3.1.

Table 4.1: Factorial Design 2 x 2

Level of achievement	Teacher-presence	
	(No teacher)	(With teacher)
Lower	1	3
Upper	2	4

Description 1 = Low level with no teacher. 2 = upper level with no teacher.

3 = low level with teacher. 4 = upper level with teacher.

RESEARCH SAMPLE AND POPULATION

The research sample consists of 68 Form 3 students who study science-physics from two schools in Kabupaten Pidie Jaya Propinsi Aceh Indonesia. The purposive sampling is to differentiate between rural and urban schools. The selection of which school became the control group or the experimental group was done at random. But, the selection of group that represents the lower and upper levels was based on the science-physics results of the students' achievement before CAL. The group that represents the upper level was indicated by collecting the score which was equivalent to the average score students got before CAL. The lower level group was determined based the score that is much lower than the average performance score before CAL.

The setting for which school represents group with teacher, or, CAL with no teacher and groups with teachers, it was done randomly. The distribution of groups for research sampling is as the table below.

Table 5.1: Factorial Research Sample Group

No	Teacher Presence (With/Without)	Level of Performance (Lower / Upper)	Students (N)
1	Without	Lower	21
2	Without	Upper	13
3	With	Lower	22
4	With	Upper	12
		Total	68

RESEARCH FINDINGS

ANOVA 2 x 2 factorial analyses were used to analyse the data. The summarization of the ANOVA analysis output with regards to the interaction effects between the variables of the level of students' achievement and teacher-presence is shown below.

Table 6.1 ANOVA analysis output – Teacher presence and Level of Students

Source	Type III Sum of Squares	df	Mean Square	F	Sig.
Teacher presence (A)	251.257	1	251.257	18.039	.000

Level of Students (B)	230.062	1	230.062	16.517	.000
Teacher presence x Level of Students (A*B)	25.607	1	25.607	1.838	.180
Error	891.418	64	13.928		
Total	363923.793	68			
Corrected Total	1357.587	67			

a. R Squared = .343 (Adjusted R Squared = .313)

With reference to table 6.1, ANOVA test showed that the main effect of teacher presence is significant at F (1, 64) = 18.039, Sig, 0.000 atau p < 0.05. The effect of with teacher presence towards the students' achievement is higher significantly than without teacher presence. **The mean achievement of the group with teacher presence is higher significantly than the mean achievement of the group without teacher presence.**

The students' mean achievement based on teacher presence is shown in the table 6.2 below. Based on the table, the mean achievement of students without teacher presence is 71.25 while the mean achievement of students with teacher presence ia 74.79.

Table 6.2: Mean Achievement of Students according to Teacher presence

CAL	Mean	N
Without teacher	71.2497	34
With teacher	74.7894	34

The main effect towards students' achievement is also significant, F (1, 64) = 16.571, Sig 0.000 atau P < 0.05. The main effect towards students' achievement in the upper level group is higher significantly than students' in the lower level group. The mean achievement of students in the upper level group is higher significantly that the mean chievement of students in the lower level group as shown in Table 6.3. The table shows that the mean achievement of students in the lower level group is 71.67 while the mean achievement of students in the upper level group is 75.35.

Table 6.3.: Mean Achievement of Students according to Students' Level

Level of Achievement	Mean	N
Lower	71.6665	43
Upper	75.3468	25

The interaction result between the variables in teacher presence with the students' level of achievement is insignificant, F (1, 64) = 1.838, Sig. 0.180, p < 0.05. Table 4.5 shows the mean and SD of teacher presence and the students' level of achievement.

Table 6.4: Mean dan SD of Students' Level of Achievement (upper and lower)and teacher presence(without and without teacher)

Students' Level of Achievement	Teacher presence	Mean	SD	N

Lower Level Group	Without teacher	70.2771	2.59934	21
	With teacher	72.9927	4.69714	22
	Total	71.6665	4.01690	43
Upper Level Group	Without teacher	72.8208	1.94153	13
	With teacher	78.0833	4.74558	12
	Total	75.3468	4.40537	25
Total	Without teacher	71.2497	2.65328	34
	With teacher	74.7894	5.25780	34
	Total	73.0196	4.50139	68

Table 6.5 Mean of Students' Level of Achievement and Teacher presence

Students' Level	Mean Teacher presence		N
	Without teacher	With teacher	
Lower	70.2771		21
		72.9927	22
Upper	72.8208		13
		78.0833	12

With reference to Table 6.4, the mean achievement of students in the lower level group without teacher is 70.28 whereas the mean achievement of students in the lower level group with teacher is 72.99. Therefore, the performance of students in the lower level group with teacher is higher than the performance of the students in the lower level group without teacher.

The mean achievement of students in the upper level group without teacher is 72.82 while the mean achievement for students in the upper level group with teacher is 78.08. Therefore, it is shown that the mean achievement of students with teacher is higher than the mean achievement of students without teacher.

The Relationship between Learning Skills and the performance achievement in Science-physics for students without teacher group.

Table 6.1.1 : Correlation between Learning Skills and the performance achievement in Science-physics for students without teacher group.

Variables relationship	r	*p*
Learning Skills and the performance achievement in Science-physics for students without teacher group.	0.573	0.000

Significant at the level $p \leq 0.05$

Table 6.1.1 showed that the correlation between learning skills and the achievement performance for students without teacher group. The result showed that there is a weak relationship and significance (r=.573, p=0.0000) between learning skills and the performance achievement in science-physics for students without teacher group. This means that the learning skill is also a factor that influences the performance achievement in science-physics.

Relationship between Students' Attitudes and Learning Skills and the performance achievement in Science-physics for students without teacher group.

Table 6.1.2: Correlation between Students' Attitudes and the performance achievement in Science-physics for students without teacher group.

Variables relationship	r	*p*

Students' attitudes and the performance achievement in Science-physics for students without teacher group.	0.299	0.086

Significant at the level $p \leq 0.05$

Table 6.1.2 shows the correlation between students' attitudes and performance achievement of students without teacher group. The correlation analysis showed that there is a weak relationship and no significance between students' attitudes and performance achievement of students without teacher group.

Table 6.1.3 : Correlation between Learning Skills and the performance achievement in Science-physics for students with teacher group

Variables relationship	r	*p*
Learning Skills and the performance achievement in Science-physics for students with teacher group.	0.753	0.000

Significant at the level $p \leq 0.05$

Table 6.1.3 shows the correlation between learning skills and performance achievement for students with teacher group. The correlation analysis showed that there is a strong relationship and significance between learning skills and performance achievement for students with teacher group.

Table 6.1.4 : Correlation between Students' Attitudes and the performance achievement in Science-physics for students with teacher group

Variables relationship	r	*p*
Students' attitudes and the performance achievement in Science-physics for students with teacher group.	0.653	0.000

Significant at the level $p \leq 0.05$

Table 6.1.4 shows the result from the correlation between students' attitude and the performance achievement for students with teacher group. The correlation analysis showed that there is weak relationship and significance between students' attitude and the performance achievement for students with teacher group in science-physics.

DISCUSSION

The research findings in this study found that performance achievement after CAL is better than the performance achievement before CAL. This finding is also proved by (Qi Chen, 1995) that is, learning using computers can increase teaching and learning quality which at the same time can increase students' performance achievement. This also was claimed by Rusdina (1993) who said that with the existence of certain characteristics which are prepared in teaching with the aid of computers can solve or remedy learning problems that are faced by students.
The findings of this study is also strengthen by a research done by Zamri & Nur Aisyah (2011) which found that teaching and learning using computers increase the cognitive ability and social skills and made learning more conducive and effective for students.

The findings from this study also found that the score performance after CAL is better than the score performance before CAL. This finding is similar to the finding in the research by Irene Cheng (2008), Yahya and Dayang (2011) Chenu, Gayraud, Martinie and Tong (2007) Naba'h, Hussain, Al-Omari, and Shdeifat (2009) that teaching and learning that comes with multimedia can increase students' understanding, can increase score performance and make learning environment more effective from learning through the conventional method.

CONCLUSION

This study has managed to answer all the research questions through the findings. The research findings and discussion found that performance achievement of students with and without teacher groups after CAL is better and CAL has helped in increasing their understanding in science-physics.

ÖZET: Bu araştırmada, eleştirel düşünme becerilerini temel alan ilköğretim 4. sınıf Fen ve Teknoloji öğretiminin, öğrenme ürünlerine etkisi incelenmiştir. Araştırmada, deneysel araştırma yöntemi uygulanmıştır. Araştırma 2011-2012 öğretim yılının güz döneminde Konya ili, Selçuklu ilçesi, Özel Konya Bahçeşehir İlköğretim Okulu 4. sınıflarından seçilen iki grup üzerinde yürütülmüştür. Bu guruplar öğretmen, yaş, cinsiyet, bilişsel ve duyuşsal hazırbulunuşluluk değişkenleri açısından birbirine denktir. Gruplardan biri kontrol grubu olarak belirlenirken diğeri deney gurubu olarak belirlenmiştir. Kontrol grubunda geleneksel öğretim yöntemi olan düz anlatım kullanılmıştır. Deney grubunda ise eleştirel düşünme becerilerini temel alan Fen ve Teknoloji öğretimi kullanılmıştır. Her iki grupta da dersler laboratuvar ve sınıf ortamında işlenmiştir. Araştırma sürecinin başında her iki gruba da Doç. Dr. Orhan AKINOĞLU tarafından hazırlanan iki test ön-test olarak uygulanmıştır. Bu testler Fen ve Teknoloji Tutum Ölçeği ve Eleştirel Düşünme Becerilerini Temel Alan Fen ve Teknoloji Başarı testidir. Uygulama sonunda aynı testler son-test olarak uygulanmıştır. Ön-test-son-test arasındaki farklarla öğrenci erişileri bulunmuştur. Araştırmanın analizinde SPSS 15.00 paket programı kullanılmıştır. Araştırmada elde edilen sonuçta deney grubunda eleştirel düşünme becerileri ve Fen ve Teknoloji dersine karşı tutumları anlamlı derecede yüksek bulunmuştur. Bu bulgulara dayanarak eleştirel düşünme becerilerini temel alan Fen ve Teknoloji öğretiminin geleneksel anlayıştan daha etkili olduğu söylenebilir.

Anahtar sözcükler: eleştirel düşünme, tutum, fen ve teknoloji, madde

ABSTRACT: In this research, the effects of critical thinking skills on the subject of science taught to 4 th grade students and the contribution to their high level thinking were investigated. In this research experimental searching method has been applied. This survey has been conducted on the chosen two group of 4 th grade students from Private Bahçeşehir Primary School in Konya, Selçuklu District during Fall term 2011-2012 school year. These groups are equal to each other in terms of teacher, age, gender, cognitive and sense level. Determining in the control group and the other one of the group defined as the experimental group. Traditional teaching method used in the control group, a straight narrative. In experimental group, based on critical thinking skills used teaching of Science and Technology. Both group were taught in classroom and laboratory. At the beginning of the survey process two tests that were prepared by Dr. Orhan AKINOĞLU were applied as pre-test. These tests are of critical thinking skils in Science and technology attitude Scale and the basic Science and Technology . The same tests were applied post-test at the end of the application. Differences between pre-test-post-test student achievement was found. SPSS 15.00 package program was used for the analysis of the study. Result obtained in this study, critical thinking skills in the experimental group was significantly higher in their attitudes towards science and technology lesson. Based on these findings, based on critical thinking skills, said to be more effective than the straight narrative method understanding of teaching science and technology.

Key Words: critical thinking, attitude, science and technology, substance

GİRİŞ

Bilgi, günümüz toplumunun hem temel kavramı hem de anahtar gücü konumuna gelmiştir. Endüstri toplumundan bilgi toplumuna geçiş süreci beraberinde güçlü bir toplum olmak için sahip olunması gereken özellikleri de değiştirmiştir. Geçmişte askeri ve ekonomik güç sosyal değişimi kontrol etmek için yeterli olurken, bugün bilgiye ulaşmayı kontrol eden toplumların sosyal değişimi yaratma gücünü ellerinde tuttukları gözlenmektedir. Bu açıdan bakıldığında, bugün eğitim ve bilgiye ulaşma askeri ve ekonomik güce sahip olma ile aynı önemi taşımaktadır.

Bilgi çağının anahtar kavramı "küreselleşme" yeni eğilimleri ve kavramları da beraberinde getirmektedir. Bu kavramlardan biri de "çoklu tercihtir". Bir işi başarmak için tek ve doğru bir yol yoktur. Başarılı bir sonuca ulaşmak için çok sayıdaki seçeneğin bir arada tümleşik bir biçimde göz önüne alınması ve kullanılabilmesi gerekmektedir. Bu duruma ilişkin en çarpıcı örnek yazılı ve görsel medyadır. Geçmişte bilgi sadece kitap, gazete, tek kanallı radyo ve televizyon aracılığıyla bireylere ulaştırılırken, günümüzde bilgi, çok sayıda radyo ve televizyon kanalı ve uluslararası bilgi ağı ile bireylere ulaştırılmaya çalışılmaktadır. Çoklu tercihler yaratan bilgi kaynakları, bireylerin bilgi toplumunun bilgi işleme, iletişim becerileri ve güvenilir olma gibi üç kritik özeliği ile donanmış olmalarını gerektirmektedir. Bu bağlamda, eğer eğitim programları öğrencilerin bu becerilerinin gelişmelerine olanak sağlayan hedef, içerik ve eğitim durumlarından yoksun ise, yirmi birinci yüzyılın başarılı bilgi toplumunu yaratmada yetersiz kalınacağı söylenebilir. Yirminci yüzyıl süresince sınıf içi uygulamaları temel alan araştırmalar, sunuş ve ezber yöntemlerinin baskın olduğunu tutarlı bir biçimde belgelemektedir. Bu tür bir sınıf ortamında öğrenciler edilgen olarak bilgiyi alır ve sadece basit düzeyde hatırlama ve kavrama gerektiren öğretmen sorularını yanıtlarlar (Onosko, 1988:1, Aktaran: Şahinel, 2002). Sınıf ortamına ilişkin elde edilen araştırma bulguları, çağdaş yaşamın karmaşıklığında başarılı olmak için gerekli olan düşünme becerilerinin öğrencilere kazandırılmadığını ortaya koymaktadır. Bu durum doğal olarak işverenlerin, eğitimcilerin ve üst düzey devlet yöneticilerin dikkatlerinin eleştirel düşünme becerileri üzerinde yoğunlaşmasına neden olmaktadır.

Eğitim sistemimiz 2004 öncesinde düşünme becerileri yeterli önem vermemekte idi. Ancak 2004 yılından sonra uygulamaya konulan yapılandırmacı yaklaşım ile bu yıkılmaya çalışılsa da tam olarak istenilen düşünme yeteneğine sahip bireyler yetiştirilmesinde güçlük yaşanmaktadır. Eğer çok boyutlu düşünmeyi eğitim sistemimize en iyi şekilde adapte edersek bilim dünyasında sözü geçen nesillere en kısa sürede ulaşmak mümkün olabilir. İçinde bulunduğumuz bilgi çağında asıl amaç düşünmeyi bilen öğrenciler yetiştirmektir. Bunun için öğretmenin anlatan öğrencinin pasif alıcı olduğu sınıflar yerine, öğrencinin düşünme becerileri ile aktif katılımının olduğu sınıflar yaratılmalıdır. Bu bağlamda düşünüldüğünde öğrenci bilgiyi işleme sürecine aktif olarak katılmalıdır. Bilgiyi pasif olarak dinleyerek alan bir öğrenci kavrama ve uygulama basamaklarında sıkıntı yaşamaktadır. Bilgiyi transfer edememektedir. Oysa eleştirel düşünme becerilerini kazanmış bir öğrenci bilgiyi rahatlıkla transfer eder, uygular ve değerlendirir. Eleştirel düşünme becerilerini kazanmış bir öğrenci üretken, verimli, aktif, sosyal, iyi düşünüp doğru karar verebilir ve hatta öğrenme sorumluluğunu alabilir. Eleştirel düşünen bireyler olaylara 'Neden?', 'Niçin?', 'Nasıl oldu?', 'Sonuçları neler olabilir?' sorularını sorar. Kendisinin ve yaşadığı çevrenin farkına varır. Kendini sürecin içine dahil eder. Öğretimin özü düşünme becerilerini kazandırma olmalıdır (Özden, 2000:92). Bu nedenle Fen ve Teknoloji öğretimi alanında öğrencilerin tutum özellikleri, eleştirel düşünme becerileri, erişi düzeyleri üzerinde durulması gerekmektedir.

Eleştirel düşünme becerilerini temel alan İlköğretim 4. sınıf Fen ve Teknoloji dersi 'Maddeyi Tanıyalım' ünitesinin öğretiminin uygulandığı grubun (deney grubu), düz anlatım ve laboratuvar uygulamalarını temel alan İlköğretim 4. sınıf Fen ve Teknoloji öğretiminin uygulandığı grubun (kontrol grubu) eleştirel düşünme becerileri testinden aldıkları puanlar arasında ve deney ve kontrol gruplarının tutum ölçeğinden almış oldukları puanlar arasında anlamlı bir fark var mıdır? araştırmanın problem cümlesi olarak belirlenmiştir.

Fen ve Teknoloji; doğa bilimlerinden yararlanarak, öğrencilere yaşadıkları fiziksel çevredeki varlıkların özellikleri ve birbirleri ile olan ilişkileri, üzerinde temel bilgi ve anlayışları kazandırma hedefi güden bir ders olarak tanımlanabilir (Akınoğlu, 2001:14). Fennin amacı doğal dünyayı anlayarak açıklamaya çalışmak; teknolojinin amacı ise insanların istek ve ihtiyaçlarını karşılamak için doğal dünyada değişiklikler yapmaktır (MEB, 2005). Aristoteles'e göre düşünme, insanı hayvandan ayıran belirgin bir özniteliktir, usun bağımsız ve kendine özgü eylemidir, karşılaştırmalar yapma, ayırma, birleştirme, bağlantıları ve biçimleri kavrama yetişidir. Düşünme ve eğitim ilişkisini incelediğimizde; öğretim düşünmeyi öğretmeye yönelik olarak düzenlenmeli, düşünce becerilerini geliştirici programlar tasarlanmalı, düşünme için öğretme ve düşünmeyi düşünme temel alınmalıdır. Uzmanlar eğitimin her kademesinde öğrencilere zeka ve yetenekleri doğrultusunda düşünme becerilerinin kazandırabileceğini belirtmektedirler. Eleştirel düşünme; tenkitçi, değerlendirmeci, şüpheci, analitik, açık, dikkatli, mantıksal ve bağımsız düşünme anlamlarında kullanılmakta (Şahinel, 2002:3) ve değerlendirme, problem çözme süreci ve entelektüel gelişme süreci olarak tanımlanmaktadır (Gibson 1995:27). Bir başka ifadeyle eleştirel düşünme; çıkarımda bulunarak, sorgulayarak, araştırarak, görüşleri yargılayarak, ilişki kurarak, bilinçli bir şekilde ön öğrenmeleri değiştirmek için kullanılan zihinsel süreçlerden problem çözme yeteneğidir (Tomaç, 2012:15).

Beyer (1991:124)'e göre iyi yetkin düşünen bireyler; bir sorunu, problemi veya iddiayı açık bir biçimde ifade eder, diğer bireylerin kesin bir dil kullanmasını, düşünülmeden hareket edilmemesini, çalışmaların kontrol edilmesini ister, bir düşünceyi oluşturmada azimli olunması, öne sürülen iddiaları destekleyen nedenleri ve kanıtları araştırma ve sunmayı isterken, daha çok dogmalar ve özlem duyulan düşünceler yardımıyla değil, sorunlar, amaçlar ve sonuçlar yardımıyla yargılama, ön bilgileri kullanma, yeterli kanıt bulana kadar yargıdan şüphe duyma eğilimi içindedir. Onosko (1991) ise eleştirel düşünmenin önündeki engelleri şu şekilde belirtmiştir: öğretimin bilgi transferi olarak tanımlanması, içeriğin çok yüzeysel ve geniş olması, öğretmenlerin öğrencilerden düşük beklentisi, sınıfların kalabalık olması, öğretmenin zamanı planlayamaması, öğretmenin izole olması, öğrencilerin sadece pasif bilgi alıcı rolünde olması, öğretmenin sadece bilgiyi dağıtan rolünde olması, öğrencilerin bilgileri hatırlamak ve sorulduğunda söylemek-yazmak zorunda olmaları, öğrencilere verilen problemlerin her zaman açık biçimde formüle edilmemesi. Mckee'ye (1998) göre ise eleştirel düşünmenin önündeki engeller şunlardır: eleştirel düşünme eğitiminin değişen öğretmen tutum ve davranışlarını gerektirmesi, öğrenciler arasındaki bireysel farklılıkları azaltma yönünde olan öğretmen davranışları, öğretmenlerin öğrenme süreci ve öğrenciler üzerinde tam kontrole sahip olmaları gerektiğine inanmaları, öğretmenlerin kendilerini konu alanı uzmanı olarak görmeleri, diğer disiplinlerden yalıtılmış biçimde kendi alanlarıyla ilgilenme eğilimde olmaları, öğretim programlarının yoğunluğu. Glaser'e göre bütün öğretmenler eğitim programları aracılığıyla eleştirel düşünmeyi öğretmelidirler. Eğitim, çocuklar için felsefe ve özgür toplumun doğasını birleştirecek, uzmanlar tarafından dikkatlice tasarımlanacak programlar aracılığıyla ilköğretim ilk yıllarından başlayarak eleştirel düşünme becerilerini geliştirme amacını taşımalıdır. Böylece öğrencilere mantıksal düşünmenin temel ilkeleri başarıyla öğretilebilir. eleştirel düşünebilmek için gerekli bilişsel ve duyuşsal becerilerin tamamı çocuklarda okuma ve dinleme kapasiteleri aracılığıyla zaman içinde köklü bir biçimde geliştirilmelidir (Aktaran: Şahinel, 2002: 15-16).

Tüm bunlardan yola çıkarak nihai amacımızın düşünmeyi ve düşünme türlerini öğretmemiz olduğu aşikar olduğu söylemek doğru olacaktır. Aslına bakılırsa, eğitim sistemi, bireyde kalıplaşmış davranış, ezbere dayalı ve dayatılmış bilgiler yerine; yaratıcı ve eleştirel düşünme becerilerine dayalı öğrenmelere olanak veren, öğrendiklerini yorumlayabilen ve düşünmelerinde tarafsız olan bireyler yetiştirme temeline dayanmalıdır. Fen eğitiminde konuyla ilgili yapılan araştırmalar tarandığında ise ortaya çıkan sonuçta eleştirel düşünmenin öğretimde etkili bir rol oynadığı yönündedir.

YÖNTEM

Çalışmada deneysel araştırma yöntemi kullanılmıştır. Çalışmada ''denk kontrol gruplu ön-test-son-test deseni'' kullanılmıştır. Bu yöntemde deney ve kontrol grupları rastgele belirlenmiştir. Araştırmada öğrencilerin Fen ve Teknoloji dersine yönelik tutumlarını ölçmek için Akınoğlu (2001) tarafından geliştirilen 'Fen ve Teknoloji Tutum Ölçeği' ve Akınoğlu (2001) tarafından hazırlanan 'Maddeyi Tanıyalım Ünitesi Eleştirel Düşünme Becerileri Ölçme Aracı' kullanılmıştır. Uygulama öncesinde grupların ikisine de Fen ve Teknoloji dersine yönelik tutum ölçeği ve eleştirel düşünme becerilerini ölçmeye yarayan başarı testi ön-test olarak uygulanmıştır. Uygulanan testler SPSS (Statistical Package for Social Science) paket programı ile analiz edilerek grupların erişi ortalamaları arasında farklılığın olup olmadığı incelenmiştir. Deney grubuna ''Maddeyi Tanıyalım'' ünitesindeki konular eleştirel düşünme becerilerini temel alan fen öğretimi ile anlatılırken, kontrol grubuna geleneksel fen öğretimi ile anlatılmıştır. Ünitenin öğretiminin sonunda her iki gruba da ön-test olarak uygulanan testler son-test olarak uygulanmıştır. Uygulamanın ardından test sonuçları SPSS paket programı yardımıyla analiz edilerek aralarında anlamlı bir fark olup olmadığı incelenmiştir.

Araştırmanın evreni, Konya ili, Selçuklu ilçesi, Özel Konya Bahçeşehir İlköğretim Okulu'nda okuyan tüm öğrenciler olup örneklemini 2011-2012 öğretim yılı birinci döneminde Konya ili Selçuklu ilçesi Özel Konya Bahçeşehir İlköğretim Okulu'nda okuyan iki sınıf arasından rastgele belirlenmiştir. Örnekleme ilişkin veriler Tablo 1. 'de gösterilmiştir.

Tablo 1. Örnekleme İlişkin Veriler

Gruplar	Kız öğrenci sayısı	Erkek öğrenci sayısı	Toplam
Kontrol Grubu	7	10	17
Deney Grubu	8	10	18
Toplam	15	20	35

BULGULAR

Grupların eleştirel düşünme becerilerini ölçmeye yönelik hazırlanan başarı testi ve tutum ölçeğine ait veriler Bağımsız t testi kullanılarak karşılaştırılmıştır. Ayrıca grupların almış oldukları puanların yüzdeleri Bar analizi yapılarak Grafiklere dönüştürülmüştür. Bağımsız t testi sonuçları Levene istatistiğinin sonucuna göre yorumlanmıştır. Levene istatistiği ve Bağımsız t testine ait P değerlerinin karıştırılmaması için sırasıyla Levene istatistiği için P_1 , Bağımsız t testi için P_2 kullanılmıştır.

Başarı Testi

Ön Test

Deney ve kontrol grubu öğrencilerinin uygulama öncesinde ön-test olarak uygulanan başarı testine ait veriler Tablo 2. ve Tablo 3. ' de verilmiştir.

Tablo 2. Grupların Ön-test Sonuçlarından Elde Edilen Ortalama Puanları

	Gruplar	N	Ortalama Puanlar	Standart Sapma
Başarı	Deney	18	18,2222	9,23265
	Kontrol	17	20,3529	17,17535

Tablo 2.' ye göre; deney grubunun ön-test ortalaması 18,2222 iken kontrol grubunun ön-test ortalaması 20,3529 olarak bulunmuştur. Deney ve kontrol grubu öğrencilerinin uygulama öncesinde eleştirel düşünme becerileri arasındaki ilişkiyi ortaya koymak için Bağımsız t testi uygulanmıştır. Elde edilen veriler Tablo 3. ' te verilmiştir.

Tablo 3. Grupların Ön-test Sonuçlarından Elde Edilen Ortalama Puanlarının Karşılaştırıldığı t Testi Sonucu

	Levene İstatistiği		t testi			
	F	P_1	t	Sd	P_2	Anlam farkı
Başarı	10,906	0,002	-0,453	24,227	0,654	-2,13072

Tablo 3. ' de de görüldüğü üzere Levene istatistiğine göre grupların varyanslarının eşit olmadığı bulunmuştur ($P_1<0.05$). Buna göre yapılan t testi sonucu grupların eleştirel düşünme becerilerine ait ortalama puanları arasında anlamlı bir farklılık bulunmamıştır ($t_{24,227}$= -0,453; $P_2>0,05$). Bu sonuca göre her iki grup uygulama öncesinde eleştirel düşünme becerileri açısından eşit düzeyde denilebilir.

Son Test

Deney ve kontrol grubu öğrencilerinin uygulama sonrasında son-test olarak uygulanan başarı testine ait veriler Tablo 4., Tablo 5. ve Şekil 1.' de verilmiştir.

Tablo 4. Grupların Son-test Sonuçlarından Elde Edilen Ortalama Puanları

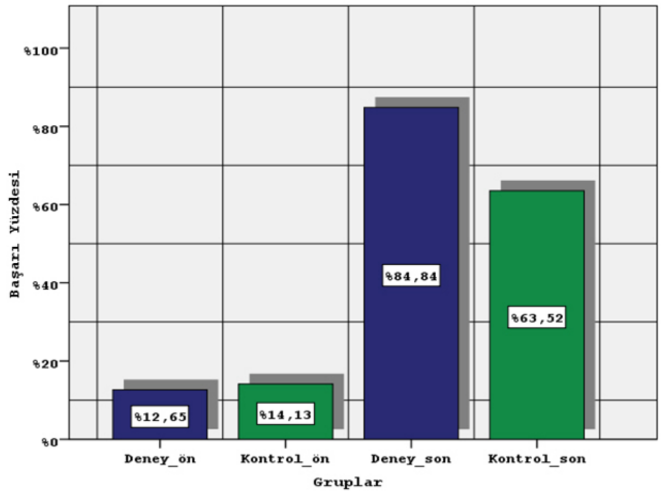
	Gruplar	N	Ortalama Puanlar	Standart Sapma
Başarı	Deney	18	122,1667	30,48095
	Kontrol	17	91,4706	16,50045

Tablo 4.'e göre; deney grubunun son-test ortalaması 122,1667 iken kontrol grubunun son-test ortalaması 91,4706 olarak bulunmuştur. Deney ve kontrol grubu öğrencilerinin uygulama sonrasında eleştirel düşünme becerileri arasındaki ilişkiyi ortaya koymak için Bağımsız t testi uygulanmıştır. Elde edilen veriler Tablo 5.'te verilmiştir.

Tablo 5. Grupların Son-test Sonuçlarından Elde Edilen Ortalama Puanlarının Karşılaştırıldığı t Testi Sonucu

	Levene İstatistiği		t testi			
	F	P_1	t	Sd	P_2	Anlam farkı
Başarı	7,904	0,008	3,733	26,478	0,001	30,69608

Tablo 5.'te de görüldüğü üzere Levene istatistiğine göre grupların varyanslarının eşit olmadığı bulunmuştur ($P_1<0.05$). Buna göre yapılan t testi sonucu grupların eleştirel düşünme becerilerine ait ortalama puanları arasında anlamlı bir farklılık bulunmuştur ($t_{26,478}$ = 3,733; $P_2<0,05$). Bu sonuca göre deney grubu öğrencileri kontrol grubu öğrencilerinden oldukça başarılıdır denilebilir.



Şekil 1. Grupların Ön-test ve Son-test Başarı Yüzdesi

Şekil 1.'den de anlaşılacağı üzere deney grubu öğrencilerinin ön-test sonuçlarının başarı yüzdesi %12,65 ve kontrol grubu öğrencilerinin son-test sonuçlarının başarı yüzdesi %14,13 idi. Deney grubu öğrencilerinin son-test sonuçlarının başarı yüzdesi % 84,84 ve kontrol grubu öğrencilerinin son-test sonuçlarının başarı yüzdesi % 63,52 olarak bulunmuştur. Bu sonuca göre de deney grubu öğrencileri kontrol grubu öğrencilerinden oldukça başarılı olduğu söylenir.

Tutum Ölçeği

Ön Test

Deney ve kontrol grubu öğrencilerinin uygulama öncesinde ön-test olarak uygulanan tutum ölçeğine ait veriler Tablo 6. ve Tablo 7. ' de verilmiştir.

Tablo 6. Grupların Ön-test Sonuçlarından Elde Edilen Ortalama Puanları

	Gruplar	**N**	**Ortalama Puanlar**	**Standart Sapma**
Tutum	Deney	18	64,1667	13,36919
	Kontrol	17	62,1176	14,77279

Tablo 6.' ya göre; deney grubunun ön-test ortalaması 64,1667 iken kontrol grubunun ön-test ortalaması 62,1176 olarak bulunmuştur. Deney ve kontrol grubu öğrencilerinin uygulama öncesinde Fen ve Teknoloji dersine karşı tutumları arasındaki ilişkiyi ortaya koymak için Bağımsız t testi uygulanmıştır. Elde edilen veriler Tablo 7. ' de verilmiştir.

Tablo 7. Grupların Ön-test Sonuçlarından Elde Edilen Ortalama Puanlarının Karşılaştırıldığı t Testi Sonucu

	Levene İstatistiği		**t testi**			
	F	P_1	T	Sd	P_2	Anlam farkı
Tutum	0,092	0,764	0,431	33	0,669	2,04902

Tablo 7.'de de görüldüğü üzere Levene istatistiğine göre grupların varyanslarının eşit olduğu görülmektedir (P_1>0.05). Buna göre yapılan Bağımsız t testi sonucu grupların Fen ve Teknoloji dersine yönelik tutumları arasında anlamlı bir farklılık çıkmamıştır (t_{33}=0,431; P_2>0,05). Bu durumda deney grubu öğrencileri ile kontrol grubu öğrencilerinin Fen ve Teknoloji dersine karşı tutumları arasında bir fark yoktur . Yani gruplar uygulamaya eşit düzeyde başlamışlardır denilebilir.

Son Test

Deney ve kontrol grubu öğrencilerinin uygulama sonrasında son-test olarak uygulanan tutum ölçeğine ait veriler Tablo 8., Tablo 9. ve Şekil 2' de verilmiştir.

Tablo 8. Grupların Son-test Sonuçlarından Elde Edilen Ortalama Puanları

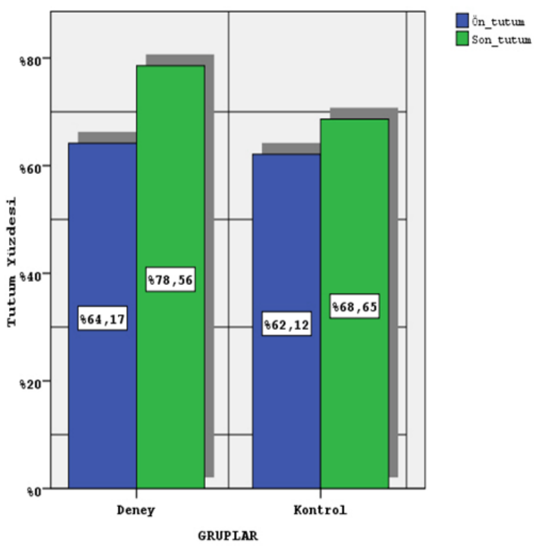
	Gruplar	N	Ortalama Puanlar	Standart Sapma
Tutum	Deney	18	78,5556	12,69656
	Kontrol	17	68,6471	13,63333

Tablo 8.' e göre; deney grubunun son-test ortalaması 78,5556 iken kontrol grubunun son-test ortalaması 68,6471 olarak bulunmuştur. Deney ve kontrol grubu öğrencilerinin uygulama sonrasında Fen ve Teknoloji dersine karşı tutumları arasındaki ilişkiyi ortaya koymak için Bağımsız t testi uygulanmıştır. Elde edilen veriler Tablo 9. ' da verilmiştir.

Tablo 9. Grupların Son-test Sonuçlarından Elde Edilen Ortalama Puanlarının Karşılaştırıldığı t Testi Sonucu

	Levene İstatistiği		t testi			
	F	P_1	t	Sd	P_2	Anlam farkı
Tutum	0,118	0,733	2,226	33	0,033	9,90850

Tablo 9.'da da görüldüğü üzere Levene istatistiğine göre grupların varyanslarının eşit olduğu görülmektedir (P_1>0.05). Buna göre yapılan Bağımsız t testi sonucu grupların Fen ve Teknoloji dersine yönelik tutumları arasında anlamlı bir farklılık çıkmıştır(t_{33}=2.226; P_2<0,05). Bu durumda deney grubu öğrencileri ile kontrol grubu öğrencilerinin Fen ve Teknoloji dersine karşı tutumları arasında uygulama sonrasında anlamlı bir fark belirlenmiştir. Yani gruplar uygulama sonunda Fen ve Teknoloji dersine karşı tutumları değişmiştir.



Şekil 2. Grupların Ön-test ve Son-test Tutum yüzdesi

Şekil 2.'den de anlaşılacağı üzere deney grubu öğrencilerinin ön-test sonuçlarının tutum yüzdesi %64,17 ve kontrol grubu öğrencilerinin ön-test sonuçlarının tutum yüzdesi %62,12 idi. Deney grubu öğrencilerinin son-test sonuçlarının tutum yüzdesi % 78,56 ve kontrol grubu öğrencilerinin son-test sonuçlarının tutum yüzdesi % 68,65 olarak bulunmuştur.

Araştırmanın bulguları doğrultusunda yapılan değerlendirme neticesinde aşağıdaki sonuçlara ulaşılmıştır:

1- Deney ve kontrol grubu öğrencileri uygulama öncesinde başarı yönünden eşit düzeydedirler.

2- Deney grubu öğrencileri uygulama sonunda kontrol grubu öğrencilerinden daha başarılı olmuşlardır. Eleştirel düşünme becerilerini temel alan Fen ve Teknoloji öğretiminin öğrencilerin üst düzey düşünme becerilerini arttırdığı ortaya çıkmıştır.

3- Uygulama öncesinde deney ve kontrol grubu öğrencilerinin Fen ve Teknoloji dersine yönelik tutumları açısından eşit düzeydedirler.

4- Deney grubu öğrencilerinin uygulama sonunda kontrol grubu öğrencilerine göre Fen ve Teknoloji dersine yönelik tutumlarındaki olumlu artışı daha fazla olmuştur. Bu durum eleştirel düşünme becerilerini temel alan Fen ve Teknoloji öğretiminin öğrencilerin Fen ve Teknoloji dersine yönelik tutumlarını arttırdığı ortaya çıkmıştır.

5- Uygulama sonunda deney grubu öğrencilerinin kontrol grubu öğrencilerinden daha başarılı olmasında eleştirel düşünme becerilerini temel alan Fen ve Teknoloji öğretiminin etkisi vardır.

ÖNERİLER

Yapılmış olan bu araştırmanın bulguları ve sonuçları doğrultusunda şu önerilerde bulunulmuştur.

1- Eleştirel düşünme becerilerini temel alan yöntem ile ders anlatılmadan önce öğrenciler bu konu hakkında bilgilendirilmelidir.

2- Eleştirel düşünme becerilerini temel alan yöntem ile ders işlenmesi konusunda uygulayıcıların bilgilendirilmesi için hizmet içi eğitim seminerleri düzenlenebilir.

3- Öğretmen eleştirel düşünme becerilerini temel alan yöntem ile ders işlemeden önce bir plan hazırlamalıdır.

4- Öğrencilerin görüşleri sabırla dinlenmelidir.

5- Sınıf içi ve laboratuar ortamı öğrencilerin rahat çalışmasını sağlayacak şekilde düzenlenmelidir.

6- Günümüz eğitim sisteminde eleştirel düşünme ile ilgili sorulara zaman zaman yer verilmektedir. Ama bu soruların artırılması sadece fen bilimlerini anlamak için değil hayattaki sorunların çözümü içinde önemli olabilir.

Not: Bu çalışma Bülgan TOMAÇ'ın 'Maddeyi Tanıyalım Ünitesinin Eleştirel Düşünme Yöntemiyle Öğretiminin Öğrencilerin Üst Düzey Düşünme Becerilerine Etkisi' isimli tez çalışmasından üretilmiştir.

8. SINIF ÖĞRENCİLERİNİN RUTİN OLMAYAN PROBLEMLER KARŞISINDA KULLANDIKLARI STRATEJİLER

EIGHTH GRADE STUDENTS' STRATEGIES TO SOLVE NONROUTINE MATHEMATICS PROBLEMS

Alattin URAL
Mehmet akif Ersoy üniversitesi, Eğitim Fakültesi, İlköğretim Bölümü, Matematik Eğitimi Anabilim Dalı
ural@mehmetakif.edu.tr

ÖZET: Bu çalışmanın amacı; sekizinci sınıf öğrencilerinin rutin olmayan matematik problemlerini çözerken kullandıkları stratejileri ve başarılarını lisede seçmeyi düşündükleri alanlar temelinde incelemektir. Çalışma üç sınıftan toplam 57 öğrenci katılmıştır. Öğrencilere 11 soruluk açık uçlu bir sınav uygulanmıştır. Sayısal bölüm düşünenlerin doğru yanıt ortalamaları (5.03) ile eşit ağırlık (1.53) ya da sözel alan düşünenlerin puanları (1.25) arasındaki fark istatistiksel olarak anlamlı bulunmuştur. Bu puanlar öğrencilerin rutin olmayan problemleri çözebilmede yetersiz olduğunu göstermektedir. Sayısalcılar kullanılan tüm stratejilerin % 69' unu, eşit ağırlıkçılar % 24' ünü ve sözelciler de % 7' sini kullanmıştır. Tahmin ve kontrol stratejisi %43, şekil çizme %24, eşitlik yazma %15, sistematik liste yapma %6, geriye doğru çalışma %6, bağıntı arama %4 ve problemi basitleştirme %3 oranında kullanılmıştır. Sayısal öğrenciler genelde tahmin-kontrol, şekil çizme ve eşitlik yazma stratejilerini; eşit ağırlıkçılar tahmin-kontrol ve şekil çizme stratejilerini; sözelciler ise sadece tahmin-kontrol stratejisini kullanmıştır. Problemi basitleştirme ve geriye doğru çalışma stratejileri sadece sayısalcılar tarafından kullanılmıştır.

Anahtar sözcükler: problem çözme stratejileri, rutin olmayan matematik problemleri

ABSTRACT: The aim of this research is to investigate 8th grade students' strategies to solve nonroutine mathematics problems, and their achievements on the basis of the divisions that they consider to select for high school. The participants are 57 students from 3 classes. 11 problems were asked to the students. Science-math, Turkish-mathematics and social sciences students averagely solved 5.03, 1.53 and 1.25 problem respectively. The differences between the Science-math students' average scores and the others were statistically meaningful. The science-math, Turkish-math and social sciences students used 69%, 24%, 7% respectively of all the strategies used. "Guess-check (GC)" (43%), "drawing a diagram (DD)" (24%), "writing an equation (WE)" (15%), "making an organized list (ML)" (6%), "working backwards (WB)" (6%), "looking for a pattern (LP)" (4%), "solving a simpler problem (SS)" (3%) are the strategies used. Science-math students generally used GC, DD, WE; Turkish-mathematics students used GC, DD; social-sciences students used only GC. SS and WB were used by only science-math students.

Key words: problem solving strategies, nonroutine mathematics problems

GİRİŞ

Matematik eğitiminin amaçlarından biri de öğrencilere problem çözme becerisini öğretmektir. Matematik derslerinde problem çözmenin önemi üzerine çok sayıda araştırma vardır (Ford, 1994; Higgins, 1997; NCTM, 1989; Verschaffel, De Corte, Lasure, Van Vaerenbergh, Bogaert, Ratinckx, 1999). Problem çözme, istenilen hedefe varabilmek için etkili ve yararlı olan araç ve davranışları türlü olanaklar arasından seçme ve kullanmadır (Demirel, 2005). Problem çözme, varolan bilgileri yeni problemlere uygulama sürecidir. Problem çözme bilimsel bir yöntem olduğundan, eleştirel düşünmeyi, yaratıcı ve yansıtıcı düşünmeyi, analiz ve sentezleme becerilerinin de kullanımını gerektirirebilir.

Problem çözme başarısını etkileyen faktörler genel olarak üç başlık altında ele alınmaktadır. Bunlar; bilişsel, duyuşsal ve tecrübe faktörleridir (Van de Walle, 2004; Baykul, 2005). Bilişsel faktörler açısından, Mayer (1982) problem çözümünde bireyin dört bilgi türüne sahip olması gerektiğini belirtmiştir. Bunlar: Anlam bilgisi, Şematik bilgi, Algoritmik bilgi, Stratejik bilgi'dir. Anlam bilgisi; öğrencinin problemde yer alan bilgileri anlam bilgisini kullanarak matematiksel ifadelere dönüştürebilmesidir. Şematik bilgi; öğrencinin problemdeki bilgi yapılarını benzer problem türü veya şemalarıyla ilişkilendirerek anlamlı bir bütün haline getirebilmesidir. Araştırmalara göre, problem çözme sürecinde şematik bilginin çeşitliliği ve gelişmişliği çözüme yarı otomatik olarak ulaşılabilmesini sağlamaktadır (Geiger&Galbraith, 1998). Algoritmik bilgi; oluşturulan denklem, eşitsizlik gibi matematiksel ifadelerin çözülebilmesidir. Stratejik bilgi; öğrencinin çözüm sürecinde kullanabileceği bazı tekniklerdir. Duyuşsal faktörler ise, problem çözmeye ilgi, istek, kendine güven, kaygı, kararlılık gibi etmenlerdir.

Rutin problemler, günlük hayatta karşılaşılan ve çözülmesinde dört işlem becerilerinin yeterli olduğu, çocukların günlük hayatta gerekli işlem becerilerini geliştirmeleri ve problemde geçen bilgileri matematiksel olarak ifade etmeyi öğrenmeleri için önemli problemlerdir. Matematik ders kitaplarında yer alan ve dört işlem becerileri ile çözülebilen problemlerdir. Orton ve Frobisher'e (1997) göre hedefe ulaşmak için başlangıçta bilinen ya da anımsama olasılığı olan matematiksel bir yöntemi olmamasından dolayı rutin problemler gerçek anlamda problem olarak düşünülmez. Alıştırmanın tanımı, öğrenilmiş bir olgunun ya da becerinin doğrudan uygulaması olduğuna göre, bu tip problemlere alıştırma denebilir. Rutin olmayan problemler rutin olanlara göre daha fazla düşünme gerektiren, çözmek için yöntemin açık olarak gözükmediği problemlerdir (Polya, 1957). Rutin olmayan problemlerin çözümleri işlem becerilerinin ötesinde, verileri organize etme, sınıflandırma, ilişkileri görme gibi becerilere sahip olmayı ve bir takım aktiviteleri arka arkaya yapmayı gerektirir (Souviney, 1989). İyi yapılandırılmamış problemlerin çözümlerinin amacı, problem çözmenin mantığını ve doğasını kavrama, bir problemle karşılaşıldığında uygun stratejiyi seçme, kullanma ve sonuçları yorumlama yeteneklerini geliştirmektir (Yaman, 2003).

Rutin olmayan problemlerde çeşitli çözümler yapmak, stratejiler kullanmak mümkündür. Aynı zamanda öğrencilere gerçek bir bağlamda uygulama, analiz, sentez gibi daha ileri düşünme becerilerini kullanma fırsatı sunar. Oregon Department of Education (1991) tarafından tanımlanan rutin olmayan problemleri anlama şunları içerir (Akt. Rina, Auxencia & Rene, 2011):
a) Kavramsal anlamayla birlikte, problemi yorumlama, uygun kavramları ve çözüme yönelik stratejiyi seçme becerisi. Problem durumu, ilgili bilgi, uygun matematiksel kavramlar ve mantıksal yanıtlar arasında ilişki kurma becerisi.
b) Prosedürel bilgiyi kullanabilme becerisi.
c) İyi bir muhakeme ve sezgisel düşünme becerisi.
Devlin (2007) kavramsal anlamayı, matematiksel kavramları, işlemleri ve ilişkileri kavrama olarak tanımlamıştır. Ben-Hur (2006) prosedürel bilgiyi formal dil veya sembolik temsiller bilgisi olarak tanımlamıştır.

Birçok araştırmada öğrencilerin özellikle rutin olmayan problemleri ele almada yetersiz oldukları gösterilmiştir (Asman & Markowitz, 2001; Higgins, 1997; Holton & Anderson, 1999). Bu durum iki temel nedene bağlanabilir: Alan bilgisi ve becerisindeki yetersizlik (kavramlar, formüller, çözüm yöntemi bilgisi, problem çözme), yaratıcı düşünme, bilişüstü becerilerde eksiklikler ve duyuşsal faktörlerdeki olumsuzluklar. Öğrenciler rutin olmayan problemlerle karşılaştıklarında çoğunlukla problem çözme stratejileri üzerinde düşünmek yerine verilen sayılarla ilgili bir işlem yapmaya eğilimi göstermektedir (Arslan ve Altun, 2007).

Problem çözme öğretimi ve onun nasıl geliştirilebileceği konusunda pek çok araştırma vardır (Ford, 1994; Verschaffel & De Corte, 1997; Higgins, 1997; Vershaffel ve diğ., 1999; Holton & Anderson, 1999; Follmer, 2000; Asman & Markowitz, 2001; Pugalee, 2001; Niederer & Irwin, 2001; Altun & Arslan, 2006; Arslan & Altun, 2007; Yazgan, 2007). Öğrencilerin problem çözme becerilerini geliştirmek için, öğretmenler bu stratejileri rutin olmayan problem durumlarında göstermelidir (Rina, Auxencia & Rene, 2011). Problem çözme öğrencilerin gerçek yaşam açısından kazanması gereken temel bir beceri olarak görülür (Krulik & Rudnick, 1996). Yaratıcı ve analitik düşünmenin yanında öğrencilerde kavramsal anlamayı ve matematiğin anlamını öğrenmelerine destek olur. Problem çözme becerisinin kazanılması uzun bir süreci kapsar ve programlı bir çalışma gerektirir. Öğrencilerin problem çözme becerilerinin yetersizliğinde öğretim yöntemleri de kuşkusuz önemli bir nedendir. Öğretim biçiminde yer alan bu yetersizlikler de iki başlık altında toplanabilir: Öğretimde kullanılan problemlerin türleri: Okullarda öğrenciler çoğunlukla sıradan problemlerle karşılaşması ve problem çözme öğretiminde kullanılan yöntem ve sınıf kültürü (Altun, 2006).

YÖNTEM

Araştırmanın Amacı

Bu çalışmanın amacı, sekizinci sınıf öğrencilerinin rutin olmayan matematik problemlerini çözerken kullandıkları stratejileri ve başarılarını lisede seçmeyi düşündükleri alanlar temelinde incelemek ve başarı puanları arasında oluşan farkın istatistiksel olarak anlamlı ölçüde farklılaşıp farklılaşmadığını incelemektir.

Araştırmanın Modeli

Araştırmanın yöntemi niteldir. Bu çalışmada sadece mevcut durum ortaya çıkarılmak istenildiğinden, yapılan araştırma betimseldir ve bir özel durum çalışmasıdır.

Çalışma Evreni ve Örneklem

Çalışmaya Antalya' da bulunan bir ilköğretim okulunun üç 8. Sınıfından toplam 57 öğrenci katılmıştır. Okulun seçiminde, okul yönetimi ve öğretmenlerinin böyle bir çalışmaya izin ve destek vermeleri en önemli nedendir. Sınavın uygulandığı sınıflar A sınıfı dışında heterojen olup, A sınıfı okuldaki en başarılı 8. Sınıf öğrencilerinden oluşmakta olup, sınıf 23 kişiliktir. Aynı zamanda bu sınıfta matematik olimpiyatlarına çalıştırılmış 8 özel öğrenci bulunmaktadır.

Verilerin Toplanması

Öğrencilerine rutin olmayan problemlerden oluşan 11 soruluk klasik bir sınav uygulanmıştır. Sorular hazırlanmadan önce yerli ve yabancı kaynaklardan, ders kitaplarından, internet üzerinden ulaşılan araştırma yazıları ve proje raporlarından rutin olmayan problemler ve bunların çözümünde kullanılan stratejiler araştırılmıştır. Bu tarama sonucunda kaynaklarda en sık rastlanan yedi temel problem çözme stratejisinin çalışılmasına karar verilmiştir. Bunlar, problemi basitleştirme, tahmin ve kontrol, bağıntı arama, şekil çizme, sistematik liste yapma, eşitlik yazma ve geriye doğru çalışma stratejileridir. Stratejilerin her biri için 2 matematik öğretmeniyle birlikte çeşitli sorular hazırlanmış, sonra bunların içinden sorulacak sorulara karar verilmiştir. Sınav sınıf ortamında ve yaklaşık 120 dakikalık bir süre tanınarak uygulanmıştır.

Verilerin Analizi

Öğrencilerin problem çözme stratejilerini belirlemek ve kategorize etmede nitel araştırmalarda kullanılan betimsel analiz yöntemi kullanılmıştır. Çözümlerin incelenmesinin ardından öğrenciler, ileride yönelmek istediği sayısal, eşit ağırlık ve sözel bölümlere göre sınıflandırılmış ve çözümleri incelenip hangi alan öğrencilerinin hangi stratejileri, ne ölçüde kullanabildiği incelenmiştir. Öğrencilerin kullandıkları stratejiler lisede seçecekleri alanlara göre ve ayrıca genel olarak da kullanılan stratejiler temelinde veriler kategorize edilerek bunlara ait elde edilen bulgular frekans ve yüzdelik tabloları şeklinde sunulmuştur. Bunun dışında, öğrencilerin soruları doğru yapıp yapmadıklarına 1 ya da 0 puan verilerek elde ettikleri toplam puanları alanlarına göre istatiksel olarak anlamlı bir farklılık oluşturup oluşturmadığına tek yönlü varyans analizi ve Scheffe Testi ile incelenmiştir.

BULGULAR

Öğrencilerin kullandıkları stratejiler lisede seçecekleri bölümlere göre kategorize edilerek bunlara ait elde edilen bulgular frekans ve yüzdelik şeklinde Tablo 1' de sunulmuştur.

Tablo 1. Kullanılan Problem Çözme Stratejilerinin Bölümlere Göre Dağılımı

Bölüm	TK	ŞÇ	EY	SLY	GDÇ	BA	PB	Toplam
Sayısal	27 (%50)	23 (%77)	16 (%84)	6 (%86)	7 (%100)	4 (%80)	4 (%100)	87 (%69)
Eşit Ağırlık	18 (%33)	7 (%23)	3 (%16)	1 (%14)	0	1 (%20)	0	30 (%24)
Sözel	9 (%17)	0	0	0	0	0	0	9 (%7)
Toplam	54 (%95)	30 (%53)	19 (%33)	7 (%12)	7 (%12)	5 (%9)	4 (%7)	126 (%100)

Tablo 1' e bakıldığında; sayısal öğrencilerin tüm stratejileri kullandıkları, eşit ağırlık öğrencilerinin GDÇ ve PB haricindeki stratejileri kullandıkları ve sözel öğrencilerin ise sadece TK stratejisini kullandıkları görülmektedir. Kullanım oranı (kullanan öğrenci sayısı/toplam öğrenci sayısı) açısından ise en çok TK stratejisi kullanılmış olup (%95), bunu sırasıyla ŞÇ (%53), EY (%33), SLY (%12), GDÇ (%12), BA (%9) ve PB (%7) izlemiştir. Toplam strateji kullanım oranları ise sayısal öğrencilerde %69, eşit ağırlık öğrencilerinde %24 ve sözel öğrencilerde ise %7' dir. Diğer taraftan, strateji bazında kullanım yoğunluğu (kullanılan streteji sayısı/toplam kullanılan strateji sayısı) ise sırasıyla; TK (%43=54/126), ŞÇ (%24=30/126), EY (%15=19/126), SLY (%6=7/126), GDÇ (%6=7/126), BA (%4=5/126) ve PB (%3=4/126)' dir. Ayrıca, PB ve GDÇ stratejileri sadece sayısalcılar tarafından kullanılmıştır.

Tablo 2. Öğrencilerin Bölümlere Göre Ortalama Başarı Puanları

Bölüm	N	$\bar{X}$	S
Sayısal	29 (%52)	5.03	2,835
Eşit Ağırlık	19 (%34)	1.53	0,772
Sözel	8 (%14)	1.25	0,463

Tablo 2' ye bakıldığında; sayısal öğrencilerin 11 soru üzerinden ortalama 5.03' ünü (%46), eşit ağırlık öğrencilerinin 1.53 (%14) ve sözel öğrencilerin 1.25 (%11) olduğu tespit edilmiştir. Öğrencilerin 11 sorudan aldıkları ortalama puanlar arasındaki farkın anlamlılığına yönelik yapılan Anova sonuçları Tablo 3' de verilmiştir.

Tablo 3. Öğrencilerin Başarılarına Göre Anova Sonuçları

Varyansın Kaynağı	Kareler Toplamı	sd	Kareler Ortalaması	F	p	Anlamlı Fark
Gruplararası	185.795	2	92.897	21.143	.000	Sy-E, Sy-Sz
Gruplariçi	237.258	54	4.394			
Toplam	423.053	56				

Analiz sonuçlarına göre, öğrencilerin başarı puanları alanlarına göre anlamlı bir şekilde değişmektedir [F(2-54)=21.143, p<.01]. Hangi bölümler arasında farkların olduğunu bulmak için yapılan Scheffe testinin sonuçlarına göre; sayısal-eşit ağırlık ve sayısal-sözel gruplar arasında anlamlı farklılık olduğu tespit edilmiştir.

TARTIŞMA VE SONUÇ

Bulgulara bakıldığında, strateji kullanım yoğunluğunun sırasıyla; TK (%43), ŞÇ (%24), EY (%15), SLY (%6), GDÇ (%6), BA (%4) ve PB (%3) şeklinde olduğu görülmektedir. Bu bulgudan hareketle, verilen problem çözme stratejilerinin kullanımının gerektirdiği zorluk (sayısal zeka) açısından zordan kolaya doğru şu şekilde sıralanabileceği düşünülebilir: Problemi basitleştirme (PB), bağıntı arama (BA), geriye doğru çalışma (GDÇ), sistematik liste yapma (SLY), eşitlik yazma (EY), şekil çizme (ŞÇ), tahmin ve kontrol (TK). Altun (1995) tarafından yapılan çalışmada da şekil çizme stratejisinin, tahmin ve kontrol stratejisine göre daha yoğun kullanıldığı gözlenmiştir. Rina, Auxencia ve Rene (2011) tarafından yapılan çalışmada da en çok şekil çizme stratejisinin kullanıldığı belirtilmiştir. Altun ve Arslan (2006) tarafından yapılan çalışmada strateji kullanım yüzdelerinin kategorik olarak küçükten büyüğe doğru sırayla; bağıntı arama ve geriye doğru çalışma (1. kategori), şekil çizme ve problemi basitleştirme (2. kategori), tahmin –kontrol ve sistematik liste yapma (3. kategori) şeklinde olduğu belirlenmiştir. Diğer taraftan, 1. kategorideki stratejilerin kullanımının yok denilecek kadar az olduğu belirtilmiştir. Bu bulgularla, yapılan bu araştırmadan elde edilen bulgular arasında büyük ölçüde paralellik olduğu söylenebilir. Genel olarak tüm bu araştırmalara bakıldığında; bağıntı arama ve geriye doğru çalışma stratejilerinin en az ve tahmin-kontrol stratejisinin en yaygın kullanıldığı görülmektedir. Bu stratejiler arasında matematiksel zorluk açısından, bağıntı arama stratejisinin daha zor, tahmin ve kontrol stratejisinin ise daha kolay olması bu durumu önemli ölçüde açıklayabilir. Diğer taraftan tahmin ve kontrol stratejisinde çözüm tahmin edilip doğruluğu araştırılır ve bu süreçte aritmetiksel işlemler yapılır ancak bağıntı arama stratejisinde ise cebirsel ifadelerin kullanımı söz konusu olabilir ve dolayısıyla çok daha zordur.

Diğer taraftan; eşit ağırlık öğrencilerin GDÇ ve PB stratejilerini kullanmadıkları ve sözel öğrencilerin ise sadece TK stratejisini kullandıkları görülmektedir. Ayrıca, PB ve GDÇ stratejileri sadece sayısalcılar tarafından kullanılmıştır. Kullanım oranı açısından ise ilk üç strateji şunlardır: TK (%95), ŞÇ (%53) ve EY (%33). Yukarıda verilen strateji sıralamasının, elde edilen bu bulguları önemli ölçüde açıklayabileceği düşünülmektedir.

Toplam strateji kullanım oranları ise sayısal öğrencilerde %69, eşit ağırlık öğrencilerinde %24 ve sözel öğrencilerde ise %7' dir. Başarı oranları ise sayısal öğrencilerde %46, eşit ağırlık öğrencilerde %14 ve sözel öğrencilerde ise %11 düzeyinde gerçekleşmiştir. Yapılan Anova ve Scheffe testi sonucunda, sayısal-eşit ağırlık ve sayısal-sözel gruplar arasında başarı anlamında anlamlı farklılık olduğu tespit edilmiştir. Verilen matematik problemlerinin çözümü sürecinin ve uygun stratejileri kullanmanın daha çok sayısal zeka gerektiriyor olması bu sıralamayı açıklamada etkili bir faktör olarak düşünülebilir.

TEACHERS ' VIEW ON EDUCATIONAL RESEARCH

Ceylan ŞEN

Habip BEDİR

Esra SARAÇ

In line with the changing training programs in a variety of different work and research resources are published for informational purposes. Many studies are presented in different application instances to teachers about the renewed program. It is important that teachers follow these studies and practice in their classroom. For this reason, teacher's opinion that related to the new teaching methods and techniques in educational research is included in this study. The study data were collected into two sections. Data were collected that semi-structured interview form was used in the first chapter and Teacher Training Agency developed by Evertone et. al. (2002) and later translated by Beycioğlu et. al. (2010) was used in the second chapter. Research was conducted with 45 science and technology teacher that work in various secondary schools in İstanbul. SPSS 16 for the package program was used for the quantitative data; content analysis method was used for the qualitative data. It was landed up that teachers do not follow education research closely and do not have a lot of information about new teaching methods and techniques and do not take heed of educational research.

Keywords: Educational Research, Teachers' View, Qualitative Research, Quantitative Research.

GEOGEBRA DESTEKLİ ORTAMLARDA ÖĞRENCİLER ARASI ETKİLEŞİMLERİN İNCELENMESİ

İlyas YAVUZ

İbrahim KEPCEOĞLU

Abdulkadir KERPİÇ

ÖZET: Matematik öğretiminde teknolojik araçların yaygın olarak kullanılmaya başlanmasıyla öğrenme ortamları değişmiştir. Dolayısıyla yeni öğrenme ortamlarında öğretmen-öğrenci arası ve öğrencilerin kendi aralarındaki etkileşimler de değişmiş, bunun yanı sıra öğrencilerin bilgisayarlar ile aralarında etkileşimler meydana gelmektedir. Öğrencilerin bilgisayar başında beraber bir geometri sorunun çözümünü yaparken birbirleriyle olan konuşmalarının ve birbirlerine müdahalelerinin incelenmesi öğrenme ortamlarının tasarlanması için önemlidir. Bu nedenle, araştırmanın amacı GeoGebra destekli matematik öğretimi ortamlarında öğrencilerin kendi aralarında meydana gelen etkileşimleri incelemek olarak belirlenmiştir. Araştırmaya Marmara Üniversitesi ilköğretim matematik eğitimi anabilim dalında öğrenim gören 10 öğretmen adayı katılmıştır. Katılımcılar ikişerli gruplar halinde 5'er tane geometri sorusunu çözmeye çalışmışlardır. Öğrenciler arası etkileşimleri incelemek için Sinclair'in (2005) müdahale stil ve yöntemleri modeli kullanılmıştır. Araştırma sonucunda öğrenciler arası etkileşimlerin çeşitlilik gösterdiği sonucuna ortaya çıkmıştır.

Anahtar Kelimeler: Öğrenci etkileşimi, bilgisayar destekli matematik öğretimi, GeoGebra müdahale stil ve yöntemleri

ABSTRACT: As technological tools have been widespread used in mathematics teaching, the learning environments have changed. Thus, in these new environments, the interactions between teacher and students and among students have also changed. Moreover, new interactions between students and computers have come into play. To investigate students' conversations, reactions and interventions during a geometric problem solving in computer based environments are important to design learning environments. Therefore in this study, the interactions among students in GeoGebra supported mathematics teaching environments have been investigated. Ten elementary mathematics pre-service teachers have participated to the study. They have worked in groups of two on five different geometric problems. The Sinclair's (2005) intervention styles and strategies model is used to analyze students' interactions. As a result of the study, it is revealed that there is a variety of the interactions among students.

Keywords: student interaction, computer based math teaching, style and methods of GeoGebra intervention

DENEYLE DESTEKLENMİŞ PROBLEME DAYALI ÖĞRENMENİN FEN VE TEKNOLOJİ DERSİNDEKİ BAŞARIYA ETKİSİ

PROBLEM-BASED LEARNING SUPPORTED EXPERIMENT EFFECT ON THE SUCCESS OF SCIENCE AND TECHNOLOGY COURSE

Ebru BAKAÇ
A.İ.B.Ü. Eğitim Programları ve Öğretim Programı Doktora Öğrencisi
ebruli_2239@hotmail.com

Bu araştırmanın amacı deneyle desteklenmiş probleme dayalı öğrenme yönteminin 5. sınıf öğrencilerinin fen ve teknoloji dersindeki akademik başarıları üzerine olan etkisini belirlemektir. Araştırmada ön test – son test kontrol gruplu model kullanılmıştır. Katılımcıları 2011- 2012 eğitim-öğretim yılında İstanbul'da bir ilköğretim okuluna devam eden 81 adet 5. sınıf öğrencisi (41 öğrenci deney grubu ve 40 öğrenci kontrol grubu) oluşturmuştur. Veriler araştırmacı tarafından geliştirilen başarı testi ile toplanmıştır. Deney grubunda 12 ders saati boyunca deneyle desteklenmiş probleme dayalı öğrenme yöntemi uygulanırken kontrol grubunda geleneksel yöntem uygulanmıştır.Araştırma sonunda deney grubu lehine anlamlı bir fark bulunmuştur.

Anahtar Sözcükler: Probleme Dayalı Öğrenme, Fen ve Teknoloji, Akademik Başarı, Deney Yöntemi

The purpose of this research is to examine effect of instruction of problem-base learning with supported experiment on achievement of fifth grade students in science and technology course. Pretest- posttest control group was used in the study. Participants has created 81 fifth grade students (41 student experimental group and 40 student control group) attending a primary school in İstanbul in 2011-2012 academic year. Data were collected by the achievement test developed by the researcher. When problem-based learning supported experimental activities was applied for twelve hours in control group, traditional method was applied in control group. At the end of the study were found a significant difference in favour of control group.

Key words: Problem-based Learning, Science and Technology, Academic Success, Experiment Method

1. GİRİŞ

Günümüzün yeni eğitim anlayışında ise öğrencilerin yaşantılardan kendine özgü anlamlar çıkarması, öğrendiklerini kendine özgü stratejilerle işleyerek onları yeniden yapılandırması beklenmektedir. Öğrenci kendi öğrenme sürecinden sorumlu olan ve en büyük rol sahibi iken öğretmen ise öğrenmeyi kolaylaştırıcı roldedir (Açıkgöz, 2007: 8). Fen öğretiminde kullanılan öğrenen merkezli yaklaşımlardan biri de probleme dayalı öğrenmedir (PDÖ). PDÖ öğrencilerin bir problem çerçevesinde grupça çalışarak araştırma yapmaları amaçlayan bir öğrenme yöntemidir (Arts, Gıjselaers ve Segers, 2002). PDÖ yönteminin kökleri ilerlemeci felsefeye, özellikle Dewey'in öğretmenler öğrencileri yaratıcılığa ve araştırmaya yönlendirmek için içlerinde var olan potansiyeli açığa çıkarmalıdır görüşüne dayanmaktadır (Delilse, 1997: 1). Borrows' a göre ise PDÖ` nin amacı öğrencilerin problem çözme becerilerini geliştirmektir (Schmidt, 1992). PDÖ yönteminin odak noktası öğrencilerin önceki bilgilerini kullanmalarına ve onları anlamlı ve anlaşılır olan yeni bir form içerisinde yapılandırmalarına yardımcı olmaktır (Savin-Baden ve Major, 2004). PDÖ'de öğrenciler problemle bağlantılı bilgileri araştırırlar ve elde ettikleri bilgileri değerlendirirler. Araştırarak öğrenme veri toplama, düşünme becerilerini kullanma ya da fikir üretme, değerlendirmede farklı seçenekleri kullanma ve çözümü uygulama seçeneklerini içerir (Demirel, 2010: 82). PDÖ yönteminde sınıflara yazılı senaryolar, anekdotlar, video, teyp gibi araçların yardımıyla gerçek bir problem durumu getirilir. Problemler gerçek yaşamdan seçilir. Öğrenciler sekiz kişiden daha az küçük gruplara ayrılır. Gruptaki öğrenciler haftada en az iki defa toplanırlar. Öğrenciler bu problem durumu ile ilgili önceki yaşantılarını ve bilgilerini birbirleri ile paylaşırlar (Kaptan ve Korkmaz, 2001). En az altı ya da sekiz oturum tekrarlanarak öğrenciler öğrendikleri yeni bilgilerle problemi çözmeye çalışırlar (Schwards, 2001: 2). PDÖ'nin, fen eğitimi için büyük önem taşıyan bazı avantajları vardır. Bunlar; öğrencilere bilimsel işlem becerilerini kazandırması, grupla çalışma becerisi kazandırması, öğrencilerin problem çözme becerisini geliştirmesi, fen okuryazarlığını artırması, öğrencilerin kendi kendine öğrenme becerilerini geliştirmesi, öğrencilere analiz, sentez ve değerlendirme gibi üst düzey bilişsel beceriler kazandırması (Tatar, 2007).

PDO`nin fen ve teknoloji dersinde başarıyı arttırdığını gösteren birçok çalışma bulunmaktadır (Deveci, 2002; Erdem, 2006; Kerfoot, Masser ve Hafler, 2005; Yıldız, 2010). Ancak PDÖ yönteminin daha verimli hale getirilebilmesi için PDÖ uygulamalarının çeşitli yöntemlerle desteklenmesinin yararlı olabileceği düşünülmektedir. Bu yöntemlerden biri deneydir. Deney yöntemi, belli bir doğa olayını, etmenleri denetim altında tutarak sınıf veya deney odasında (lâboratuvar) öğrencilere göstermek için yapılan plânlı bir deneme veya sınama işi olarak tanımlanabilir (Büyükkaragöz ve Çivi,1999: 94). Bu yöntemin başarılı olabilmesi için bir plâna göre yapılması gerekir. Bir deney plânı ana hatlarıyla şu başlıklardan oluşur. 1) deneyin yapılacağı ders, sınıf ve saatler, 2) deneyin konusu, 3) deneyin amaçları, 4) Kullanılacak araç ve gereçler, 5) amaçların gerçekleşmesi için öğrencilerin yapacağı etkinlikler, 6) deney sonucunun değerlendirmesi (Hesapçıoğlu,1994: 222). Araştırmacının yaptığı literatür taraması sonucu PDÖ'nin deney yöntemi ile desteklenmesinin 5. sınıf fen ve teknoloji dersindeki akademik başarıya etkisini sınayan bir çalışmaya rastlanmamıştır. Bu nedenle çalışmanın literatüre bir katkı getireceği, bu alanla ilgili araştırma yapacaklara yol göstereceği düşünülmektedir. Bu nedenden dolayı araştırma deneyle desteklenmiş PDÖ` nin öğrencilerin akademik başarıları üzerine olan etkisini belirlemeyi amaçlamaktadır. Bu amaç ekseninde aşağıdaki soruya yanıt aranacaktır:

Deneyle desteklenmiş PDÖ yöntemi kullanılarak öğretim yapılan deney grubu öğrencileri ile yapılandırmacı yaklaşım kullanılarak öğretim yapılan kontrol grubu öğrencilerinin son-test puanları arasında deney grubu lehine anlamlı bir fark var mıdır ?

2.YÖNTEM

Araştırmada öntest – sontest kontrol gruplu model kullanılmıştır. Bu yöntem; kişilerin deney ve kontrol gruplarına gönderilmesinde rastgele dağılımın kullanılmadığı bir deneysel araştırma yöntemidir. Öğrencilerin deneysel işlemden önce ve sonra bağımlı değişkenle ilgili olarak ölçüldüğü ilişkili bir desendir. Çünkü aynı kişiler bağımlı değişken üzerinde iki kez ölçülürler (Büyüköztürk, 2010).

Tablo 1. Araştırma Deseninin Simgesel Görünümü

Deney Grubu	R	T1	X	T2
Kontrol Grubu	R	T1		T2

Katılımcılar

Araştırmanın katılımcılarını 2011- 2012 eğitim-öğretim yılının birinci döneminde İstanbul'da bir ilköğretim okulunda öğrenimlerine devam eden 81 adet 5. sınıf öğrencisi oluşturmuştur. Deney ve kontrol gruplarının denkleştirilmesinde öğrencilerin ön-testten aldıkları puanlar kullanılmıştır.

Tablo 2. Deney ve Kontrol Grubunun Ön Test Puanlarına Göre t- testi Sonuçları

ŞUBE	N	X	SS	s	t	p
DENEY	41	11,17	3,33	79	0,289	0,774
KONTROL	40	10,95	3,55			

Tablo 1'e göre deney ve kontrol grubunun ön-test puanlarında anlamlı bir fark yoktur, t(79)=0,289, p>.05. Bu verilere göre öğrencilerin uygulama öncesinde fen ve teknoloji dersine yönelik başarı testi puan ortalamaları; deney grubunda (X =11,17) ve kontrol grubunda (X =10,95) olarak benzerlik göstermektedir. Bu bulgudan haraketle deney ve kontrol gruplarının başarı yönünden denk oldukları söylenebilir.

Verilerin Toplanması

Başarı Testi

Araştırmanın verileri araştırmacı tarafından geliştirilen Maddenin Değişimi ve Tanınması Başarı Testi ile toplanmıştır. Testte yer alacak soruların belirlenmesinde, geniş bir literatür taraması yapılarak değişik türden test kitapları incelenmiş ve çok sayıda soru toplanmıştır. Toplanan sorulardan hangilerinin kullanılacağına karar verme aşamasında, öğrenci seviyeleri ve programda konu ile ilgili yer alan kazanımlar esas alınmıştır. Hazırlanan başarı testi belirtke tablosunda gösterilerek testteki soruların kapsam geçerliği sağlanmaya çalışılmıştır. Ayrıca testin kapsam geçerliliği için 2 fen ve teknoloji ve 1 sınıf öğretmeninin görüşlerine başvurulmuştur ve öneriler doğrultusunda gerekli değişiklikler yapılmıştır. Geliştirilen Maddenin Değişimi ve Tanınması Başarı Testi madde analizi yapabilmek için pilot uygulama olarak bu konuları gören 125 tane 6. sınıf öğrencisine uygulanmıştır. Uygulama sırasında öğrencilerin tüm soruları cevaplamak için ne kadar zamana ihtiyaç duydukları ve soruları anlamakta zorluk çekip çekmedikleri belirlenmiştir. Uygulama sonunda testin geçerlik ve güvenirlik araştırması yapılmıştır. Madde analizi sonucunda maddenin ayırt ediciliği değerlendirilirken şunlara dikkat edilmiştir: Ayırt edicilik indisi 0,40 veya daha yüksek bir değerde olan maddeler çok iyi, 0,30–0,40 arasında olanlar iyi sayıldığından teste alınmış; 0,20–0,29 arasında olan birkaç madde de zorunlu hallerde aynen kullanılabilir olduğundan teste alınmış; 0,20'den daha küçük bir değerde olan maddeler testte kullanılmamıştır Ayırt ediciliği sıfır veya negatif olan maddeler de testte kullanılmamıştır (Yılmaz, 2004: 226). Güvenirlik tahmininde 0,00 ile 1,00 arasında değerler elde edilir. Güvenirlik indeksinin 1,00'a yakın olması testin güvenirliğinin yüksek, 0,00'a yakın olması da testin güvenirliğinin düşük olduğu anlamına gelir (Yılmaz, 2004: 215). Başarı testlerinde cevapların doğruluğu ve yanlışlığı mantığına uygun düştüğü için güvenirliği hesaplamada genellikle Kuder-Richardson 20 formülü kullanılmaktadır. Nihai testin 20 sorudan oluşmasına karar verilmiş ve testin aritmetik ortalaması X: 8.65, standart sapması Ss: 4.68, ortalama güçlük değeri P: 0.43 ve güvenirlik katsayısı KR20= 0.74 bulunmuştur.

İşlem Basamakları

1- Deney ve kontrol gruplarının belirlenmesinde öğrencilerin ön test puanları kullanılmıştır.

2- Öğrencilere önce araştırma hakkında bilgi verilmiştir. Araştırma sırasında uygulanan başarı testinin araştırmanın amaçlarına ulaşması açısından önemli olduğu vurgulanarak öğrencilerden bu testi cevaplarken samimi olmaları istenmiştir.

3- Deney ve kontrol gruplarına araştırma başlamadan önce ön test olarak başarı testi uygulanmıştır.

4- Çalışma haftada dörder saat olmak üzere toplam 3 haftalık bir süreci kapsamıştır.

5- Kontrol gruplarında yapılandırmacı yaklaşıma dayalı öğretim yöntemi kullanılmıştır.
6- Deney ve kontrol gruplarına araştırmanın bitiminde son test olarak başarı testi uygulanmıştır.

Verilerin Analizi

Deneyle desteklenmiş PDÖ yöntemi uygulanan deney grubu ile yapılandırmacı yaklaşımın kullanıldığı kontrol grubu öğrencileri arasında başarı düzeyleri bakımından fark olup olmadığını test etmek için SPSS 16.0 (Statistical Package for The Social Science) paket programı kullanılmıştır. Anlamlılık düzeyi. 05 olarak belirlenmiştir. Veriler ilişkili örneklem t-testi ile analiz edilmiştir.

3. BULGULAR

Tablo 3. Deney ve Kontrol Grubu Öğrencilerinin t- testi Sonuçları

ŞUBE	N	X	SS	s	t	p
DENEY	41	15,48	3,09	79	4,055	0,000
KONTROL	40	12,80	2,85			

Tablo 4'e göre deney ve kontrol grubunun son-test puanları arasında anlamlı bir fark oluşmuştur, t(79)=4,055, p<.05. Bu verilere göre öğrencilerin uygulama sonrasında fen ve teknoloji dersine yönelik başarı testi puan ortalamaları; deney grubunda (X =15,48) ve kontrol grubunda (X =12,80) olarak farklılık göstermektedir. Bu bulgudan hareketle deneyle desteklenmiş PDÖ` nin akademik başarıyı arttırmada yapılandırmacı yaklaşımın uygulandığı geleneksel öğretime göre daha etkili olduğu söylenebilir.

4.TARTIŞMA

Araştırma sonunda deney yöntemi ile desteklenmiş PDÖ'nin akademik başarıyı arttırmada geleneksel öğretime göre (yapılandırmacı yaklaşım) daha etkili olduğu bulunmuştur. Araştırmanın bulgusuna paralel olarak Yıldız (2010) ve Çınar (2007) da PDÖ`nin öğrencilerin akademik başarılarına olumlu etkisi olduğunu belirtmektedirler. Aydoğdu (2012) da Fen Bilgisi öğretmenliği öğrencilerinin elektroliz ve pil konularını öğrenmelerine PDÖ'nin etkisini incelemiş, başarı yönünden deney grubu lehine anlamlı bir fark bulmuştur. Taşoğlu ve Bakaç (2013) tarafından yapılan çalışmada lisans düzeyinde manyetizma konularının öğretiminde, probleme dayalı öğrenme yaklaşımı ve geleneksel öğretim yöntemleri karşılaştırılmış. Araştırma sonunda deney grubunun anlama yüzdelerinin kontrol grubuna oranla genellikle daha fazla olduğu sonucuna ulaşılmıştır.

Araştırma sonuçlarına paralel olarak eğitimcilere ve araştırmacılara aşağıdaki önerilerde bulunulmuştur: PDÖ`nin daha iyi uygulanabilmesi için senaryo yazımı ve PDÖ basamakları hakkında öğrencilere gerekli eğitimin verilmesi, PDÖ konusunda eğitim fakültelerinde okutulan öğretim ilke ve yöntemleri dersinde uygulamalar yaptırılması, araştırmacıların farklı sınıf seviyeleri ve derslerde PDÖ'nin farklı değişkenler üzerine etkisini sınayan çalışmalar yapması önerilmektedir. Bu çalışmanın öğretmenlere yeni yöntem ve teknikler konusunda bilgi sunacağı ve araştırmacılarda yeni bakış açıları oluşturacağı düşünülmektedir.

(mbarin623@yahoo.com)

ABSTRACT: One the basic and the fundamental differences between the traditional and the intelligent schools, which has proposed in our country and has been conducted in some schools since 2005, is the method of learning and teaching in these schools which should be learnt by the teachers of these schools. But theconstructional teaching approach, with regard to the features it possesses, can contribute to materialize the goals of the intelligent schools in case it is used by the teachers. Because the tasks of the teachers and the students in the schools match greatly with the tasks of the teachers and the students in the constructional approach if it is applied. Therefore in this article the author, by studying the features of the constructional approach of teaching and the principle bases of the intelligent schools concludes that if the teachers of the intelligent schools are well- familiar to the constructional teaching approach, they can be to large extent useful in materializing the goals of the intelligent schools and playing the teaching role.

Key words: constructional Approach, Curriculum of the intelligent Schools

THE DEFINITIONS OF CONSTRUCTIONAL APPROACH

Constructional approach has been defined in various ways but all of them focus on the active role of the learners in the comprehension and construction of knowledge. According to Santrock (2004) constructional approach is a learning approach which focuses on the activeness of learners in the construction of knowledge and understanding (p. 561). Also, Schunk (2000) argues that, "constructional approach is a psychological and philosophical viewpoint according to which people construct and form most of their own learning (p. 229).

To be brief, constructional approach is based on the idea that learners gain knowledge from their own experiences (Ormrod, 1995).

Nowadays, rather new theories have been presented in psychology and education which are called Constructivism and have their root in the past scientific and philosophical ideas. Constructivism has its origins in the works done by Piaget, Vygostky, Gestalt psychologists, Bartlett, Bruner, and Dewey's philosophy of education. All the above-mentioned works only constitute a part of the literature review (Woolfolk, 2004).

Constructivism can be defined as, "knowledge as a result of the productive activities of individuals". Knowledge is not outside the minds of those who want to acquire that and is not the result of the experience of others, but is the consequence a person's own experience. Teaching according to constructivism helps learners to internalize newly acquired information and give new form to or modify them (Salimi, 2009).

Based on constructivism, there is not any independent reality but all types of reality depend upon the minds of people and mind is a base and tool for the interpretation of events, objects, and prospects in the world and such interpretations establish knowledge. Today, the main focus in education is on innovations, creativity, and the construction of knowledge and to base teaching methods on the interaction of learners with the environment and discovery of facts. So, the constructional approach has a special consistency with this issue because in this approach focuses on personal achievements and the invention of methods and concepts. Also, it must be noted that in this approach, teachers and other equipment are considered as the "facilitators" of knowledge construction by learners.

Teachers who are interested in planning and teaching their subject matter according to constructivism accept to and must play different roles. The main task for teachers in this method is to facilitate the process of knowledge construction and to guide learners in this process.

Before the levels in the execution of constructivism be explained, it must be mentioned that teachers need to take into account the important topics in the following table and put those topics as guidelines for themselves in the execution of constructivism.

The Major Concept In Constructivism

1. The concept of construct

Construct means a framework consisting of a set of concepts (for example, the concepts related to an event or accident, a system, or knowledge). In order to assign meaning to the natural phenomena, learners must create mental constructs in an informed way and based on such constructs which include beliefs, opinions, and knowledge try to interpret reality.

2. The concept of knowledge construction

This concept means the mental production of information.

Learners must take the responsibility of their own learning and the method of learning by themselves and must choose or develop their own learning strategies and set their own educational goals.

3. The concept of reality

In constructivism, reality is not outside a person's mind but is a meaning which has been constructed by the person based on the world he lives.

Steps In The Execution Of Constructivism

1. Searching an exploration

It means looking for ways to construct knowledge by the learners. In this step, learners attempt to construct knowledge by getting help from all their senses. The construction of knowledge occurs throughout the process of search and exploration. In this step, the teacher tries to explain the topic and ask the students to express their own information, skills, and ideas. This step is roughly the first step in brainstorming and the inductive approach. (the genesis of concepts)

2. Understanding and explanation

In this step, teachers and students discuss about the information, skills, and ideas presented in the previous step. In other words, reaching to an agreement on the issues presented is the most important task in this step. Here, teachers ask Why and How questions related to the arguments put forward by learners.

Teachers should guide their students to share their ideas and findings with other members of the group.

3. Generalization and spread

In this step, teachers help their students to generalize and expand their findings. In other words, helping the learners to improve and develop personal information and skills and expanding them to other. In this step, the topic is expanded when students study reference books and get information from others. Usually, making use of extension homework can help to expand the topics.

4. Checking and evaluation

In this step, all the activities, skills, and findings are checked and evaluated in order to determine the amount of changes in thoughts, mastery of skills, learned materials, and the construction of knowledge. In order to evaluate the learned materials, thought provoking questions and such tools as interviews with informed people and referring to useful resources can be used. Also, the results gained from this step should be made use of in teaching and learning systems (Shabani, 2010).

The Major Characteristics In A Constructivist Instructional Design

1. The goals are developed in a more comprehensive and basic way.

2. A suitable learning environment is being provided.

3. Teachers and students help each other to select those activities, materials, projects, and operations which help learners to understand the subject matter.

Also, the process of learning and the thoughts behind that is emphasized over the product of learning (Seif, 2010).

SMART SCHOOLS

A smart school is a physical school in which the control and administration is done based on computer and networks and the materials are mainly electronic. Also, testing and monitoring systems in such schools are smart. In these types of schools, a smart student develops and modifies his/her executive abilities and resources by being involved with various topics in a continuous way and this issue lets school officials to make their students ready to acquire new information by considering the changes happened and the increase in the level of information that their students are familiar with.

The Objectives Of Smart Schools

1. Comprehensive development of students (mental, physical, emotional, and intellectual)

2. Upgrading personal capabilities

3. Training humans who are contemplative and familiar with technology

4. Increasing public participation

In smart schools, students are both teachers and learners. In such schools, the curriculum is not limiting and students are allowed to go beyond their curriculum. There, teaching methods are based on student-centeredness. Focus on thinking abilities and the provision of a teaching-learning environment are among the strategies and policies of smart schools. Seven key principles in smart schools include: 1. creative knowledge, 2. learning aptitude, 3. attention to the understanding of materials, 4. learning with the goal of mastery of the content and transferring it, 5. the evaluation of learned materials in a focused way, 6. overcoming difficulties, 7. School as an educational organization. In smart schools, students can use CDs and computers are used instead of blackboards. Here, students can get a lot of information on any subject by the use of the Internet. In these schools, teaching is not merely done by teachers but students are also involved in the process of teaching. Teachers help students to understand the topics better and save more time by making use of electronic materials and students have the chance to demonstrate their abilities and produce educational materials.

Success is accessible in these schools and the rate of success depends on students' effort and perseverance and a right direction. In this method, the spirit of research and explorations replaces an aimless spirit among learners. In constructivism, the main prerequisite for any change is the change in though and tools and equipment are just used in order to realize thoughts.

Instead of providing the answers to students' questions, teachers can ask their students to look for the answers of their questions and tell them to the other students.

The foundations for the development of smart schools are making use of modern information and communication technologies and their difference with virtual schools is that here the students must be present physically at the schools but in virtual schools teachers and students can be hundreds of kilometers apart from each other. There is not any necessity for the teachers in smart schools to be masters of IT but they need to be informed of the system of such schools and make good use of the equipment there. A teacher should know where the resources are so that when students ask questions, he/she can guide them to the required resources.

Parents communicate with smart schools through computers and have the possibility to connect with the principal and get informed of the educational status of their children.

Libraries in smart schools are electronic and students can use them in an online way. Discussion and question and answer forums are provided in a synchronous and asynchronous way.

The Pillars Of Smart Schools

Teaching – Learning environment

This domain covers four areas:

a. Curriculum

b. Teaching methodology

c. Evaluation

d. Content

Administration

Supports the resources and processed required in a teaching – learning environment.

People's responsibilities and the required skills: In smart schools, the roles of principals, students, and parents are changed in order to play a more effective role by making use of their abilities and knowledge.

Technology

Teaching – learning environment, administration, and external communications necessitate solutions which are based on the use of technology.

The characteristics of the pillars of smart schools

a. Curriculum

The principles governing the curriculum in smart schools include: Designing to help students develop in a comprehensive way, the integration of students in order to develop in a comprehensive way, the integration of knowledge, skills, and values through curriculum (by assigning the activities related to content into projects), discipline and continuity in education, establishing positive attitudes towards the use of technology, getting all the students to access suitable education.

The attitudes towards curriculum

Meaningfulness: All students understand the concepts in education in order to understand the goals of their education.

Social Responsibility: Students get informed of their responsibilities in the society and feel responsible towards their people.

The feedback of curriculum: Curriculum should induce learners with critical thinking and skills, and positive creativity.

Comprehensiveness: Curriculum should focus on all aspects of human beings and help learners to understand the relations between different topics.

Non-restrictiveness: Curriculum is not restrictive. First, the current programs are being revised in a "continuous" way. Secondly, the students are allowed to go beyond the curriculum.

Being targeted: Curriculum makes use of technology as an instrument to transfer knowledge and teaches the students how to make use of it in order to get help from it in times of need.

b. Teaching Methodology

The teaching methodology used in smart schools is student-centered and the following principles govern the mythology used there:

The provision of a combination of teaching methods to make sure of the comprehensive development of students' aptitudes and abilities in order to:

a. Encourage learning and develop creativity

b. Making the activities student-centered and develop individual skills

c. The provision of various educational methods to develop learning

d. The direction of classes by making us of various teaching – learning methods

In smart schools the students have a more important role in a way that:

Students form the educational goals by getting help from teachers.

Students determine educational tasks by getting help from teachers.

In the selection of materials, students consider the materials themselves and ask for teachers' attitudes on them.

c. Evaluation

In smart schools, evaluation is smart and sometimes is not smart depending the lesson type.

The characteristics of evaluation:

Comprehensive

Various forms

Multiple-choice methods

On time

Student centered

Continuity

Evaluation is performed in a comprehensive way in smart schools and in addition to the summative evaluation includes readiness and development and provides various forms of information on students' abilities learning methods.

Initial evaluation: The evaluation of the level of knowledge and abilities

Formative evaluation: The evaluation of a student's ongoing development in order to determine strong and weak points

Summative evaluation: Considering the current educational system, this type of evaluation is performed in a pencil – and- paper method to evaluate students' learning.

Evaluation is designed in different firms such as: classroom evaluation, school evaluation, and focused (centralized) evaluation.

Classroom evaluation: This type of evaluation is performed during and after the lessons.

School evaluation: It is performed after each section of the lessons has been finished.

Focused evaluation: This types is performed in the form of a project whenever learners demonstrate their readiness.

d. Content

Content is provided in two forms in smart schools:

Standardized content (through the Ministry of Education)

Teacher content

Generally speaking, content is formed based on four major indicators:

1. Technical quality

2. Attraction

3. Educational quality

4. Accordance with the curriculum

THE APPLICATIONS OF CONSTRUCTIONAL APPROACH IN ELECTRONIC LEARNING ENVIRONMENTS:

The constructional approach provides ideas and principles that are important for learning environments by getting help from technologies. Those ideas and principles are as follows:

1. Learning takes place in real and meaningful conditions. In order to realize this, students should participate actively in the process of decision-making.

2. Learning is turned into an individual and social activity. The influences of technology on learning have a deep impact on the social aspects of learning. This is because we can observe the individual activities of students when they are working with computers. On the other hand, technology provides students with various social learning situations and allows to learn better through computers, social networks, electronic mail, and telecommunications.

The growing understanding of the important roles that learning environments can play with the help of technology might lead to the creation of different learning environments such as environments for social and creative learning which are focused in the Constructional approach (Lotfi & Abdollahi, 2010).

DISCUSSION AND CONCLUSION

Based on what mentioned before it can be concluded that the Constructional approach have some features that can be effective in the realization of objectives in smart schools. It can be argues that there is a high degree of similarity between the learning situations that teachers in the constructional approach create for their students with the situations that teachers in smart schools desire to establish. So, it can be said that as teachers who design educational plans based on constructivism are considered as the facilitators of the process of knowledge construction and help and guide students in the construction of knowledge, teachers in smart schools play the role of guides in the process of education and create situations for the students to learn how to learn.

If teachers make use of the Constructional approach in order to teach their students how to process information, think about various data and information, use the materials learned in daily life, know different sources of information (global and local), and connect in a suitable and effective way with others through media, in fact they help them to be involved in the process of learning. In other words, they help their students to manage their own learning and give depth to it. It is clear that the above-mentioned situations are the objectives that are being followed in smart schools. So, if teachers in smart schools have a command of the Constructional approach and provide students with interactive learning, they would be able to advance the objectives of smart there schools through the establishment of a real and meaningful learning environment.

A SURVEY OF INFLUENCE OF ENVIRONMENT AS A MOTIVATOR ON SECONDARY SCHOOL STUDENTS' PERFORMANCE IN MATHEMATICS IN NIGERIA

Suleiman BASHIR PhD
absuleimank@gmail.com
+2348060431859
Department of Mathematics
Federal college of Education (Tech) Gusau, Nigeria

ABSTRACT: The study investigated the Influence of Environment on the Performance of Secondary School Students in Mathematics in some selected States of the Northwest of Nigeria. The study is a survey research type and the sample size is 1000 Secondary School Students from Three States of Kebbi , Sokoto and Zamfara . The self-developed questionnaire was used for data collection and the percentage and mean were used to answer the research questions while Chi-square was used to answer the hypothesis. The finding revealed that the Environment of the School and the Student's house has influence on the student's Academic Performance in Mathematics. The researcher recommended that School should be cited far away from noisy areas such as Market and Industrial estate. This will control the pollution of the Environment and distraction from Academic work. Research study like this can also be conducted using other Geo-political areas of the Country or any other part of the World.

INTRODUCTION

The term environment can be regarded as the surroundings in which an organism operates which include air, water, land, natural resource, flora, human and their interrelation (Romer, 1993). Owitti (2001) stated that environment of an organism includes both the physical properties such as local biotic factors like climate and geology, as well as other organisms that share its habitant. The environment based on the above definitions can be seen as a complex of physical, chemical and biotic factors such as climate, soil and living things that act upon an organism or ecological community and ultimately determine its form and survive. In other words, the environment is the sum of all external conditions affecting the life, development and survival of an organism. Among the factors responsible for the state of learning in general and mathematics in particular is environment. Condition of learning environment matters a lot in the students' learning ability. The environment of a student is both school and home environment. This research study tried to find out the extent to which both school and home environment influences student's performance in mathematics.

METHODS

The research is a survey study in which 1000 secondary school students were both purposively and randomly sampled from the population of senior secondary school students from Kebbi, Sokoto and Zamfara states of Nigeria. The students sample size per state is in ratio 7:7:6 for Kebbi, Sokoto and Zamfara states respectively.

Researcher's self-developed questionnaire was used for the study .Items in the questionnaire were based on school and home environment condition of the students. The questionnaire was subjected to validation and has reliability coefficient of 0.71 using test-retest procedure. The questionnaire was administered personally by the researcher in the three states and did the analysis using the mean to answer the research questions and t-test for testing the hypothesis.

Research Questions

The following research questions were answered in this study.

1. Does the environment has any influence on the student's performance in Mathematics?
2. Does the school environment has any influence on the student's performance in Mathematics?
3. Does the students's home environment has any influence on his/her mathematics performance?

Research Hypothesis

The following hypothesis was tested in this study.

There is no significant difference in the students' view on the influence of school and home environment on their performance in Mathematics.

RESULTS AND FINDINGS

The researcher used Likert Scale of four points for the transformation of the opinion of students of strongly agreed, agreed, disagreed and strongly disagreed into quantitative data. The acceptance of influence level used for the study is 2.50. The analysis techniques used to answer the research questions are the frequency counts and means.

Research Question 1: Does the environment has any influence on the students' performance in Mathematics?

Table 1. Students' View on Influence of Environment on Performance in Mathematics

	Students 'View						
Item	Strongly agreed	Agreed	Disagreed	Strongly Disagreed	Total	Mean	Dec
Schools located around Factories are exposed to noise and air pollutions which contaminates the air and causes health problems to the students. this induces drop in students performance in mathematics	700	200	50	50	1000	3.55	Acc
Stimulating environment promotes positive attitude in students and enhances performance in mathematics	800	100	100	0	1000	3.70	Acc
Condition of learning affects teacher's behavior and attitude towards teaching and consequently affect students' performance	850	150	0	0	1000	3.85	Acc
School building condition can affect student's self –							

worth and esteem and may influence his performance in Mathematics	750	150	75	25	1000	3.63	Acc
Poor school environment leads to poor attendance, low concentrate and unhealthy motivation in which leads to student's poor performance in mathematics	700	200	50	50	1000	3.55	Acc
Teaching mathematics under hot afternoon makes students lose concentration and may affect their performance in mathematics	900	75	25	0	1000	3.88	Acc
Unhealthy school environment exposes students to disease and this affects their performance in mathematics	950	25	25	0	1000	3.93	Acc
Poor lighting and ventilation in the classrooms affects student's behavior such as paying no attention to their teachers and thereby affect their performance in mathematics	600	150	150	100	1000	3.25	Acc
School environment affects student's Performance in mathematics	750	150	75	25	1000	3.63	Acc

My house is always dirty	25	100	100	775	1000	1.38	Rej
My house has a reading room/ library	50	50	100	800	1000	1.35	Rej
Conducive home environment enhances child academic success	600	150	100	150	1000	3.20	Acc
My house is located in an isolated area	25	50	250	675	1000	1.43	Rej
My parent always involve in my homework and assignment	550	150	200	100	1000	3.15	Acc
The child's home environment plays an important role in the mathematics performance of the child	650	150	125	75	1000	3.38	Acc
Total	8900	1850	1425	2825	15000	2.99	Acc

From table 1 above, the means score on view of students on influence of environment on their learning and performance in mathematics is above 2.50 on 12 items of the 15 items, and the mean of the 15 items is 2.99.This shows that the environments do influence student's performance in mathematics.

Research Question 2: Does the school environment has any influence on the students' performance in mathematics?

Table 2: Student's View On Influence Of School Environment On Their

Performance In Mathematics

Research Question 3: Does the students home environment has any influence on his/her mathematics performance

Table 3. Students View On Influence Of Home Environment On Their Performance In Mathematics

	Students view						
Item	Strongly agreed	Agreed	Disagreed	Strongly disagreed	Total	Mean	Decis
10.	25	100	100	775	1000	1.38	Rej
11.	50	50	100	800	1000	1.35	Rej
12.	600	150	100	150	1000	3.20	Acc
13.	25	50	250	675	1000	1.43	Rej
14.	550	150	200	100	1000	3.15	Acc
15.	650	150	125	75	1000	3.38	Acc
Total	1900	650	875	2575	6000	2.32	Rej

Items 10 to 15 in table 1, answered research question 3.From table 3 above, the mean of mean score is 2.32, which is below 2.50 acceptance level. Therefore the student's home environment has no influence on their performance in mathematics.

Research Hypothesis: There is no any significant difference in the students' view on the influence of school and home environment on their performance in Mathematics.

Table 4: t-Test On Influence Of Environment On Students 'Performance In Mathematics

Type	N	Mean	S.D	df	t-cal	t-critical	Decision
School Environment	1000	3.66	0.198				
				998	0.030	1.96	Sign
Home Environment	1000	2.32	0.931				

$t_{998} = 0.030$, $p < 0.05$

From table 4 above, the t-calculated of 0.030 is less than the t-critical of 1.96, therefore the hypothesis of there is no difference in the view of students on influence of school and home environment on their performance in mathematics is rejected. This findings show from the students' view that the school environment has greater influence on their performance in mathematics than the home environment. This indicates that the difference of 1.34 in the mean in favour of school environment is significant.

CONCLUSION

The result of this study was able to reveal that the environment has influence on students' performance in Mathematics. More specifically the school environment has greater influence on students' performance in Mathematics, than the home environment. Therefore, students' learning ability is highly connected to the Learning environment.

RECOMMENDATION

Based on the findings from this study ,the following recommendations were made

1. Schools should not be sited around the industrial and market areas. This is to avoid noise and pollution.
2. The school environment needs to be kept good with good ventilation, vegetation and all the necessary social amenities to be present in the school.
3. The student's home environment to be conducive for learning by establishing home library and the parent to always make sure that they motivate their children/wards to do their homework and assist them where necessary.

CEBİRSEL MUHAKEME DEĞERLENDİRME ARACI: ARAÇ GELİŞTİRME, GÜVENİRLİK VE GEÇERLİK ÇALIŞMASI

ALGEBRAIC REASONING EVALUATION TOOL: TOOL DEVELOPMENT, THE STUDY OF RELIABILITY AND VALIDITY

ÖZET: Bu araştırmanın amacı ilköğretim yedinci sınıf öğrencilerinin cebirsel muhakeme becerilerini değerlendirmeye yönelik bir ölçme aracı geliştirmektir. Cebirsel muhakeme değerlendirme aracının geliştirilmesinde öncelikle alan taraması yoluyla benzer durumdaki araçların nasıl geliştirildiğine yönelik çalışmalar incelenerek ölçme aracın boyutları belirlenmiştir. Daha sonra her bir boyut için madde havuzu oluşturulmuştur. Oluşturulan bu havuz içerisinden uygun görülen maddeler seçilerek 210 yedinci sınıf öğrencisine uygulanmıştır. Uygulama sonucunda elde edilen veriler kapsamında ölçme aracının geçerlik ve güvenirlik çalışmaları gerçekleştirilmiştir. Güvenirlik çalışması olarak, cronbach alfa iç tutarlılık katsayısı, test-tekrar test güvenirlik katsayısı ve madde analizi sonuçları değerlendirilmiştir. Geçerlik çalışması olarak da kapsam ve yapı geçerlikleri incelenmiştir. Belirtilen analizler neticesinde ölçme aracından elde edilen ölçümlerin geçerli ve güvenilir olduğuna karar verilmiştir.

Anahtar sözcükler: cebirsel muhakeme, geçerlik, güvenirlik

ABSTRACT: The aim of this study is to develop a measurement tool for assessing algebraic reasoning skills of seventh grade students. Firstly, in the development of the algebraic reasoning assessment tool, the sub-dimensions of the measurement tool was determined by analysing researches about how similar tools developed by using field scanning. Later, an item pool was created for each sub-dimension. The items which were chosen from the pool for the reason that they were seen as suitable were applied to 210 seventh grade students.The validity and reliability studies of the measurement tool were carried out by using data obtained from the application. The results of cronbach's alpha coefficient of internal consistency, test-retest reliability coefficients and item analysis were evaluated within the scope of reliability studies. Content and construct validity were analysed within the scope of validity studies. As a result of the mentioned analysis, it was decided that the measurements obtained from the measurement tool is valid and reliable.

Key words: algebraic reasoning, validity, reliability.

GİRİŞ

Cebir, cebirsel düşünme ve muhakeme edebilme becerilerinin bir ön koşulu olarak düşünüldüğünde sadece bir ders konusundan ziyade günlük hayatta karşılaştığımız güçlüklere karşı çözüm yolları bulmamıza yarayan bir araç olarak ele alınması gerekmektedir. Çünkü öğrencilerin cebirde başarılı olabilmeleri için kullanılan temel kavramları, sembolleri, ifadeleri iyi anlaması ve kullanabilmesi gerekir (Kieran, 1992). Nitekim 1989 yılında, aralarında Ulusal Araştırma Konseyi (National Research Council, [NRC]) ve Ulusal Matematik Öğretmenleri Konseyinin (National Council of Teachers of Mathematics, [NCTM] de bulunduğu birçok kuruluş, cebir için fonksiyonel bir yaklaşımın da içinde bulunduğu, cebirsel düşünme ve muhakeme becerisine vurgu yapan bir cebir müfredatının geliştirilmesine yönelik reform çağırısında bulundu (Nilklad, 2004:1). Bu reformun sloganı ise çok sayıda öğrenciye cebiri daha iyi öğretmek, onları cesaretlendirerek cebir öğrenmeye teşvik etmekti. Matematik müfredatının yeniden yapılandırılmasına yönelik bu atılım sayesinde, öğrencilerin cebirsel düşünme ve muhakeme becerilerinin gelişiminde önemli ilerlemeler sağlanmış, erken yaşta cebirsel fikirleri temsil eden değişik türdeki araçlara olan erişim kolaylaşmış, cebirsel beceriler ve anlayışların hızlanmasına paralel olarak geliştirilen düşünceler birçok alanda uygulama fırsatı bulmuştur (NCTM, 2000). Muhakeme kavramı ise Peresini ve Webb (1999)'a göre çeşitli düşünme tarzlarından oluşan bir faaliyettir. Yackel ve Hanna (2003), muhakemeyi hem tümevarım, tümdengelim, ilişkilendirme ve çıkarsamanın kullanımı hem de öğrenenlerin problemleri çözmek için birbirleriyle etkileşime geçtikleri ortak bir faaliyet alanı olarak tanımlamışlardır. Cebirsel muhakeme ise genellikle matematiksel muhakemenin önemli bir formunu oluşturmaktadır (Nilklad, 2004). Bir başka ifade ile cebirsel muhakeme nicel durumları göstererek değişkenler arasındaki ilişkiyi açık hale getirebilme kapasitesidir (Driscoll, 1999). Kaput (1994) göre cebirsel muhakeme; bilerek genellemeler yapma, araştırma ve varsayımda bulunma, modellerin ve düzenlerin temsiline yönelik yapılan süreçlerin inşasıdır. Aynı zamanda cebirsel muhakeme kavramı çeşitli temsillerle modellenen problemlerin ve örüntülerin genellendiğinde matematiksel süreçlerin tanımlanmasında kullanılır (Driscoll, 1999; NCTM, 2000). Bu çalışmada, ilköğretim yedinci sınıf öğrencileri için cebirsel muhakeme değerlendirme aracı geliştirilmiş, geliştirilen ölçme aracının geçerlik ve güvenirlik ile ilgili izlenen süreçler ele alınmıştır.

YÖNTEM

Çalışma Grubu

Araştırmanın çalışma grubunu, İzmir ili Buca ilçe merkezinde bulunan 4 farklı devlet ortaokulunda öğrenim gören 210 yedinci sınıf öğrencisi oluşturmaktadır.

Cebirsel Muhakeme Değerlendirme Aracı

Cebirsel Muhakeme Değerlendirme Aracının geliştirilmesinde Gibson (2005) tarafından ortaya konulan üç aşama kullanılmıştır. Birinci aşamada, kullanılacak aracın geliştirilebilmesi için literatür taraması yoluyla hem matematiksel hem de cebirsel muhakemenin değerlendirilmesi amacıyla gerçekleştirilmiş olan araştırmalar incelenmiştir. İkinci aşamada, cevap formatlarının belirlenmesi, soru bankasının oluşturulması, kapsam geçerliliğin sağlanması, her bir madde içerisinde yer alan belirsizliğinin belirlenerek giderilmesi ve maddelerin geniş bir örneklem grubuna uygulanması olmak üzere beş adımda gerçekleştirilmiştir. Üçüncü aşamada ise madde analizi, path analizi ve ölçme aracından elde edilen ölçümlerin güvenirlik çalışması yapılmıştır.

Kavramın Tanımlanması

Öncelikle literatürde muhakemenin değerlendirilmesi ile ilgili yapılmış çalışmalar incelenerek ölçme aracının boyutları belirlenmiştir. NCTM (2000) muhakeme becerilerini; muhakeme ve ispat kategorileri ile birlikte ele almaktadır. NAEP (2002) muhakeme becerilerine problem çözme becerisi ve matematiksel güç içerisinde yer vermekte, Bloom'un sınıflamasında muhakeme becerileri; sentez ve değerlendirme gibi üst basamaklar karşılamaktadır (Suzuki, 1998). TIMMS (2003) muhakeme becerilerini; analiz, genelleme, sentez, karar verme ve rutin olmayan problemleri çözme kategorileri içerisinde tanımlamakta, MEB (2009) ise muhakeme becerilerini akıl yürütme becerisi olarak ele almaktadır.

Tablo 1. Cebirsel Muhakeme Değerlendirme Aracının Boyutları ve Soru Sayılarının Dağılımı

Araç Boyutları		Beceri Sayısı ve Oranları	
		f	%
Ana-liz	Cebirsel yapıları/ilişkileri tanıma ve kullanma	10	23,8
	Aynı verinin farklı cebirsel ifadelerini kullanma	3	7,1
	Uygun cebirsel muhakemeyi belirleme	7	16,7
Cebirsel ifadelere yönelik çıkarımda bulunma		6	14,3
Çıkarıma yönelik cebirsel işlemler yapma		4	9,5
Sonucun doğruluğuna ve çözüm yoluna karar verme		5	11,9
Rutin olmayan problemleri çözme		7	16,7
Toplam		42	100

Maddelerin Geliştirilmesi

Literatür taraması sonucunda, ölçme aracının belirlenen her bir boyutu için NCTM, NAEP, TIMMS ve MEB tarafından ortaya konulmuş olan değerlendirme ile ilgili ölçütler ve veri toplama araçları dikkate alınmıştır. Araçta öğrencilerin cebirsel muhakeme yetenekleri ile ortak ve alana özgü becerilerin, duyuşsal özelliklerin, öz düzenleme ve psikomotor becerilerini ortaya çıkarabilecek açık uçlu sorular ile ölçme aracının kapsam geçerliliğinin sağlanması amacıyla çoktan seçmeli tipte soruların kullanılmasına karar verilmiştir.

Psikometrik Ölçümler: Güvenirlik Çalışmaları

a) İç Tutarlılık Katsayısı

Hesaplanan iç tutarlılık katsayısı için de genel kabul en az 0,70 olmasıdır (Büyüköztürk, 2003; Özçelik, 2010; Pilten, 2008). Ölçüm sonuçlarına göre Cronbach-Alfa güvenirlik katsayısı 0,93 olarak hesaplanan ölçme aracının katsayısı 0,70'in üzerindedir.

b) Test-Tekrar Test Güvenirliği

Test-tekrar test güvenirlik çalışması amacıyla cebirsel muhakeme değerlendirme aracı, deneme uygulaması yapılmış olan 210 öğrenciden tesadüfî olarak seçilmiş olan 30'una 3 hafta sonra tekrar uygulanmıştır. Öğrencilerin iki uygulamadan almış oldukları puanlar için hesalanan Pearson Momentler Çarpımı Korelâsyon Katsayısı 0,77 olarak hesaplanmıştır. Bu sonuç, ölçme aracının test-tekrar test ölçüm güvenirliğine de sahip olduğunu göstermektedir.

c) Madde Analizi

Değerlendirme aracında yer alan, çoktan seçmeli soru tipinde olan maddelerin madde analiz işlemleri için "Finesse" adlı test analiz programı kullanılmıştır. Cebirsel muhakeme değerlendirme aracında yer alan açık uçlu soruların madde ayırt edicilik ve güçlük indekslerinin hesaplanmasında ise Öncü (1999)'ün belirtmiş olduğu formüllerden yararlanılmıştır.

Tablo 2. Cebirsel Muhakeme Değerlendirme Aracında Yer Alan Maddelere Ait Madde Güçlük ve Ayırt Edicilik Gücü İndeksleri

Boyut	Soru Tipi	Soru No	Güçlük İneksi (pj)	Ayırt Edicilik (dj)
Cebirsel yapıları/ilişkileri tanıma ve kullanma	Ç. S.	1	0.60	0.61
	Ç. S.	2	0.79	0.61
	Ç. S.	3	0.71	0.52
	Ç. S.	4	0.78	0.67
	Ç. S.	5	0.28	0.06*
	Ç. S.	6	0.74	0.56
	Ç. S.	7	0.66	0.71

Madde güçlük indeksinin 0,50 olması sorunun orta güçlükte olduğunu gösterir (Atılgan, Kan ve Doğan, 2007). Tablo 2 incelendiğinde cebirsel muhakeme değerlendirme aracında yer alan maddelerininin çoğunluğunun orta güçlük ve orta güçlüğe yakın değerlerde olduğu görülmektedir. Ayırıcı gücü 0,40 veya daha yüksek olan maddeler "çok iyi", 0,30 ile 0,40 arasında olanlar "iyi" maddelerdir. Ayırıcı gücü 0,20 ile 0,30 arasında olan maddeler zorunlu ise kullanılmalı; pozitif olmakla birlikte 0,20'den düşük olanlar mutlaka geliştirilmelidir. Testte, ayırıcı gücü negatif olan, ters ayrım yapan maddelere hiç yer verilmemelidir (Özçelik, 1992:220). Tablo

2'e göre, maddelerin çoğunluğunun madde ayırt edicilik güçleri bakımından oldukça iyi oldukları söylenebilir. Ancak 5, 9 13 ve 42 sorularının ayırt edici indeksleri bakımında düşük olmasından dolayı araçtan çıkarılması uygun görülmüştür. Söz konusu soruların araçtan çıkarılmasıyla güvenirlik katsayısı 0,94 olarak bulunmuştur.

Geçerlik Çalışması

Araştırmada kullanılan "Cebirsel Muhakeme Değerlendirme Aracının" geçerliği kapsam ve yapı geçerlikleri yoluyla test edilmiştir.

Kapsam Geçerliği

İçerik geçerliği ölçeğin, bütünün ve alt boyutlarının ölçülmek istenen alanı ölçüp ölçmediğini ve ölçülecek alan dışında farklı kavramları barındırıp barındırmadığını değerlendirmek amacıyla yapılır (Gözüm ve Aksayan, 2003:10). Bu amaçla geçerlik işlemleri sırasında ölçme aracı boyutlarının birbiriyle olan ilişkilerinin belirlenmesinde Pearson Momentler Çarpımı Korelâsyon Katsayısı kullanılmıştır (Tablo 3). Her bir boyutun ölçme aracı ile olan ilişkisinin belirlenmesinde ise regrasyon katsayılarından yararlanılmıştır (Tablo 4).

Tablo 3. Modele İlişkin Korelâsyon Matrisi

	CYİTK	AVFCİK	UCMB	CİYÇB	ÇYCİY	SDÇYKV	ROPÇ
CYİTK	1,000						
AVFCİK	,735	1,000					
UCMB	,693	,641	1,000				
CİYÇB	,632	,631	,631	1,000			
ÇYCİY	,634	,660	,635	,643	1,000		
SDÇYKV	,629	,679	,646	,586	,673	1,000	
ROPÇ	,580	,597	,588	,587	,614	,651	1,000

Tablo 4. Modele İlişkin Standardize Edilmiş Regrasayon Katsayısıları

	Regrasyon Katsayısı	P
CMDA → CYİTK	.872	.000
CMDA → AVFCİK	.824	.000
CMDA → UCMB	.847	.000
CMDA→ CİYÇB	.804	.000
CMDA → ÇYCİY	.822	.000
CMDA → SDÇYKV	.827	.000
CMDA → ROPÇ	.794	.000

(CMDA: Cebirsel Muhakeme Değerlendirme Aracı, CYİTK: Cebirsel yapıları/ilişkileri tanıma ve kullanma AVFCİK: Aynı verinin farklı cebirsel ifadelerini kullanma, UCMB: Uygun cebirsel muhakemeyi belirleme, CİYÇB: Cebirsel ifadelere yönelik çıkarımda bulunma, ÇYCİY: Çıkarıma yönelik cebirsel işlemler yapma, SDÇYKV: Sonucun doğruluğuna ve çözüm yoluna karar verme, ROPÇ: Rutin olmayan problemleri çözme)

Tablo 3 incelendiğinde ölçme aracı boyutları arasında en yüksek ilişkinin "cebirsel yapıları/ilişkileri tanıma ve kullanma" ile "aynı verinin farklı cebirsel ifadelerini kullanma" arasında (r=0,735), en düşük ilişkinin ise "cebirsel yapıları/ilişkileri tanıma ve kullanma" ile "rutin olmayan problemleri çözme" (r=0,580) arasında olduğu görülmektedir. Sonuç olarak araç boyutları arasındaki ilişki göz önüne alındığında Cebirsel Muhakeme Değerlendirme Aracının kapsam geçerliğinin olduğu söylenebilir.

Yapı Geçerliği

Yapı geçerliği, bir ölçeğin ve ondan elde edilen puanın gerçekte ne anlama geldiğini araştırma sürecidir. Bu süreç, ölçeğin öçtüğü faktörler incelenerek ya da geçerliği araştırılan ölçeğin diğer ölçek ve ölçülerle olan ilişkisini araştırarak gerçekleştirilir (Gözüm ve Aksayan, 2003:11). Tablo 5'de mükemmel ve iyi uyum değerleri, modelin geçerli sayılabilmesi için uyum testlerine ait değerlerin bulunması gereken aralıkları göstermektedir (Çokluk ve diğer.,2010). Cebirsel muhakeme modeline ilişkin elde edilen değerler ise deneme uygulaması sonunda model uyum testlerinden alınan puanları ifade etmektedir.

Tablo 5. Model Uyum Indeksi ve Modele İlişkin Değerler

Uyum Indeksi	Mükemmel Uyum	İyi Uyum	Cebirsel Muhakeme Modeline Ait Değerler
x^2/sd	$0 \leq x^2/sd \leq 2$	$2 \leq x^2/sd \leq 3$	1.404
RMSEA	$0 \leq RMSEA \leq 0.05$	$0.05 \leq RMSEA \leq 0.08$	0.044
AGFI	$0.95 \leq AGFI \leq 1.00$	$0.90 \leq AGFI \leq 0.95$	0.901
NNFI	$0.95 \leq NNFI \leq 1.00$	$0.90 \leq NNFI \leq 0.95$	0.940
IFI	$0.95 \leq NFI \leq 1.00$	$0.90 \leq NFI \leq 0.95$	0.950

CFI	$0.95 \leq CFI \leq 1.00$	$0.90 \leq CFI \leq 0.95$	0.950

(x^2 / sd: Ki-Kare Değerinin Serbestlik Derecesine Oranı, RMSE: Yaklasık Hataların Ortalama Karekökü İndeksi, AGFI: Ayarlanabilir İyilik Uyum İndeksi, NNFI: Normlaştırılmamış Uyum İndeksi, IFI: Artmalı Uyum İndeksi, CFI: Karşılaştırmalı Uyum İndeksi)

SONUÇLAR

Öncelikle ilk formdan oluşan 42 maddelik ölçme aracından elde edilen ölçümlerin Cronbach Alfa güvenirlik katsayısı hesaplanarak 0,93 olarak, daha sonra da ayırt edicilik indeksi ideal değerin altında olan 4 madde çıkartıldığında Cronbach Alfa güvenirlik katsayısı 0,94 olarak bulunmuştur. Bu sonuç aracın iç tutarlılık katsayısı bakımından ölçüm sonuçlarının güvenilir olduğunu göstermektedir. Yapılan analizler sonucunda aracın Test-Tekrar Test Güvenirlik katsayısı 0,77 olarak bulunmuştur. Bu sonuç literatürde bir testin güvenilir kabul edilebilmesi için gereken en küçük değerdeden (0,70) büyük olduğunu göstermektedir. Finesse programı yardımıyla yapılan madde analizi sonucunda 38 maddenin ayrıt edicilik indeksinin oldukça iyi ve iyi, 4 maddenin de düzeltilmeye ve geliştirilmeye muhtaç ve zayıf olduğu görülmektedir. Ayrıca LISREL 8.72 programı ile her bir alt boyutun, birbirleriyle ve tüm testle olan ilişkisine bakıldığında aracın kapsam geçerliğinin olduğu görülmektedir. Aracın yapı geçerliğine ilişkin değerler incelendiğinde ise uyum testlerinden elde edilen puanların iyi uyum ile mükemmel uyum aralıklarında olduğu görülmektedir.

NOT: Bu çalışma, 2013.KB.EĞT.009 nolu proje kapsamında Dokuz Eylül Üniversitesi Bilimsel Araştırma Projeleri Koordinasyon Birimi tarafından desteklenen, ikinci yazar danışmanlığında, birinci yazar tarafından hazırlanan "Çoklu Temsil Temelli Öğretimin Öğrencilerin Cebirsel Muhakeme Becerilerine, Cebirsel Düşünme Düzeylerine ve Matematiğe Yönelik Tutumlarına Etkisi Üzerine Bir İnceleme" isimli doktora çalışmasının bir bölümünü oluşturmaktadır.

TEACHING THE FUTURE TEACHERS: MAKING SCIENCE RELEVNAT, USEFUL AND MEANINGFUL FOR NEW ZEALAND PRE-SERVICE TEACHERS

Steven S. SEXTON
University of Otago
steven.sexton@otago.ac.nz

ABSTRACT: This self-study investigated how one teacher educator and his final-year pre-service teachers perceived the primary science classroom learning environment. The study utilized the Nature of Science as Argumentative Questionnaire (NSAAQ) and regularly scheduled focus group interviews. These tools investigated how the learning environment the teacher educator created effectively modelled the pedagogical approaches stated in *The New Zealand Curriculum*. The initial NSAAQ results indicated where the pre-service teachers understanding of the nature of science were naïve and what aspects needed to be addressed over the course of the programme. Focus group sessions revealed how student teachers' science attitudes altered over their course of study. These pre-service teachers reported they are now more confident to teach science and that their teacher educator influenced their anticipated teaching practices. The findings support the explicit inclusion of the effective pedagogy approaches from the curriculum. This research supports the importance of self-study in initial teacher education.

Key words: Primary science, Teacher education, Self-study

INTRODUCTION

A number of challenges for the New Zealand educational system in primary science have been reported (Bull, Gilbert, Barwick, Hipkins, & Baker, 2010; Education Review Office, 2012; Gluckman, 2011). All of these reports note that while there are some noteworthy science teaching practices, there are more issues regarding ineffective science teaching. Many of the challenges for primary school science are neither new to New Zealand nor to many other countries (Ginns & Watters, 1995; Prenzel, Seidel, & Kobarg, 2012).

Teacher quality is one of the main means to address the challenges in primary science education (Gluckman, 2011). But how is a quality primary school teacher prepared for education in science? It has been noted that how teachers are prepared for the classroom during their university education is a good indicator of how well they may eventually teach (Darling-Hammond, 1999; Education Review Office, 2010; Rice, 2003). Within initial teacher education (ITE) programmes, two influences need to be considered when evaluating future teacher quality: the teacher educator (Cochran-Smith, 2003); and, if the pre-service teachers practice teaching using the pedagogy learned during their coursework (Hudson & Skamp, 2002).

Teacher educators create the classroom learning environments in which pre-service teachers experience learning and teaching. How then do teacher educators and their classroom learning environments contribute to the multi-faceted educational picture of primary science teacher preparation? Does the teacher educator's practice and created learning environment influence how final-year student teachers may eventually teach primary science?
The purpose of the present study was an investigation into how the researcher, as teacher educator, and his final-year undergraduate pre-service teachers understood the programme's targeted primary science. The research scrutinized which aspects of the researcher's classroom practices influenced the pre-service teachers' pedagogical understandings of primary science. The study explicitly sought to identify the extent to which the student teachers' perceived how the classroom modeled *The New Zealand Curriculum*'s (Ministry of Education, 2007) effective pedagogy approaches.

Why Teacher Educators?

Who teaches the teachers how to teach? This task is given to teacher educators (Cameron & Baker, 2004). Even though teacher educators are an important aspect of teacher education, research literature indicates we are an often-neglected group in research studies. Little research has focused on the quality or expertise of teacher educators (Cameron & Baker, 2004; Smith, 2005).

The present study focused on the practice of one teacher educator, the researcher, and how he worked to develop science pedagogical understandings in seventeen final-year undergraduate pre-service teachers. As teacher educators are responsible for providing pre-service teachers with strong foundations of professional teaching knowledge, the researcher wanted to inform his own teaching practice.

Why Effective Pedagogy As Defined In *The New Zealand Curriculum*?

The New Zealand Ministry of Education introduced a dramatically revised integrated curriculum document in 2007 compared to the previous curriculum documents (Benade, 2009). Included in the 2007 curriculum are seven pedagogical approaches that teachers are encouraged to incorporate into their own teaching practice. These are creating a supportive learning environment; encouraging reflective thought and action; enhancing the relevance of new learning; facilitating share learning; making connections to prior learning and experience; providing sufficient opportunities to learn; and, teaching as inquiry. The curriculum document notes that these pedagogies are based on a wide body of evidence about what positively impacts student learning (Ministry of Education, 2007). Pre-service teachers, therefore, need first authentic exposure to and then practical experience in these approaches in order to be able to incorporate them into their own teaching practice.

METHODOLOGY

To address the research question, this self-study research project used a mixed method framework (Lunenberg, Zwart, & Korthagen, 2010; Russell, 2010). Mixed method is a methodology often used in learning environment studies and has proven to be effective (Aldridge, Fraser, Taylor, & Chen, 2000; Pickett & Fraser, 2002).

Nature Of Science As Argument Questionnaire

The researcher selected the Nature of Science as Argument Questionnaire (NSAAQ) for the present study, see Appendix. The NSAAQ developed by Sampson and Clark (2006) measures key aspects of participants' epistemological understanding of the nature of scientific knowledge. The NSAAQ provides information on four specific aspects of the nature of science. These are the nature of scientific knowledge; how scientific knowledge is generated; how that knowledge is evaluated; and science as a socially and culturally embedded practice. The questionnaire has proven validity (Sampson & Clark, 2006).

The survey was administered by the researcher at the beginning of the first session of the programme to establish an understanding of what these final year pre-service teachers understood about the nature of science. For this ITE programme, student teachers are required to take a compulsory introductory course in science in their first-year of their undergraduate programme. As part of their final-year of study, student teachers are required to take Literacy and Numeracy plus two additional curriculum learning areas of their choice, of which science is one option. This programme is delivered over ten two-hour tutorials.

Focus Group Sessions

Focus group sessions were used to elicit pre-service teachers understandings of Shulman's (1986) theoretical constructs of pedagogical content knowledge (PCK). PCK is generally seen as a combination of general pedagogical knowledge and subject matter knowledge (Gess-Newsome, 1999). Content knowledge (CK) by contrast, is defined as the subject matter that is taught and how it is organised in the teacher's mind (Shulman, 1986). Teacher educators need both knowledge types to develop in pre-service teachers as teachers draw on these knowledge constructs to know what to teach and how to teach it. As the NSAAQ examined what aspects of the nature of science these pre-service teachers understood, the focus group sessions evaluated what pedagogy individuals understood from the course and if it reflected the effective pedagogy approaches from *The New Zealand Curriculum* document. The focus group sessions were a regular part of their university coursework and each averaged 25 minutes of the two-hour tutorials.

The researcher conducted all sessions, as these were a part of their science education course. The transcripts were continuously reviewed for themes that emerged by analytic induction (Erickson, 1986). Analytic induction is a way to sift through the narrative data, first coding for general themes. One of the themes the transcribed interviews were coded for were indications of how the researcher's/teacher educator's primary science course was impacting on pre-service teachers' pedagogy. After coding for general themes, each general theme was then analysed again until a more detailed pattern emerged. The detailed themes that emerged from the data were then linked, when possible, to *The New Zealand Curriculum's* effective pedagogy to formulate an overall understanding of what was taught by the teacher educator and what was perceived by pre-service teachers.

Participants

Participants for this study were from one undergraduate programme of study at a large university in New Zealand. All 17 student teachers enrolled in the 2014 final-year science curriculum studies course voluntarily participated in this study. The ten two-hour sessions were face-to-face tutorials. Participants were 18-years or older, of which 15 were female and two male, see Table 1:

Table 1: Participants' Self-Identified Demographic Data from NSAAQ

Total surveys	17
Female	15
Male	2
NZ European	17
18-20-years	2
21-25-years	10
26-29-years	4
30 + years	1

Science Education Programme

The present study's science programme was a ten-session course of study in the first semester of 2014. The student teachers who enrolled into this science paper did so voluntarily. These student teachers were informed that they would be required to create a unit of study on a primary science topic as the assessment requirement for this course. During this final-year of study, the student teachers spent one-day a week in a school as part of their professional learning experience. At the completion of this course, the student teachers had two weeks to prepare for a three-week block placement of sustained control teaching of this same class. It is anticipated that the student teachers will use their unit of work while on this sustained teaching placement, but this is not a course requirement.

On the first day of the science education course, the teacher educator informed the student teachers that the course science content would be determined by their input. As this course requires the student teachers to build a unit of work based on the interests and abilities of their teaching placement classroom, their science education facilitator would model this. The student teachers brought to the second tutorial the science topics they wanted the course to include; see Table 2.

Table 2: Teaching and Learning Schedule

Week	Course Content	Explicit Nature of Science – New Zealand Curriculum	Explicit Nature of Science pedagogy	Explicit effective pedagogy - *The New Zealand Curriculum*
1	Agar jelly dishes: using science to explain school/class rules	Reviewing *The New Zealand Curriculum*'s science learning area: Nature of Science and the four Content Strands	The nature of scientific knowledge	Creating a supportive learning environment
2	Cool bombs: common kitchen ingredients	How Investigating in Science and Understanding about Science link	How scientific knowledge is generated	Encouraging reflective thought and action
3	Mini-beasts: how to investigate the Living World, ethics of science	The importance of students being able to use the correct vocabulary to talk about science	How scientific knowledge is evaluated	Enhancing the relevance of new learning
4	Change of State: how the Physical World is different from the Material World	Relating the science to students' everyday world	How scientific knowledge is generated	Facilitating shared learning
5	Gardening	Using both Living World and Planet Earth to demonstrate Participating and Contributing	Science as a culturally and socially embedded practice	Making connections to prior learning and experience
6	Space	Effective and models to Investigate in science using Planet Earth and Beyond	The nature of scientific knowledge	Providing sufficient opportunities to learn
7	Planet Earth: Volcanoes, Tornados, Weather	How Earth behaves and how to incorporate appropriate vocabulary for students	Science as a culturally and socially embedded practice	Encouraging reflective thought and action; Making connections to prior learning and experience
8	Games	Types of fun that facilitate student learning about their world	How scientific knowledge is evaluated	Facilitating shared learning; Providing sufficient opportunities to learn
9	Electricity	Integration of all four elements of the curriculum's Nature of Science	How scientific knowledge is generated	Teaching as inquiry
10	Explosions	Integration of all four elements of the curriculum's Nature of Science	Science as a culturally and socially embedded practice	Teaching as inquiry

RESULTS

Each question of the NSAAQ presents two contrasting views of the nature of science, a naïve and an informed perspective. A five-point scale separates the two statements (Sampson, 2006). The NSAAQ survey includes at least five questions addressing each of the four identified aspects. Quantifiable data from the NSAAQ surveys was analysed using the Statistical Package for the Social Sciences (SPSS) version 21.0. The consistency of the responses among the participants' responses to the individual NSAAQ items was calculated by using Cronbach alpha coefficient as 0.64 for the initial test and .71 for the second test that indicated that the questionnaire had sufficient internal consistency (Gliem & Gliem, 2003).

NSAAQ And Scoring Descriptions

In scoring the responses to the NSAAQ survey, a naïve view was taken as a response of 1, 2 or 3, while an informed view was taken as a score of 4 or 5. This decision was based on the premise that participants who selected 3 for their response to any of the NSAAQ questions were unable to make a distinction between the two views (Sampson, 2006). The mean, standard deviation and percentage of respondents who selected 1, 2 or 3 for each question was calculated (see Table 3, below). The range of the means for the initial-test questions was from 1.51 to 4.55, while the range of the second-test was 2.59 to 4.94.

Table 3: Student Teachers' views of Nature of Science

NSAAQ	M	SD	% answering 1, 2, or 3	M	SD	% answering 1, 2, or 3
	Initial-test			Second-test		
1	2.3	1.27	82.3	2.59	.64	70.6
2	2.89	1.19	47.1	3.71	.64	35.3
3	3.75	0.97	29.4	4.06	.49	0
4	4.21	0.41	0	4.41	.56	0
5	2.22	0.92	88.2	2.88	.75	58.8
6	3.93	1.22	29.4	4.94	.73	0
7	3.01	0.89	82.4	3.47	.66	47.1
8	4.42	0.49	0	4.53	.50	0
9	2.56	0.67	100	2.88	.83	82.3
10	1.90	0.71	100	2.59	.92	88.2
11	2.48	0.85	100	3.17	.96	70.6
12	1.51	0.67	100	3.29	.80	58.8
13	3.32	0.78	70.6	3.24	.84	70.6
14	3.08	0.77	82.4	3.94	.40	41.2
15	3.63	1.23	29.4	4.88	.39	0
16	2.85	1.16	82.4	3.18	.97	58.8
17	3.01	0.89	70.6	4.12	.85	11.8
18	3.92	0.83	23.5	3.35	.59	17.6
19	4.13	0.72	23.5	4.24	.46	0
20	2.71	1.19	70.6	2.76	.78	64.7
21	2.72	0.94	70.6	3.29	.89	58.8
22	2.63	0.66	100	2.94	1.22	64.7
23	3.76	1.00	29.4	4.41	.67	0
24	2.91	0.83	70.6	3.00	1.00	58.8
25	4.11	0.87	17.6	4.71	.46	0
26	4.55	0.50	0	4.94	.30	0
Overall	3.15	0.87		3.67	.70	

The researcher decided to calculate the percentage of respondents who indicated 1, 2, or 3 for each question as this provided an indication of the percentage of respondents holding naïve views. The range for the percentages for the initial test was from 0 to 100%. This identified the five questions where all of these student teachers held naïve views, see questions 9, 10, 11, 12 and 22.

Overall, these student teachers held naïve views for 12 of the 26 pre-test questions. This indicated what the teacher educator needed to prepare in the course material that would address both the student teachers' pedagogical content knowledge in effective science education and the nature of science aspects covered by questions 9, 10, 11, 12 and 22. At the completion of this programme, these student teachers held naïve views for only 6 of the 26 questions which included questions 9, 10 and 22.

Effective Pedagogy Approaches

As *The New Zealand Curriculum* highlights seven effective pedagogical approaches, the researcher wanted to investigate how well these teaching approaches were reflected in the data analyses. Creating a supportive learning environment recognises that learning is social and cultural process. Students learn better when they part of a positive classroom environment (Ministry of Education, 2007). This approach was noted by almost all the student teachers as one of the strengths of the course. One student noted, "I have really enjoyed science and have particular liked how you designed the course so that what we learnt was relevant for our teaching practice." These student teachers really appreciated the amount of control they had over course content. This was commented upon by most of these student teachers, for example, "it was helpful to be able to choose the topics we covered in the classes." When asked to explain how this was helpful, this student teacher added, "these are topics that are useful to us as these are what our mentor [classroom teacher hosting the student teacher] want us to teach."

As part of the learning environment, these student teachers had multiple opportunities to develop and reflect on their own and others' ideas in scaffold opportunities of reflective thought and action (Ministry of Education, 2007). These student teachers commented that the classroom was a learning environment that not only encouraged them to question the teacher educator's plans, methods and ability to explain concepts but also to develop their own ideas with each other. Support for these approaches was observed during the hands-on science activities used in class sessions that then had the student teachers reflect and discuss what they thought they knew and what actually occurred. It should be noted that some activities elicited significantly more reflection and frustration than others did, for example, it was anticipated that many of these student teachers would find it difficult to use models to demonstrate the orbit of the Moon and explain a near total lunar eclipse was going to be visible from New Zealand on April 15th, 2014. The Moon's orbit provided these student teachers an opportunity to reflect critically on how activities are able to lead to deeper thinking. As effective and appropriate use of models to stimulate critical reflective thought and discussion is an area where these student teachers needed more support, they were informed that they would need to include in their unit plans how and where they were going to encourage their students to engage in critical reflection.

The learning classroom environment cultivates shared learning and reflective discourse (Ministry of Education, 2007). The teacher educator, using both small group and whole group discussions, supported these approaches as classes developed the language of teaching as well as the language used in science by engaging in hands-on science activities. *The New Zealand Curriculum* places the Nature of Science as the overarching strand of science in New Zealand. It should be noted that the Nature of Science (capital letters) is different from the nature of science (lower case letters). In New Zealand, the Nature of Science includes understanding about science, investigating in science, communicating in science, and, participating and contributing. Teachers use appropriate science content to expand their students' worlds through the Nature of Science. Teachers, therefore, need to provide the opportunities to allow students to ask questions about the science they are doing, use the appropriate vocabulary necessary to talk about the science they are doing and understand how this science relates to their world. As one student teacher commented, "I found it [this course] very helpful in the sense that you learnt how to teach science." When asked to clarify what she meant, she went on to state, "science is students using the correct words to questioning each other, to question the science and question me as the teacher." In this same focus group session, another student teacher remarked that she found out that it was, "ok for a teacher not to know everything" and that one can, "learn from your students" which were attitude shifts from how she learned science in school.

Students' learning is supported when new knowledge is incorporated with what they already know and connections can be made to other learning areas (Ministry of Education, 2007). This teaching approach was supported with pre-service teachers commenting on how science could be ordinary things from their everyday life. They noted how to use activities that students would be able to connect to their own lives, such as batteries, rubber bands, paper clips, and metal cans to make a toy that returns to the child when rolled away.

Students' deeper learning is facilitated when they understand what, why and how they could use their new learning; that is enhancing the relevance of new learning having the opportunities to learn (Ministry of Education, 2007). This was best represented when one student commented that after the session on weather (see session 7, Table 2) he now understood how and why thunder occurs. Even better, in the focus group session for session 8, he talked about doing the previous week's thunder activity with his teaching experience class and how with a piece of paper he showed his students and mentor in less than 30-minutes, "how cool science can be." As stated, in this programme student teachers were explicitly involved in making their own learning decisions. More than one student teacher was pleased that what was being taught was what they could use in their own unit planning or weekly teaching; for example, "I liked how each class covered a different aspect of science, based on what anyone needed or was going to need in their up coming practicum."

The teacher educator modelled in the course and made explicit examples of how the programme content was reviewed and adjusted using evidence-based strategies. This was done so the student teachers were aware of when the teacher educator was implementing inquiry into the teaching and learning relationship (Ministry of Education, 2007). As stated, the student teachers were required to plan a science unit that was anticipated they would teach. They were instructed that as part of their planned unit they would be assessed on how well they linked lessons and built on the conceptual understandings of their students. This was done to support the pre-service teachers need for structured assistance to understand how to challenge ideas and assess student learning. Not all of the student teachers appreciated this emphasis on modelling what, how and why in learning.

One student teacher rated the course very well and noted that, "Steve always put 100% into ever lesson, which was interesting and hands on for us the students." This same student teacher then commented that I was supportive and helpful with the assessment tasks, but not as helpful and supportive in class. It would appear for at least this one student teacher a ten-week course was not long enough in showing her the importance of challenging what she thought she knew about science. Not only did see comment negatively on having her ideas challenged by the course but also she did not alter her naïve position for NSAAQ questions 9, 10, 11, 12 or 22.

CONCLUSIONS

The NSAAQ was developed to address concepts of the nature of science, and to provide a tool that could be used to discriminate between how the nature of science is viewed. In addition to identifying participants' nature of science understanding, the individual questions provided a tool to highlight the specific nature of science concepts to explore within the tutorials in order to enhance each individual's understanding.

Semi-structured focus group sessions supported how student teachers' perceptions changed over the course. Overall, these student teachers did move to a more positive attitude towards how to teach primary science than when they started the course and linked this to the teacher educator's enthusiasm and passion for the topic. As teacher dislike of science is a reason why some students are not taught science (Sexton, Atkinson & Goodson, 2013), the shift to a more positive attitude towards science by these student teachers is encouraging.

During the focus group sessions, the student teachers commented on how the teacher educator modelled the science teaching practices they were expected to use. The student teachers, however, indicated that more work on their part was required before they would feel as confident in their teaching practice. This supports research that student teachers need to experience effective pedagogy for it to be incorporated in their own PCK (Stofflett & Stoddart, 1994).

One aspect of the primary science course that these student teachers commented on was that after being introduced to effective pedagogy through science education, they wanted more practice in using it. Many of these student teachers stated. "I feel much more confident in teaching science now" as they felt much better prepared by this course to teach science. However, once student teachers are in a teaching position, research indicates it was difficult for them to implement the pedagogy they learnt at university as they coped with full-time responsibilities of a classroom (Sexton, Atkinson & Goodson, 2013).

Hands-on activities were used during the coursework and the use of activities like these was stated as a key pedagogical approach that shaped how many of the student teachers would begin to teach science in their own classrooms. This is a positive outcome as it indicates these student teachers intend to implement a more student centred approach to hands-on science. However, how well and how often these student teachers will actually use hands-on activities once they are classroom teachers is not known. As the reality of limited school resources, teacher preparation and setup time, as well as scheduling time for science teaching impacts beginning teachers

(Education Review Office, 2012), follow-up research is required to indicate if high quality hands-on activities are actually used.

Another concern that might affect the student teachers' science pedagogy is the emphasis on literacy and numeracy. This emphasis on literacy and numeracy is a reason given in the 2010 Education Review Office report as to why primary science teaching time has waned in schools. Other researchers have reported that when science is not considered important by teachers or is assigned a low priority compared to other subjects like literacy and numeracy, little time is spent teaching it (Education Gazette, 2009; Roden, 2000).

Effective pedagogies should be taught not only in science but also across all subject areas during the pre-service teachers' education. ITE providers should review what is taught throughout the teaching degree programmes and evaluate if effective pedagogies are taught, linked and explicitly made known to student teachers. As New Zealand's Ministry of Education is interested in having these approaches utilised by its teachers, more research into the application of the approaches as well as student and in-service teacher professional development in the use of the approaches would be required. As these effective pedagogical approaches are not just for the curriculum area of science, educational opportunities in how to use them effectively is necessary.

RECOMMENDATIONS

Teachers are the key to a quality education as they are the link between curriculum, pedagogy, assessment, and social and learning outcomes (Jones & Baker, 2005). Primary school teachers who can effectively develop these links in the learning area of science are needed (Gluckman, 2011). But it is difficult to achieve a positive link for New Zealand primary students when many of their primary school teachers are uncomfortable with teaching science (Education Review Office, 2010, 2012; Lewthwaite, 2000).

An important element in teacher education is the teacher educator. Teacher educators convey all aspects of *The New Zealand Curriculum* to include both necessary content knowledge and pedagogical content knowledge. Therefore, teacher educators need to know which parts of their practice are influencing pre-service teachers. Teacher educators should not assume that the concepts taught and modelled during primary science coursework are understood, nor that in the future they will be integrated into the teaching pedagogy of the student teachers once they are in a classroom situation.

APPENDIX:

Nature of Science as Argumentative Questionnaire (NSAAQ)

Directions: Read the following pairs of statements and then circle the number on the continuum that best describes your position on the issue described. The numbers on the continuum mean:

1 = I completely agree with viewpoint A and I completely disagree with viewpoint B

2 = I agree with both viewpoints, but I agree with viewpoint A more than I agree with viewpoint B

3 = I agree with both viewpoints equally

4 = I agree with both viewpoints, but I agree with viewpoint B more than I agree with viewpoint A

5 = I completely agree with viewpoint B and I completely disagree with viewpoint A

What is the nature of scientific knowledge?

When you think of the body of knowledge that has been generated by the work of scientists, how would you describe it? The statements below describe scientific knowledge from different viewpoints.

	Viewpoint A	A not B	A>B	A=B	B>A	B not A	Viewpoint B
1	Scientific knowledge describes what reality is really like and how it actually works.	1	2	3	4	5	Scientific knowledge represents only one possible explanation or description of reality.
2	Scientific knowledge should be considered tentative.	1	2	3	4	5	Scientific knowledge should be considered certain.
3	Scientific knowledge is subjective.	1	2	3	4	5	Scientific knowledge is objective.
4	Scientific knowledge does not change over time once it has been discovered	1	2	3	4	5	Scientific knowledge usually changes over time as the result of new research and perspectives
5	The concept of 'species' was invented by scientists as a way to describe life on earth.	1	2	3	4	5	The concept of 'species' is an inherent characteristic of life on earth; it is completely independent of how scientists think.
6	Scientific knowledge is best described as being a collection of facts about the world.	1	2	3	4	5	Scientific knowledge is best described as an attempt to describe and explain how the world works.

How is scientific knowledge generated?

When you think of what scientists do in order to produce scientific knowledge, how would you describe this process?

The statements below describe different viewpoints for how scientific knowledge is generated.

	Viewpoint A	A not B	A>B	A=B	B>A	B not A	Viewpoint B
7	Experiments are important in science because they can be used to generate reliable evidence.	1	2	3	4	5	Experiments are important in science because they prove ideas right or wrong.
8	All science is based on a single scientific method	1	2	3	4	5	The methods used by scientists vary based on the purpose of the research and the discipline.
9	The methods used to generate scientific knowledge are based on a set of techniques rather than a set of values.	1	2	3	4	5	The methods used to generate scientific knowledge are based on a set of values rather than a set of techniques.
10	Science is best described as a process of exploration and experiment.	1	2	3	4	5	Science is best described as a process of explanation and argument.
11	An experiment is used to test an idea.	1	2	3	4	5	An experiment is used to make a new discovery.
12	Within the scientific community, debates and discussions that focus on the context, processes, and products of inquiry are common.	1	2	3	4	5	Within the scientific community, debates and discussions that focus on the context, processes and products of inquiry are rare.

What counts as reliable and valid scientific knowledge?

A central claim of science is that it produces reliable and valid knowledge about the natural world.

The statements below describe different viewpoints about what counts as reliable and valid scientific knowledge.

	Viewpoint A	A not B	A>B	A=B	B>A	B not A	Viewpoint B
13	Scientific knowledge can only be considered trustworthy if the methods, data, and interpretations of the study have been shared and critiqued.	1	2	3	4	5	Scientific knowledge can be considered trustworthy if it is well supported by evidence.
14	The scientific method can provide absolute proof.	1	2	3	4	5	It is impossible to gather enough evidence to prove something true.
15	If data was gathered during an experiment it can be considered reliable and trustworthy.	1	2	3	4	5	The reliability and trustworthiness of data should always be questioned.
16	Scientists know that atoms exist because they have made observations that can only be explained by the existence of such particles.	1	2	3	4	5	Scientists know that atoms exist because they have seen them using high-tech instruments.

	Viewpoint A	A not B	A>B	A=B	B>A	B not A	Viewpoint B
17	Biases and errors are unavoidable during a scientific investigation.	1	2	3	4	5	When a scientific investigation is done correctly errors and biases are eliminated.
18	A theory should be considered inaccurate if a single fact exists that contradicts that theory.	1	2	3	4	5	A theory can still be useful even if one or more facts contradict that theory.
19	Scientists can be sure that a chemical causes cancer if they discover that people who have worked with that chemical develop cancer more often than people who have never worked that chemical.	1	2	3	4	5	Scientists can only assume that a chemical causes cancer if they discover that people who have worked with that chemical develop cancer more often than people who have never worked that chemical.

What role do scientists play in the generation of scientific knowledge?

The statements below describe different viewpoints for what scientists do and what they are like.

	Viewpoint A	A not B	A>B	A=B	B>A	B not A	Viewpoint B
20	In order to interpret the data they gather scientists rely on logic and their creativity and prior knowledge.	1	2	3	4	5	In order to interpret the data they gather scientists rely on logic only and avoid using any creativity or prior knowledge.
21	Scientists are influenced by social factors, their personal beliefs, and past research.	1	2	3	4	5	Scientists are objective, social factors and their personal beliefs do not influence their work.
22	Successful scientists are able to use the scientific method better than unsuccessful scientists.	1	2	3	4	5	Successful scientists are able to persuade other members of the scientific community better than unsuccessful scientists.
23	Two scientists (with the same expertise) reviewing the same data will reach the same conclusion.	1	2	3	4	5	Two scientists (with the same expertise) reviewing the same data will often reach different conclusions.
24	A scientist's personal beliefs and training influence what they believe counts as evidence.	1	2	3	4	5	What counts as evidence is the same for all scientists.
25	The observations made by two different scientists about the same phenomenon will be the same.	1	2	3	4	5	The observations made by two different scientists about the same phenomenon can be different.
26	It is safe to assume that a scientist's conclusions are accurate because they are an expert in their field.	1	2	3	4	5	A scientist's conclusion can be wrong even though scientists are experts in their field.

NO YOUTH LEFT BEHIND: REFLECTIONS FROM UNDERGRADUATE MATHEMATICS

Ersin İLHAN
Bayburt University
eilhan@bayburt.edu.tr

ABSTRACT: With the initiative of Council of Higher Education (HEC), all graduates from high schools almost have a chance to take a place in undergraduate programs because of the newly founded universities in all cities in Türkiye. The problems arise in the first year of higher education for the students who have not enough competences in mathematics. The program's courses in universities are similar but the enrolled students in programs are not homogeneous in their mathematics backgrounds. No Youth Left Behind (NYLB) in placement is achieved for schooling purposes, but is it reasonable to say NYLB in first year mathematics is achieved. Thus, the aim of study is to find the way for achievement in transition and first year mathematics in higher education. In order to accomplish the aim, the head of mathematics department in citywide should be co-head with the head of departments at university.

Key words: Undergraduate Mathematics, Function, Transition

INTRODUCTION

With the initiative of HEC in Türkiye, all graduates from high schools almost have a chance with 74,86% gross schooling (TUİK, 2014) and their chances will be increased by newly founded higher education institutions in the following years, to take a place in undergraduate programs only with ranking system in entrance examination without considering academic abilities of candidates. That's why the process of placement can be called a continuation instead of transition from high school to higher education.

Increasing higher education schooling to get enough places at universities for the high school graduates can be thought as the democracy of equality in reaching the higher education and building socially well environments. By the years pass away, the ratio of continuing tertiary education increases as Sewell & Hauser (1972) states that a student in the high socioeconomic status category has a 2,5 times greater chance of continuing his or her education beyond high school than one in the low socioeconomic status category whereas Hoffman, Vargas and Santos, (2009) state that young people from middle- and upper-income families are five times more likely to earn a two- or four-year college degree than those from low-income families. Tanrıkulu (2011) states principle factors for increasing higher education schooling ratios as employment and its impact on income and also population at age of higher education. The stated findings constitute the reasons of growing number of universities to form socially well prepared societies, taking low socioeconomic students into consideration. From this point there is no problem in No Youth Left Behind (NYLB) Act. The problems arise in the first year of higher education with students who have not enough competences in mathematics. The program's courses in all universities are almost similar but the students in programs are not homogeneous in their backgrounds in mathematics. NYB in placement is achieved, but is it reasonable to say No Youth Left Behind in first year mathematics achievement. In the study, No Youth Left Behind is investigated from two perspectives; one is from high school to university and the other is from university to anywhere but not the following year at the university.

This state of students' feeling is explained by rite of passage and Mutch (2005) see transition as the process you go through mentally when you face a big life change, and recognizes the first year of higher education experience as an identifiable period of transition. In this study, I examined the period from high school to university exam and from there to the first year of higher education from the point of "rites of passage". Theory is combined with the lens of mathematics, how the transition period is experienced by students from the line of mathematics. Transition period includes three phases as Clark and Lovric (2008) explains; Separation (from high school) takes place while students are still in high school, and includes anticipation of forthcoming university life; Liminal (from high school to university) includes the end of high school, the time between high school and university, and the start of first year at a university and Incorporation (into university) includes, roughly, first year at a university. When separation and incorporation phases are thought together Clark and Lovric (2008) asks for what to teach students to prepare them for university and the other asks for finding effective ways of students' prerequisite knowledge can be found not only at the liminal phase as a question of "how can we prepare students in the separation phase so that they can study / review functions" that is also needed at higher education level. Then the problem of curriculum gap arises in the form of continuing or background about the functions to be studied at higher education. The curriculum gap is explained by Brandell, Hemmi and Thunberg (2008) as students' abilities to draw accurate sketches of elementary functions are below what is expected.

Liminal phase considering the university examination, the similar history can be found in Japanese higher education system. Increasing number of universities lowers the level of students and importance of the university exam and produces the new problem of students without enough competencies to be seat at the first year of university courses (Mori, 2002). When transition and curriculum gap are introduced together, the aim of study is to find the way for achievement in transition and first year mathematics in higher education

METHODS

In this study, to minimize the curriculum gap, at the beginning of the course the functions are review from the perspective of modelling. Modelling contributes towards giving more meaning to the learning and teaching of mathematics (Blum, 1993). In the first step of this study, the 42-students of Bayburt University in economics program of Faculty of Economics and Administrative Sciences are introduced learning model activities (group learning and problem solving) and students' task papers are analysed under the implementation of quantitative approach.

The transition period from the students' view can be understand as to find a place but then the emerging problems linking high school and first year at the university arises in so many different levels that need to be overcome for the sake of our nation's young generation. To reveal the existing situation, students' thoughts in first year mathematics are investigated in qualitative approach. In the second step, the same students' thought about the education in high school, in higher education and the process of Student Selection and Placement System (OSYS) are obtained using the open questioned survey to get their feelings about all aspects of the transition period.

Curriculum Gap; Functions

High school mathematics program (NME, 2005) aims to develop eight significant mathematics skills of students. In this study, two of them, problem solving and modelling, are taken in to consideration to use concrete link between high school and higher education. The transition period links students' mathematical knowledge between high school and higher education in modelling using functions. Modelling is taught for the revision of functions that students should be familiar from high school mathematics lessons. The problem, in lesson plan, which includes the skills named modelling, problem solving and topic of function, given in the mathematics program is "In meteorology, the balloon is inflated with helium gas and with related rate of 1.5 cm/sn. Find the function of volume V in terms of time t?" (NME, 2005, p.41). It is used to get idea of students' mathematics level and use that information to form groups in problem solving activity. The implementation of the problem solving approach with the problem task given in the math class as a group work is "when you turn on a hot-water faucet, the temperature T of the water depends on how long the water has been running. Draw a rough graph of T as a function of time t that has elapsed since the faucet was turned on" (Stewart, 2009, p.15).

The problem task is formed with Polya's five steps in problem solving evaluation approach (Baki, 2006); Understanding Problem, Making Plan, Implementation of Plan, Evaluation and Making New Problem, with voluntarily formed 2-person groups of total 42. The task is distributed to groups as mentioning to work alone at the beginning of activity and later on to work as a group for the prequisite of group working. At last, they share their solutions to whole class by writing them on the blackboard. After all, I combine all solutions by negotiating with students to draw the common result for the task problem. Groups' papers are evaluated according to the problem solving evaluation scale Baki (2006).

Transition

The transition period's phases are to be asked to students at survey. For each phase, one open ended question is used to get students' inner thought during the whole transition period. The questions and the responses are evaluated to get the idea of situation that students face as rite-of-passages. For separation phase, high school period, "What are your experiences about mathematics in high school?", for liminal phase, the period from high school to university, implies the university exam, waiting for results, making the selection for placement according to points and ranking in exam, the question "What are you experiences about OSYS?" and for incorporation phase, includes the first year in the university, the question is "What are you experiences about mathematics at university?".

RESULTS AND FINDINGS

The Function

The students draw their solution on the blackboard to see all in one shot to analyze as a class and two of them are given in Figure 1. The graphs are different in detail but when you look them to get the pattern, there are some similar ones. Even they can be grouped according to their similarities. This is caused by the problem text that the value of temperature is not given and they choose their own values.

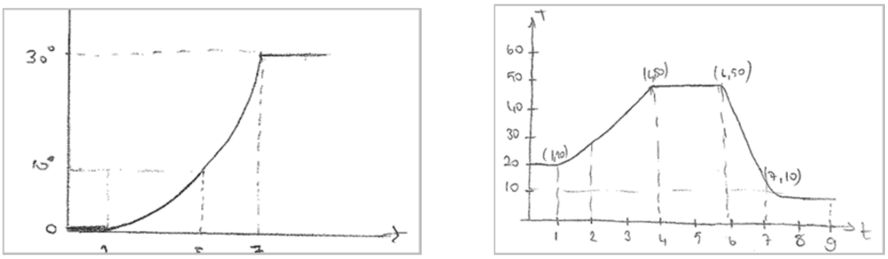

Figure 1. Samples of Students'Works

The problem solving evaluation scale, according to analyzing of task papers, findings and their descriptive statistics at level three are given in Table 1 with all steps in Polya's problem solving process that are evaluated with five dimensions. With 71%, it is known that students have a difficulty of understanding problem in the perspectives of rewriting them in a different way. 60% of students have the difficulty in forming strategy to lead solving problem. Whatever their strategy is, students try to calculate and graph something with 45%. Backward study on the solution steps or in giving arguments to verify the solution steps, there are no such task papers. In making new problem with the logic of the given one, there are no great efforts but only 40%. In problem solving evaluation steps with five dimensions, implementation of plan works better besides the others.

Table 1. Problem Solving Evaluation Scale

Problem Solving Evaluation Process	n	%
Understanding Problem	12	29
Making Plan	17	40
Implementation of Plan	19	45
Evaluation	-	-
Making New Problem	17	40

Groups' tasks finding in Table 1 emphasis the weakness of students' problem solving skill that are aimed in high school and also in higher education.

The Transition Period

For the transition period survey findings are given in three phases. Separation phase (Figure 2), all the responses are coded and then categorized under three themes; high school type, mathematics lesson and mathematics teacher. High school type; I see myself in lack of knowledge graduated from vocational high school, need to shadow education, prepares us to university examination. Mathematics lesson; more about memorization, not oriented to university examination, not related to university mathematics topics, mathematics topics are not completed, topics in high school mathematics should be similar to university examination. Mathematics teacher; I wonder what happens if someone from HEC comes to any of the high school's any mathematic lesson, university teachers should have classes in high schools.

Liminal phase (Figure 2), all responses are categorized under two themes; system and placement. System; we are experimental subject, having not enough information about the system, tiring empty brains. Placement; I do not know but when I see my community, everybody seems to be placed in any university, do not know how

OSYS place students, no placement according to abilities, nobody is in the university that they wish, no examination but place everybody where they want.

Incorporation phase (Figure 2), all responses are categorized under four themes; mathematics exams, mathematics topics, mathematics teacher and class attendance. Mathematics exams; examinations are difficult, the entire fault is not our, because it is known that we are not good at mathematics, we are not mathematicians so easy questions. Mathematics topics; not see the mathematics topics in high school, study topics from economics perspective, should start from lower levels that we do not know. Mathematics teacher; understand topics because teach well, teaches for understanding not for memorization. Class attendance; when attend the class I understand, where is the problem; math education which is not given us in high school or OSYS which places us at university with such a mathematics knowledge or students who do not put enough effort to get the knowledge. Class attendance is considered as inner source of phase so there is no linkage with other phases.

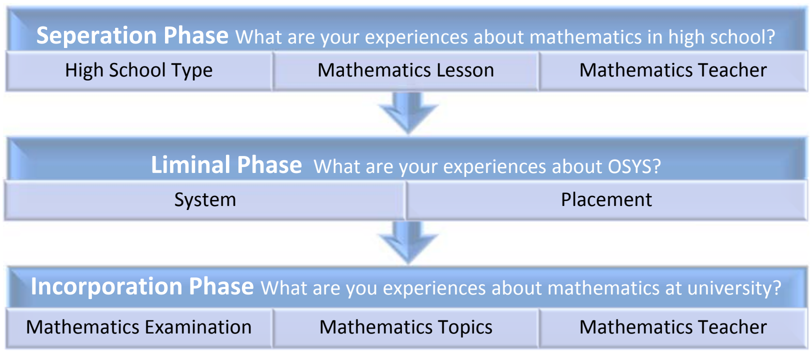

Figure 2. Transition Period

The phases of transition period are interlinked in three main issues as shown in the same column (Figure 2.). The first is, high school type, system-placement and mathematics examination reveals importance of school type and OSYS and their effects on undergraduate mathematics examination. The second is, mathematics lesson in high school and mathematics topics in university is explained by disconnection. The third is, mathematics teacher in both class presents the method used in teaching. Hence, the link among phases are set by the students is line to carry out the remedial education.

CONCLUSION

The mathematics levels of students in modelling task of the functions (Table 1.) reveals the weakness of the understanding, making plan, evaluation and making a new problem that are the dimensions of the problem solving process. It is strange that understanding and making new problem have same percentages explains without understanding there is nothing to do. Beside these, implementation of the strategy whatever they choose shows the greatest percentage as 45% can be understand as students just know to do some manipulation even without knowing what they are doing, which represents the term “memorization”. The findings shows that OSYS places every graduate at higher education from the socially well-being generation perspectives but OSYS should think also the cognitive states and needs of the students as well.

To avoid the disadvantages of shadow education for students, higher education institutions should find the ways as “remedial education” to help first year students for their academic achievements. Mori (2002) states that higher education institutions make students’ transitions smooth and one major issue under dispute is who is responsible for remedial education. Otherwise, after first year in higher education NYLB will be accomplished as not passing the following year means that it is the end of university life.

RECOMMENDATIONS

It is concluded that each youth should have a right to study in higher education by providing not only more places for them but also preparing them to be ready to study in higher education. As Mori (2002) states who is responsible for remedial education especially the ones coming from the disadvantaged high school such as vocational, implies that there should be close and immediate cooperation between NME and HEC, opposite to giving majority of responsibility to high school (HEC, 2007), about findings ways of strengthening students' cognitive level even starting from kindergarten to higher education. In order to accomplish this cooperation, the head of mathematics departments in citywide should be co-head with the head of departments at university.

THE DİCHOTOMOUS MARKOV PROCESS WİTH NONPARAMETRİC TEST APPLİCATİON; A DECİSİON SUPPORT METHOD İN LONG-TERM RİVER BEHAVİOURAL ANALYSİS

Mohammad SEPEHRİFA

Shantia YARAHMADİAN

We use the Dichotomous Markov Noise (DMN) model with constant transition rates to describe the dynamics of fluctuations in the water level as a stochastic process, which is imposed on river discharge changes. By applying this model, two different regimes are determined for the long-term behaviour of the river. Based on these regimes, we define two nonparametric classes of the overall increasing/decreasing nature of the water level in the long-term behaviour, which are separated by an exponential steady state regime. In this paper, we develop a nonparametric testing procedure to test exponentially (steady state regime) against an alternative overall decreasing level distribution. The proposed test predicts the long-term regime behaviour of the river. The mathematical tools introduced to handle the problem should be of general use and the testing procedure can be considered as a new mathematical tool in the study of water level dynamics. Under conditions of data austerity and as a case of study, we examine the stochastic characteristics of the Zayandeh Rud River (Isfahan, Iran) water level.

FACILITATING STUDENTS' GEOMETRIC THINKING THROUGH VAN HIELE'S PHASE-BASED LEARNING USING TANGRAM

Nyet Moi SIEW

The aim of this study was to determine the effects of Van Hiele's phases of learning using tangrams on 3rd grade primary school students' levels of geometric thinking at the first (visual) and second (analysis) level. The study further investigated if high, moderate, and low ability students acquire better mastery in geometric thinking at the end of tangram activities. Pre-test and post-test single group experimental design was employed in the study. A total of 221 students enrolled in Grade Three during the 2013 educational year formed the sample. The students learned Two-dimensional geometry and Symmetry through the Van Hiele's phases of learning using tangram. A geometric thinking test was administered to students before and after the intervention. The intervention took place for 3 hours. Paired samples t-tests comparing the mean scores of geometric thinking pre-test and the post-test were computed to determine if a significant difference existed. One-way Multivariate analysis of variances (MANOVA) was conducted to compare the students' pretest and posttest mean scores across the three groups:- high, moderate and low ability students. The results found that there were significant differences between pre-test and post-test in students' geometric thinking. It was also found that Van Hiele's phases of learning using tangrams was able to significantly promote geometric thinking in the van Hiele's first (visual) and second (analysis) level among high, moderate and low ability students. Low ability students were observed to have the greatest improvement score compared to moderate and high ability students. Thus, the Van Hiele's phases of learning using tangram can be applied in primary school mathematics to help students achieve better level of geometric thinking

EFFECT OF GENDER, AGE AND MATHEMATICS ANXIETY ON COLLEGE STUDENTS' ACHIEVEMENT IN ALGEBRA

Owolabi JOSIAH
josiahowolabi@yahoo.com

Etuk-iren Olubunmi ADEJOKE
olubunmietukiren@yahoo.com

Mathematics/Statistics Department
Federal College of Education (Technical), Akoka, Lagos, Nigeria.

ABSTRACT :Mathematics is a very important subject. It is the language of science and technology and so it is a force to reckon with in the development of any nation. Several studies on factors that affect mathematics achievement have been conducted. However, studies on factors that affect mathematics achievement among College students in Nigeria seems to be rare. This study therefore sought to investigate the effects of gender, age and mathematics anxiety of College students on their achievement in Algebra. The study adopted an expost-facto design since no variable was manipulated. The participants of the study are mathematics teacher trainees in the Federal Colleges of Education in Lagos and Ogun states of Nigeria. The data for the study was from a questionnaire which elicited information on gender and age of respondents, a mathematics anxiety scale (r=0.82) and participants' achievement score in an Algebra course coded MAT 111. The achievement score in Algebra is the dependent variable while gender, age and mathematics anxiety formed the independent variables of the study. The data collected were analysed using mean, standard deviation, independent t-test and One-way ANOVA. The results of the analyses showwed average performance in the Algebra course. Besides, the differences in achievement across gender,age and mathematics anxiety groupings (low, medium and high) were all non-significant. Since the participants are on their first semester in the college and their performance is generally on the average, it is recommended that proper orientation be given to new students on how to be high achievers on the programme. Besides, their lecturers should be as simple as possible in their instructions.

Keywords: Gender, age, anxiety, mathematics, achievement.

INTRODUCTION

Several studies have been conducted over the years to determine the predictors of mathematics achievement among various groups of individuals. Some of the predictors discovered are: socio- economic status (Ajayi & Muraina 2011), students' employment status (Wantanabe, 2005), teaching methods (Eniayeju, 2010), gender and continuous assessment (Owolabi & Etuk –Iren, 2009). Other factors found to affect achievement in mathematics are: self-concept and learning style (Rech & Stevens,1996), reading abilities, mathematics self efficacy and teacher evaluation (Larwin, 2010) and students' previous knowledge (Siegler, Duncan,Davis-Kean, Duckworth, Claessens, Engel, Susperregury and Chen, 2012).

One variable that has, over the years, received considerable attention in many studies on science achievement in general and mathematics achievement in particular is gender. In a meta –analysis of 77 studies conducted between 1980 and 1991 among middle and high school students, DeBaz (1994) found a significant gender effect favouring males in overall science achievement. Hedges and Newell (1999) discovered that boys outperform girls in science but in reading and writing girls have the advantage. Researchers have indicated that gender affects mathematics achievement. For example, Trends in International Mathematics and Science Study (TIMSS), found significant differences between male and female students in mathematics achievement, with male students significantly outperforming their female counterparts. Epstein, Elwood, Hey, Maw (1998) reported that females outperform males in mathematics. In their study, Hedges and Newell(1999) reported that girls perform better than boys in reading and writing. However, a Nigerian study by Abiam and Odok(2006) shows no significant gender-achievement relationship in number and numeration, algebraic process and statistics. Similar results showing no significant gender difference in mathematics achievement were found by Habibollah, Abdullahi, Arizan, Sharir, and Kurma (2009) and Abubakar(2010).

Another variable which is of great interest to this study is age. Many studies have been conducted to investigate the effect of age on students' achievement. White (1982) found that the correlation between age and school achievement diminishes as students become older. According to White (1982), schools provide equalizing experiences, and thus the longer the students study in the schooling process, the more the impact of the age on students' achievement is diminished. In addition, as the students move up the age, more students drop out of school, thus reducing the magnitude of the correlation. On the contrary, results from longitudinal studies have contradicted White's results by demonstrating that there is a gap in students achievements as students get older (Walker, Greenwood, Hart & Carta, 1994). La Paro & Pianta (2000) presented evidence that older children fared better academically than the younger ones.

Akman-Yesilel (2012) submits that anxiety is a term used for several disorders that cause nervousness, fear, apprehension and worrying. According to him, these disorders affect the way we feel and behave. Zhang (2004) see it as a cognitive behaviour rising from self doubt and self depreciation. Many students with mathematics anxiety possess little or no confidence in their ability to solve mathematics problems. The pertinent question is what is the level of anxiety which is acceptable and beyond which performance is seriously affected? According to Ashcraft and Kirk (2001), the correlation between mathematics anxiety and academic performance is negatively significant. The findings of Hembree (1990) shows that a students with high level of mathematics anxiety have lower levels of mathematics achievement.

Different studies have been conducted to investigate the kind of relationship displayed across several age population. For example, mathematics anxiety is negatively correlated with mathematics performance among adults among college students in particular (Frary & Ling, 1983). Hembree (1990) reported an average correlation between anxiety and achievement for college students. In their study, Eccless and Jacobs (1986) after introducing gender as a mediating variable found that gender difference in mathematics anxiety are attributable to gender differences in mathematics achievement. Wood (1988) reviewed research on mathematics anxiety manifested among elementary teachers and suggested that mathematics teachers anxiety towards mathematics was likely to be transmitted to their students.

Studies that investigated the collective and individual influence of age, gender and mathematics anxiety on mathematics in general and Algebra in particular seems to be very rare. On this note, this study seeks to find out the influence of gender, age and mathematics anxiety on achievement in Algebra among NCE mathematics students in south-western Nigeria.

Purpose of the Study

This study will determine:

1. The influence of gender on students' achievement in Algebra
2. The influence of age on students' achievement in Algebra
3. The influence of mathematics anxiety on students' achievement in Algebra

Hypotheses

The following hypotheses were tested:

1. There is no significant difference in the achievements of male and female students in Algebra.
2. There is no significant difference in the achievements of students in Algebra across age groups.
3. There is no significant difference in the achievements of students in Algebra across low medium and high anxiety groups.

METHOD

The study adopted a survey design with all undergraduate computer/mathematics students of the Federal colleges of education in Lagos and Ogun states of Nigeria as population for the study. The sampling procedure was purposive as students who had offered the Algebra course in their first semester year one were eligible to participate in the study. The mathematics anxiety rating scale was administered on one hundred and sixty computer/mathematics students of Federal College of Education (Technical), Akoka, Lagos state, Nigeria and Federal College of Education, Osiele, Abeokuta, Ogun state, Nigeria. To determine the mathematics ability of students, their first semester scores in a course titled "Algebra" (MAT 111) was used. The student background questionnaire was used to elicit information on age and gender of the respondents. The mathematics anxiety rating scale was originally designed and validated by Baloglu and Zelhart (2007). The scale has 14 items. The respondents were given instructions to rate their anxiety levels when faced with mathematical concepts. The questionnaire was designed using a four-point Likert-scale using the following response format: strongly agree (SA), agree (A), disagree (D) and strongly disagreed (SD). The reliability coefficient using cronbach alpha was found to be 0.82. The resulting data were analysed with the aid of Statistical Package for Social Sciences (SPSS) version 17.0 software using correlation and multiple regression.

RESULTS

The results and the relevant discussions are presented below in accordance with the hypotheses stated.

Hypothesis One: There is no significant difference in the achievements of male and female students in Algebra.

Table 1: T-test comparison of male and female students in Algebra

Gender	No	Mean	S.D	Tcal	Df	P-value	Remark
Male	82	55.06	18.583	0.372	158	0.711	N.S
Female	78	53.94	19.721				

Table 1 presents the t-test comparison of the scores of male and female students in Algebra. The t-test comparison showed a statistical difference which is not significant between the mean scores of male and female students in Algebra (tcalculated = 0.372, df = 158, $p > 0.05$). We therefore accept the null hypothesis. The mean scores showed a higher mean for male students. It therefore follows that the mean score of male students in Algebra (mean = 55.06, Standard deviation = 18.583) is higher but not significantly higher than that of their female counterparts (mean = 53.94, Standard deviation = 19.721).

Hypothesis Two: There is no significant difference in the achievements of students in Algebra across age groups.

Table 2: The Influence of Age on Achievement in Algebra.

	Sum of Squares	df	Mean Square	F	P-value
Between Groups	982.075	3	327.358	0.896	0.445
Within Groups	56987.900	156	365.307		
Total	57969.975	159			

The F value of 0.896 in Table 2 is not significant at 0.05 level of significance, implying that achievement in Algebra do not vary across age groups. On the sample selected however, the post hoc analysis showed that those between age 15 to 20 years had the highest mean score, while those above 30 years had the least mean score.

Hypothesis Three: There is no significant difference in the achievements of students in Algebra across mathematics anxiety groups.

Table 3: The Influence of mathematics anxiety on Achievement in Algebra.

	Sum of Squares	df	Mean Square	F	P-value
Between Groups	707.160	2	353.580	0.964	0.384
Within Groups	57206.023	156	366.705		
Total	57913.182	158			

The F value of 0.964 in table 3 is not significant at 0.05 level of significance, implying that achievement in Algebra do not vary across mathematics anxiety groups. On the sample selected however, the post hoc analysis showed that those that are in the medium anxiety level had the highest mean score, while the highest anxiety level had the least mean score.

DISCUSSION

The findings of this study agrees with the findings of Abiam and Odok(2006) , Habibollah, Abdullahi, Arizan, Sharir, and Kurma (2009) and Abubakar(2010). It is however in contrast with the findings of Epstein, Elwood, Hey, Maw (1998) and Hedges and Newell(1999). On the whole, it is hoped that if both gender are given proper orientation, opportunities and training gender will no longer be an issue in mathematics achievement in general and achievement in Algebra in particular.

The insignificant differences in achievement in Algebra across age groups in this study agrees with Abubakar and Oguguo (2011), but disagrees with Walker, Greenwood, Hart & Carta, 1994), Crosses (1991) and La Paro & Pianta (2000). More influential factors might be active in determining variation in achievement in Algebra.

Level of anxiety was not seen to affect achievement in Algebra in this study. However among the participants of the study, those with medium level of anxiety performed best. This is in agreement with the assertion of Skemp (1986), that a moderate amount of anxiety may actually facilitate performance. Beyond a certain degree, anxiety hinders performance particularly in the case of higher mental activities and conceptual process.

CONCLUSION AND RECOMMENDATION

Gender, age and mathematics anxiety did not significantly affect achievement in Algebra. It is recommended that studies on the interaction effects of these variables should be carried out.

"I AM UN/SUCCESSFUL IN MATHEMATICS BECAUSE…" : STUDENTS' SELF-PERCEIVED COMPETENCE IN MATHEMATICS

Hüseyin ÖZDEMİR

Neslihan ÖNDER ÖZDEMİR

The present study aims to investigate 76 students' self-perceived competence in Mathematics in a state vocational high school in Turkey. The data was collected from five different classrooms through a reflective journal each student kept anonymously after taking Mathematics course. Students assessed themselves concerning their competence in Mathematics. Content analysis was employed to analyse the data. Findings revealed that 26 students reported that they were successful by providing 25 different reasons, while 45 students stated that they are unsuccessful with 21 different perceptions as salient themes. Five students felt both successful and unsuccessful in different aspects. The most frequent three salient explanations for successful students were 'teacher' ability to teach the course effectively, good background in Mathematics, the love for the course'. The most frequent three salient reasons for unsuccessful students were 'insufficient background, not studying and difficulty in understanding Mathematics'. The reports of the students and pedagogical implications are provided in light of the literature.

BRAİD FOLDİNG AND BURAU REPRESENTATİON

Mohammed Mahyoub Ali AL-SHAMİRİ

Mathematical Department, Faculty of Science,Ibb University , Ibb, Yemen.
Shamiri71@yahoo.com

ABSTRACT:In this article we introduce the definition of braid folding, and braid graph ,the braid folding of braid is discussed, we prove that we can fold any braid graph by the graph folding, by using matrix Burau representation we describe the straight folding

.

Key words: Braid, braid group, braid folding, graph folding

INTRODUCTION

In1925, Email Artin, a mathematician born in Germany began a study that eventually developed into what is know as braid theory. This remarkable insight itself was not sufficient to sustain research in this area, and so it slowly began to wither. However, in the1950s this concept of braids was found to have applications in other fields and this gave fresh impetus to the study of braids. By this braids theory has gradually been prospected, refined and polished, braid theory is, now recognized as one of the basic theories in mathematics and is of benefit in such branches as topology and algebraic geometry. The braid group was took an important role in this field. In [6] and [7] we are studied a new direction on knot theory called folding of knots. The folding of manifold defined by Rebortson [16] and the folding of manifold into another, or into itself are studied by El-Kholy [8] and El-Ghoul [1-5]. In this article we introduce braid folding and braid graph and we describe the straight folding by using matrix Burau representation. Also we describe the graph folding of braid graph.

In this section we will summarize some definitions and basic concepts which we will use it in the main

results.

Definition2.1. Let D be a unit cube ,so $D=\{(x,y,z):0\le x,y,z\le 1\}$ on the top face of cube place *n* points, $a_1,a_2,.....,a_n$ and ,similarly ,place *n* points on the bottom face $b_1,b_2.......,b_n$ Now ,join the points $a_1,a_2,.....,a_n$ with $b_1,b_2.......,b_n$ by means of *n* arcs $d_1,d_2,.....,d_n$ (as smooth curves), this arcs are mutually disjoint and each d_i connects some a_J to $\mathrm{b_k}$ $(J\ne K$ or $\mathrm{J=K})$ not connect a_j to a_K or b_j to b_K .Each plane E_s ,such that $z=s$, $0\le s\le 1$ (parallel to $xy-$ plane intersections each arc d_i at one and only one point.

A configuration of *n* arcs $d_1,d_2,.....,d_n$ with end points $a_1,a_2,.....,a_n$ and $b_1,b_2.......,b_n$ is called n – braid or a braid with *n* strings Fig.(1)[13]

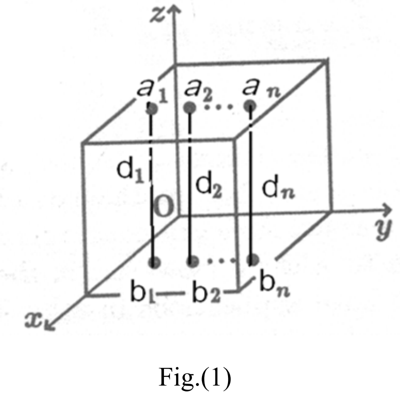

Fig.(1)

Definition2.2.A map $F: M \to N$, where M, N are C^{∞} Rimannian manifolds of dimension m , n , respectively, is said to be an isometric folding of M into N, if and only if for any geodesic path $\gamma: J \to M$ the induced path $F \circ \gamma: J \to N$ is a piecewise geodesic and of the same length as γ. If F does not preserve length, then F is a topological folding [16].

Definition2.3. Let A be a subset of a topological space X .A continuous map $r: X \to A$ is said to be retraction if $r(a) = a$ for all $a \in A$ [12,14].

Definition2.4.Let B_n be a set of all n- braids and $\beta_1, \beta_2 \in B_n$,we may create a third n – braid from them which we shall call their product and denoted by $\beta_1\beta_2$ as follows:

Glue the bottom arcs of β_1 with the top arcs of β_2 Fig.(2)[13].

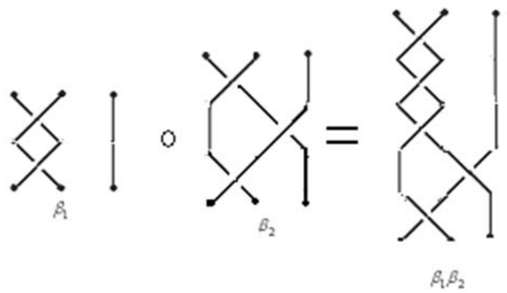

Fig.(2)

Remarks2.1. 1) For $\beta_1 \in B_n$ there is $\beta_1^{-1} \in B_n$ such that $\beta_1\beta_1^{-1} = e \in B_n$ Fig.(3)

2) $\beta_1\beta_2 \neq \beta_2\beta_1$

3) The product of braids is associative ,i.e. $(\beta_1\beta_2)\beta_3 \approx \beta_1(\beta_2\beta_3)$.

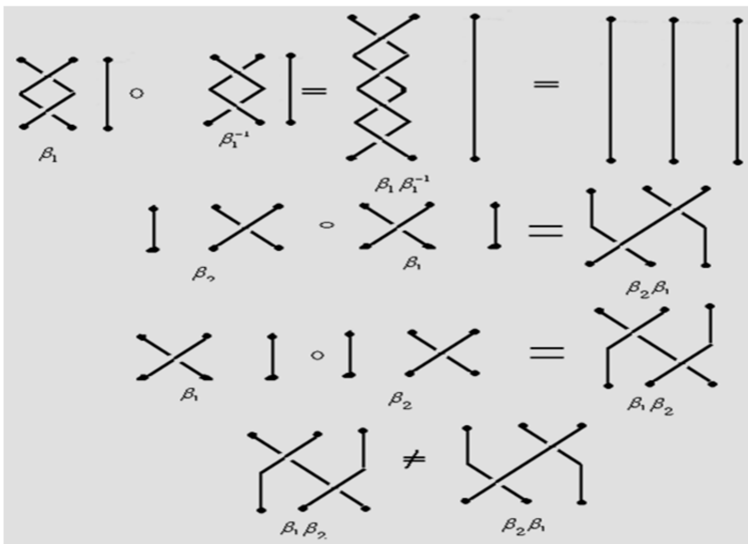

Fig.(3)

Theorem2.1. The set of all n- braids B_n forms a group. This group is usually called the n- braid group or Artin's n – braid group [11, 13, 15].

Theorem2.2. For any $n \geq 1$ the n – braid group B_n has the following presentation,

$$B_n = \langle \sigma_1, \sigma_2, \ldots\ldots, \sigma_{n-1} : \sigma_i \sigma_{i+1} \sigma_i = \sigma_{i+1} \sigma_i \sigma_{i+1} \quad for\ i = 1,2,\ldots.,n\text{-}2$$
$$and\ \sigma_i \sigma_j = \sigma_j \sigma_i \ \ for |j\text{-}i| \geq 2 \rangle,$$

where σ_i denotes the standard generator of the braid group. Fig (4) [11, 13, 15].

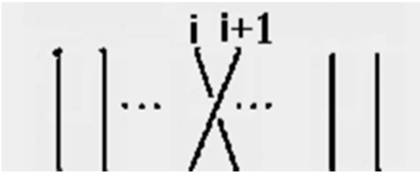

Fig.(4)

Definition 2.5. Let $\beta \in \mathrm{B}_n$ be a n- braid define a mapping $\Phi_n : \mathrm{B}_n \to M(n, Z[t, t^{-1}]$ by

$$\Phi_n(\sigma_i) = \left[\begin{array}{c|cc|c} I_{i-1} & & & \\ \hline & 1-t & t & \\ & 1 & 0 & \\ \hline & & & I_{n-i-1} \end{array}\right]$$

where I_m is the $m \times m$ identity matrix and the empty matrix consisting of only zeros ,also

$$\Phi_n(\sigma_i^{-1}) = \left[\begin{array}{c|cc|c} I_{i-1} & & & \\ \hline & 0 & 1 & \\ & t^{-1} & 1-t^{-1} & \\ \hline & & & I_{n-i-1} \end{array}\right]$$

this representation of B_n is called the Burau representation[11,15].

Definition2.6. An n- dimensional manifold is a Housdorff topological space M , such that every point of M has a neighborhood homeomorphic to open set $U \subset R^n$ [14].

Definition2.7.A folding which folds a point of upper arc crossing on a point of lower crossing is said to be a crossing folding[6].

Definition2.8. A subset $A \subset X$ is a deformation retract of X if there is a retraction $r : X \to A$ such that $i \circ r$ homotopic to the identity map. That is, there exists a continuous function $f : X \times [0,1] \to X$ such that for $x \in X$, $f(x,0) = x$ and $f(x,1) = r(x)$ and for all $a \in A$ and all $t \in [0,1], f(a,t) = a$ [14] .

RESULTS AND FINDINGS

To obtain the main results ,we should introduce the following definitions.

Definition3.1. Let β, β' be two n-braids ,the map $f : \beta \to \beta'$ is said to be a braid folding, if $f(d_i) = d'_j$ where d_i is a string in β and d'_j is a string in β', $i, j = 1,2,3,......., n, i = j \ or\ i \neq j$.

If d_i and d'_j are straight strings ,then f is said to be straight folding.

Definition3.2. Let $A = [a_{ij}]$ be a matrix, the map $f : A \to A$ is said to be matrix folding, if f maps column to column or row to row .

Theorem3.1. A straight folding of a braid is a braid **.**

Proof. Let $\beta \in B_n$ be a n- braid with L straight strings and *f* be a straight folding from β into itself such that *f* folds m straight strings from L on themselves then $f(\beta)$ is *n-(m-1)*- braid.

Corollary3.1. A limit of straight foldings of a braid into itself is a braid.

Proof. The proof comes directly from Theorem3.1**.**

Now we will give some conditions on the straight folding .

Theorem3.2. For every non-trivial n-braid $\beta, n \leq 3$,there is no non trivial straight foldings can be define for β.

Proof. Since β is non trivial, hence $n \neq 1$ if $n = 2$ then we can write $\beta = \sigma_1^m$ or $\beta = \sigma_1^{-m}$ And hence there is no straight strings can be folded it by straight folding.

If $n = 3$ then we can write:-

1) $\beta = \sigma_1^{\varepsilon m}$ or $\beta = \sigma_2^{\varepsilon m}$ $\varepsilon = \pm 1$ in this case there is only one straight strings and hence can not define straight foldings for β.

2) $\beta = \sigma_1^{\varepsilon m}\sigma_2^{\varepsilon l}, \varepsilon = \pm 1$ in this case there is no straight strings .

4.Braid folding and Burau representation

Let $\beta = \sigma_i$ be a n-braid and $\varphi_n(\sigma_i)$ its matrix Burau representation ,if f can be defined on β ,then we can be partition the matrix into four blocks, such that the matrix which appears in the upper left corner block or the matrix which appears in the lower right corner block is an identity matrix $I_m, m \geq 2$,and the matrix in the upper right corner block is a zero matrix.

Conversely, if the matrix Burau representation $\varphi_n(\sigma_i)$ can be partitioned into four blocks with the identity matrix $I_m, m \geq 2$ at the upper left corner or at the lower right corner and the zero matrix in the upper right corner block ,than a straight folding can be defined on β .

Examples.1) Let $\beta = \sigma_1$ be a 6-braid Fig.(5)

Fig.(5)

The matrix Burau representation $\varphi_6(\sigma_1)$ of β has the following form

$$\varphi_6(\sigma_1)=\begin{pmatrix} 1-t & t & 0 & 0 & 0 & 0 \\ 1 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 & 0 & 1 \end{pmatrix}$$

Now ,we can partition $\varphi_6(\sigma_1)$ to take the following form

$$\varphi_6(\sigma_1)=\left(\begin{array}{ccc|ccc} 1-t & t & 0 & 0 & 0 & 0 \\ 1 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 & 0 \\ \hline 0 & 0 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 & 0 & 1 \end{array}\right)$$

Thus we can define a straight folding $f_1 : \beta \to \beta$ by $f_1(d_6) = d_5$ Fig.(6).

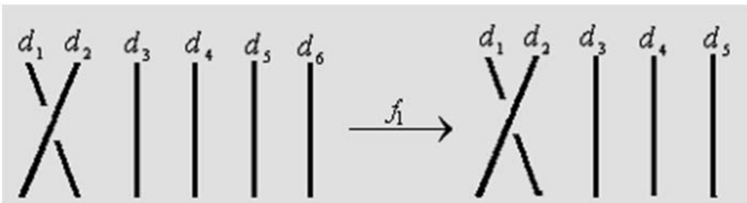

Fig.(6)

The matrix Burau representation $\varphi_6(f_1(\sigma_1))$ has the following form

$$\varphi_6(f_1(\sigma_1))=\begin{pmatrix} 1-t & t & 0 & 0 & 0 \\ 1 & 0 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 & 1 \end{pmatrix}=\varphi_5(\sigma_1)$$

If we applying the matrix folding f from $\varphi_6(\sigma_1)$ into itself by folded the six column onto five column, then we have $\Phi_5(\sigma_1)$:

$$\underset{\varphi_6(\sigma_1)}{\begin{pmatrix} 1-t & t & 0 & 0 & 0 & 0 \\ 1 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 & 0 & 1 \end{pmatrix}} \xrightarrow{f} \begin{pmatrix} 1-t & t & 0 & 0 & 0 \\ 1 & 0 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 & 1 \\ 0 & 0 & 0 & 0 & 0 \end{pmatrix} \simeq \underset{\varphi_5(\sigma_1)}{\begin{pmatrix} 1-t & t & 0 & 0 & 0 \\ 1 & 0 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 & 1 \end{pmatrix}}$$

The result of matrix folding compatibles with the result of straight folding .

Note that we can also define a straight folding f_2 from $f_1(\beta)$ into itself Fig.(7), and we can also partition the matrix Burau representation $\varphi_6(f_1(\sigma_1))$.

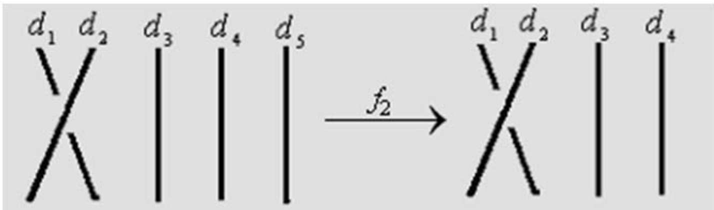

Fig.(7)

$$f_2(d_5) = d_4$$

$$\varphi_5(\sigma_1) = \varphi_6(f_1(\sigma_1)) = \left(\begin{array}{ccc|cc} 1-t & t & 0 & 0 & 0 \\ 1 & 0 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 \\ \hline 0 & 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 & 1 \end{array}\right)$$

The matrix Burau representation $\varphi_5(f_2(\sigma_1))$ has the following form

$$\varphi_5(f_2(\sigma_1)) = \begin{pmatrix} 1-t & t & 0 & 0 \\ 1 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{pmatrix} = \varphi_4(\sigma_1)$$

By matrix folding we have:

$$\underset{\varphi_5(\sigma_1)}{\begin{pmatrix} 1-t & t & 0 & 0 & 0 \\ 1 & 0 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 & 1 \end{pmatrix}} \xrightarrow{f_2} \begin{pmatrix} 1-t & t & 0 & 0 \\ 1 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ 0 & 0 & 0 & 0 \end{pmatrix} \simeq \underset{\varphi_4(\sigma_1)}{\begin{pmatrix} 1-t & t & 0 & 0 \\ 1 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{pmatrix}}$$

We get the same result.

Also we can again define a straight folding f_3 from $f_2(f_1(\beta))$ into itself Fig.(8) , and we can also partition the matrix Burau representation $\varphi_5(f_2(\sigma_1))$.

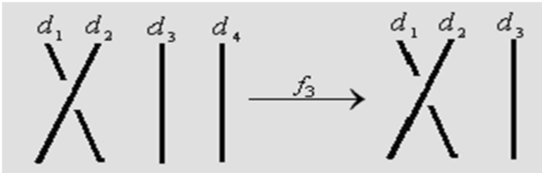

Fig.(8)

$f_3(d_4) = d_3$

$$\varphi_5(f_2(\sigma_1)) = \left(\begin{array}{cc|cc} 1-t & t & 0 & 0 \\ 1 & 0 & 0 & 0 \\ \hline 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{array}\right)$$

The matrix Burau representation $\varphi_4(f_3(\sigma_1))$ has the following form

$$\varphi_4(f_3(\sigma_1)) = \begin{pmatrix} 1-t & t & 0 \\ 1 & 0 & 0 \\ 0 & 0 & 1 \end{pmatrix} = \varphi_3(\sigma_1)$$

By matrix folding we have :

$$\underset{\varphi_4(\sigma_1)}{\begin{pmatrix} 1-t & t & 0 & 0 \\ 1 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{pmatrix}} \xrightarrow{f_3} \begin{pmatrix} 1-t & t & 0 \\ 1 & 0 & 0 \\ 0 & 0 & 1 \\ 0 & 0 & 0 \end{pmatrix} \simeq \underset{\varphi_3(\sigma_1)}{\begin{pmatrix} 1-t & t & 0 \\ 1 & 0 & 0 \\ 0 & 0 & 1 \end{pmatrix}}$$

It is the same result .Note that we can not define a straight folding and we can not partition the matrix Burau representation $\varphi_4(f_3(\sigma_1)) = \varphi_3(\sigma_1)$ and we can not apply the matrix folding on $\Phi_3(\sigma_1)$ this is exact the limit of matrix foldings also it is the limit of straight foldings.

2) Let $\beta = \sigma_5$ be a 6-braid Fig.(9).

Fig.(9)

$$\varphi_6(\sigma_5)=\begin{pmatrix}1&0&0&0&0&0\\0&1&0&0&0&0\\0&0&1&0&0&0\\0&0&0&1&0&0\\0&0&0&0&1-t&t\\0&0&0&0&1&0\end{pmatrix}$$

Similarly we can define a sequence of straight foldings $f_i:\beta\rightarrow\beta$ and The matrix Burau representation can be partitioned we get the limit as follows:

$$\varphi_6(\sigma_5)=\left(\begin{array}{ccc|ccc}1&0&0&0&0&0\\0&1&0&0&0&0\\0&0&1&0&0&0\\\hline 0&0&0&1&0&0\\0&0&0&0&1-t&t\\0&0&0&0&1&0\end{array}\right)\xrightarrow[i\to\infty]{\lim f_i}\underset{\Phi_3(\sigma_2)}{\begin{pmatrix}1&0&0\\0&1-t&t\\0&1&0\end{pmatrix}}$$

By matrix foldings we have:-

$$\underset{\Phi_6(\sigma_5)}{\begin{pmatrix}1&0&0&0&0&0\\0&1&0&0&0&0\\0&0&1&0&0&0\\0&0&0&1&0&0\\0&0&0&0&1-t&t\\0&0&0&0&1&0\end{pmatrix}}\xrightarrow{f_1}\underset{\Phi_5(\sigma_4)}{\begin{pmatrix}1&0&0&0&0\\0&1&0&0&0\\0&0&1&0&0\\0&0&0&1-t&t\\0&0&0&1&0\end{pmatrix}}$$

$$\xrightarrow{f_2}\underset{\Phi_4(\sigma_3)}{\begin{pmatrix}1&0&0&0\\0&1&0&0\\0&0&1-t&t\\0&0&1&0\end{pmatrix}}\xrightarrow{f_3}\underset{\Phi_3(\sigma_2)}{\begin{pmatrix}1&0&0\\0&1-t&t\\0&1&0\end{pmatrix}}$$

$\lim\limits_{i\to\infty} f_i=f_3$. After $\Phi_3(\sigma_2)$ the matrix folding can not define

3) Let $\beta=\sigma_1\sigma_2\sigma_3$ be a 5-briad Fig.(10)

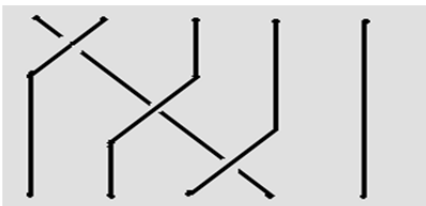

Fig.(10)

Its matrix Burau representation $\varphi_5(\sigma_1\sigma_2\sigma_3)$ is

$$\Phi_5(\sigma_1\sigma_2\sigma_3)=\begin{pmatrix}1-t & t(1-t) & t^2(1-t) & t^3 & 0\\ 1 & 0 & 0 & 0 & 0\\ 0 & 1 & 0 & 0 & 0\\ 0 & 0 & 1 & 0 & 0\\ 0 & 0 & 0 & 0 & 1\end{pmatrix}$$

We can not define a straight folding on $\beta=\sigma_1\sigma_2\sigma_3$ as a 5- braid ,also note that the matrix Burau representation $\varphi_5(\sigma_1\sigma_2\sigma_3)$ can not be partitioned and the matrix folding can not be defined.

After the above dissections we introduce the following theorem.

Theorem4.1. A straight folding f can be defined for β as n- braid if and only if the matrix Burau representation $\varphi_n(\beta)$ can be partitioned to four blocks, such that the matrix which appears in the upper left corner block or the matrix which appears in the lower right corner block is an identity matrix $I_m, m\geq 2$,and the matrix in the upper right corner block is a zero matrix.

Proof. Came directory from above discussion.

Corollary4.1. A straight folding f can be defined for β as n-braid if and only if the matrix folding $\bar{\bar{f}}$ can be defined for the matrix Burau representation $\varphi_n(\beta)$.

Theorem4.2. If f is a straight folding defines for $\beta=\sigma_1\sigma_2....\sigma_m$,then induces a straight folding $\bar{\bar{f}}$ on $\sigma_1,\sigma_2,...,\sigma_m$.

Proof. Since f was defined for $\beta=\sigma_1\sigma_2....\sigma_m$, this means $m<n-2$ and hence $\forall\sigma_i\ ,i<n-2$ there is at least two straight strings can be folded, hence there is straight folding $\bar{f}$ can be defined for all $\sigma_i, i=1,2,3......,m.$

Corollary4.2. The converse of theorem 4.2 is not necessary true.

Example 3 shows that.

5.Graph folding and Braid graph

If β is a braid we shall say that $\hat{P}\ (\beta)=\hat{\beta}$ is the projection of β Fig.(11).

$\hat{P}$ The map that projects the point $\hat{P}(x,y,z)$ in E^3 onto the point $\hat{P}\ (x.y,0)$ .The effect of $\hat{P}$ on β is to display a set of n simple curve $d_1,d_2,....,d_n$ in E^3 on the xy – plane. In all probability ,a general projection onto the xy – plane will give a set of curves $\hat{d}_i$ with many point of intersection of $\hat{\beta}$ However. In fact $\hat{\beta}$ is a graph represents β and has some properties:-

1- $\hat{\beta}$ has at most a finite number of points of intersection.

2- If Q is a point of intersection of $\hat{\beta}$ then $P^{-1}(Q)\bigcap\beta$ in β has exactly two points, which make a cross in β.

3- A vertex of β is never mapped onto a double point o $\hat{\beta}$ f.

A projection $\hat{\beta}$ that satisfies the above three conditions is said to be regular projection of. β By another mean $\hat{\beta}$ is a braid graph of β.

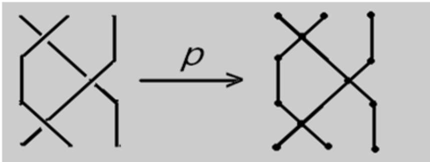

Fig.(11)

Let G_1 and G_2 be graphs and $f : G_1 \to G_2$ be a continuous function .Then f is called a graph map, if

i) for each vertex $v \in V(G_1), f(v)$ is a vertex in $V(G_2)$.

ii) For each edge $e \in E(G_1), \dim(f(e)) \leq \dim(e)$.

We call a graph map $f : G_1 \to G_2$ a graph folding if and only if f maps vertices to vertices and edges to edges ,i.e., for each $v \in V(G_1), f(v) \in V(G_2)$ and for each $e \in E(G_1), f(e) \in E(G_2)$. Else that, we can not get a graph folding [9].

In Fig. (15) δ_i is called δ_i- braid graph ,we make a braid graph of n-vertex in top level by δ_i, $i = 1,2,3,......., n-1$ and called it a n-braid graph

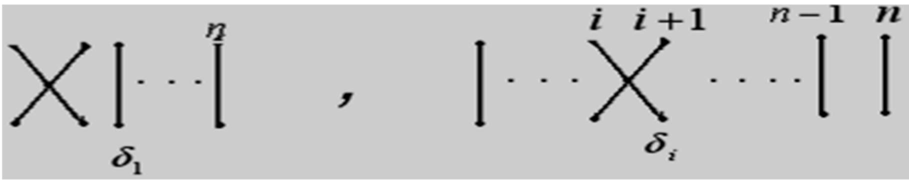

Fig.(12)

Note that δ_i in n – braid graph, $n > 2$ is a disconnected graph. Every n- braid graph which formed by $\delta_1, \delta_2, ..., \delta_{n-1}$ together is a connected graph.

We consider $\mathrm{B}G$ the set of all n- braid graphs which have n- vertex in its top level and define the operation product on $\mathrm{B}G$ similar to the product in braid group therefore $\mathrm{B}G$ forms a monoid .This monoid generated by $\delta_1, \delta_2, ..., \delta_{n-1}$. If β_i and $\beta_j \in \mathrm{B}G$ then $\beta_i\beta_j \in \mathrm{B}G$,also $\beta_i(\beta_j\beta_k) = (\beta_i\beta_j)\beta_k$,we consider $\widehat{p}(\sigma_i\sigma_{i+1}\sigma_i) = \widehat{p}(\sigma_{i+1}\sigma_i\sigma_{i+1})$, *i=1,2,3,...n-1* and $\widehat{p}(\sigma_i\sigma_j) = \widehat{p}(\sigma_j\sigma_i)$, $|i-j| \geq 2$

Theorem5.1. For every straight folding f of β into itself, β is a n-braid, there is an induced graph folding $\bar{f}$ of $\widehat{\beta}$ into itself, $\widehat{\beta}$ is a n–braid graph.

Proof. Let f be a straight folding from β into itself ,then $f(\beta)$ is a (n-m)-braid ,m< n-2 , a projection of β, $\hat{\beta}$ is a n-braid graph ,hence there is a graph folding $\bar{f}$ from $\hat{\beta}$ into itself such that $\bar{f}(\hat{\beta})$ is a (n-m)- braid graph which exact $\hat{p}(f(\beta))$.

Theorem5.2. Every connected braid graph $\beta = \delta_1\delta_2\delta_3 ......\delta_{n-1}$ can be folded into itself by a sequence of graph foldings onto an edge.

Proof. Let $\beta = \delta_1\delta_2\delta_3 ......\delta_{n-1}$ Fig.(13) be a braid graph of n-vertex in its top level .Then the vertices set of β is $V(\beta) = \{v_1, v_2, v_3, ..., v_m\}$, $m > n$, and the edge set of β is $E(\beta) = \{e_1, e_2, e_3, ..., e_{m-1}\}$.

Let $f_1 : \beta \to \beta$ be a graph folding ,where $f_1(\beta) = \beta_1$ is a subgraph of β by fold one edge or more, and $f_2 : \beta_1 \to \beta_1$,where $f_2(\beta_1) = \beta_2$ is a subgraph of β_1 also by fold one edge or more ,until we get one edge.

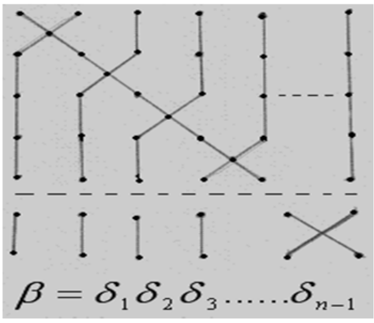

Fig.(13)

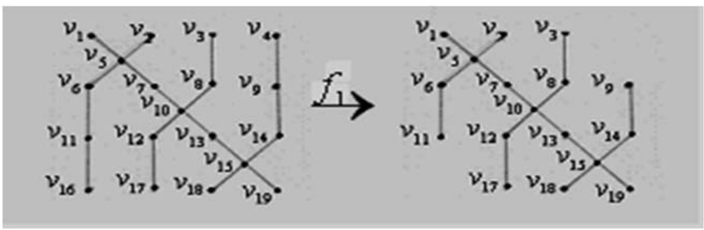
Corollary5.1. Every braid graph $\beta = \delta_{n-1}\delta_{n-2} ....\delta_2\delta_1$ can be folded into itself by a sequence of graph folding onto an edge.

Proof. Similar to the proof of theorem (5.2).

Example5.1. Let $\beta = \delta_1\delta_2\delta_3$ be a4-braid graph, its vertex set $V(\beta) = \{v_1, v_2, ..., v_{19}\}$ Fig.(14). Let $f_1 : \beta \to \beta$ be a graph folding defined as follows. $f_1\{v_4, v_{16}\} = \{v_{14}, v_6\}$ and $f_1\{\{e = \{v_{11}, v_{16}\}, e = \{v_4, v_9\}\} = \{\{e = \{v_{11}, v_6\}, e = \{v_9, v_{14}\}\}$ a graph $f_1(\beta) = \beta_2$ can be folded again as follows. Let $f_2 : \beta_1 \to \beta_1$ be given by $f_2\{v_3, v_9, v_{11}, v_{17}\} = \{v_{10}, v_{15}, v_5, v_{10}\}$ and $f_2 : \{\{e = \{v_3, v_8\}, e = \{v_{11}, v_6\}, e = \{v_9, v_{14}\}, e = \{v_{17}, v_{12}\}\} = \{\{e = \{v_8, v_{10}\}, e = \{v_{11}, v_6\}, e = \{v_{14}, v_{15}\}, e = \{v_{12}, v_{10}\}\}$
also, again $f_2(\beta_2)$ can be folded until we get a graph consists of only one edge Fig.(14).



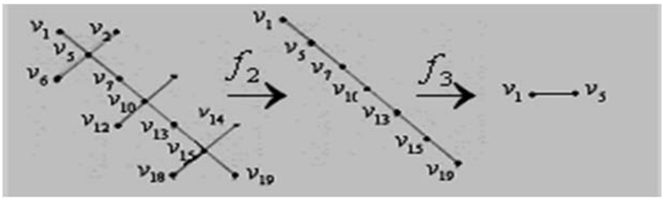


Fig.(14)

Theorem 5.3. Let A_n be a monoid braid graph generated by $a_1, a_2, \ldots\ldots, a_{n-1}$,where $a_i = \delta_{n-1}\delta_{n-2}\ldots\ldots\delta_{i+1}\delta_i^2\delta_{i+1}\delta_{i+2}\ldots\ldots\delta_{n-1}$,then we can fold any connected element in A_n into itself by sequence of graph foldings onto an edge.

Proof . Let b an element in A_n ,then $b = a_i$ or $b = a_1a_2\ldots a_m$,if $b = a_i$ then we can define a graph folding $f : a_1 \rightarrow a_1$ by $f(a_1) = a_1'$ where $a_1' = \delta_1\delta_2\ldots\ldots\delta_{n-1}$ and by theorem(5.1) we can define a sequence graph folding on a_1' until we get a graph consists of only one edge.

I f $b = a_1a_2\ldots a_m$ then we can define a graph folding $g : b \rightarrow b$ by $g(a_1a_2\ldots a_m) = (a_1'a_2\ldots\ldots a_m')$ where $a_1' = \delta_1\delta_2\ldots\ldots\delta_{n-1}$ and $a_m' = \delta_{n-1}\delta_{n-2}\ldots\ldots\delta_m$ hence

$a_1'a_2\ldots\ldots a_m' = \delta_1\delta_2\ldots\ldots\delta_{n-1}\delta_{n-1}\ldots\ldots\delta_3\delta_2^2\delta_3\ldots\ldots\delta_{n-1}\delta_{n-1}\ldots\ldots\delta_4\delta_3^2\delta_4\ldots\ldots\delta_{n-1}\delta_{n-1}\ldots\ldots\ldots\delta_m$ every $\delta_j\delta_j$ can be folded onto two edges connect between two intersection points of first δ_j and second δ_j $\forall j$, continue this way until we get a graph consists of only one edge .

Example5.2. Let A_4 be a monoid braid graph generated by $a_1 = \delta_3\delta_2\delta_1^2\delta_2\delta_3$, $a_2 = \delta_3\delta_2^2\delta_3$, $a_3 = \delta_3^4$ Fig.(15) ,we take $b_1 = a_1a_2 = \delta_3\delta_2\delta_1^2\delta_2\delta_3\delta_3\delta_2^2\delta_3$, $b_2 = a_1a_3 = \delta_3\delta_2\delta_1^2\delta_2\delta_3\delta_3^4$ and applying a graph folding on b_1 and b_2 see Fig.(16) and Fig.(17).

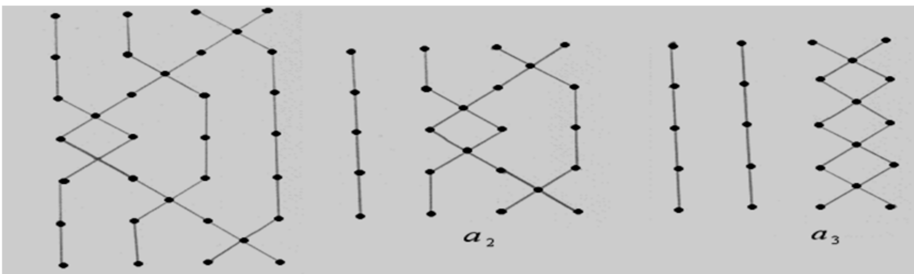

Fig.(15)

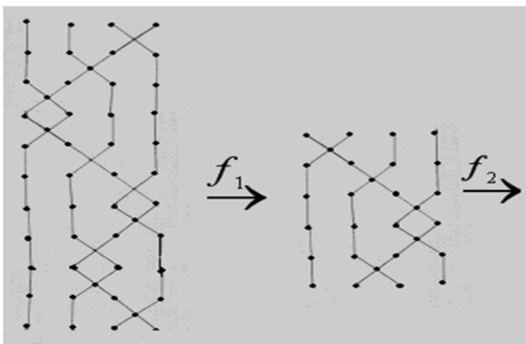

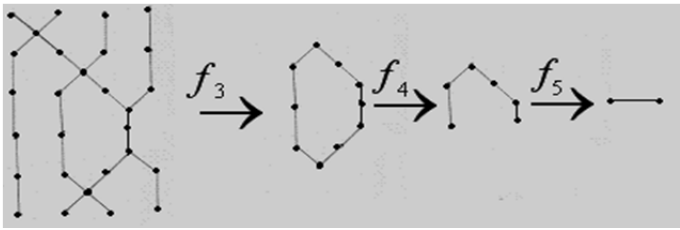

Fig.(16)

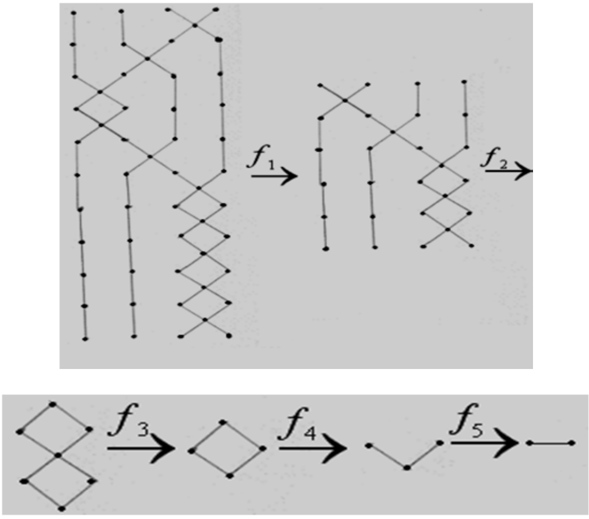

Fig.(17)

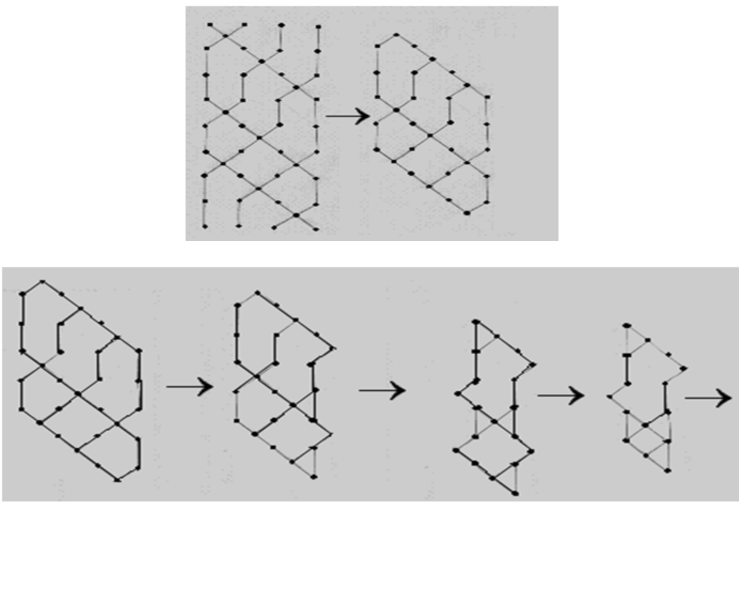
After we introduce a braid graph and apply the graph folding on it .Is all braid graph can be folded by a graph folding? and what the result?.To answer we introduce the following theorem

Theorem5.4. Let $\beta = (\delta_1\delta_2\delta_3.........\delta_{n-1})^{n-1}$ be a n-braid graph ,then we can be folded β into itself by sequence of graph foldings onto a complete graph K_3.

Proof. The proof came directly from the above discussion.

Example5.3. Let $\beta = (\delta_1\delta_2\delta_3)^3$ be a4- braid graph then we can make the following graph folding and get a complete graph K_3 .Fig.(18).



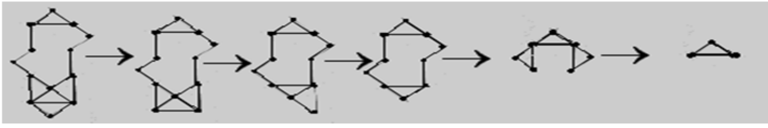


Fig.(18)

Theorem5.5. Any connected braid graph can be folded into itself by a sequence of graph foldings onto an edge or complete graph K_3 .

Proof. The proof came directory from the above theorems.

ABSTRACT: The word "UNESCO" was created by being taken the initials of "United Nations Educational, Scientific and Cultural Organization" (Altun & Ata, 2013). UNESCO has undertaken two main objectives as it can be understood from the name of the organization. This organization is an international organization that works for the expedience of the world in long term and as a whole aims to serve to the aims of United Nations including humanitarian purposes. Moreover, the organization aims to support and develop all aspects of the concepts of education, science and culture (Huxley, 1946: 4). Based on these purposes, UNESCO has provided the preparation of many publications as book, journal, report, and article etc. in the field of education. It is seen that some of these publications are related with mathematics education.

The aim of this study is to examine the publications of mathematics education published by UNESCO from "Standards and Principles for School Mathematics" document of NCTM issued in 1989 to present. These publications are comprised of article, book, report and documents placed in the publications of education in the web site of the organization. 272 publications of UNESCO were examined with document analysis. In the study, document analysis method, one of qualitative research methods, was used. Investigated publications were analyzed in terms of publication years, publication types, subject areas, contents and related countries. Descriptive analysis method was used in the process of analysis of publications. As the result of investigation of these publications of UNESCO about mathematics education, it is revealed that the publications focused especially on mathematics education programs of countries, international measurement and assessment exams as TIMMS, PISA and subjects about teaching and learning mathematics.

Key words: UNESCO, mathematics education, NCTM

INTRODUCTION

The word "UNESCO" was created by being taken the initials of "United Nations Educational, Scientific and Cultural Organization" (Altun & Ata, 2013). The aim of UNESCO, as it is understood from the name of the organization, can be summarized as contributing to global peace, removing poverty, sustainable development and inter-communal dialogue based on shared common values. There are 195 full members and 9 associated members of UNESCO in the world. It is possible to reach the list of the member countries and the date of their membership on the website of the organization.

It has been one of the main aims of the organization to encourage tolerance and peace since the establishment of the organization. The main approach of the organization is educational: the action program is quite extensive and variable including not only international explanation of tolerance and peace concepts but also development of textbooks, production of education materials, organizations of seminar and conference and initiation of "The Associated School Project" (UNESCO, 1997:40). Education is one of the primary areas of UNESCO. UNESCO believing that education is the key point in social and economic development and undertaking a humanitarian educational vision, has been studying to improve education worldwide since its establishment (www.unesco.org). For example, the organization has carried out its educational activities within the framework of program accepted in World Education Forum in DAKAR in 2000 and determining the goals to be achieved up to 2005 which is called shortly as "Education for All". UNESCO substantially comes into prominence with studies and agreements setting standards that the organization pioneers in the international field.

In this study, it was attempted to explain the general situation of the studies of UNESCO about mathematics education from 1989 to today. The aim of the study is to evaluate these studies of UNESCO in terms of the questions below. The research questions are as follows:

1. How is the distribution of the publications of UNESCO about mathematics education according to years?
2. How is the distribution of the publications of UNESCO about mathematics education according to publication series?
3. How is the distribution of the publications of UNESCO about mathematics education according to continents and countries?
4. How is the distribution of the publications of UNESCO about mathematics education according to whether the publications are UNESCO publication or not?
5. How is the distribution of the publications of UNESCO about mathematics education according to subject areas?
6. How is the distribution of the publications of UNESCO about mathematics education according to accessibility (online access)?

METHOD

Research Design

In this study, aiming to examine the publications of UNESCO about mathematics education, descriptive model was used because of the fact that it was aimed to describe the existing situation as it is. Qualitative research method was used in collection, analysis and evaluation of obtained data.

The Investigated Publications

1198 publication were obtained in the expert search section of data base of UNESDOC. Because of the difficulty of examination of 1198 publications obtained by purposive sampling method, 272 of these publications whose publication language was English and which were published after the publication of the "Principles and Standards for School Mathematics" document of NCTM, were examined in the scope of this study.

Data Collection

Document analysis method was used as data collection technique in the study. Document analysis includes analysis of written materials giving information about case or cases aimed to investigate. Document analysis can be performed in five stages in general as: reaching documents, control of originality, analysis of data and use of data (Yıldırım& Şimşek, 2011). In the study, the publications reached from UNESDOC data base were investigated in accordance with these stages.

UNESCO offers the publications that has been published and included in its libraries and on its data base to relevant people via four different web sources. These sources are "Online Book for Sale" section where book, multiple media, periodical and scientific maps for professionals in six languages (English, French, Spanish, Russian, Chinese and Arabic) are sold, "UNESDOC data base" section where approximately 120 000 publications in six languages published form 1945 to today are offered to online access freely, "UNESCO Library" in Paris and "archive" section at the same place. In this study, UNESDOC data base having online access was used and it was reached to this data base from the address of http://www.unesco.org/new/en/unesco/resources/online-materials/publications/unesdoc-data base/.

Data Analysis

Information about the publications as it is given in Figure 1 is seen when it is clicked on the link of the publications investigated as a result of searching on UNESDOC data base. On this webpage it is seen that title, publication series (if exists), country, publication date, key words, situation of online access and document type of the publications. Publication date, country, publication series, subject area, situation of being a UNESCO publication and online access were determined as the categories of the study.

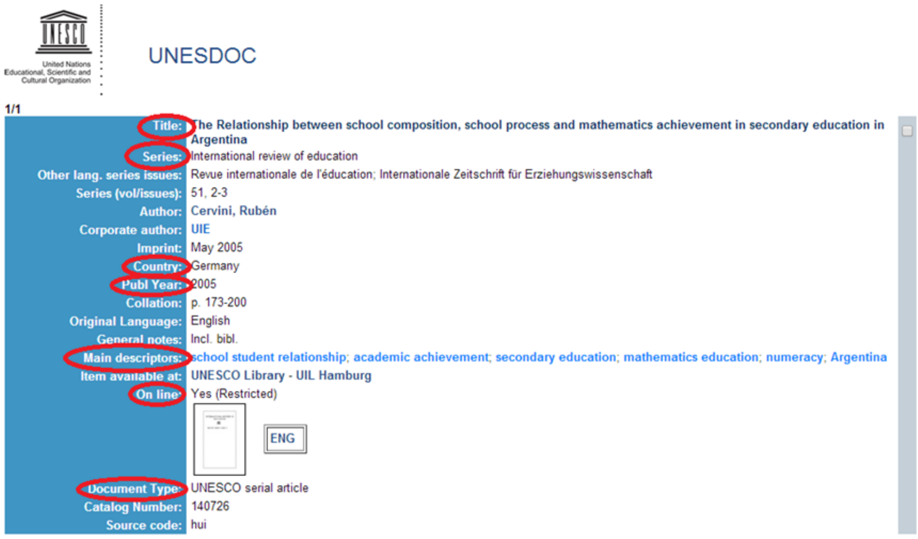

Figure 1. An example publication tag from UNESDOC data base

FINDINGS

1. The Distribution of the Publications of UNESCO about Mathematics Education according to Years

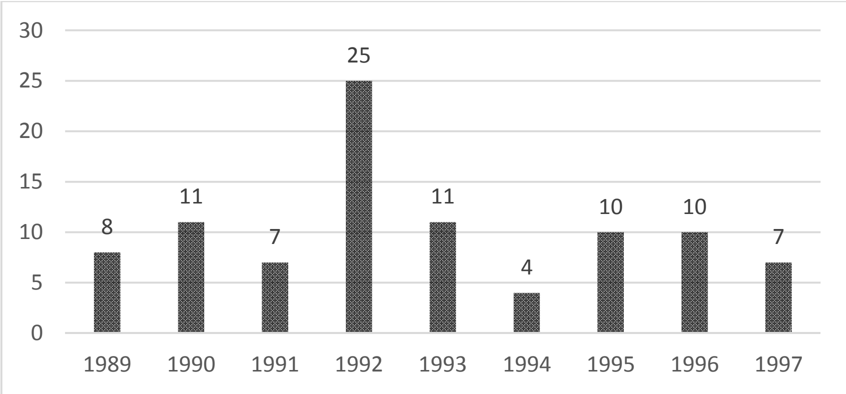
It is found that although UNESCO was established in 1945, the publications about mathematics education on UNESCO website had started to be published in 1935. The reason for this is that this publication was on UNESCO data base although it was a non-UNESCO publication. Moreover, it is found that there were any publications published in 2014.

As it was stated in methodology, the examination was carried out between the years of 1989 and 2013 and for the distribution to be seen better, the numbers of publications were given in 3 groups of years, two of which contained 8 years and the one contained 9 years (See Table 1).

Table 1. The Distribution of the Publications about Mathematics Education on UNESCO Website according to Years

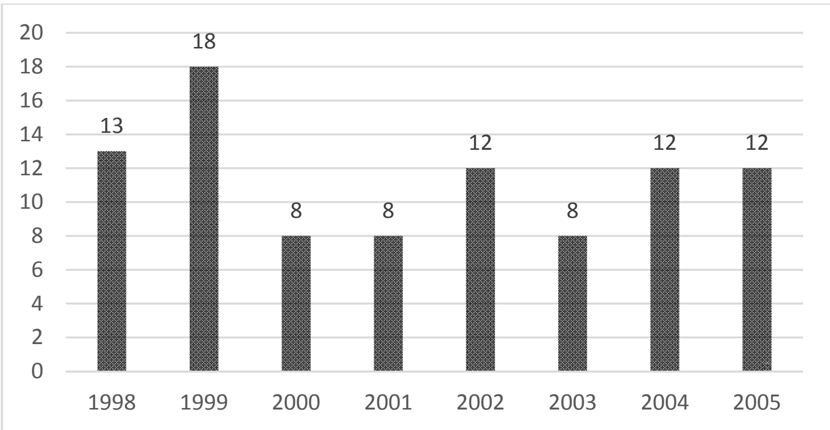
Years	Number	Percentage	Years	Number	Percentage	Years	Number	Percentage	Years
1989	8	2,94	1998	13	4,78		2006	25	9,19
1990	11	4,04	1999	18	6,62		2007	15	5,51
1991	7	2,57	2000	8	2,94		2008	14	5,15
1992	25	9,19	2001	8	2,94		2009	9	3,31
1993	11	4,04	2002	12	4,41		2010	12	4,41
1994	4	1,47	2003	8	2,94		2011	6	2,21
1995	10	3,68	2004	12	4,41		2012	6	2,21
1996	10	3,68	2005	12	4,41		2013	1	0,37
1997	7	2,57	**Total**	**91**	**33,46**		**Total**	**88**	**32,35**
Total	**93**	**34,19**							

When the table is examined, it is seen that the most publications were published in 1992 (25 publications) in the group of the years between 1989 and 1997, in 1999 (18 publications) in the group of the years between 1998 and 2005 and in 2006 (25 publications) in the group of the years between 2006 and 2013.



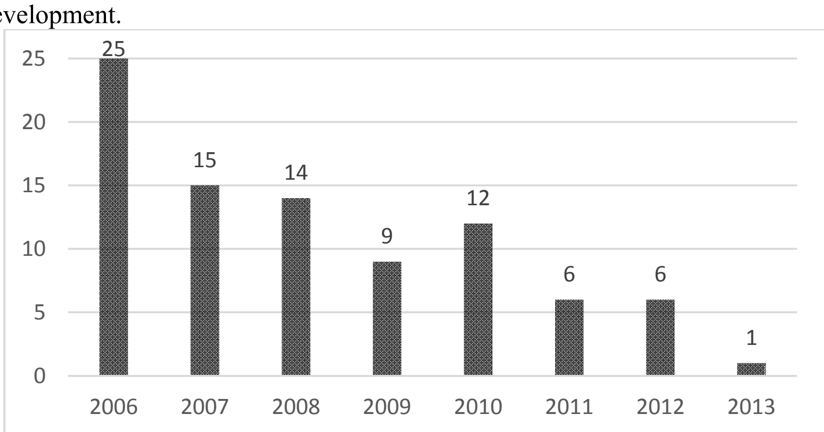
Graph 1. The Publications about Mathematics Education Published between the years of 1989 and 1997 and Placed on UNESCO Website

When the publications in 1992 were examined, it is appealed that 15 of 25 publications were published in "*Moving into the twenty-first century: (Studies in mathematics education)"*series and 13 of the publications were related to investigation of mathematics education systems of different countries. 4 of other 10 publications published in 1992 were related to mathematics education in countries. From this point of view, it can be stated that most of the publications were about the mathematics systems of the countries



Graph 2. The Publications about Mathematics Education Published between the years of 1998 and 2005 and Placed on UNESCO Website

When the publications in 1999 were examined, it is seen that 13 of 18 publications were related to mathematics course education programs. 9 of these publications were about mathematics course education programs from 1st grade to 9th grade, separately. 3 of remaining 4 publications were about program comparisons and 1 of them was about program development.

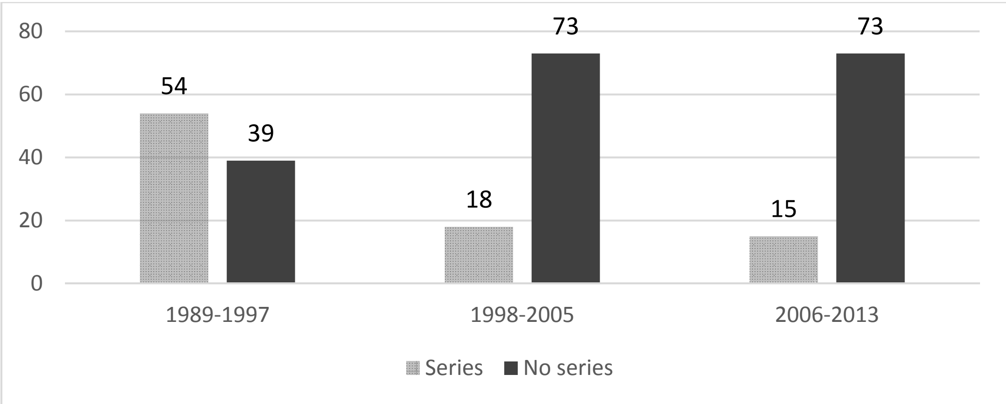


Graph 3. The Publications about Mathematics Education Published between the years of 2006 and 2013 and Placed on UNESCO Website

When the publications in 2006 were examined, it is seen that 22 of 25 publications were related to mathematics course education programs. Among the rest of the publications, 1 publication was about measurement-assessment, 1 publication (for each) was about the use of technology and computer in mathematics education and the other was about counting.

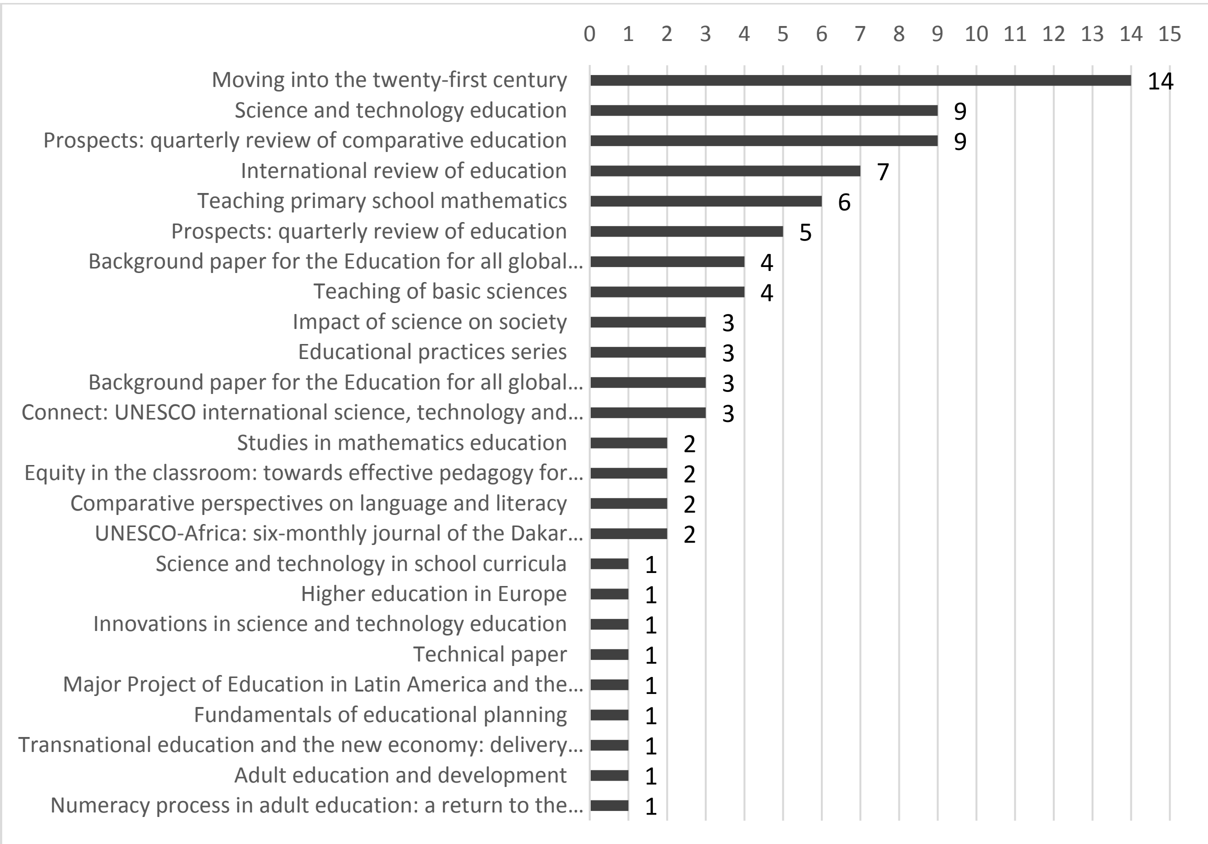
2. The Distribution of the Publications of UNESCO about Mathematics Education according to Publication Series

When the publications were examined, it seen that 87 of 272 publications were classified in specific series. The distribution of the publications according to series were given in Graph 4.



Graph 4. The Distributions of Publication Series of the Publications of UNESCO about Mathematics Education according to Years

When Graph 4 is examined, it is seen that the publications between the years of 1989 and 1997 were published in series mostly. It is appealed that the publications were not published in series mostly from past to present; they were published as independent publications.



Graph 5. Publication Series of the Publications of UNESCO about Mathematics Education

When the publication series were examined, most of the publications were in "Moving into the twenty-first century” series with 14 publications. The series aims to examine mathematics education systems of countries while entering into 21st century. It was followed by "Science and technology education" and "Prospects: quarterly review of comparative education" series with 9 publications in each.

3. The Distribution of the Publications of UNESCO about Mathematics Education according to Continents and Countries

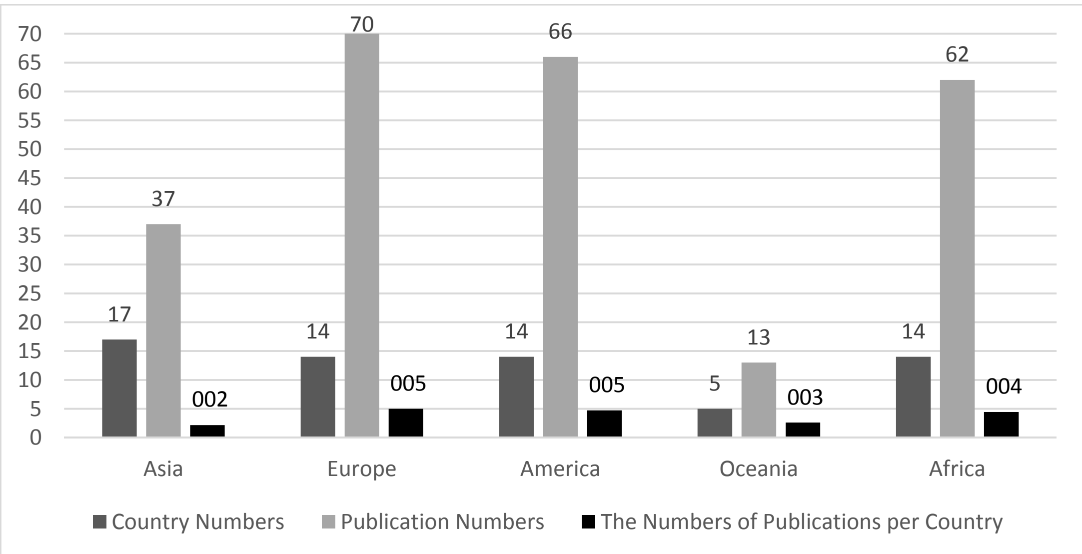
As the result of examination, it is seen that the publications about mathematics education on UNESCO website were published in countries of 5 continents (Africa, America, Europe, Asia, Oceania). The distributions of the publications according to the continents were given in Table 2.

Table 2. The Distributions of the Publications about Mathematics Education on UNESCO Website according to the Continents

Continent	Numbers of Countries in Continent *	Numbers of Countries about which Publications Published		Number of Publications	
		f	Percentage in terms of numbers of countries in continent	f	Number of Publications Per Year
Asia	49	17	34.69	37	2.18
Europe	43	14	32.55	70	5.00
America	41	14	34.14	66	4.71
Oceania	17	5	29.41	13	2.60
Africa	54	14	25.93	62	4.43

* In the table 204 members of UNESCO are given totally (195 countries are full members and 9 countries are associated members).

When Table 2 was examined, it is seen that the continents where the number of the publications was the most between the years of 1989 and 2013 were Asia and America. However, when the numbers of countries in the continents were taken into consideration, it is appealed that publications about mathematics education existed in approximately 35 % of the countries in the continents of Asia and America. Africa was the continent having the least value for this ratio.



Graph 6. The Graph of the Publications about Mathematics Education Published between the years of 1989 and 2013 and Placed on UNESCO Website according to the Continents of Related Countries

When Graph 6 was examined, it is seen that Europe was the continent that the number of publications per country was the most with 5 publications and Asia was the continent that the numbers of publications per country was the least with 2,18 publications. Because of the fact that 37 publications were published for 17 countries in the continent of Asia, the number of publications per country was less. Moreover, the numbers of publications published in the countries placed in these continents were given in Table 3.

Table 3. The Distributions of the Publications about Mathematics Education on UNESCO Website according to the Countries

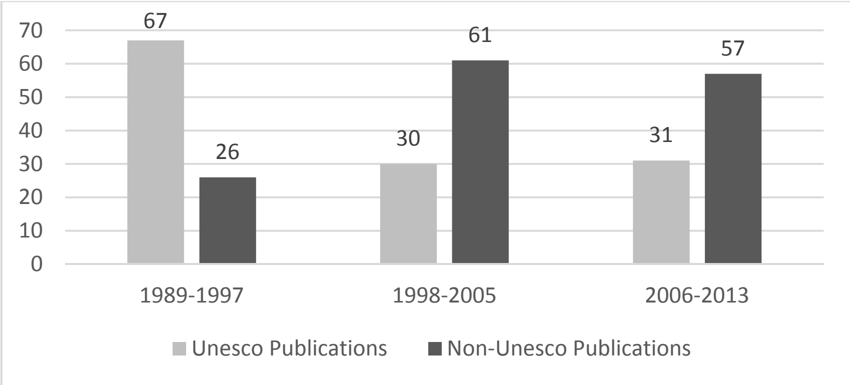
Country	Number	Country	Number	Country	Number
No information	24	Belize	3	Argentina	1
French	19	Botswana	3	Bhutan	1
UK	16	Philippines	3	Bulgaria	1
USA.	13	Indonesia	3	Cook Islands	1
Antigua and Barbuda	10	Canada	3	Denmark	1
Bahamas	9	Hungary	3	Philippines	1
South Africa	9	Mauritius	3	Developing countries	1
Australia	8	Senegal	3	Iran	1
Jamaica	8	Trinidad and Tobago	3	Cairo	1
Namibia	8	Uganda	3	Qatar	1
Swiss	7	Zambia	3	Kuwait	1
Thailand	7	Zimbabwe	3	Lesotho	1
Africa Countries*	6	Caiman Islands	2	Malaysia	1
Germany	6	Dominic Republic	2	Malta	1
Kenya	6	Estonia	2	Holland	1
Rwanda	5	Iraq	2	Nigeria	1
Brazil	4	Italy	2	Norway	1
Chili	4	Japan	2	Palau	1
Ghana	4	Egypt	2	Paris	1
India	4	Nepal	2	Romania	1
Sweden	4	Samoa	2	Sri Lanka	1
OECD	4	Singapore	2	Uruguay	1
Pakistan	4	Arabia Countries *	1	Victoria	1
America Countries *	3			Total:	272

* Presented as this because of being titled generally and not being stated any specific country.

When Table 3 was examined, it is seen that 24 publications did not have information about country. It is also appealed that 19, 16 and 13 of the publications were published in France, the United Kingdom and the United States of America, respectively. This finding shows that there were more publications in three of the biggest countries in the world. Moreover, it is quite meaningful that the numbers of the publications were the most in France when it is thought that the central office of UNESCO is in France (http://en.unesco.org/feedback/contact-us)

4. The Distribution of the Publications of UNESCO about Mathematics Education according to whether the Publications are UNESCO Publication or not?

It is seen that the publications about mathematics education were presented under two categories as: UNESCO publication and non-UNESCO publication. The distributions of the publications according to this criteria was given in Graph 7. For these publications to be seen better in terms of years, they were presented in 3 groups of years.



Graph 7. The Distribution of the Publications of UNESCO according to UNESCO and Non-UNESCO Publications

When Graph 7 was examined, it is seen that the numbers of UNESCO publications were the most between the years of 1998 and 2005 with 67 publications and there were nearly 30 publications in other groups of years. Moreover, it is found that the numbers of UNESCO publications have decreased since 1988.

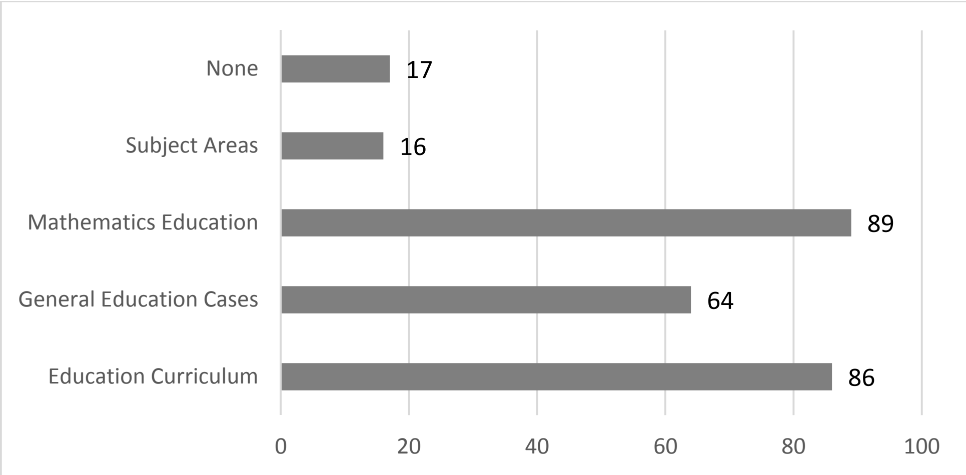
5. The Distribution of the Publications of UNESCO about Mathematics Education according to Subject Areas

The publications of UNESCO published between the years of 1989 and 2013 were examined according to subject areas. When the publications were examined, they were coded according to the key words and contents of the publications. As a result of coding, five main themes were formed as education curriculum, general education cases, mathematics education, subject areas and no subject (See Table 4). The subjects of some of the publications could not be determined. Therefore, a theme as "no subject" was formed. The reason for not determining the subjects of some of the publications was that the publications did not have online access and the key words were insufficient to explain the contents of the publications.

Table 4. The Distributions of the Publications about Mathematics Education on UNESCO Website according to the Subject Areas

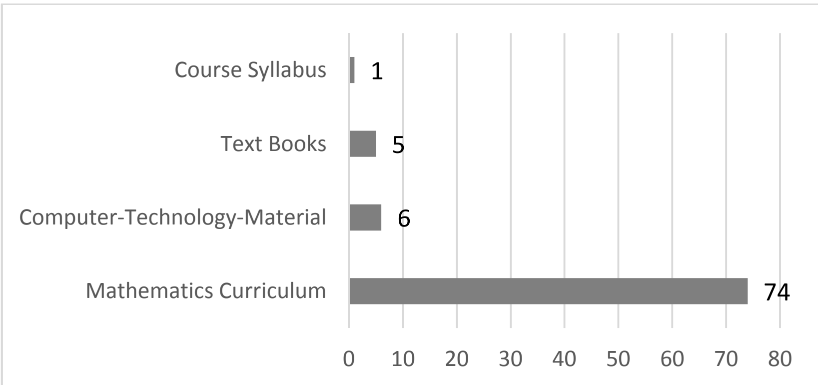
Categories	Pub. Numbers	Subjects	Pub. Numbers
Education Curriculum	86	Mathematics Curriculum	74
		Computer-Technology-Material	6
		Text Books	5
		Course Syllabus	1
General Education Cases	63	Countries and country comparatives	34
		Teacher Education	12
		Learning Class, Disabilities of Mathematics, Culture and Problems and Solving Suggestions	6
		Equity and Gender Differences	4
		Conference	3
		Special Education	2
		Higher Education	1
		Olympics	1
		Gifted and Talented Students	1
Mathematics Education	89	Mathematics Education	38
		Evaluation and Assessment (PISA, TIMMS)	25
		Teaching of Mathematics	15
		Learning of Mathematics	8
		Mathematics Education in Future	1
		History of Mathematics Education	2
Subject Areas	16	Number and Numerosity	8
		Statistic	3
		Fractions	2

		Teaching of Arithmetic	1
		Problem Solving	1
		Street and School Mathematics	1
None	17		



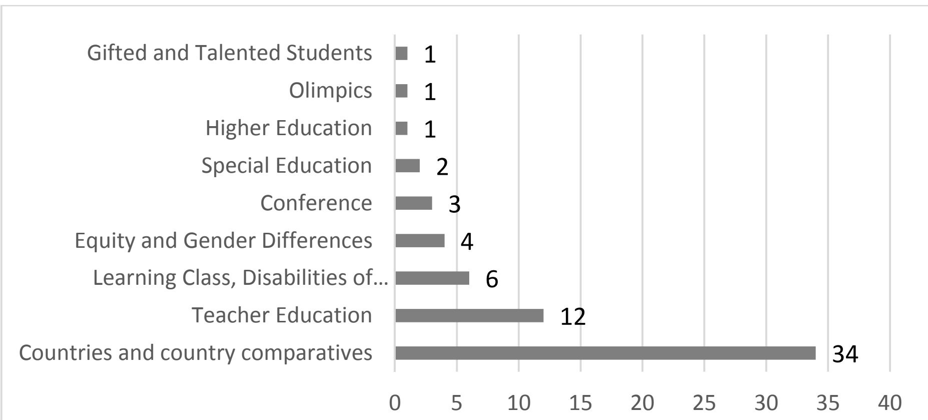
Graph 8. The Subjects of the Publications about Mathematics Education Published between the years of 1989 and 2013 and Placed on UNESCO Website according to the Subject Areas

It is seen in Graph 8 that 89 of the publications were about mathematics education. This themes was followed by education programs with 86 publications, general education cases with 64 publications and subject areas including sub-areas of mathematics with 16 publications. The subjects of the publications published between the years of 1989-2013 were not determined.



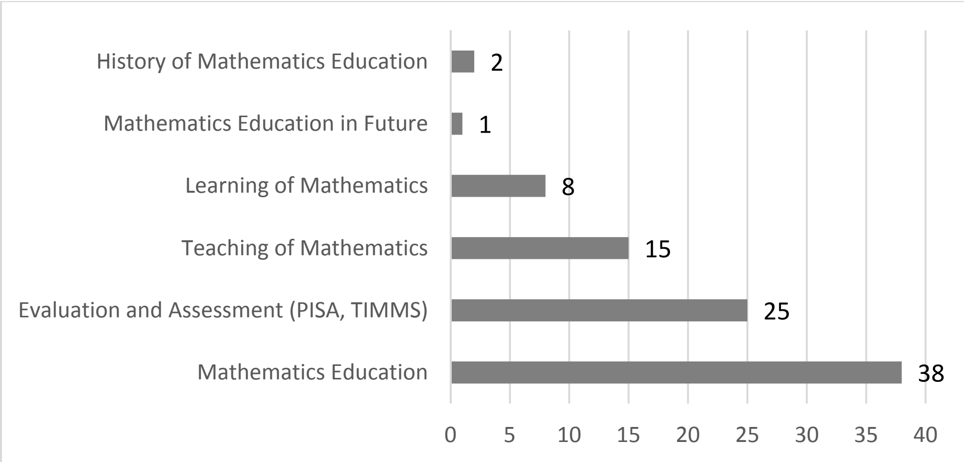
Graph 9. The Publications about Education Programs

The most of the publications in the theme of education programs were about mathematics course education programs. It is also seen that there were not many publications about textbooks (See Graph 9).



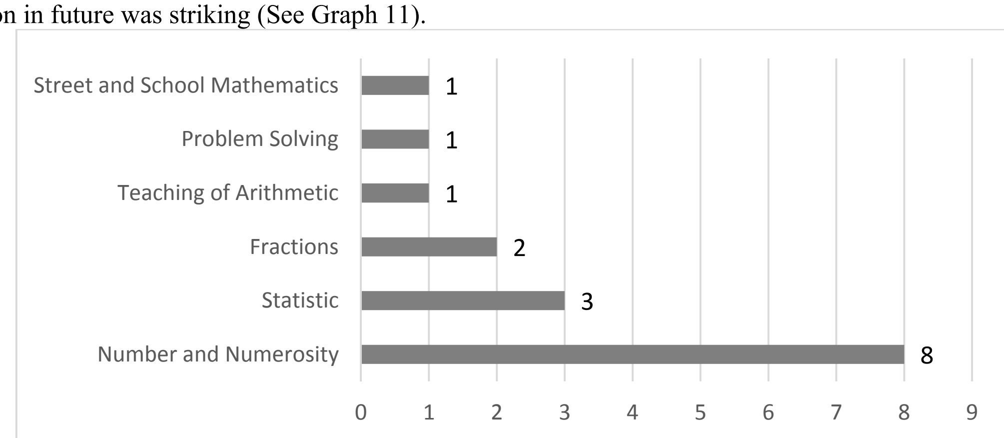
Graph 10. The Publications about General Education Situations

It is seen in Graph 10 that 34 publications were about countries and comparisons of countries. It is also found that 12 of the publications were about teacher education. This category is followed by the publications about learning environments, mathematical difficulties and culture with 6 publications for each.



Graph 11. The Publications about Mathematics Education

It is seen that the number of the publications about mathematics education was much more than the number of other sub-categories in the theme of mathematics education (See Graph 11). It is found that there were 38 publications about mathematics education on UNESCO data base. This sub-category was followed by measurement-evaluation with 25 publications. Between the years of 1989 and 2013, 15 publications were published about mathematics teaching and 8 publications were published about mathematics learning. It is seen that there were only 2 publications about mathematics education history about which more publications have been published with increasing importance in recent years. Moreover only 1 publication was published about mathematics education in future. When it is compared with other sub-categories in the theme of mathematics education, the fewness of the numbers of the publications about mathematics education history and mathematics education in future was striking (See Graph 11).



Graph 12. The Publications about Subject Areas

It is seen in Graph 12 that the number of the publications in the theme of subject areas including sub-areas of mathematics was the most in the sub-category of number and numerosity. 8 publications were published in the sub-category of number and counting between the years of 1989 and 2013. This sub-category was followed by the sub-category of statistics with 3 publications and the sub-category of fractions with 2 publications. It is seen that only 1 publication (for each) was published in the sub-categories of street and school mathematics, problem solving and arithmetic.

6. The Distribution of the Publications of UNESCO about Mathematics Education according to Accessibility (Online Access)

When the publications were examined, it is seen that some of the publications on UNESCO website had online access. The publications were examined under two categories to investigate the accessibility of the publications (See Table 5).

Table 5. The Distributions of the Publications about Mathematics Education on UNESCO Website according to the Accessibility (Online Access)

Year	Online Access	Non-Online Access
1989-1997	61	31
1998-2005	57	33
2006-2013	29	61
Total	147	125

When Table 5 was examined, it is seen that the number of the publications having online access was the most between the years of 1989 and 1997. It is also found that that the number of the publications not having online access was the most between the years of 2006 and 2013. Moreover, it is seen that the numbers of publications having online access have been decreasing from past to present.

DISCUSSION AND CONCLUSION

In this study, evaluating the publications about mathematics education on UNESDOC database, 272 publications were reached. Only 147 of these publications were accessed online. Some of the publications of the rest were not included on data base and some were accessed by user name and password. It is thought that accessing some publications by user name and password contradicts with the identity of the organization because of the fact that the organization is known as a nonprofit and international education, science and culture organization. Since such implementations prevent people to access the publications. When the publications were examined according to years, it was seen that online accessibility decreased. In this era that technology has been developing continuously and becoming an information society, accessing data is provided in digital environments. Despite this, while more publications were accessed online in the past, online accessibility of the publications has been decreasing from past to present.

Another finding revealed that the distribution of the publications according to years was consistent. When the publications were examined according to years, it was found that nearly 90 publications existed for each group. It was appeared that there were more publications especially in 1992 and 2006. The reason of existing more publications in 1992 and 2006 may arise from the fact that countries evaluate their own mathematical education more after the publication and revision of “Principles and Standards for School Mathematics” document by NCTM in 1989 and 2000.

As a result of analysis of investigated publications according to subject areas, it was found that the publications focused mostly on “Mathematics Education” and “Education Programs” topics. “Mathematics Course Education Programs” was the topic that the most publications were published. It is found that in recent years many publications related to situations of countries have also published as measurement and international evaluation reports like PISA, TIMSS were published. Moreover, it was appeared that there were no more publications about sub-areas in mathematics (arithmetic, algebra, problem solving etc.). According to purpose of establishment of UNESCO, it is also aimed to be developed educational systems of countries. Despite this purpose, it is surprising that there was only one publication about how future mathematics education should be. Moreover, it also contradicts with the aim of UNESCO focusing also differences among cultures that only 4 publications existed related to equality and gender differences in mathematics education.

It is seen that there were more publications in the countries located in the continents of America and Asia. When the publications on UNESDOC data base were examined, it is appeared that the ratio of numbers of countries in each continent where publications were published to the numbers of countries in the continents was 25-35 %. It is thought that the ratio of countries publishing publications was less in Africa because of the fact that the number of countries in Africa is more. It is seen that although the ratio of countries where publications were published was less, the number of publications (4,43 publications) per country was more. It is appeared that the continent where more publications existed was Europe with 5 publications. Similarly, it is found that number of publications per country was also high in America with 4,71 publications. It is seen that although in the continent of Asia, the ratio of the number of countries where publications published to all countries in this continent was approximately 35%, the number of publications per country was the least among the continents with 2,18 publications.

When the publications were examined, it is found that the number of publications published in France was the most with 19 publications among other countries. The reason may be the fact that the central office and library of UNESCO place in this country. Moreover, it is revealed that the number of publications was also high in less developed countries as Antigua and Barbuda (10 publications), Bahamas (9 publications) publications) and South Africa (9 publications) as well as they were published in developed countries as the United Kingdom (16 publications) and the United States of America (13 publications).

When the publications were examined, it is seen that especially the publications published between the years of 1989 and 1997 were published within the scope of series. It is revealed that the number of publications published in series had decreased from past to present and they were published as independent publications. When the series of publications were examined, it is found that the number of the publications in "Moving into the twenty-first century" series was the most. It was followed by the series of "Science and technology education" and "Prospects: quarterly review of comparative education". However, the numbers of publications were the least in the series of "Science and technology in school curricula, Higher education in Europe, Innovations in science and technology education, Technical paper etc."

dimdiam@sch.gr

ABSTRACT: This paper discusses a problem-centering strategy in integrating mathematics and science with ICT in a secondary school, in Greece. Integration involves establishing ties between scientific and mathematical sub-fields. The problem-centering strategy involves enlisting the knowledge in two or more disciplines to address particular tangible and real-world problems. In this pilot study, the problem-centering strategy was applied to two classrooms of a secondary school in Athens. Its advantage was that it brought together the disciplines of mathematics and science with ICT use (as a tool). Pupils, aged 13-14 years old, carried out learning activities integrating mathematics and physics in a computer environment using the "Geogebra" software. The learning activities focused on resolving tangible problems. This approach seemed to have improved pupils' motivation to learn mathematics.

Key words: mathematics, science, ICT, problem-centering strategy, interdisciplinary approach

INTRODUCTION

Several studies back the benefits of incorporating a multi-disciplinary curriculum. Research in the area of education, as well as in cognitive science, suggests that curriculum variations featuring an inter-disciplinary curriculum are likely to promote more learning (Loepp, 1999). Throughout the 1990's, curriculum integration and its application has been a consistent and important theme in education reform strategies, yet very few schools have adopted this reform in practice (Wisconsin Department of Public Instruction, 1999). This has happened despite praise from parents and pupils who describe the approach as valuable and challenging (Reid & Feldhaus, 2007); despite recommendations from many experts in the field and standards initiatives in science, mathematics, and technology that call for implementation of a multi-disciplinary approach; and despite research that shows integrating the math, science, and technology education curriculum helps pupils across a wide range of academic achievement (Wicklein & Schell, 1995; Bailey, 1997).

This paper discusses a problem-centering strategy in integrating mathematics and physics with ICT in a secondary school, in Greece. This is an introductory pilot study, since we still collect data from classroom practices. Three terms which are relevant to the study are defined here, for clarity. *Integrated Curriculum* - Two or more teachers from different disciplines working together to coordinate their course instruction, develop materials, link academic and occupational skills, and develop varied instructional strategies (Wisconsin Department of Public Instruction, 1999). *Interdisciplinary Curriculum* - A term that can mean any of the following: (i) Applying methods and language from more than one academic discipline to examine a theme, issue, question, problem, topic, or experience. Interdisciplinary curriculum creates connections between traditionally discrete disciplines such as mathematics, the sciences, social studies, or language. An interdisciplinary curriculum may be pursued by individual teachers working on a particular unit or among teachers planning together, (ii) The process teachers use to organize and transfer knowledge under a united theme (Maurer, 1994). Finally the term *ICT* (*Information and Communication Technology*) is used as synonymous to *computers* and *technology*.

INTERDISCIPLINARY APPROACHES IN THE LITERATURE

Several studies support the benefits of incorporating a multi-disciplinary (or interdisciplinary) curriculum. Wicklein and Schell (1995) performed four separate case studies using a multidisciplinary approach to mathematics, science, and technology education. The goals of these case studies included increasing the interest level of the pupils in these subject areas, to help teachers to understand that their particular instructional areas did not stand alone within the curricular offerings, to improve pupils' attendance in school, and to transfer learning to unique problems. Through the application of "hands-on and minds-on" curriculum, the pupils understood the practical uses of the three instructional areas (Project Lead the Way, 2007-2008). For example, pupils were able to see direct applications of math and science to their everyday life through a variety of technology-based activities. Students demonstrated more motivation by reducing their absences from school and discipline problems based on the school records from the previous year. Furthermore, pupils demonstrated an appreciation for the structured learning activities, were able to perceive the importance of working together to solve a common problem, were able to appreciate the occupational strategies of modern businesses and industries, and demonstrated an improvement in self-esteem (Wicklein & Schell, 1995; Rossiter, 2002). The findings from this case study were not limited to pupil improvements. Faculty agreed that a multi-disciplinary approach created a learning atmosphere that provided pupil with a unique opportunity to learn in a much broader context. In addition, it allowed them to teach more effectively by revealing that pupils had been trained to dismiss subject matter learned in one classroom as having little or no relevancy to another. Research has also reported that motivation for learning increased when pupils worked on real-problem elements. When pupils were actively involved in planning their learning and in making choices, they were more motivated and exhibited fewer behavior problems. A multi-disciplinary curriculum was consistent with increased self-direction, improved attendance, higher levels of homework completion, and a more positive outlook towards school and academics. Inter-disciplinary education curriculum helped pupils make connections, solve problems and addressed better pupils' learning styles.

It is a challenging -but not an easy- task to integrate mathematics and science into the rest of the secondary school curriculum. The challenge comes from the specialization of knowledge in these areas, the use of different sets of terminology, as well as a tradition of teaching these subjects in a way that emphasizes singular facts and precise tools over broad concepts and generalizable ideas. Even within the sciences and mathematics, the separation between the different sub-fields is so rigorously maintained and the boundaries so clearly drawn, that the internal integration within them is not a minor task. Integration involves establishing ties between scientific and mathematical sub-fields. Furthermore, all too often such sub-fields are represented as (indeed reduced to) collections of facts and formulas to be utilized to address decontextualized problems. Higher levels of disciplinary thinking (e.g., developing mathematical proofs or constructing original testable hypotheses) are noticeably absent from many mathematics and science classrooms.

An integration strategy /approach to the teaching of science and mathematics in integrative ways, is proposed here. This strategy, which we call problem-centering strategy, involves enlisting the knowledge and modes of thinking in two or more disciplines (e.g., science, mathematics,) to address particular problems, develop specific products, or propose a course of action. For example, a way to teach evolution in an integrative way is to present pupils with a tangible problem that could be solved with the help of some aspects of evolutionary theory. This would constitute a problem-centered approach to integrating material on evolution.

A PROBLEM-CENTERING STRATEGY IN MATHEMATICS AND SCIENCE

Focus on a tangible and real-world problem rather than on enhancing disciplinary understanding, defines the problem-centering strategy and determines a special kind of relationship among the disciplines. Problem-based learning is the pedagogy that we tried to apply in some classrooms of our school. Problem-centering of the curriculum is applicable in different classrooms. Problem-centering can bring different fields in close interaction with one another and thus foster broad external connections between the sciences and other fields. Although problem-centered learning could be part of any classroom, some disciplines seem to be more regular and consistent users of this strategy. These tend to be science disciplines, such as biology or physics, which target a problem as the subject of their analysis. Addressing a tangible and real-world problem involves mapping the problem territory, bringing together all of the relevant disciplinary tools in order to provide a rich description of the problem, isolate its "primary issue," and define what the solution might be. In the process of generating an answer from these various sources, pupils confront differences in perspective and have to reconcile them. Thus, the final report is a synthesis of mathematics, science and other disciplines. The advantage of this pragmatic orientation toward interdisciplinary interaction is that it brings together a wide range of disciplines.

The scientific /mathematical tools and procedures are engaged in the problem-centering approach thoroughly, if not extensively. As a result, the pupil might actually perfect his/her skill of statistical analysis or learn more about molecular weights as he/she assesses the contamination of groundwater. When mastery of disciplinary tools serves a compelling problem, significant and highly motivated learning of mathematical and scientific theories can occur. Problem-centering tends to be a transferable strategy. It offers the point of connection that provides motivation for negotiating and reconciling disciplinary differences. Science and math often find themselves as valuable partners in this conversation as they lend tools and practices for collective inquiry into a complex issue. The strengths of this strategy include: pupils' attention and creativity are fully mobilized by the urgency of the problem; it inspires activist approach to learning and knowledge in pupils; motivation and thorough mastery of the disciplinary content (e.g., facts, practices, theories) occurs as a result; unrelated disciplines come together easily in this strategy, as differences between them are addressed decisively and pragmatically. In parallel, there are some weaknesses of the problem-centering strategy: learning is highly targeted to the problem and therefore coverage of the field is limited to relevant tools and theories only; reflection and deliberation on the discrepancies in the disciplinary approaches is minimal.

Problem-centering uses an ill-structured problem, rather than history or culture, as a point of connection between science or mathematics and any other discipline. It makes connections between ideas precise and pragmatically relevant. No investigation of broader disciplinary context of the issue or different tools is typically undertaken, nor does one typically spend much time on concept-building or deriving historical meaning from mathematical or scientific data in this model. Problem-centering, as a strategy, pursues a clearly defined goal: to resolve an urgent, tangible, and complex problem that invites or demands input from several fields. The problem-centering strategy/ approach is aimed at generating critical action. The integrative strength of this model lies in its flexibility to reach out and include a wide spectrum of disciplines as well as to encourage the mastery of disciplinary content. The blind spot of this strategy could be the pragmatic narrowness of the disciplinary exploration. Nevertheless, the motivational and integrative power of this strategy is notable.

ICT Integration in Secondary Science and Mathematics

The distinction between teaching ICT (or computers, or Information Technology) as a discrete subject and teaching different (other than ICT) subjects with/via the use of ICT is widely known. In this paper we refer to the latter case, and more specifically, the ICT use/ integration in science and mathematics lessons. Research findings suggest that ICT in secondary science, particularly in the form of simulations or animations of processes, provides a range of affordances for learning science (e.g., Webb & Cox, 2004). Computer science software allows pupils to visualize and understand phenomena that cannot easily be observed or allows pupils in constructing and interpreting graphs (e.g., of speed over time). For example, research showed that through using simulations pupils gained understanding of physical phenomena involving interacting variables, enabled pupils to perform at higher cognitive levels and promoted conceptual change (Jimoyiannis & Komis, 2001; Nikolopoulou, 2000). Cox and Nikolopoulou (1997) showed that computer based data analysis software helped 13-14 year old pupils to perform a range of intellectually advanced/ complex data analysis tasks, such as classifying data according to different criteria.

Regarding ICT use/ integration in secondary mathematics classrooms, there have also been research studies which provide evidence of a positive effect of ICT on pupils' attainment. Important affordances of ICT in mathematics are associated with investigations where pupils explore, conjecture, construct and explain relationships. The use of software to support exploration of quadratic functions with an open learning environment allows pupils to explore within a framework. Effective pedagogical practices in these contexts are promoting pupils' interaction with the task and with each other. For example, Jones (2002) reported that interacting with dynamic geometry systems can help pupils to explore, conjecture and explain geometrical relationships. It can provide them with the basis from which to build deductive proofs. Hennessy (2000) working with graphing, observed that the graph plotting became very simple, and the learning gains were greatest in the area of determining intercept, interpolation and finding range from a graph.

Evidence suggests that different types of ICT use provide different affordances for pupils' learning in different subject areas. We emphasize that when ICT is integrated in science or mathematics classrooms there are various factors that impact on pupils' learning such as the type of the software, the pedagogical practices, classroom interactions (e.g., collaborative learning) and the teachers' beliefs, skills and knowledge.

THE STUDY

Sample and Procedure

As discussed earlier this is a pilot study, as we still collect data for the main study. The authors of this paper are mathematics and physics teacher respectively and decided to integrate mathematics and physics using ICT as a tool, in two classes. Both classes held 56 pupils aged 13-14 years old (i.e. attending the 2^{nd} year of the Greek secondary school), and the pilot study was carried out during the autumn term 2013-14. The school is a "pilot experimental" high school (pupils aged 12-15 years old) and its policy encourages teachers to apply and evaluate experimental strategies/ approaches in their classroom practices. Thus, an interdisciplinary approach to mathematics and science is positioned within the school's acceptable educational practices. We planned together and we worked on particular units of our subjects (mathematics and physics).

Examples of Topics

Table 1 shows examples of topics which involve mathematics and physics, as well as indicative pupils' tasks and relevant corresponding mathematic learning objectives. The topics shown are indicative and these are included in the curriculum we follow in the school for pupils aged 13-14 years old. The problem-centering approach may improve pupils' motivation to learn mathematics. For example, pupils who do not enjoy learning the vectors unit (or find it useless), may start using vectors to solve geometry problems, or mechanics problems in physics – understanding better the operations with vectors. Moreover, pupils who may not like mathematics but are good at physics can see the vectors' applicability to physics and start thinking that learning maths supports them in understanding physics (e.g., velocities and forces).

Table 1. Examples of topics which involve both mathematics and physics

Topic	Pupils' tasks	Mathematic learning objectives
Quadratic functions	- pupils watch the video of the freely falling ball experiment and use the freely falling ball graph (position depending on time) - by reading the graph, pupils identify the position of the ball at different moments, the interval of time between two different positions of the ball, the domain and co-domain of the function, axes intercepts and their meaning related to the experiment, coordinates of the vertex point, monotonicity of the function, the image of the function - pupils calculate the 2nd degree polynomial which defines the graphed function	- pupils interpret functions from graphs - analyze quadratic functions to describe the motion of an object - identify applicability of quadratic functions
Vectors	- pupils explain the solution of the two vectors problems (use of addition vectors tools to solve relative velocity) - the problems could be available on a website proposed to pupils	- pupils use addition of vectors to solve problems in nonmathematical context - identify applicability of vectors

Indicative Learning Activities with ICT

Figure 1 shows two screen shots from learning activities integrating mathematics with physics in a computer environment, using the "Geogebra" software. Geogebra is a DAS (Dynamic Algebra Systems) which combines dynamic manipulation of a representation (i.e., a graph) with the functionalities of a CAS (Computer Algebra System) (Noss et al., 1997). The most important tool of DAS used in the following activity was the variation tool. Graphical representations of equations such as v=S/t which is a line that passes through the origin O (0, 0). The main advantage is that when pupils manipulate the variation tool, the result leaves its traces on the screen. One problem posed to the pupils was to calculate the velocities of a hare and a turtle, as well as to determine the position of each animal on specific time (i.e., on the 5th minute). In the beginning of this activity students are asked which one of the two lines (the green or the red one) is the graph of distance (S) over time (t) with greater velocity than the other. Students using the variation tool, manipulate time as a variable "t". Then, they can see that the distance of the corresponding points on S axis increases, as time passes; which means that velocity represented by the green line is greater. They can form the assumption that the slope of the line is related with the velocity of the moving object. Thus, the relation between slope of the line and velocity help students to embody (Tall, 2004) the relation between slope of the line and ratio of proportions. Of course the next step is proving the relation using symbols of algebra.

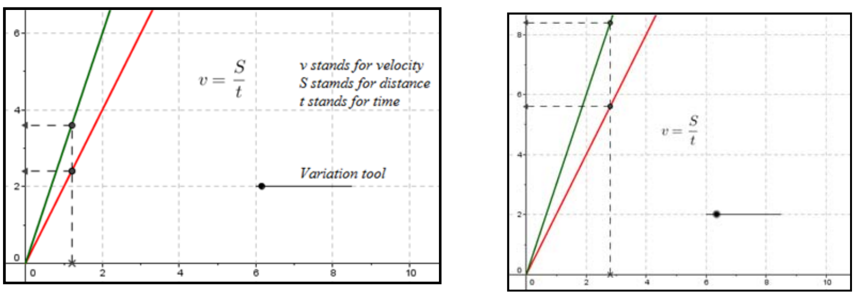

Figure 1. Learning Activity Integrating Mathematics with Physics, using "Geogebra" Software

CONCLUDING REMARKS

This pilot study revealed that pupils enjoyed seeing applications of mathematics and physics in real-world problems (and this is in agreement with relevant literature). Some of the pupils, who under other circumstances were not motivated, did show increased motivation. However, this was a pilot study with several limitations. The sample was small and we did not gather data on pupils' academic achievement on accomplishing the tasks. In our main study we aim to apply the strategy to more classes, for a longer period of time, and to also collect data on pupils' perceptions and self-esteem. We aim to apply the problem-centering strategy to younger pupils (12-13 years old) studying the topic of temperature, via integrating mathematics with physics. This is an interesting topic as among the curriculum objectives are, for pupils to construct and interpret graphs of temperature versus time.

A problem-centering strategy/ approach could be extended to other school subjects, in the school. For example, mathematics and science teachers can learn from the humanities subject about the history of ideas in their fields, and focus on problems from the real world. Conversely, a problem-centering pedagogy would profit from a richer historical context. At the same time, teachers in other schools and in any subject area can benefit from keener awareness of the different frameworks that they have available to them as they design their own interdisciplinary curricula. For example, by inviting science/ mathematics and social science teachers to provide a historic context for scientific discoveries, for example, or by problem-centering of the inquiry. They will have to search for hybrid ways to build a particularly effective interdisciplinary exchange that reflects their teaching goals.

SCIENCE TEACHERS' PERSPECTIVES ON BENEFITS AND PROBLEMS FACED USING TABLET COMPUTERS IN SCIENCE EDUCATION: THE STORY FROM A SECONDARY SCHOOL IN TURKEY

Sıla KAYA

Jocelyn WISHART

Over the past decades, the importance of using tablet computers (TPCs) in science education has increased as it fulfils a goal common to both science education and Information and Communication Technology use in education. Teachers are the first implementers of the educational developments; therefore science teachers' perspectives on using TPC in science education play a key role. In this study, 9 science teachers are interviewed to gain a rich picture of the benefits arising from and problems faced in deploying TPCs in teaching. The TPCs were used mostly for time saving activities and whilst many findings were in line with the literature on obstacles such as infrastructure problems and their benefits such as supporting science classes through multimedia, especially visual images, there was a discrepancy, mainly based on the students' motivation. It was found that giving out TPCs without including a way of the teacher being able to monitor the students' activities caused pedagogical, technical and management problems. The literature regarding teachers' opinion on the relationship between teachers' prior knowledge and ease of use of a TPC has been extended by this exploratory study.

ORTAOKUL 6. SINIF ÖĞRENCİLERİN MATEMATİĞE VE MATEMATİKÇİLERE BAKIŞ AÇILARI

Nevin SÖKMEN

Türk Dil Kurumuna göre Matematik "Aritmetik, cebir, geometri gibi sayı ve ölçü temeline dayanarak niceliklerin özelliklerini inceleyen bilimlerin ortak adı" olarak tanımlanmıştır. "Matematik Nedir?" sorusu üzerinde aslında tam bir görüş birliği bulunmamaktadır. Sawyer' a göre "matematik, tüm olası modellerin incelenmesidir." Boole' a göre ise "matematiğin özü, sayı ve miktarla ilgili düşüncelerle çalışmak değildir. Matematik, kullanılabilecek yollardan bağımsız olarak kendi içinde hesaba katılan uygulamalarla ilgilidir." Freundenthal ise matematiği "Matematik, deneyim alanlarını organize etme etkinliğidir." olarak ifade etmiştir. Matematik üzerine farklı tanımlamalarının nedeni matematiğe karşı farklı bakış açılarından ve deneyimlerden kaynaklanmaktadır.

Matematiğin özelliklerini bilmek, matematiği daha iyi anlamaya yardımcı olacaktır. Matematiğin, insan beyninin ürettiği bir soyutlama olması, kendisine özgü bir dili olması, ardışık ve yığılmalı bir bilim olması, diğer bilimler tarafından kullanılan bir araç olması, matematiğin özelliklerinden bir kaçı olarak sıralanabilir.

Öğrencilerin matematik ve matematikçiler hakkında çok olumlu bakış açıları olmadığı bilinmektedir. Öğrencilerin matematikle ilgili yaşantılarının (sınav başarıları, öğretmenleri, ders kitapları, matematik dersleri, vb.) matematik ve matematikçi hakkındaki bakış açılarını etkilediği görülmüştür. Ülkemizde son yıllarda okutulan matematik ders kitaplarında ünlü matematikçilere ve matematik tarihine belirli oranda yer verilmektedir. Bu yolla matematiğe karşı ilginin artacağı düşünülmektedir. Bununla beraber öğrencilerin matematik ve matematikçi ile ilgili bakış açıları hala merak konusudur.

Bu çalışmada, ortaokul 6. sınıf öğrencilerinin matematik ve matematikçilere bakış açıları incelenmiştir. Çalışma, Eskişehir merkez bir ortaokul 6. Sınıfına devam eden 40 öğrencinin katılımı ile gerçekleştirilmiştir. Öğrencilere en az 4 ünlü matematikçinin bir arada olduğu hikâye yazmaları istenmiştir.

Yazılan hikâyeler, yer verilen matematikçiler, olaylar, zaman dilimi gibi kriterler açısından incelenerek öğrencilerin matematiğe ve matematikçilere bakış açıları belirlenmeye çalışılmıştır.

THE PERSPECTİVE OF 6TH GRADE STUDENTS TO MATHEMATİCS AND MATHEMATİCİANS

Nevin SÖKMEN

According the Turkish Language Association Mathematics is defined as the " common name of the sciences investigating the properties of the characteristics of arithmetics, algebra, geometry and such which are based on numbers and measures". There is actually no agreement on the answer to the question "What is Mathematics?" According to Sawyer "mathematics is the examination of all possible models". Boole defines mathematics as "not the study of notions relating to numbers and quantities in its essence. Mathematics is concerned with applications on their own sake, without explicit reference to and indenpendent of the means used". Freundenthal, on the other hand, defines it as "the activity of organizing the area of experiences". These different definitions of Mathematics differ due to different point of views and experiences. Mathematics can be better understood through learning its essential properties. A few of its properties can be listed as it being the abstraction of of the brain, that it has its own language, it is a sequential and cumulative science, and a tool used by other disciplines. It is known that student do not have a positive view of mathematics and mathematicians. It has been observed that these views are affected by their experiences (success in exams, teachers, text books, mathematics lectures, etc.) of mathematics. In recent years, text books used in our Country's schools consist a certain percentage of famous mathematicians and history of mathematics which is thought and accepted to increase the interest in mathematics. Still yet, it is a curious matter how pupils consider mathematics and mathematicians. In this study, the point of view of 6th graders has been cosidered. The work is carried out in

Eskişehir, at a central school, with the participation of 40 6th grade students. The students were asked to tell a story containing at least four famous mathematicians. The stories told are investigated in terms of the mathematicians included, events, time spans, and the students' points of views has been tried to be determined.

A NEW METHOD FOR SOLVİNG BLACK-SCHOLES PARTİAL DİFFERENTİAL EQUATİON

Zieneb Ali ELSHEGMANİ

The closed-form analytical solution of the Black-Scholes of the arithmetic Asian options partial differential equation (PDE) is not known. This is due to the fact that, the arithmetic average of a set of lognormal random variables is not lognormally distributed. In this paper we study the analytical solution of the arithmetic Asian option PDE, that provide the Asian option pricing formula. we derive a closed-form solution for a continuous arithmetic Asian option by means of partial differential equations (PDEs). A new method for solving arithmetic Asian options PDEs using general transformation techniques is offered. The two dimensions PDE of the arithmetic Asian options are reduced to the classical Black-Scholes PDE with one dimension. In addition, Mellin transform is used to obtain the final solution to the arithmetic Asian option PDE. Using general transformation techniques, we transform the degenerate arithmetic Asian option PDE to the simplest heat equation, that has a known solution

milijas@fon.bg.ac.rs

ABSTRACT: University students' retention and performance in higher education are important issues for educational institutions, educators, and students. Educational data mining is focused on developing models and methods for exploring data collected from educational environments in order to better understand and improve educational process. Analyzing and determining patterns among indicators of academic success (study grade point average) and their correlation to students' personal, high school, admission data can present be a good foundation in process to adapt and improve the curriculum of higher education institutions, according to the students' characteristics. In this paper we use different artificial neural network algorithms in order to find the best suited model for prediction of students' success at the end of their studies. Additionally, we identified which factors had the crucial influence on overall students' success. Data were collected from the graduated students of Faculty of Organizational Sciences, University of Belgrade.

Keywords: Educational data mining, student success, artificial neural network, university education

INTRODUCTION

Academic education represents one of the key roles in the process of a country modernization and achieving competitive advantage. The process of education and development of human resources is becoming increasingly important concept, by which it can be determinant success in business and in society as a whole unit. It can be said that the new social elite is coming from academic circles with the aim to stabilize and improve the overall state of the economy and society.

In this research, artificial neural networks are used in order to make a system for early prediction of the success of students based on their success on the exams on the first year of studies. Early prediction of students' success could help teachers to identify students that have potential for advanced courses and also students who need the additional education in order to improve their knowledge. On the other side, developed system could be useful for students, so that they could estimate their future success in their studies on the basis of their learning habits, their work and grades. This could help them to identify on time whether they need an additional effort in order to achieve the success they want.

The paper has following structure: Section 2 gives a review of the state-of-the-art for prediction of students' success with artificial neural networks. In Section 3, the structure and the function of artificial neural networks, as well as the efficient methodologies for prediction are explained. In Section 4, we present the experimental results of this research. Evolved models in this research are evaluated on the real data about students and their success on the Faculty of Organizational Sciences in Belgrade. In section 5, results are discussed and the directives for further researches are given.

SOLUTIONS FOR PREDICTING THE SUCCESS OF THE STUDENTS

The ability to predict the students' academic performance is very important in institution educational system, as well for faculty, university and educators, as well as for students. Data mining in the field of education (Educational Data Mining - EDM), as a new field of research, has developed in the last decade as a special area of application techniques and tools for detecting regularities and correlations in the data (data mining), with the aim of analyzing the unique data types that appear in educational system for solving various problems of educational and instructional improvement process (Romero & Ventura, 2007; Romero & Ventura, 2010). EDM is engaged in development, research and application of methods to detect regularities in the data in the database in the field of education, which would otherwise be difficult or almost impossible to analyze and determine the dependency patterns of behavior and learning among students, primarily because of the large amount of data (Romero et al., 2010).

Applications of data mining techniques in educational environments are more and more popular area of research and there is an increasing number of research papers published in the last years (Minaei-Bidgoli & Punch, 2003; Schumacher et al., 2010; Etchells et al.; 2006; Ayesha et al., 2010; Wook et al., 2009). Researches in educational data mining area focus on different aspects of educational process: students, teachers, teaching aids, organization of teaching etc. (Falakmasir & Habibi, 2010; Kumar & Chadha, 2011; Romero & Ventura, 2007; Guruler et al., 2010). One of the main goals and the basic application fields of educational data mining can be classified into the following categories: Prediction of students' success, Organization of teaching programs, Prediction of enrolment of students to the higher level of educational program, Discovering cheating during an on-line examination, Identification of abnormal/extreme values in the educational system, (Kumar & Chadha, 2011). In order to achieve these goals, different algorithms of data mining are used, such as: decision trees, artificial neural networks (ANNs), k-nearest neighbor, naive Bayes, support vector machines, cluster algorithms, (Ayesha et al., 2010).

Traditionally, academic researchers have used statistic models and methods in order to predict the success of the students. Today, there are many different approaches about classifying the students and predicting their grades Gonzalez and DesJardins (2002) tried to predict the success of the students, using the linear regression and neural network models. The results of their research point that the models of logistic regression do not predict behavior of students equally well as the artificial neural network models. Thomas and Hass (2001), compared the performance of the three different techniques of data mining for predicting students' behavior: neural networks, cluster algorithms and decision trees, where the model based on neural network gave the best results. Delgado (Delgado et al., 2006) used neural networks to predict success of the students on the exams, defined with binary classes (pass or fail). Wook (Wook et al., 2009), compared two data mining techniques, ANN and the combination of clustering and decision tree classification techniques for predicting and classifying students' academic performance, and based on that research they identified the patterns that influence or affect the student's academic performance. Guo (Guo, 2010) used neural network for establishing dynamic models for analyzing and predicting student course satisfaction.

In paper of (Stathacopoulou et al., 2007) neural networks were used to add learning and generalization abilities to the fuzzy model by encoding teachers' experience through supervised neural network learning. The study of (Wu et al., 2008) indicates that a properly trained ANN classification model can be a strong predictor for use in the learning disabilities diagnosis procedure, and furthermore, a well-trained ANN model can also be used to verify whether a learning disabilities diagnosis procedure is adequate. Artificial neural networks for prediction of the number of secondary-school pupils who will continue university studies are used in (Gerasimović et al., 2001). Isljamovic (Isljamovic et al., 2012) compared several classification algorithms in order to predict if a student would display excellent performance (i.e. highest grades) on a selected course in technology enhanced learning environment. ANNs were among the best algorithms by several evaluation criteria.

ARTIFICIAL NEURAL NETWORKS USAGE

Artificial neural networks (ANNs) are, according to their structure, function and data processing, similar to biological neural networks and represent a relatively good technique which solves the problem of classification and prediction. ANN presents a collection of mathematical models which can simulate some of the characteristics of biological neural systems and have similarities with adaptive human learning. They are made of a great number of connected neurons (processing elements), connected by their ties which contain permeable (weight) coefficients that are, according to their role, similar to synapses. The neurons are organized in three levels: input layer, one or more hidden layers and output layer. ANN process information like biological neural networks, with the possibility of remembering, learning and removing errors with high speed of getting the solution, so that the neural networks can be used for solving complex problems, such as classification and prediction (Yeh, 1999). ANNs were successfully used in variety of disciplines for modeling complex and real problems (Liao & Wen, 2007).

In order to find the best quality model, we used six different methods for building neural network models:

- *Quick*: a method that uses rules of thumb and characteristics of data in order to choose an adequate topology of network;
- *Dynamic:* a method that automatically creates initial topology and then adds or takes away hidden nodes during training;

- *Multiple*: a method that creates several networks with different topologies, where the exact number depends on quantity of training data. These networks are trained in parallel and the model with the smallest error is represented as the final model.
- *Prune*: a method that initially creates large network (with a lot of hidden layers and nodes) and then removes the weakest units from the input and hidden layers. This method is usually slow, but very often gives better results than the other methods.
- *RBFN (radial basis function network)*: uses a technique similar to k-means algorithm of clustering in order to separate data in accordance with output variable.
- *Exhaustive prune*: a method very similar to Prune method, that initially creates a large network (with a lot of different layers and nodes), and then removes the weakest units from the input and hidden layers. Parameters for this method are adjusted so that they ensure a very detailed search of possible model's space, in order to find the best possible model. This method is the slowest, but usually gives the best results.

In this research, software package Clementine (SPSS) was used for ANN developed as one of temporarily the most efficient and most effective software solutions which enable data mining, as well as quick development of predicting model, with a high quality. Data processing in Clementine is being done by using different kinds of nodes which are connected, forming a certain flow of data over which data mining and prediction are being done.

STUDENT SUCCESS PREDICTION – CASE STUDY

Research study performed on the Faculty of Organizational Sciences, which represents one of leading faculties, is in group of faculties of technology and engineering sciences of University of Belgrade. Faculty of Organizational Sciences is a higher education institution that deals with education, scientific research and consultancy through development of knowledge and skills in management, information systems and technology with the aim to enable future professionals to develop potentials of commerce and society. This research includes the first five generations of students, with 1787 graduated student, who have been registered in accordance to the principles of higher education implemented by the use of the Bologna Declaration, which had completed their studies by November, 2013. In this time frame more than 60% of enrolled students have graduated, achieving an overall Grade point average (GPA) of 8.63 on average time of study almost 5 years.

As an input data (predictors), 15 variables were used and represent data correlated to students' personal characteristics (students' gender), high school information (high school GPA and high school type), admission data (entrance examination points) and the first year examination grades (individual grades at 11 examinations of the first year of elementary studies). On the other side, as an output from neural network, we used a GPA at the end of their studies. Ratio between the training data and the testing data was 80:20. Model evaluation is performed on so far non-used data.

Performances of developed models are measured by Absolute average error, Standard deviation and Linear correlation. Results and performance of developed ANN are presented in Table 1. The best values for each criteria of comparison are shown in bold font.

Table 1. Results of developed ANNs (6 algorithms)

Algorithm	*Absolute average error*	*Standard Deviation*	*Linear correlation*
Quick	0.233	0.295	0.893
Dynamic	0.239	0.300	0.889
Multiple	0.234	0.294	0.892
Prune	0.238	0.297	0.892
RBFN	0.259	0.324	0.873
Exhaustive Prune	**0.231**	**0.293**	**0.894**

Comparative analysis of the results, on the test sample, showed that the developed ANN gives acceptable results. An absolute average error of prediction in all the networks is from 0.231 to 0.259 and the linear correlation coefficient is always over 87%. Exhaustive Prune stands out as the best algorithm by all criteria, giving the smallest absolute average error (0.231, the smallest standard deviation (0.293), and at the same time, the largest linear correlation coefficient (89.4%). A developed multilayer neural network with Exhaustive Prune method consists of input layer with 15 variables, output layer with one variable and two hidden layers with 30 and 20 neurons. Results with best ANN indicate that in almost 90% system will correct predict final student

GPA, which represent more than good precision in prediction, especially if we know that GPA will be round on one or two decimals, then standard deviation will have even less influence to final result.

With usage of ANN give as one more advantage compared to some other data mining methods and technique, which is represented in calculation of relative importance of the input variables for predicting an output variable. In order to identify the major influenced factors of students' success, we used this advantage of ANN. Importance of the attributes of the developed ANN model are given in Table 2. It can be seen that 6 firstly ranked attributes within the developed model are considered as the most important (relative value over 0.1).

By doing further analysis, we can conclude that grades on the exam in the first semester of studies have a great influence to overall success of studies, as well as data from high school (High school type and High school GPA), where both groups of variables achieved importance over 0.1. On the other side, as it can be seen from Table 2, gender of the students and entrance examination points are not of the greatest importance for predicting student's success. Also some grades from the first year exams, especially on subjects form second semester had small influence on it, such as Management, Economy and Psychology/Sociology.

Table 2. Relative importance of the input variables

Input variable	*Relative importance*
Mathematics 1	0.1223
Basics of information-communicational technologies	0.1103
High school type	0.1072
Basics of organization	0.1034
High school GPA	0.1024
Introduction into the informational systems	0.1004
Production systems	0.0602
Mathematics 2	0.0513
English language 1	0.0502
Entrance examination points	0.0426
English language 2	0.0411
Management	0.0402
Student gender	0.0343
Economy	0.0215
Psychology/Sociology	0.0126

After selection of 6 the most important input variables, we repeated process of predicting GPA only with that 6 variables, in order to examine potential performance of prediction model with less input variables. Results and performance of developed ANN are presented in Table 3, by using same performance measurements.

Table 3. Results of developed ANNs (6 algorithms with 6 input variables)

Algorithm	*Absolute average error*	*Standard Deviation*	*Linear correlation*
Quick	0.259	0.323	0.886
Dynamic	0.262	0.330	0.881
Multiple	0.255	0.319	0.889
Prune	0.259	0.323	0.886
RBFN	0.294	0.367	0.849
Exhaustive Prune	**0.253**	**0.317**	**0.890**

Developed models with reduces number of input also gave satisfactory results. Once more, Exhaustive Prune stands out as the best algorithm by all criteria, giving the smallest absolute average error (0.253, the smallest standard deviation (0.317), and at the same time, the largest linear correlation coefficient (89%). A developed multilayer neural network with Exhaustive Prune method consists of input layer with 6 variables, output layer with one variable and two hidden layers with 24 and 18 neurons. Comparing two developed ANN with Exhaustive Prune method it can be concluded that there exists no significance, so by occasion it can be also used model developed with 6 input variables.

CONCLUSION

In this paper, model for prediction of students' success is developed in order to help professors to identify students that have potential for learning advanced courses and also students who need the additional education in order to improve their knowledge. Using information about students after their first year of studies as input variables, a developed model of multilayer neural network has the ability to predict the success of students at the end of their studies. Development of such model gives a chance of recognizing which aspects of educational plan and program should be improved in order to induce students to work harder and improve their knowledge in certain scientific branches. This system should also be useful to students, so that they could adopt their learning habits, their work and grades, so that they could achieve the overall success they want.

Future developments and research, firstly in terms of advance use of the concepts EDM, will include integration of a large number of input variables, such as those that are directly related to studies and socio-economic and demographic indicators, their comparative analysis, and secondly in way of model development for predicting study success based on variables that were analyzed in this paper.

METHOD OF PROTECTİNG EDUCATİONAL CERTİFİCATES FROM FORGERY

Nashwan Ahmed AL-MAJMAR
Department of Math's and Computers, Faculty of Science, Ibb university, Yemen.
almojammer@yahoo.com

ABSTRACT : Protecting educational certificates from forgery in a modern society is a very important issue. That protection can be provided by using information cryptographic authentication methods based on digital signature schemes. The present paper suggests a system to issue such documents in a way that provide high security and this can be done through using two or more digital signatures based on different and difficult mathematical problems.

Key words: Digital Signature Scheme (DSS), Digital Signature (DS), Information Authentication, Information Verification, Public Key Infrastructure (PKI).

INTRODUCTION

One of the actual and sensitive issues in the modern society is getting illegal certificates and diplomas on education by the people who are not enrolled in universities. This issue is related to the nature of criminal activities structure, performing the forgery of these documents. In this paper we propose a system that uses cryptographic protection methods for issuing and verifying the authenticity of documents, practically the application of this method solves the problem referred to previously and does not require significant costs.

SYSTEM DESCRIPTION

The proposed system can be explained simply on the basis of existence of the used and wide information infrastructure (internet) and the presence of used broadly DS. The proposed method for the validation of diplomas and certificates is based on using a centralized database where reserved digital certificates for documents issued by educational institutions. These digital certificates contain signatures of these educational institution as shown in figure 1.

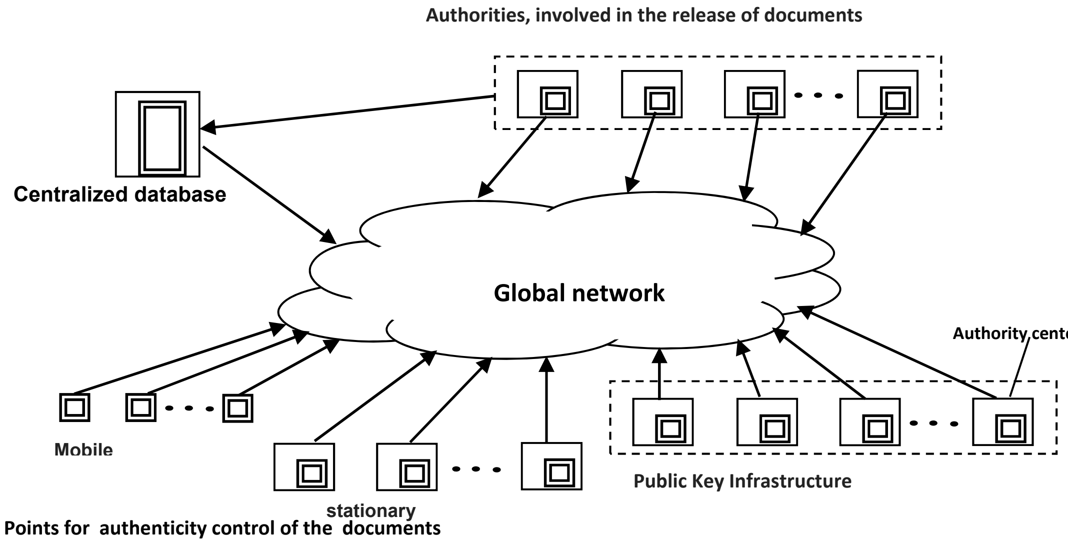

Figure 1. Architecture Of Automated System For Supporting Cryptographic Protection Technology Of The Documents Against Forgery

Each educational document related to digital certificate containing the readable automatically following information:

1. First and last name of the student
2. Name of educational institution
3. Issuing date of the document

Number of document .4
Specialization .5
Public key and DS of educational institution .6

Such documents' issuing system has increased resistance against attacks related to falsifying documents. This resistance linked to using cryptographic protection technology against forgery and applying two DS schemes, based on two different and difficult computational problems i.e. discrete logarithm and factorization. The possibility of applying DSS of the second type is due to the result of development of DS algorithms based on complexity of factorization problem that provide reducing signature's up to 320 bits[1]. Personalized thanks to the small size of DS has the possibility to sign a master image, associated with the document and its content by several different authorities involved in the release of this document. This provides a high security to the system against insiders.

The presence of several authorities, legalizing release of the document, will significantly reduce the probability of participation of the people who are authorized to carry out the legalization of documents, in the process of illegal documents' registration. This is due to a remarkable decrease of the probability that potential internal adversaries will receive simultaneously authority to issue documents. Therefore, in the considered technology requires the presence of two or more digital signatures of controlled message. On the basis of constructing of this system has a technical solution involving the use of a digital signature to bind a specific form of the document with a specific data contained in the document. Thus, we propose the use of paper with stable random microscopic inclusions and the presence of mass production of portable and stationary scanners with sufficient resolution. It also assumes that on the form of document to apply a special mark on which the scanner automatically determines the location of the site is scanned to identify the unique digital image of the form, in which is made an educational certificate document.

The practical impossibility of forgery is linked to the formation of DS to the message, which is formed as an union of a digital image of a particular form with the specific content of the document through the series and number of the document. Taking into consideration the possibility of acceding to such information and biometric information about the owner of the document. As a result, it is possible to verify the authenticity of the document by digital signature, which uses the public key of one, two or more authorities, confirming by its digital signatures the legitimacy issue of this particular instance of the document and its authenticity.

It's supposed to use existing and practically applied PKI for the sake of the distribution of public keys related to the digital legal certificates of the documents on education. Public keys can be obtained from the centralized database via the Internet or from a public key directory distributed by certifying centers. In the case of the developed system obtaining public keys of authorities that certify the authenticity of documents, and checking their authenticity is not a problem, since relying party requires only a few public keys that are valid for quite a long time and are used to verify a large number of documents.

DS is applied to the document in one or two places in a document given that provides a constant presence of the signature in the document. When checking the authenticity of the document, should be scanned the digital image of the document, should be read the information content of this document, form control message and verify the authenticity of a digital signature to this control message. Because that DS physically must be presented on the document, then the crucial issue is to reduce the total size of all DS captured on document in the form of machine-readable tags, this is achieved by using algorithms DS generating signatures with minimal size.

Document's authentication procedure includes:

1. Scanning digital image of document.
2. Formation controlled dataset.
3. Verifying the validity of all signature, using public keys of authorities, confirming the authenticity of the educational certificate.

Modern scanning devices are quite reliable, miniature and reasonably priced, so the proposed technology to protect documents from material counterfeiting is promising for mass application.

GENERATION AND VERIFICATION ALGORITHMS OF DIGITAL SIGNATURES

Persistence of modern DS schemes based on the complexity of solving a difficult computational problem, however, there is a sufficiently small probability that theoretical advances will reduce the security of a digital signature below the critical level**.** In order to reduce this probability, we have suggested DS schemes, the

disclosure of which requires the simultaneous solution of two or more difficult mathematical problems of various types. In this case, the probability of compromise DS drastically reduced because it is equal to the product of the probabilities of developing more effective ways to solve each of the difficult mathematical problems, such as:
probability (solution of difficult problem of type 1) ≈ 10^{-9}
probability (solution of difficult problem of type 2) ≈ 10^{-9}
probability(simultaneous solution of difficult problems of the 1st and 2nd type)≈10^{-18}

As mentioned earlier regarding automated system for supporting technology of cryptographic protection of documents against forgery is supposed to provide confirmation of the validity of the document by two or more authorities, involved in the issuance of documents. Therefore it's interesting to use two or more different algorithms DS based on various difficult mathematical problems. However, Currently there is a limited number of such problems ,on which can be provided high resistance and relatively small size of DS (320-640 bits).

The simplest solution for diagramming DS, hack which requires the simultaneous solution of two different difficult computational problems is to construct DS schemes, which are based on" mechanical "combination of two different DS schemes, i.e generation of signature as a combination of two independent signatures. This means that a user's digital signature to some document consists of two independent parts, generated by independent algorithms. DS is considered true if each of individual digital signature is genuine. The most interesting mathematical problems for this application are the integer factorization problem of a special type and the discrete logarithm problem in a finite group of large prime order.

3.1. DSS Based On Factorization Problem

As DS scheme, based on the complexity of the factorization problem, it is proposed to use the following scheme represented by the following algorithms of generation and authentication of the digital signature having small size.

Generation Algorithm Of The System Parameters:

The public key is a pair of numbers n and $y = \alpha^x \bmod n$, where x – is a secret key, n – is a 1024-bit number that = $p * q$ where $|p| = |q|$ = 512-bit .1

α - is a number referring to simple indicator γ' on modulo p and simultaneous referring to simple indicator γ'' on modulo q, where γ' *and* γ''– 80-bit primes. .2

Generate a random number k, such that $GCD(k, \gamma'\gamma'') = 1$ and $1 < k < \gamma'\gamma''$ .3

Generation Algorithm Of Signature To The Message M:

Generate a random number k, such that gcd(k, $\gamma'\gamma''$) =1 and $1 < k < \gamma'\gamma''$, where γ' and γ'' are some 80-bit primes. .1

Calculate the value of $r = \alpha^k \bmod n$. .2

To the message m joined *the number r* to form a message $M = m\|r$, and compute the hash function of the value M: $E = h(M)$ .3

Calculate the value of s: $s = k - xE \bmod \gamma'\gamma''$ .4

The public key is (n , y ,α) and the digital signature is a pair of numbers (s, E).

Verification Algorithm Of Signature (S, E):

Calculate the value of r': $r' = \alpha^s y^E \bmod n$. .1

To the message M joined the number r' to form a message $M' = M\|r'$, and compute the hash function of the value M' : $E' = H(M')$. .2

Compare the values E and E', i.e. if $E = E'$, then the signature is considered genuine. .3

This scheme is based on the complexity of the factorization problem as a basic problem. In fact, the secret key can be calculated by solving the discrete logarithm on modulo n, i.e. solving the equation of calculating the public key $y = \alpha^x \bmod n$, where x – is the unknown quantity. However, the complexity of computing discrete logarithms on composite modulo is not lower complexity of module factorization [1,2].

DSS Based On Discrete Logarithm Problem .3.2

As another type of algorithm, supplementing 1st type algorithms can be used the following scheme of Schnorr C. P. [3].

Generation algorithm of the system parameters:

primes p, γ, such that $\gamma | (p - 1)$; $|p| \approx 1024$, $|\gamma| \approx 160$ Choose .1
q, i.e. $\alpha^{\gamma} = 1 \bmod p$ an element $\alpha \in Z_p^*$ of order Choose .2
hash function H a cryptographic Choose .3
such that $1 < x < \gamma x$ number Generate random .4
Calculate $y = \alpha^{-x} \bmod p$ .5
is (p, γ, α, y) and the public key x, is Private key .6

Generation algorithm of Signature to the message m:

k such that $1 < k < q$ number Generate a random *.1*
value of $r = \alpha^k \bmod p$ Calculate the .2
To the message m joined the number r to form a message $M = m \| r$, and compute the hash function of .3
the value M: $E = h(M)$
$s = k + xE \pmod q$ Calculate the value of s: .4
the digital signature is a pair of numbers (s, E).

Verification algorithm of signature (s, E):

$R' = \alpha^S y^{-E} \bmod p$ value of r': Calculate the .1
To the message m joined the number r' to form a message $M' = m \| r'$, and compute the hash function of .2
the value M' : $E' = h(M')$.
Performs a comparison of E and E', if $E = E'$, then the signature is considered genuine. .3

We will show that the system is cryptographic, if the pair (m, (s,E)) is a true pair of "message-signature":

$$R' = \alpha^S y^{-E} \bmod p = \alpha^{k+xE} \alpha^{-xE} = \alpha^k = R \bmod p$$

As in the ElGamal scheme [4] the parameter k ,acting the role of a one-time secret key must be selected using simple random selection method and used only once.

CONCLUSION

Thus, the suggested system that involves the proposed cryptographic methods, on the basis of their used different DSS makes the forgery of documents impossible. By using this technology, the possibility of criminal groups and elements in their malicious activity are considerably reduced, which in general will favor the rule of law in the society.

ABSTRACT: In a nationwide study conducted in Brunei Darussalam, a survey was given to 322 Mathematics teachers teaching upper primary classes in all government primary schools. One of the aims of the study was to examine the professional practice of teachers in relation to the teaching of Mathematics including the teachers' understanding of the curriculum and their sense of preparedness in the teaching of primary Mathematics topics. From the findings, 44.3% of teachers recorded a high understanding of the new reformed curriculum goals. However, only 20.2% indicated their degrees of success in the implementation. In relation to the teachers' sense of preparedness, the primary Mathematics teachers rated themselves as well prepared in teaching majority of the topic areas listed under Number and Operations, Measurement, Geometry and Statistics (between 83% to 96%). While the teachers' preparedness to teach Algebra (77.0%) and Mathematical Thinking and Problem Solving (65.2%) were not as encouraging.

Key words: Mathematics Teaching; Upper Primary; Newly Reformed Education Curriculum; Teachers' Preparedness; Brunei Darussalam

INTRODUCTION

The primary years are important in laying the foundations for the development of children's numeracy skills. Students who complete primary schooling with strong numeracy skills are more likely to be successful in secondary school, and to continue on to further education and training so that they acquire the knowledge and skills that will enable them to be productive in the workplace. It has been observed that the abilities to analyse and problem-solve depend on a firm command of the basic enabling skills of literacy and numeracy (Masters, 2009). Numeracy skills are essential to prepare students to meet with the academic demands of schooling, and for future success in the workplace. In addition, numeracy skills are also important for life in the home and community as both print and digital texts play an increasing role in the activities of daily life.

The rationale for the focus on teachers and teaching draws from the fact that teachers play an important role in enabling students to acquire numeracy skills through the implementation of the newly reformed national education curriculum, *Sistem Pendidikan Negara Abad ke-21* (hereafter referred to as SPN21 or the 21st Century National Education System), and the delivery of programmes and other initiatives aimed at improving learning outcomes in Mathematics. Furthermore, the rationale to focus on the upper primary levels of schooling draws from prior research that highlight these levels of schooling as important in terms of the transitions students have to make in terms of curricular demands. Students who fail are at risk of failure in the later years (Croninger et al., 2012). It has been noted that the key to improving learning in primary schools is through improving the quality of classroom teaching (Masters, 2009). Barber and Mourshed (2009) observe that students placed with high performing teachers' progress faster than those placed with low-performing teachers. A major factor in students' learning of numeracy, therefore, is the quality of the teaching of numeracy that they experience in primary school.

The mode of language instruction for the teaching of Mathematics in the lower primary school levels started with the use of Malay Language. It was only in 2008 that Mathematics was then taught in English Language across all the primary levels in schools in Brunei Darussalam. This study encompassed the entire population of teachers for Mathematics for upper primary classes in government schools in Brunei Darussalam. The national survey was administered in relation to the entire cohort of this teaching force. Respondents were informed that all data obtained would be confidential and anonymity was ensured. The aims of this nationwide study were to:

- ✓ Develop a profile of the contexts of teaching in schools.
- ✓ Examine the professional practice of teachers in relation to the teaching of Mathematics including the use of teaching strategies in the delivery of curriculum specifications for this subject.
- ✓ Profile teachers' professional learning by way of their participation in and need for continuing professional development, as well as teachers' perceptions of changes in their practice.

METHODS

This nationwide survey on teachers and the teaching of Mathematics which was conducted in 2013 focused on the following dimensions: Teacher demographics; Aspects of teaching in relation to the respondent's school; the professional practices of respondents; Practices in relation to the teaching of Mathematics; and Professional development experiences and beliefs of teacher respondents (Shahrill et al., 2014). In this paper, we will only report on the findings comprising of the dimensions in relation to the teacher practices in the teaching of Mathematics that is 'Teacher Knowledge and Preparedness'.

In developing the questionnaire, relevant literature were reviewed (e.g. IAEEA, 2005; 2007; Mullis et al., 1999; OECD, 2009; Poet et al., 2010; Richards et al., 2001; Wray et al., 2013) on the teaching and the professional development of teachers to identify dimensions which would impact students' learning including with regards targeted subject areas. A pilot study was conducted with a sample of 53 upper primary teachers of Mathematics from private primary schools in the nation. The pilot results of the instrument showed that the instrument could be applied in the Bruneian government primary school context and the scales were found to have an acceptable level of reliability which was 0.96 of the Cronbach Alpha. The purpose of the pilot was to examine if the questions actually elicited the intended information for the study and to ensure that the terminology used was understood by each respondent. Suggestions were solicited from the respondents and modifications were made to the questionnaire where several items had to be reworded and mistakes and misinterpretations found were rectified.

For the main study, the questionnaires were administered in 120 government primary schools in all the four districts in Brunei Darussalam to Years 4 to 6 subject teachers of Mathematics (in total 322 teachers). A total number of 310 questionnaires were returned, a 95% return rate in relation to the questionnaires which were distributed. However, only 287 respondents' survey scripts were viably used for further analyses. Codes were developed for questionnaire items for the keying in of data. The quantitative analysis was computed using the IBM SPSS Version 21 software. The basic analysis of the survey data involved frequencies, percentages and some cross-tabulations. Table 1 below represents the demographics of upper primary teacher respondents.

Table 1. The Demographics for the Upper Primary Mathematics Teachers (N = 287)

Description		Frequency	%
Gender	Male	49	17.1
	Female	238	82.9
Age	Below 20	2	0.7
	21-30	72	25.1
	31-40	131	45.6
	41-50	56	19.5
	51-60	26	9.1
Highest Qualification*	BC GCE O Level (Year 11 equivalent)	10	3.5
	BC GCE A Level (Year 13 equivalent)	16	5.6
	HNC, NC, NC or Certificates	33	11.5
	HND, ND, OND, or Diplomas	66	23.0
	Bachelor Degree	132	46.0
	Master Degree	28	9.8
	PhD	1	0.3
Number of years as a Mathematics teacher**	0-5	86	30.0
	6-10	105	36.6
	11-15	38	13.2
	16-20	27	9.4
	21-25	10	3.5

RESULTS

Teaching Mathematics in Upper Primary Classes

In teaching Mathematics in primary classes, teachers may draw from a wide repertoire of practices to develop pedagogical routines and teaching practices in relation to the aspects of mathematical learning stipulated in the national curriculum for Mathematics. Informing the practice of teaching Mathematics in Bruneian upper primary classes are the teacher's understanding of the curriculum, and a sense of preparedness in relation to the teaching of the subject.

Teacher Knowledge of the Curriculum

The national curriculum is realised through the teaching that takes place in schools. Vital to its effective enactment is teachers' understanding of the broad curriculum goals, as well as subject specific aims and objectives. In one of the survey items, the teachers were asked to report on their understanding of the goals of SPN21 and the Mathematics syllabus, as well as their degrees of success in implementing these curriculum frameworks. The results in the Figure 1 below indicated that 44.3% of teachers recorded a high to a very high understanding of the SPN21 goals. However, only 20.2% indicated their degrees of success in implementing the SPN21 goals. Here we also raise questions about factors that may have impeded the effective implementation of the curriculum. The largest proportion of teachers saw themselves as having a moderate understanding of curriculum goals (53.7%) with a similar degree success in putting them into practice (72.5%).

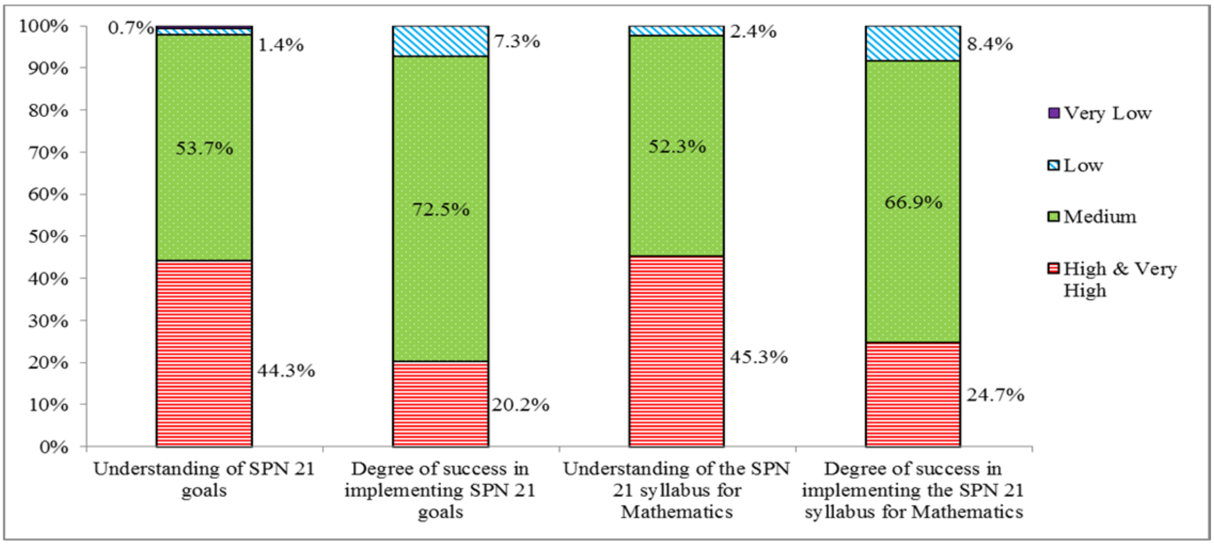

Figure 1. Teachers' Understanding and Perceived Success in Implementing the Curriculum

From Figure 1, the Mathematics primary teachers indicated a relatively higher proportion (45.3%) in understanding the SPN21 syllabus for Mathematics. However, about a quarter (24.7%) of the teacher sample rated themselves as very successfully having implemented the syllabus through their teaching. Just over half of the teacher sample (52.3%) indicated a moderate understanding of the Mathematics syllabus and a much higher sample (66.9%) reported having moderate success in implementing the SPN21 syllabus for Mathematics.

In relation to the findings of the cross tabulations between the number of years as a Mathematics teacher and this survey item overall, we anticipated that many of the beginning teachers (between 0 to 11 years of teaching experience as a Mathematics teacher) would have indicated high or very high understanding of the SPN21 goals or the SPN21 syllabus for Mathematics. However, these were not the case. Many of them reported a medium level of understanding. In contrast, those who had indicated a high to very high proportion in understanding, we anticipated that they will be able to successfully implement the SPN21 goals or the SPN21 syllabus for Mathematics to a higher degree of implementation. Again, these do not appear to be. The number of teachers decreased, across the range of the number of teaching years in regard to the success in implementing.

Preparedness to Teach Mathematics

We also probed teachers' sense of preparedness in relation to teaching the specific topic areas in the primary Mathematics syllabus. There are several areas in relation to the main topics listed, which are Number and

Operations, Measurement, Geometry, Statistics and, Algebra or Pattern and Relation. The results are given below in Table 2. The overall results indicated that the primary Mathematics teachers rated themselves as well prepared and very well prepared in teaching majority of the topic areas listed (between 83% to 96%), with the exception of topic areas in Rates (74.8%), Algebra (77.0%) and Mathematical Thinking and Problem Solving (65.2%).

Table 2. Teachers' Preparedness to Teach the Mathematics Topic Areas

Mathematics topics and sub-topics		Percentage (%)			
		Not prepared at all	Not well prepared	Somewhat prepared	Well prepared & Very well prepared
Number & Operations	Whole Numbers	0.0	0.0	3.1	96.9
	Order of Operations	0.0	0.0	3.5	96.5
	Multiplication and Division	0.0	0.0	8.4	91.6
	Fractions	0.0	0.7	15.4	83.9
	Decimals	0.0	0.7	9.8	89.5
	Percentages	0.0	1.4	15.1	83.5
	Rates	0.7	3.9	20.6	74.8

	Read, Interpret, and Draw Simple Bar Graphs and Pictograms	0.0	0.3	10.5	89.2
	Read, Interpret, and Draw Simple Bar Graphs and Pictograms	0.0	0.3	10.5	89.2
	Line Graphs	0.7	1.4	10.6	87.3
	Average	0.7	1.4	12.7	85.2
Algebra / Pattern & Relation	Algebra	1.1	2.1	19.9	77.0
	Mathematical Thinking and Problem Solving	0.3	4.2	30.3	65.2

CONCLUSION AND RECOMMENDATIONS

According to Mullis et al. (1999), teachers' familiarity with the intended curriculum documents can influence the teachers' planning as well as the content delivered and the the kinds of instructional methods to be used. From our findings, the upper primary Mathematics teachers' understanding and their perceived success in implementing the curriculum was not encouraging. This suggests the need for a continuous profesional development series if teachers are to realise their full potential as competent practitioners capable of successfully delivering the syllabus. Teachers' understanding of both the national curriculum and the Mathematics syllabus are critical as these documents articulate goals and provide frameworks for practice, which shapes students' learning. Further findings also revealed that the teacher respondents relied heavily on the use of workbooks (96.5%), followed by the category labelled as 'others' (78.2%) and textbooks (67.8%) as the resources used in their Mathematics lessons. These are expected findings because in Mathematics lessons, teachers are dependent on the readily available textbooks and workbooks as their main sources of references or teaching materials. In the 'others' category, majority of the responses given from the submitted questionnaires were worksheets taken from other resources listed such as from other primary mathematics textbooks, the internet and also sourced from own or other teachers' previous collections. Many have also listed the past year examination papers as the resources used by the students in their lessons.

In relation to the teachers' preparedness to teach Algebra (77.0%) and Mathematical Thinking and Problem Solving (65.2%), the results shown are not as promising. This may not be surprising as these topic areas typically involve the mathematical numbers and symbols that students may not be familiar with, although they may often encounter mathematical word problems in their classwork and/or homework exercises, tests or exam questions. Previous findings by local researchers in Brunei Darussalam (Gurung, 2003; Raimah, 2001; Saman, 2000) found that students may be having difficulties in solving word problems because the questions are set in

English. However, there have been contradicting findings that suggested their level of English competency does not influence students' performance in doing mathematics word problems significantly (Pungut & Shahrill, 2014; Yusof, 2003). In addition to that, in these topic areas especially in Mathematical Thinking and Problem Solving, teachers need to have clear understanding of the processes involved in solving non-routine problems. Peker (2009) found that pre-service primary teachers have less anxiety in teaching mathematics when they have conceptual knowledge on problem solving strategies as compared to learning to do problem solving questions using textbook where they read the problem, decide the methods, solve and check their answers. In a different study, one of the suggested effective practices evident from the 20 successful schools surveyed was to implement problem solving with the use of real-life contexts (Ofsted, 2011). Perhaps, teachers may need to explore further to what extent they are willing to make the link of the mathematics taught and to connect real life experiences and the everyday contexts; as well as the application of mathematics for students' future and promoting mathematics as a relevant and interesting subject.

ACKNOWLEDGEMENT

This research was part of a larger project by the Ministry of Education, Brunei Darussalam in collaboration with Sultan Hassanal Bolkiah Institute of Education, Universiti Brunei Darussalam and Institut Teknologi Brunei.

ASSESSING TEACHER'S PERFORMANCE IN THE LIGHT USING TECHNOLOGICAL TOOLS IN TEACHING AND ITS RELATIONSHIP TO THE STUDENT'S PERFORMANCE AND THEIR ATTITUDES TOWARD MATHEMATICS EDUCATION

Dr. Othman Ali ALGHTANI
Assistant professor of teaching mathematics, University of Tabuk
othman1435@yahoo.com

ABSTRACT: The main aim of this research was assessing Teacher's Performance in the light using Technological tools in teaching mathematics. To achieve this aim, literature and previous studies were analyzed to characterize the variables of the study, and building the tools of this search, that identified with the four dimensions: (Technological tools support the educational environment in a mathematics class- Technological tools in teaching plan and applying- evaluating the performance of students – reflective teaching and professional development for teachers of mathematics). also , the mathematics test and scale to assess the student's performance and their attitudes toward mathematics Education.

The research was based on descriptive analytical method, the sample consisted of (30) teachers of mathematics in primary school and their students (n=480)from Tabuk city schools, and after field Appling procedures, the main finding was 60% of math teachers have not perspective to use the technological in supporting educational environment in a mathematics class the technological tools to encourage the learner to interact positively, and using technological tools in the planning and implementation of teaching, evaluating the performance of the students, and employ them in order to self-professional development for teachers of mathematics. also There is a direct correlation between the use of positive mathematics teachers for the technological tools and the development of students' performance and positive attitudes towards mathematics. The recommendations of study are building training programs to employ technological tools in support of learning environment school mathematics and improve their performance teaching through the development of positive attitudes towards their relevance and effectiveness in mathematics.

Keywords: teaching mathematics, Teacher's Performance.

INTRODUCTION

Kingdom of Saudi Arabia developed the curriculum in the light of both national and international standards . The main aims were: developing how the students build the knowledge, developing thinking process, and improving the smart behavior of the students. The educational system tried to solve a lot of problems that relatee to the vision, mission, and the aims of learning. also the currclum of mathematics education depends on using the technological tools in mathematics education. It is very necessary to apply the technological tools im math clasess

On the other hand, in the last 20 years, a lot of researches presented the main ideas about using technological tools. it is relted to developing mathematical concepts, mastaring mathematical skills, and descovering many mathematical genrlizations. (**Hartsell** , et.al, 2009). It is considered to be very essential for the students in the 21st century. technological tools is educational frameworks that helps in improving the mathematics education aims. it encourge the students, and math teachers through communicating using alternative ways. (**Beyerbach, Walsh**, 2001).

Alot of finding of studies refare to using technological tools in mathematics class improve student's performance in mathematics , for example solving problem skills, and word problem solving. it helps the students to make mathematics representations. Also, the to using technological tools develop their attitudes toward mathematics Education(**Naida, 2003).**

A good starting point when using technological tools into a school is introducing the technological tools to teachers mathematics. The experience will be more effective for students if teachers develop a deep understanding and appreciation of using technological tools before they present them to the students in class.

They may have numerous initial questions, for examples: What do these using technological tools in mathematics clasess? , How will the teachers work with the students to develop mathematical knowledge using technological tools?, How can the teachers put the model into practice? And What is the role of the teachers in using technological tools?(**Yildirim, 2000).**

In addition, classroom environment plays the main role in achieving the objectives. It provides many opportunities to influence behavior, cognitive behavior, learning, and growth (**Friedman, 1999).** about using technological tools on the classroom environment providing the students with a good learning environment and developing the math objectives. (**Norton**, et.al, 2000)

Finally, Developing and assessing the mathematics education aims are the main tasks of the teachers. For that reason, a lot of researchers have been investigating the teaching procedures in order to develop them. It is very important to be able to observe the teachers and encourage them to be reflective and help them improve their performance in math class.

***Research questions*:** This research investigates the following question:

- To what extent mathematics teachers master using technological tools in certain fields of the teaching and learning process; i.e. (teaching plan, building the knowledge, group management, assessment, and extra activities)?
- what the relationship between Teacher's Performance in the light using Technological tools and the student's performance and their attitudes toward mathematics Education?

METHODS

Instrumentation : To achieve the aims of this research two Instruments were used. To assess the teaching performance , questionnair was prepared. It is related to the assessment of the teaching performance of learning habits of mind. It included 5 dimensions of teaching: (teaching plan, building the knowledge , groups management, assessment , extra activities) also the questionnair was prepared to assess the students attitude.

Search sample: The sample of this search was selected from the original community at Tabuk city. it included 30 mathematics teachers and thire students (480) from primary, prep., scoubdary schools.

The instrument were applied by the researcher and mathematics supervioser at the school. they help the teachers tthrough applying the atitude scale . the researchers met the teachers to apply the questionnaire that related to measuring the atitude. The meeting with the teachers was meant to discuss and interpret a lot of question about the terms and concepts that were included in the questionnaire. Through that open discussion, we noticed that there were a lot of generalizations, and that most of the teachers did not have enough experience regarding the concepts .

RESULTS AND FINDINGS

To answer the first question: **extent mathematics teachers master using technological tools in certain fields of the teaching and learning process; i.e. (teaching plan, building the knowledge, group management, assessment, and extra activities)?**

Through using SPSS, the frequency, percentage and the mean were calculated. The results are clearly stated in the following table:

Table (1) The Frequency, Percentage And The Mean Of Using Technological Tools indicators

Teaching Performance	Distribution								
	Exemplary (4)		Accomplished (3)		Developing (2)		Beginning (1)		
	frequency	Percent %	frequency	Percent %	frequency	Percent %	frequency	Percent %	The mean

Using technological tools as a framework of teaching	2	6,6	6	20	10	31.7	12	40	1.97
Write the aims of the lesson in relation technological tools	2	6,6	5	16.7	9	30	14	46,7	1.73
Using technological tools to building mathematical knowledge	2	6,6	6	20	12	40	10	33,4	1.95
Design the cooperative learning activities	4	13.3	8	26,7	8	26,7	10	33.3	2.52
dependen on Using technological tools	5	16.7	9	30	8	26,7	8	26,7	2.38
Organize the content gradually									
Connect between conceptual and procedural knowledge using Using technological tools	8	26.6	16	53,5	5	16.7	1	3,3	3.07
Use the technological tools in problem solving strategies	4	13.3	6	20	10	33.3	10	33.3	2.13
Encourage the discussion among the students	3	10	7	28,3	12	40	8	26.7	2.15
Use of appropriate equipment in class	2	6.7	13	43.3	9	30	6	20	2.37
Use the technological tools to enhance the students in developing math thinking	3	10	6	20	9	30	12	40	1.98
create a class environment Using technological tools is main part in work	1	3,3	8	26,6	16	53.3	5	16.7	2.15
Encourage students to use the environmental tools	2	6.7	10	33.3	12	40	6	20	2.27
Connect between family and school to enhance students using technological tools	1	3.3	3	10	20	66,6	6	20	2.02
Use the technological tools to communicate with students with homework activities	6	20	16	53.3	9	30	0	0	3.03
Use the technological tools in developing thinking	8	13.3	14	23.3	30	50	8	13.3	2.37
Design the different activities, for examples: search, use library, math site, ...e-mail, facebook,..	4	6.7	13	21.6	25	41.6	18	30	2.05
The mean of total									2,26

Through the table (1) we can observe that the mean total of the checklist is (2.26). It is less than the mastering value (≥ 3.2) . Also, the mean of all of the items are less than the mastering value.Through the observation, the researchers noticed that most of the teachers of the sample do not have clear perspective of using the technological tools of teaching mathematics. In addition, the range of means of the teaching indicators is (1.73 and 3.07). Most of the indicators are not close to the mastering value (3.2). There are, however, some indicators which are close to the mastering value, for example: Connect between conceptual and procedural knowledge using technological tools (3.07), Use the technological tools to communicate with students with homework activities (3.03), Use the technological tools to communicate with students with homework activities (3.03). Help the students to apply the pervious experiences (3.02). Most of the pervious indicators refer to general teaching procedures, and did not relate directly to using technological tools.

On the other hand, there are a lot of indicators that refer to a weakness in using technological tools for most of the sample. Most of those indicators are mainly related to the procedures for using technological tools, for example: Write the aims of the lesson in relation technological tools (1.73), Using technological tools to building mathematical knowledge (1.95), Using technological tools as a framework of teaching (1.97), Use the technological tools to enhance the students in developing math thinking (1.98). Finally , the researchers deduce that Most of the teachers did not master the indicators of Using technological tools as a part of teaching performance that relate to: (teaching plan, , building the knowledge , groups management, assessment , extra activities).

To answer the second question: what the relationship between Teacher's Performance in the light using Technological tools and the student's performance and their attitudes toward mathematics Education? Through using SPSS , the frequency , percentage and the mean were calculated .The results are detailed in the following table:

Table(2): The Frequency , Percentage And The Mean Of The İndicators Of 16 Habits Of Mind

	Accomplished		**Developing**		**Beginning**		Beginning		
	frequency	Percent %	frequency	Percent %	frequency	Percent %	frequency	Percent %	
İ like the mathematics class	18	5	167	46.7	113	31.7	10	16.7	2.4

Mathematics topices are not relatetded to my life.	24	6.7	54	15	96	26.7	186	51.7	1.93
İ ask my teacher when faced with a task, a problem, or a question.	23	6.7	96	26.7	209	58.3	31	8.3	2.32
İ like mathematics clasess include the situation that makes make me enthusiastic.	73	20	126	35	137	38.3	25	6.7	2.35
İ use the pervious knowledge in solving the problems related to the situation.	107	30	168	46.3	102	23.3	0	0	3.07
İ work mathematically with enhancement activities continuous learning.	67	18.3	192	53.3	89	25	13	3.3	2.87
İ Consider the learning interests in mathematics class.	35	10	149	41.7	121	33.3	54	15	2.47
İ make connection between family and school	37	10	83	23.3	109	30	22	36.7	2.07
Total									2,32

Through table (2) we can deduce that the mean total of the questionnaire is (2.32). It is less than the mastering value(≥ 3.2) . All the means' of all items are less than (≤3,07) and more than (≥1.8) . Through the observation, the researchers observed that most of the students of the sample do not have clear perspective about the mathematics education, its relatedt to thire life . they also do not have general perspective in developing thire performance buy using technological tools.

CONCLUSION

Using Technological tools is a main part in teaching mathematics. Through the results of this research , most of the teachers did not have clear and deep perspective about using Technological tools in teaching mathematics in general and its dimensions (teaching plan, building the knowledge, groups management, assessment, and extra activities). Most of them did not write lessons aims that are relative to using Technological tools, did not organize classes, did not design strategies that encourage the students to using Technological tools in mathematics representation. They, also, did not assess thire teaching performance in the light of using Technological tools . also , most of the teachers did not have clear and deep perspective of habits of mind in general as well as in detail . They did not have enough experiences that relate to the terms of habits of mind and how to develop them. also there are positve relationship between using Technological tools in teaching mathematics, and students performance and thire atitude toword mathematics.

RECOMMENDATIONS

Finally, The study found a set of recommendations the most important building training programs procedural to employ innovations of technology in support of learning environment school mathematics and improve their performance teaching through the development of positive attitudes towards their relevance and effectiveness in mathematics.

ÖZET: Son yıllarda matematik eğitiminde çeşitli şifreleme teknikleri kullanılarak yapılan etkinliklere rastlanmaktadır. Çalışmanın amacı araştırmacılara ve öğretmenlere matematik derslerinde kullanılabilecek bir şifreleme etkinliği örneği sunmaktır. Bu doğrultuda araştırmacılar tarafından "modern şifreleme" adı ile bir çalışma yaprağı oluşturularak iki ders boyunca etkinlik gerçekleştirilmiştir. Çalışmaya bir devlet okulunda eğitim-öğretim görmekte olan 36 altıncı sınıf öğrencisi katılmıştır. Uygulamalar sırasında her öğrenciye çalışma kâğıdı dağıtılmış, öğrenciler bireysel olarak çalışmışlardır. Bu etkinlik üç adımdan oluşmaktadır ve her bir aşamada istenilenler bir önceki aşama ile bağlantılıdır. Etkinlikteki adımlar sırasıyla öğretmen rehberliğiyle gerçekleştirilmiştir. Şifreleme etkinliği öteleme işlemini temel almaktadır. Her bir adım bir sonraki ile ilişkili olduğundan doğru şifreye ulaşabilmek için tüm adımlar hatasız bir şekilde tamamlanmalıdır. Bu da öğrencilerin dikkatli olmasını ve odaklanmasını gerektirmektedir. Nitekim etkinlik sonunda sadece beş öğrenci doğru şifreye ulaşmıştır. Matematik derslerinde eğitim-öğretim sürecinde şifreleme etkinliklerinin kullanılması öğrencilerin ilgisini çekmektedir. Dolayısıyla böyle etkinlikler öğrencilerin matematik dersine dikkatlerini çekmede ve motivasyonlarını arttırmada bir araç olarak kullanılabilir.

Anahtar sözcükler: şifreleme etkinliği, matematik eğitimi, öteleme

ABSTRACT: In recent years, there are various encryption activities which are used in mathematics lessons. The aim of the study is to present an example which can be used in mathematics classes for teachers and researchers. For this purpose a worksheet was named " modern encryption" was prepared by researchers. This activity was carried out during two lesson time. 36 sixth grade students attended to study from a public university. The worksheet was handed out to each student and they worked individually. This activity consisted of three steps and operations in each step were associated with the previous step. The steps in the activity were performed by teacher guidance respectively. The encryption activity was based on translation process. Using of encryption in teaching-learning process has attracted the attention of students. Thus, such activities draw students' attention to mathematics and can be used as a tool to increase their motivation.

Key words: encryption activities, mathematics education, translation

GİRİŞ

Schneider (1996) kriptolojinin Yunanca krypto's (saklı) ve lo'gos (kelime) kelimelerinin birleştirilmesinden oluşturulduğunu ifade etmiştir (akt: Yerlikaya, 2006). Kriptoloji, şifreleme çalışmalarından meydana gelmektedir (Güler, 2007).

Son yıllarda matematik eğitiminde çeşitli şifreleme teknikleri kullanılarak yapılan etkinliklere rastlanmaktadır (Myerscough ve diğerleri, 1996; Özdemir ve Yıldız, 2012; Katrancı ve Özdemir, 2013; Bahadır ve Özdemir, 2012; Güler, 2007). Myerscough ve arkadaşlarının çalışmasının sonuçlarına göre bazı öğrenciler şifreyi çözmede zorlanmış, bazıları öğretmen ipucu vermeden şifre hakkında yorum yapmamış fakat birçoğunun şifreyi çözmede inatçı ve başarılı oldukları tespit edilmiştir (akt: Güler, 2007). Güler (2007) yaptığı çalışmada modüler aritmetik konusunun öğretiminde şifreleme etkinliklerinin kullanılmasının öğrenci tutumu ve başarısına etkisini incelemiştir. Araştırmada ön test – son test kontrol gruplu desen kullanılmış ve deney grubu öğrencilerine modüler aritmetik konusunun öğretiminde şifreleme etkinliklerine yer verilirken, kontrol grubu öğrencilerine ise geleneksel öğretim yöntemi kullanılarak dersler işlenmiştir. Araştırma sonucunda deney grubu öğrencilerin akademik başarıları kontrol grubu öğrencilerine göre anlamlı düzeyde yüksek çıkmıştır. Deney grubu öğrencilerinin şifreleme etkinliklerine yönelik tutumlarının ise olumlu olduğu belirlenmiştir. Özdemir ve Yıldız (2012) barkodlarla ilgili bir şifreleme etkinliğinin uygulanabilirliğinin incelenmesi ve öğrencilerin etkinlikle ilgili görüşleri başlıklı çalışmalarında 11 adet sekizinci sınıf öğrencisi ile çalışmışlarıdır. Araştırma sonucunda, kullanılan etkinliğin ilköğretim 8. sınıf düzeyi için uygun ve kullanılabilir olduğu sonucuna ulaşılmıştır. Ayrıca öğrencilerin etkinlikle ilgili görüşlerinin olumlu yönde olduğu görülmüştür. Bahadır ve Özdemir (2012) çalışmalarında "yer değiştirme şifrelemesi" isimli şifreleme tekniği ile ilgili bir şifreleme etkinliğinin 7. sınıf matematik dersindeki permütasyon ve olasılık konu-sunun işlenmesi sırasında uygulanabilirliğini incelemiş ve bu etkinlikle ilgili öğrencilerin görüşlerini incelemiştir. Benzer şekilde kullanılan etkinliğin ilköğretim 7. sınıf düzeyi için uygun ve kullanılabilir olduğu sonucuna ulaşılmıştır ve öğrencilerin şifreleme etkinliği ile ilgili görüşleri olumlu yöndedir. Katrancı ve Özdemir (2013) araştırmalarında RSA şifreleme yöntemini kullanarak, öğrencilerin modüler aritmetik konusunu pekiştirmelerini amaçlamıştır. RSA şifrelemesi yöntemine göre hazırlanan etkinlikler bir devlet okulunda öğrenim görmekte olan 19 adet on birinci sınıf öğrencisiyle iki ders saati boyunca gerçekleştirilmiştir. Günlük hayatta pek çok şifre ile karşılaşan öğrencilerin değişik bir yöntem öğrenmenin hazzını yaşadıkları gözlenmiş, modüler aritmetik konusunda zorlandıkları noktaları aştıkları, eksik oldukları noktaları tamamladıkları sonuçlarına ulaşılmıştır.

Bu çalışmada "Mathematics Enchancement Programme" programının önerdiği "modern şifreleme" etkinliği kullanılmıştır. Matematik derslerinde kullanılabilecek bir şifreleme etkinliği örnek olarak sunulmuş ve bu etkinliğin değerlendirilmesi yapılmıştır.

YÖNTEM

Çalışmada doküman analizi yapılmıştır. Yapılacak olan çalışma ile ilgili mevcut kayıt ve belgelerin toplanıp incelenmesine doküman analizi denir. Bu süreçte araştırmacı kaynaklardaki bilgileri alır ve araştırması için kullanır (Çepni, 2009). Genel literatür taraması olarak da ifade edilmektedir. Bu çalışmada matematik eğitiminde şifreleme etkinliklerinin yeri araştırılmış ve bir örnek sunulmuştur. Şifreleme etkinliği üç adımdan oluşmaktadır ve her bir aşamada istenilenler bir önceki aşama ile ilişkilidir. Etkinlikteki adımlar sırasıyla öğretmen rehberliğiyle gerçekleştirilmiştir. Şifreleme etkinliği öteleme işlemini temel almaktadır. Doğru şifreye ulaşabilmek için tüm adımlar hatasız bir şekilde tamamlanmalıdır. Etkinlik bireysel olarak tamamlandıktan sonra şifreye ulaşıp ulaşmama durumları, her bir adımın ayrı ayrı değerlendirmesi yapılmış ve toplam 36 öğrenci için genel değerlendirme puanı hesaplanmıştır. Araştırmanın çalışma grubunu bir devlet okulunda öğrenim gören 36 adet altıncı sınıf öğrencisi oluşturmaktadır. Etkinlik 2 ders saati süresince gerçekleştirilmiştir.

Uygulama Süreci

Araştırmada kullanılan etkinlik, "modern şifreleme" şeklinde isimlendirilen bir şifreleme etkinliği ile ilgilidir. İlk olarak öğrencilere uygulama süresince yapılacaklardan bahsedilmiştir. Daha sonra bireysel olarak çalışma kağıdındaki soruları çözmeleri istenmiştir. Çalışma yaprağında yer alan sorular aşağıdaki gibidir:

Çalışma Yaprağı

Modern şifreleme isimli bu etkinlik 3 adımdan oluşan bir şifreleme etkinliğidir. Her bir aşamada istenilenleri bir önceki aşama ile bağlantılı bir şekilde yapmaya dikkat ediniz.

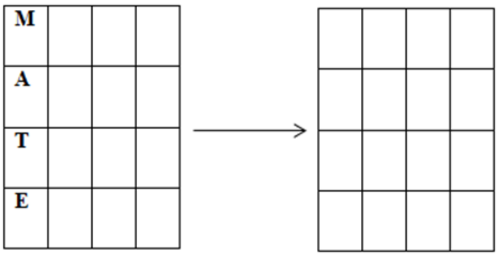
Aşağıdaki adımları izleyerek modern şifreleme yoluyla "MATEMATİK SEVGİSİ" metnini şifreleyiniz.

Adım 1: Değişken değiştirme

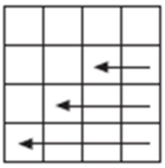
Bu adımda öncelikle harfler sütunlara yerleştirilir. Sonra 3 birimlik öteleme ile yani aşağıda tabloda verildiği gibi harfler ötelenerek şifreleme yapılır.

A	**B**	**C**	**Ç**	**D**	**E**	**F**	**G**	**Ğ**	**H**	**I**	**İ**	**J**	**K**	**L**	**M**
Ç	D	E	F	G	Ğ	H	I	İ	J	K	L	M	N	O	Ö
N	**O**	**Ö**	**P**	**R**	**S**	**Ş**	**T**	**U**	**Ü**	**V**	**Y**	**Z**	**.**	**,**	**?**
P	R	S	Ş	T	U	Ü	V	Y	Z	.	,	?	A	B	C

İlk sütun aşağıdaki gibi doldurulmuştur. Benzer şekilde diğer sütunlara da harfleri yerleştirerek öteleme işlemini yapınız.



Adım 2: Satır değiştirme

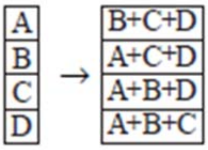


Yandaki gibi satırların kendi içinde öteleme yapılır. İlk satırda hiçbir değişiklik yapılmaz. İkinci satırdaki her bir harf sola doğru 1 birim yer değiştirir. Üçüncü satırdakiler 2 birim, son satırdakiler 3 birim sola ilerlerler.

1. adım sonunda elde ettiğiniz tabloya 2. adımdaki satır değiştirme işlemini yapınız.

Adım 3: Sütun dönüşümü

Her bir sütun için aşağıdaki örnekteki gibi bir dönüşüm yapılır.



Toplama işlemi yapılırken ikili sisteme uygun olarak şu yol izlenir:

0 + 0 = 0	0 + 1 = 1
1 + 0 = 1	1 + 1 = 0

Her bir harfe karşılık gelen beş basamaklı sayılar şunlardır:

Harf	**Sayı**	**Harf**	**Sayı**	**Harf**	**Sayı**	**Harf**	**Sayı**
A	00000	Ğ	01000	N	10000	U	11000
B	00001	H	01001	O	10001	Ü	11001
C	00010	I	01010	Ö	10010	V	11010
Ç	00011	İ	01011	P	10011	Y	11011
D	00100	J	01100	R	10100	Z	11100
E	00101	K	01101	S	10101	.	11101
F	00110	L	01110	Ş	10110	,	11110
G	00111	M	01111	T	10111	?	11111

Etkinlik gerçekleştirildikten sonra çalışma yaprağında yer alan her bir adım için puan verilerek her bir öğrenci için bir değerlendirme puanı elde edilmiştir. Bu puanlara ait ortalama, standart sapma değerleri bulunarak betimsel istatistik değerleri hesaplanmıştır.

Çalışma yaprağında yer alan her bir adım ve şifreye ulaşma durumu olmak üzere toplam dört aşamada değerlendirme yapılmıştır. Adımların değerlendirilmesi için "rubrik" hazırlanmış ve sonra da genel bir değerlendirme yapılmıştır. Değerlendirme şu şekilde gerçekleştirilmiştir.

"MATEMATİK SEVGİSİ" metninin ilk tablonun sütunlarına yerleştirilmesi	İlk tabloyu kullanarak öteleme yapılması	1. adım sonunda elde edilen matrisin yerleştirilmesi	Satır değiştirme işleminin yapılması	Sütunların yerleştirilmesi	Toplamların yazılması	İkili sisteme uygun işlemlerin yapılması	Toplam Puan	Şifreye Ulaşma
1 puan	1 puan	1 puan	1 puan	1 puan	1 puan	1 puan		

Her bir durumun doğru gerçekleştirilmesi durumunda 1 puan verilecektir. Örneğin hem "MATEMATİK SEVGİSİ" metnini ilk tablonun sütunlarına doğru yerleştiren hem de ilk tabloyu kullanarak doğru öteleme yapan kişi bu adım için 2 puan alırken herhangi birini yapan kişi 1 puan alacaktır.

Son olarak şifreye doğru bir şekilde ulaşıp ulaşmama durumu değerlendirilmiştir. Şifreye doğru ya da yanlış bir şekilde ulaştı şeklinde değerlendirme yapılmıştır.

BULGULAR

Verilerin analizinde öğrencilere dağıtılan çalışma yaprakları incelenmiştir. Çalışma yaprağında yer alan sorular yukarıda belirtildiği şekilde değerlendirilerek her bir öğrenci için elde edilen genel değerlendirme puanlarına ait ortalama, standart sapma değerleri aşağıdaki gibidir:

Tablo 1. Şifreleme etkinliğinin değerlendirilmesi

	N	Ortalama	Mak.	Min.	Standart Sapma
Genel Değerlendirme Puanı	36	3,9	7	2	1,96

Doğru şifreye ulaşan kişiler 7 puan almıştır. Dolayısıyla şifreleme etkinliğinden alınacak maksimum puan 7 dir. Şifreye ulaşma durumlarına bakıldığında ise 36 öğrenciden sadece 5'i doğru şifreye ulaşırken, 31'i yanlış bir şifreye ulaşmış ya da herhangi bir şifreye ulaşamamıştır. Sonuç olarak sınıfın yaklaşık % 86'sı doğru şifreye ulaşamamıştır.

Her bir öğrencinin çalışma kağıdı incelendiğinde öğrencilerin en az puan aldığı kısım 3. adımdır. Üçüncü adımda sütundaki her bir elemanın dönüşümü yapılacaktır. Bu aşamada öğrencilerin alışık olduklarından farklı bir toplama işlemi vardır. Ve elde edilen sayılara karşılık bir harf bulunur ve şifre çözülür.

SONUÇ VE ÖNERİLER

Bu çalışmada matematik derslerinde kullanılabilecek bir şifreleme etkinliği örnek olarak sunulmuştur. Etkinlik birbirini takip eden üç adımdan oluşmaktadır. Etkinlikte kullanılan çalışma yaprağı yukarıda tanıtılmaktadır. Öğrencilerin en düşük puanı 3. adımda almalarının sebebi bu adımın kendi içinde birden fazla aşama içermesidir ve öğrencilere daha karmaşık gelmiş olabilir. Doğru şifreye ulaşabilmek için bütün adımları hatasız sürdürmek gerektiğinden etkinliğe iyi odaklanılması ve işlem hatası yapılmaması gerekmektedir.

Ayrıca dersin dikkati çekme, derse geçiş aşamalarında şifreleme etkinlikleri kullanılabilir. Ders kitaplarında uygun konularda şifreleme etkinliklerine yer verilebilir. Şifreleme kullanılarak yapılan bu etkinlik örnekleri beşinci ve altıncı sınıf düzeyinde "matematik uygulamaları" dersinde etkili araçlar olarak kullanılabilir. Derste şifreleme etkinlikleri öğretmen tarafından verildikten sonra öğrencilerden de çeşitli şifreler üretmeleri ve ürettikleri şifreleri deşifre etmeleri istenebilir.

EFFECTS OF PARENTAL ROLES IN STUDENTS' MATHEMATICAL LEARNING: HOW DOES THE EDUCATION LEVEL OF PARENTS EFFECT THEIR INVOLVEMENT?

Şule ŞAHİN DOĞRUER
Şükufe Nihal Ortaokulu
sule_sahinn@hotmail.com

ABSTRACT: The purpose of this is qualitative study was to explain the parents' (specifically mothers' in this study) own experiences with mathematics, and how these practices affected beliefs and motivation about mathematics, their roles in involvement of their children's mathematics learning process. While explaining the phenomenon, the expectancy value and attribution theories were used. There were seven themes related to the obtained codes from the study. These were: Understanding of Mathematics, Importance of Mathematics, Knowing Mathematics, Nature of School practices, Mother Competency, Mother as Resource Provider, and Mother as Motivator. The study tried to explain whether their parental roles can be explained through the context of parental views of the importance of the subject and their involvement, through expectations for successful outcomes as a result of their involvement. Additionally, this study tried to investigate whether the education level of parents' effect their parental involvement their children's mathematical learning process.

Key words: parental involvement, parents' roles, mathematics, learning, teaching, student motivation.

INTRODUCTION

Parental Involvement

There is a long history of studying parental involvement in students' education (Berger, 1991). The home was recognized as the base of education nearly over 100 years ago, and the role of parents in their children's education continues to be recognized today (Cai, 2003). Jeynes (2005) created an operational definition of parental involvement as "parental participation in the educational processes and experiences of their children" (p.245). This definition includes parental involvement related to education within the school and also in the home of each child. Research has shown that parents who are involved in their child's education contribute not only to higher academic achievement but also to positive behaviors and emotional development (Eccles & Harold, 1993, Epstein, 1986, Cai, 2003). As the relationship between parents and school becomes more connected, student achievement increases (Epstein et al., 2009).

Pomerantz, Moorman, and Litwack (2007) differentiated between school- based and home-based involvement: School-based involvement requires parents to make actual contact with school personnel (for example, attending school meetings, talking to teachers, supporting school events, and volunteering time at the school). On the other hand, home-based involvement encompasses assisting with homework, responding to children's academic performance, and talking with children about happenings at school (Pomerantz et al., 2007). Recent studies suggest that the importance in examining the home involvement of parents' in their children's motivation and success (Cai, 2003). In a study of sixth through eighth graders, Grolnick and Slowiaczek (1994) found that the three dimensions were relatively independent and were associated with children's motivational resources and school performance. Specifically, mothers who were high in behavioral and cognitive involvement had children who felt more competent in school and more in control of school outcomes than those who were less involved. In turn, these motivational resources predicted school grades (Grolnick & Slowiaczek, 1994).

Among the studies examining parental roles supporting students' learning in home settings, only a few of them have been done to examine parental support in home settings involving mathematics with early childhood and elementary school children (e.g., Anderson, 1997). Recently, Cai et al. (1999) have identified five parental roles in middle school students' learning of mathematics: motivator, monitor, resource provider, mathematics content adviser, and mathematics learning counselor. Mathematics content adviser and mathematics learning counselor are roles that parents play in directly assisting students' learning of mathematics in the home setting. Parents as motivator, monitor, and resource provider are roles that parents play in providing emotional and resource support in students' learning. (Cai, 2003).

How does parents' education affect parental involvement?

Another issue is that parents' levels of involvement in school may be influenced by qualities of the parent-child communication and by characteristics of each member (Hoover-Dempsey, Bassler & Brissie, 1987). Within this category, parents' thoughts and beliefs about themselves as parents are one set of such characteristics. First, parents differ in terms of their ideas about their role in their child's learning. To the extent that they believe strongly that parents have a role in the teaching-learning process, they may be more likely to take on involvement activities. Further, personal efficacy is also likely to impact on behavior (Bandura, 1986). Parents who believe they can make a difference are more likely to be involved (Hoover-Dempsey, Bassler & Brissie, 1987). In this study, we will try to investigate how education level of parents' affects their motivation and willingness to parental involvement in their children's learning. According to the Tsui (2005), the education level of a parent is a significant predictor of a child's educational achievements and behavioral outcomes.

Theoretical Background

Expectancy–value theory and attribution theory are based in the notion of motivation and could explain differing parents' motivation to help their children learn mathematics in ways identified as meaningful in previous research (Cai, 2003). In expectancy–value theory, individuals' expectancies for success and the value placed on succeeding are important determinants of motivation to perform different tasks (Eccles & Wigfield, 2002).

The concept of *expectancy* represents the idea that most individuals will not choose to do a task or continue to engage in task whey they expect to fail. The expectancy construct concerns the answer to the question "Can I do this task?" If the answer is yes most people will choose to engage in the task. If the answer is no or there are doubts about one's capabilities to succeed, individuals are less likely to engage in the task (Pintrick & Schunk, 2002). The other half of the equation is the *value* component. Value refers to the different beliefs students have about the reasons they might engage in a task. It concerns the answer to the question "Do I want to do this task and why?" Both components are important for predicting people's future choice behavior, engagement persistence and actual achievement. (Pintrick & Schunk, 2002). All parental involvement in mathematical learning is likely to be influenced by parents' perceived importance of mathematics which is value; and an expectation of success that may result from their involvement which is expectancy (Hunt & Hu, 2011).

Attribution theory suggests parental involvement in mathematics depends heavily on the controllable or uncontrollable factors involved in the task and the connected need for achievement (Weiner, 1972). Attributing an outcome to a stable cause such as ability or skill has a stronger influence on expectancies for future success than attributing an outcome to an unstable cause such as effort. This is an important point when considering parental roles and why certain parents become more involved than others. Weiner (1972) states that if individuals are high in achievement motivation perceive that effort is an important determinant of outcome that is high effort produces success and low effort results in failure. This study will expand understanding of the nature of involvement in students' mathematical learning by explaining the influences of mothers' perceptions and beliefs toward mathematics through expectancy–value and attribution theories. Specifically, this research answers the following questions:

1. What are the mothers' personal experiences in learning mathematics?
2. Why might their views, experiences and education level influence engagement of parents' regarding their child's mathematics learning?

METHODS

Design and Context of the Study

A purposive sampling was used throughout all sampling process, that's while choosing the school, the class, and the parents (mothers). Three seventh grade students' (students were also chosen from boys to eliminate the possible biases come from gender differences regarding the motivation and success in mathematics) mothers were accepted to participate to the study. Each mother was from different education level, that's one left the school from second grade and did not turn back again, another was graduated from high school, and the last one graduated from university. Additionally, two of them were housewives and the last one graduated from university, was working as Turkish teacher. Efforts were taken to interpret all research data by using various verification strategies. Verification of data analysis, resulting codes and themes, and guards against external threats to validity were achieved through a variety of means. First, two independent coders reviewed transcripts at stages two of data analysis (Grbich, 2007). Codes were deemed to be reliable if we achieved 90% agreement or greater. We reached consensus on our disagreements by having discussion on them. Second, reliability of source information was obtained through the use of verbatim translation (Grbich, 2007).

Data Sources and Data analysis

Interviews were the primary data collection method employed in the study to gain an in-depth understanding of the research questions. Each mother participated in one interview session focusing on parents' perceptions of mathematics teaching and learning and questions relating to each mother's perceived roles in her child's mathematical learning. An interview protocol was utilized during the interview process. Questions used were open-ended to allow participants to supply researchers with as little or as much information as they felt necessary to express their thoughts (Grbich, 2007). Each mother was interviewed five to ten minutes. The analysis of interview data involved stages of identifying, sorting, and analyzing. First, all interviews were audiotaped and transcribed verbatim (Grbich, 2007).

RESULTS AND FINDINGS

We came to a consensus on seven themes that were obtained from the interviews. These are Understanding of Mathematics, Importance of Mathematics, Knowing Mathematics, Nature of School practices, Mother Competency, Mother as Resource Provider, and Mother as Motivator. Table 1 shows the obtained themes from the study. Following each theme will be briefly explained.

Interview Themes	Indicators		
	Parent 1	Parent 2	Parent 3
Understanding of Mathematics	Calculations	Calculations Difficult Formulas Practice Develop thinking	Calculations Certainty
Importance of Mathematics	Will use in future/other areas Shopping	Will use in future/other areas Shopping Requirement	Will use in future/other areas Shopping Requirement
Knowing Mathematics	Hard work Practice Listening teachers	Hard work Practice Application Integration	Hard work Interest Ability Practice Application Motivation Repetition
Nature of School practices	No idea	Too simple Lack of depth Lack of application	Lack of student interest Crowd of classes Different levels of students
Mother Competency	Bad Can't do	Not good, not bad Can't do Try to be better	Not good, not bad Can't do Doesn't like
Mother as Resource Provider	Provide additional test books	Provide additional test books Send to course Search on internet Get help from teacher	Provide additional test books Send to course
Mother as Motivator	Verbal motivation	Verbal motivation Modeling	Verbal motivation

Table 1: Seven Themes Obtained from Interviews

Understanding of Mathematics

The first theme uncovered relayed parents' perceptions of the nature of mathematics. This theme revolved around ideas and memories of parents' own learning of mathematics and parent's perceptions of the learning process.

Importance of Mathematics

We defined this theme as importance of mathematics, which revolved around parents' appreciation of mathematics as a learning phenomenon as well as the relevance of mathematics to life events.

Knowing Mathematics

Knowing mathematics refers to parents' views on what is takes for someone to come to know and excel at mathematics.

Nature of School practices

The fourth theme revealed thoughts concerning how mathematical practices occur in classroom environment. Specifically, it was focused on the mothers' beliefs related to effectiveness of these practices.

Mother Competency

In general, last three themes dealt with parental roles in children's mathematical learning and factors that might have influenced these roles. Specifically this theme uncovered related to parents' feelings of competency regarding their own knowledge of mathematics.

Mother as Resource Provider

The seventh theme was about parents as resource providers for their children.

Mother as Motivator

The final theme dealt with a mother being a motivator of her child's learning process.

DISCUSSION AND CONCLUSION

The results of this study suggest that parental roles in mathematics can be explained through the context of perceptions of their views about math, expectations for successful outcomes as a result of their involvement.

Apparent in the results was the difference in the importance of mathematics between mothers. According to expectancy–value theory, perceptions of task utility (important or unimportant) could be influenced by a person's interpretations of their own past performance in mathematics and their affective memories (Eccles & Wigfield, 2002). Indeed, two mothers remembered doing not too bad in math seemed to value the subject more than another who remembered doing poorly or who attached a negative connotation to the subject. This valuing or devaluing could prove to affect the support given to children or the type of support given like being motivators (Eccles & Wigfield, 2002).

According to attribution theory, beliefs about a person's own mathematics ability or efforts may lead to feelings of controllability or uncontrollability on the part of the parent. This can lead them to become more or less involved in their child's learning or to become involved in qualitatively differing ways (Weiner, 1972). For example, second mother who has the most comfort with math, mentioned to do extra work with their children or brought mathematics into daily life routines. But the first mother who has a not a good education memory seemed to not to be involve in the process that she states that she have no ability of mathematics.

In Eccles (2005) revealed that parental involvement is actually more important than the school itself when it comes to students' academic achievement. She also pointed out that children learn by example, often through observations at home. If a child's parents are reading books, attending ongoing education classes and taking him along to the museum and they are engaging him in a number of direct-learning experiences that will help him value achievement and success (Eccles, 2005). This kind of role modeling can be seen as in the current study. One mother mentioned her taking night courses of mathematics to be more helpful for his son; and her studying with him is a good example for this issue. Also her efforts seemed to make him give more value to studying math. Again according to Eccles (2005), parents with higher education levels have stronger confidence in their child's academic abilities, and they also have higher expectations of their child. They expect that their child will earn good grades, behave well in school and attend college. These high expectations motivate their child to do well. The confidence they have in their child builds his own confidence in his academic abilities and makes him more likely to succeed. Mother 2 and mother 3 were good examples of this explanation regarding their high expectations from their children.

The study of Tsui (2005) indicated that the education level of a parent is a significant predictor of a child's educational achievements and behavioral outcomes. Parents, who are educated raise children to have healthy self-perceptions when it comes to their academic abilities, engage them in intellectual activities that help them develop a healthy attitude about learning. In current study, mother 1 was non-educated and she was and felt herself inadequate to help her child. Since her education background was bad, she thought she do not have ability and prefer to refrain from the education process. Moreover she does not have any ideas, who are the teachers of her son and what is going on in school practices. This is a result of expectancy-value construct as well as a result of education level of parents. When we look at the mother 2, it is clear that there is not a very good memory of math with her, but she seemed to spend admirable effort to be better in math for being more helpful for her child. This is what her education level makes her more motivated to success, believes herself to be better, and related to these to participate in her child's mathematical learning process.

RECOMMENDATIONS

The results of the present study extend previous research literature in two important ways that hold implications for teacher educators and parents. First, the use of attribution and expectancy–value theories offered unique perspectives on the reasons parental support offered in mathematics to children may differ that have not been previously discussed. Previous research identified how support is offered by different parents; notions of mothers' need for achievement in parental roles.

Additionally, although the sample size was small and means of data collection were modest, the study leaves open the door for important future research regarding the possible improvement of parental involvement in mathematics learning.

ABSTRACT: This research aimed to define the views that related to effects of the projects made by the secondary school students in their extracurricular exercises on their Science and Technology lesson's achievement. The study group is consisted of seven students in a secondary school in Ankara. In this research, the qualitative research technique has been internalized. The data has been consisted of the observation of the environments that the research made and the interview that made with the students. The structured interviews have been made with the 5 students who participated in the project study with the interview forms that consisted of the open ended questions. The 7 students who form the research have been observed. They defined that the project study brought positive contribution on their Science and Technology lesson; it made them develop positive attitudes and provided them to make the connection with the other disciplines. It has been among the other suggestions that these kinds of studies made as an extracurricular exercises within the concept of the Science and Technology lesson can be used during the class effectively.

ÖZET: Bu çalışmada fen öğretiminde öğrencilerin uzaktan öğrenmelerini sağlayabileceği web tabanlı öğrenme ortamı tasarlanmıştır. Bu e-öğrenme ortamına çoklu öğrenme uygulamaları eklendi ve kalıcı öğrenmenin oluşması amaçlandı. Tasarlanan bu e-öğrenme ortamı ile öğrenciler istediği anda ve mekânda ders içeriğine erişebilecek ve kendini sınama imkânı yakalayabilecektir. Hazırlanan bu e-öğrenme ortamı bireysel öğrenmeye imkân tanımakta ve ihtiyaç halinde tekrarlanabilmektedir. Aynı zamanda fen eğitimi için hayati öneme sahip laboratuar etkinliklerinin yapılmasına ve tekrarlanabilmesine olanak sağlamaktadır. Öğrenci velileri, öğrenci faaliyetlerini tablo ve grafikler üzerinde takip edebilmektedirler. Ortamın geliştirilmesinde konu anlatımları, sınavlar ve grafikleri için asp tabanlı bir web ara yüzü, ders içerisindeki etkinlik ve deneyler için flash tabanlı etkileşimli animasyonlar, sistemin donanım alt yapısında ise windows tabanlı bir sunucu kullanılmıştır.

Anahtar sözcükler: fen bilgisi, e-öğrenme, etkileşimli öğrenme, çoklu ortam.

ABSTRACT: In this study, web based learning environment designed that could provide distance learning of students in science education. This e-learning environment added to multiple learning application and it is aimed to permanent learning. Designed with the e-learning environment, students can access the course content that want to at the time and place, they are able to capture to facility the self test. It is prepared this e-learning environment, allowing to learn individual can be repeated as needed. At the same time, it is permitting conducted and repeated to laboratory activities of withal importance for science education. Parents of students are able to follow to students activities on the chart and graphs. Environment in developing and asp based web interface for description of the subject, exams, graphics, flash based interactive animations for event and experiments in course and it is used windows based in the systems hardware infrastructure.

Key words: science education, e-learning, interactive learning, multiple environment

GİRİŞ

Geçmişten günümüze kadar ağırlıklı olarak geleneksel yollarla eğitim-öğretim faaliyetleri verilmeye devam etmiştir. Çağımızın gelişen teknolojisiyle beraber geleneksel eğitim-öğretime katılamayanlara yönelik olarak alternatif öğretim yöntemleri geliştirilmeye başlanmıştır. Bunlardan bazıları uzaktan eğitim, e-öğrenme, web tabanlı öğrenme gibi yollarla sağlanmıştır. Böylece eğitim-öğretim programlarına katılamayan öğrenciler web teknolojileri sayesinde öğrenimine devam edebilmekte veya eğitim-öğretimini sürdüren öğrenciler ise kendilerini farklı alanlarda geliştirme, bilgilerini revize edebilme imkânı bulmaktadırlar. E-öğrenmenin materyal, araç-gereç bakımından güçlük çekilen fen bilimlerine uygulanması da fen öğretiminin sağlanmasında oldukça kolaylık sağlamıştır. Bu yolla laboratuarı olmayan veya materyal bakımından yetersiz durumda bulunan okullarda bilgisayar üzerinden web ortamında öğrencilere istenilen deney ve etkinlikleri kolayca yapma ve öğrendiklerini uygulama olanağı sağlanmaktadır. Bu doğrultuda bu çalışmada öğrencilerin okulda öğrendikleri bilgilerini evde tekrarlayabilmesi, eksik kaldığı konularını tamamlayabilmesi için bir e-öğrenme ortamı oluşturulmuştur. Bu e-öğrenme ortamına çoklu öğrenme uygulamaları eklenerek kalıcı öğrenmenin oluşması amaçlanmıştır. Tasarlanan bu e-öğrenme ortamı ile öğrenciler istediği anda ve mekânda ders içeriğine erişip çalışabilecek ve kendini sınama şansını yakalayabilecektir.

E-Öğrenme

E-öğrenme; öğrenmenin istenildiği zaman, istenildiği yerde, istediği bilgiye ulaşılabilen ve öğrenmeyi sağlayan internet teknolojileri kullanılarak yapılan eğitim tekniğidir. Elliot Masie'ın tanımına göre ise; (USA'da e-öğrenme gurusu), "Çevrimiçi öğrenme bir kurs alma gibi değildir, masaüstünde e-öğrenme aracına bağlantı sağlama ve kaynakların, iletişimin, performans desteğinin ve yapısal öğrenme aktivitelerinin harmanlanmasıdır." (The MASIE center: 2011, akt: Işık, Yağcı, 2011). E-öğrenme iki farklı şekilde yapılabilir. Birincisi öğrenenin kendi başına başkalarından bağımsız olarak istediği zaman bilgiye ulaşıp öğrenebilmesidir. İkincisi ise öğrenenler ve öğretici aynı anda internet ortamında bir sınıf oluşturarak öğrenmenin sağlanması şeklindedir.

E-öğrenmenin özellikleri:

- E-öğrenme daha hızlı ve esnek bir öğrenmeyi sağlar.
- E-öğrenme öğrenme için ikinci bir yol değil öğrenmeyi destekleyen bir değer olarak ele alınmalıdır.
- Öğrenci okulda öğrendiklerini e-öğrenme yoluyla pekiştirip destekleyebilir veya eksik öğrenmeleri tamamlayabilir.
- E-öğrenme öğrenci merkezlidir; öğrenci istediği zaman bilgiye defalarca ulaşabilir istediği kadar tekrar edebilir ve istediği hızda ilerleyebilir. Böylece öğrenme maliyetini de düşürür.
- Öğrencinin e-öğrenme ortamında yaptıklarına ilişkin bilgiler istatistiksel olarak tutulup veli bilgilendirilebilir.
- Eğitim içerikleri standarttır, tüm öğrenciler aynı bilgiye ulaşabilir.
- Bu çalışmada da görüldüğü üzere e-öğrenme ortalarında öğrenci kendi kendini test edebilir ve tecrübeli eğitmenlerden yardım isteyebilir (Duran, Önal ve Kurtuluş, 2006).
- Bireyselleştirilmiş öğrenmeyi sağlayarak grup baskısından uzak kaldığı için motivasyonu artırır.
- E-öğrenme ile öğretmen-öğrenci iletişimi daha kolay sağlanabilmektedir.
- Öğrenci öz-düzenleme konusunda yetersiz ise e-öğrenme başarısız sonuçlar doğurabilir. Aynı zamanda iletişim sorunları ortaya çıkmasıyla sosyalleşmeyi engelleyebilir.
- Öğrenciler ve öğretmenler bilgisayar ve internet konusunda yeterli bilgiye sahip olamayabilirler, bu da teknik aksaklıklara yol açabilir (Altıparmak, Kurt ve Kapıdere, 2011).

E-öğrenme ortamlarına çeşitli animasyonlar, oyunlar ve görsel nesnelerle desteklenmesiyle öğrencilerin dikkati artırılabilir. Özellikle soyut kavramların öğretiminde bu tür görsel nesneler öğrenme kalıcılığını artırır. Bu çalışmada da görüleceği üzere fen öğretiminde yapılması zor olan deneylerin yapılması veya soyut kavramların öğretiminde animasyonların kullanılması anlamayı kolaylaştıracaktır.

Çoklu Ortamlarda Eğitim

Çoklu ortam uygulamaları; değişik veri tiplerini, bilgiyi ve içeriği açıklamak için bir arada dijital ortamlarda kullanılmasıdır. İnternet hızının yavaş olduğu dönemlerde çoklu ortam uygulamaları daha çok cd ve dvd gibi ortalar üzerinden kullanılmaktaydı. İnternetin hızının artması ve yaygınlaşması ile birlikte çoklu ortamların kullanımı artış göstermektedir. Çoklu ortamlar içerik olarak; ses, görüntü, video, tablo, animasyon, similasyon vb. türleri olabilir (Gülbahar, 2012).

Bu çalışmada eğitici, öğretici değeri olan çoklu ortam içerik türleri kullanılarak öğrenmeyi kolaylaştırıp hızlandırarak aynı zamanda çalışmaya olan istekliliği ve motivasyonu artırarak öğrenmeye yardımcı olması sağlanmıştır. Çoklu ortamların birden fazla duyu organına hitap edebilmesi özelliği ile kalıcı öğrenme kolaylaştırılır, çeşitli zekâ düzeylerine sahip bireylerin öğrenmesi sağlanabilir (Gündüz, 2009). Öğrenciler; işitsel ve görsel öğrenmenin yanında uygulayarak, deneme-yanılma ve hatalarını fark edip düzeltmesi ile bilgiyi aktif olarak yapılandırır. Aynı zamanda karmaşık konuların veya soyut kavramların öğrenilmesinde çoklu ortamların kullanılması öğrenme düzeyini artırmaktadır (Alakoç,2003). Bu çalışma kapsamında hazırlanan çoklu ortam içerikleri ile fen bilgisi dersinde imkân yetersizliğinden, güvenlik açısından veya zorluğundan dolayı deneyleri bilgisayar ortamında kolaylıkla yapılabilmesi ve defalarca denenebilme imkânının bulunması öğrenciler için büyük bir avantaj oluşturmaktadır.

Öğretim süreci boyunca yenilikçi öğretim teknolojilerinin kullanımı her sınıf ve okul düzeyi için önemli olsa da fen ve teknoloji dersi için faydalı olmanın dışında gerekli ve önemli bir yer tutmaktadır. Milli eğitim Bakanlığı'nın fen ve teknoloji dersi için hazırladığı öğretim programında bilgisayar, iletişim ve teknoloji ürünlerinin ders içeriği öğretiminde kullanılmasının önemi vurgulanmakta ayrıca hem öğrenciler hem de öğretmenlerin bu teknolojilerden faydalanması istenmektedir (MEB, 2004). Ayrıca fen bilgisi müfredatı ele alınacak olursa; konuların birden çok kavram içermesi, kavramların birbirine yakın olması, konuların belli bir kısmının soyut ve anlaşılmasının güç olması ve dinamik bir yapıya sahip olmasından dolayı teknolojiyi kullanma ihtiyacı oldukça fazladır. Öğrenciler bu tür konuların bilgisini alıp, ön öğrenmelerini yeni bilgilerle ilişkilendirip yapılandırırken, her safhasında güçlükler yaşamaktadır. Bu sebeple ilköğretimin her kademesinde fen ve teknoloji derslerinde yer alan konuların öğretilmesinde yeni teknolojilerin olanaklarından faydalanılmalıdır. Sunulan imkânlar ile fen, teknoloji, toplum ve çevre gibi hayatın her alanında kendisine yer bulmuş kazanımlara sahip fen ve teknoloji dersinin kazanımları daha kolay, kalıcı, doğru anlaşılması ve öğrenilmesi sağlanabilir.

UYGULAMA ORTAMI

Uygulama ortamı her ders için 5 temel öğeden oluşmaktadır. Bunlar konu anlatım ekranı, video izleme ekranı, etkinlik ekranı, sınav ekranı ve soru sorma ekranıdır. Öğrenciler ortama ilk girdiklerinde sınıflarına göre tüm konuları görebilmektedirler. Bir konuyu başarıyla bitirmeyen öğrenci diğer konuya geçememektedir. Öğrenciler bu ekranda konuyu detaylı bir şekilde öğrenip, uygulama ve deneyleri tamamlayıp, ilgili testleri çözüp eğer varsa eğitimcilere sorup diğer konuya geçmektedir. Böylece tam öğrenmenin temelleri atılmıştır.

Ortamın Altyapısı

Ortamın yazılım alt yapısı MSSQL, ASP, AJAX ve JAVASCRIPT, donanım alt yapısı ise Windows Server 2008 kullanılarak oluşturulmuştur.

MSSQL Server Windows ve web tabanlı uygulamalarda veri saklama çözümlerinde kullanılan bir sunucu yazılımıdır. SQL Server ile veriler saklanıp, işlenip, analiz ve raporlama işlemleri yapılabilir. Derslere ait konu anlatımları, konulara ait testler, öğrencilerin ve eğitimcilerin bilgileri, temel istatistikler ve soru cevap bilgilerinin hepsi MSSQL veri tabanında tutulmaktadır.

Eğitimci ve öğrenci ekranlarının tamamı ASP kullanılarak tasarlanmıştır. ASP (Active Server Pages), Microsoft'un dinamik web sayfaları oluşturmak amacıyla geliştirdiği sunucu tabanlı çalışan betik motorudur. Klasik ASP olarak da bilinir. ASP kodları HTML sayfalarının içine gömülüp çalıştırıldığında ekran çıktısı sadece HTML kodları olarak görünür.

Öğrenciler konuya ait testleri çözerlerken soruların yanıtlanması ve süre kısıtlaması gibi fonksiyonların tamamında javascript kullanılmıştır.

Windows Server 2008, sunucu tabanlı Microsoft Windows işletim sistemlerinin bir sürümüdür. Ortamın donanım alt yapısında MSSQL veri tabanı ve ASP tabanlı uygulamanın çalışabilmesi için Windows 2008 sunucu kullanılmıştır.

Ayrıca ders içerisindeki deneysel işlevlerin gerçekleştirilmesi etkinliklerin yapılabilmesi için derslere özel olarak FLASH tabanlı deney ortamları oluşturulmuştur.

Ortamın Ana Bileşenleri

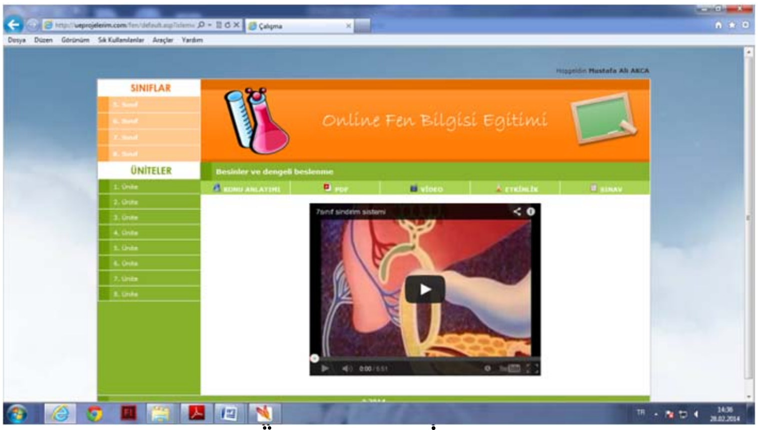
Öğrenci Konu Anlatım Ekranı

Şekil 1'deki öğrenci konu anlatım ekranında, öğrenci konuya ait bilgileri metin ve resim olarak detaylı bir biçimde görüntüleyebilmektedir. Öğrenci konuyu online olarak internet üzerinden takip edebileceği gibi ilgili üniteye ait ders metnini pdf olarak bilgisayarına kaydedebilir.

Şekil 1. Öğrenci Konu Anlatım Ekranı

Öğrenci Video İzleme Ekranı

Bu bölümde öğrenciler ders anlatımından sonra derse ait kısa videolar izleyebilmektedir. Şekil 2'de görülen ders videoları öğrencilerin anlayabileceği şekilde basit grafiklerden oluşturulmuş ve seslendirilmiştir.

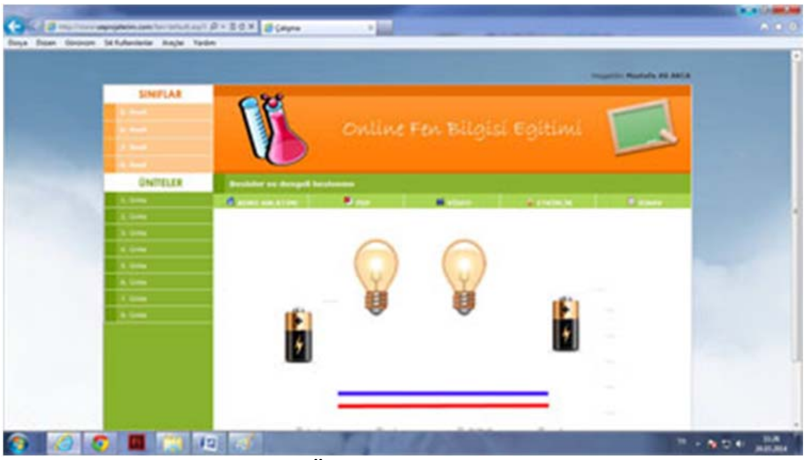


Şekil 2. Öğrenci Video İzleme Ekranı

Öğrenci video sayfasına girdiği andan itibaren bu sayfada geçirdiği sürede istatistiksel olarak takip edilmekte, bu veriler sınıf ortalaması ile karşılaştırılıp öğrenci velisine sunulmaktadır.

Öğrenci Etkinlik Ekranı

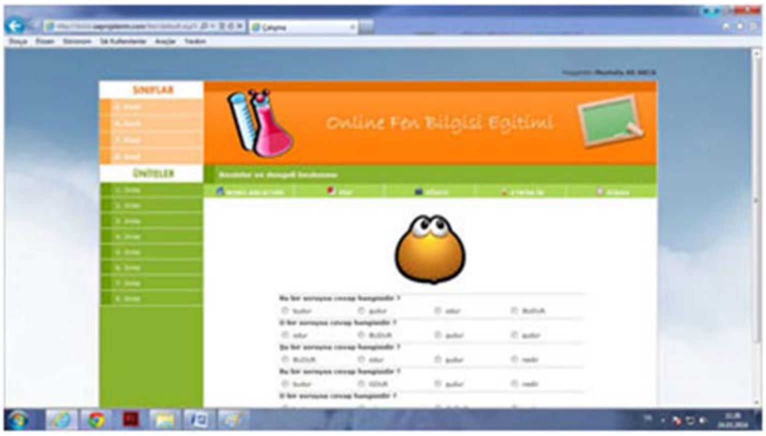
Öğrenci etkinlik ekranları konu anlatımı ve videodan sonra konunun daha iyi pekişmesi için gerekli olan etkinlikleri ve deneyleri kapsar. Deney ortamındaki tüm malzemeler öğrencinin kontrolü altındadır. Şekil 3'teki bu yapı flash kullanılarak tasarlanmıştır. Öğrenciler deney alanındaki malzemeleri konuya uygun şekilde kullanarak etkinliği tamamlar.



Şekil 3. Öğrenci Etkinlik Ekranı

Öğrenci Sınav Ekranı

Derse ait konu anlatımı, video izleme ve etkinlik yapma işlemleri bittikten sonra öğrenciler Şekil 4'te görülen çoktan seçmeli ve boşluk doldurma şeklinde 2 farklı tür sınava tabi tutulmaktadır. Sınavlarda belirttiğimiz orandaki başarı sağlanana kadar öğrenciler yeni konuya başlayamamaktadır.

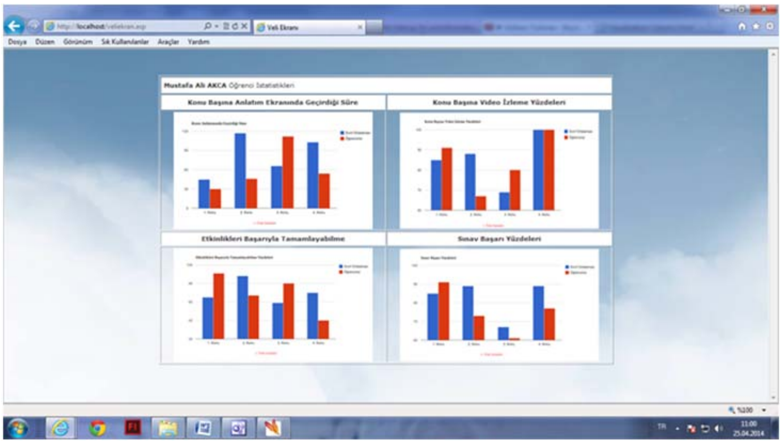


Şekil 4. Öğrenci Sınav Ekranı

Sınavla ilgili veriler istatistiksel olarak tutulup veli ekranına yansıtılabilmektedir. Öğrenciler çoktan seçmeli ve boşluk doldurma sınavını başarıyla tamamladıktan sonra yeni üniteye geçebilmektedir.

Veli Ekranı

Veli ekranı öğrenci velisinin kendisine verilen şifreyle girebileceği öğrencinin istatistiklerinin bulunduğu bir sayfadır.



Şekil 5. Veli Ekranı

Bu sayfada veli öğrencisine ait istatistikleri görebildiği gibi, aynı istatistiklerin sınıf ortalamalarını da görebilmekte ve kendi öğrencisiyle sınıftaki diğer öğrencileri karşılaştırabilmektedir. Şekil 5'te görüldüğü gibi bu sayfada "Konu Başına Anlatım Ekranında Geçirdiği Süre", "Konu Başına Video İzleme Yüzdeleri", "Etkinlikleri Başarıyla Tamamlayabilme", "Sınav Başarı Yüzdeleri" gibi istatistikler yer almaktadır. İstatistik ekranında görülen mavi çubuklar sınıf ortalamalarını, kırmızı çubuklar ise öğrenciyi temsil etmektedir.

SONUÇ

İlköğretim fen bilgisi derslerinde öğrenciler dersin teorik kısmının işlenmesinden sonra dersin daha iyi kavranabilmesi amacıyla konuya ait etkinlikler yapması gerekmektedir. Bu e-öğrenme ortamı sayesinde dersi kaçıran veya aldığı dersi pekiştirmek isteyen öğrenciler bu e-öğrenme ortamı üzerinde çalışma şansına sahip olabilecektir. Sisteme üye olan öğrenciler, her bir konu anlatımını ve etkinlikleri tamamlayıp test aşamasına geçerek üniteyi tamamlamış olur. Ünite konuları Milli Eğitim Bakanlığı'ndaki (MEB) Fen Bilgisi programına göre sıralanmış ve aşamalılık ilkesine dikkat edilmiştir. Her bir konunun başarıyla bitirilmesinden sonra öğrenme ortamında pekiştireçlere yer verilmiş böylece öğrencilerin derse katılmaya ve çalışmaya yönelik motivasyonlarının sağlanmasına önem verilmiştir. Böylece önceki konulardaki konuyu anlama oranlarına bağlı olarak sonraki konulardaki başarıları da şekillenecektir. Geliştirilen bu e-öğrenme ortamı sayesinde öğrenciler e-öğrenme ortamına entegre edilmiş konuyla ilgili MEB'deki kitap içeriklerini okuyup, etkinlikler yaparak ve testler ile kendilerini sınayarak konuları bir bütün halinde öğrenebilmektedirler. Okulunda fen laboratuarı olmayan, araç-gereç eksikliği nedeniyle veya tehlikeli olabilecek durumlar için fen deneylerini yapamayan öğrenciler bu e-öğrenme ortamında deneylerini yapma imkânı bulacaklardır. Etkinliklerin yapılması için flash ortamında görselliğe dikkat edilerek tasarlanan gerçekçi deney setleri hem öğrencilerin tüm deneyleri yapabilmesini hem de öğrenci isterse aynı deneyi tekrar tekrar yapabilmesini sağlayacaktır. Sistem çevrimiçi çalıştığı için öğrenciler gittikleri her ortamda internet üzerinden bu faaliyetleri kesintisiz olarak sürdürebilecektir. Aynı zamanda veliler de öğrencilerin ders durumlarını tablo ve grafikler halinde görebilecek ve sınıf ortalamasıyla karşılaştırıp takip edebileceklerdir.

ABSTRACT: This paper reports a study on the impact of "Lesson Study" on primary mathematics teachers' instructions in Brunei Darussalam. The purpose was to determine whether Lesson Study had a positive impact on teachers' instructions. Quantitative data were collected from; checklists from four research lesson classroom observations, and teachers' questionnaire that was distributed to 28 practitioners and qualitative data were collected from interviews, reflective journals and the study of lesson plans. From the results, four pathways were identified in which teachers' instructions had indeed improved, 1) Lesson plan development had broadened teachers' content and pedagogical knowledge; 2) Observation of students' learning helped teachers to be more conscious and sensitive towards students' learning needs and difficulties; 3) The development of teachers' self-confidence, teaching skills, questioning skills and classroom management skills; and 4) Feedbacks from peers and 'knowledgeable others' had made them more aware of the weaknesses and strengths on their own teaching.

Key words: Lesson Study; Primary Mathematics Teachers; Professional Development Program; Teachers' Instruction; Brunei Darussalam

INTRODUCTION

The New Education System (known as *Sistem Pendidikan Negara Abad ke-21* or SPN21) provided the much needed changes and improvement towards the standard of education in Brunei Darussalam. One of the aims of the system is to equip Bruneian students with essential 21st century skills in order to meet the social and economic challenges, and compete intellectually and academically with other students internationally (Ministry of Education, 2009). Therefore there was an immediate need for the implementation of a teachers' professional development program that can provide Bruneian teachers with sufficient content knowledge and pedagogy skills that can help them to implement the SPN21 curriculum efficiently. A teachers' professional development program known as the Lesson Study was selected to be one of the 'tool' to facilitate and support the implementation process of SPN21 in Brunei Darussalam. Despite a growing body of literature on the roles of Lesson Study in facilitating educational reforms, there have been only few research publications on Lesson Study conducted in Brunei Darussalam although interest in Lesson Study in Brunei Darussalam has gained momentum since its introduction in 2009.

There has been a proliferation of research, aims to impart descriptive knowledge base of lesson study in enhancing teachers' mathematical instructional practices. And we have since realised the importance to conduct researches on Lesson Study in schools in Brunei Darussalam and its effect towards teachers' instructional practices. Takahashi, Watanabe and Yoshida (2006) stated that lesson study has the features to potentially influence the quality of mathematics teaching practices in the United States, and elsewhere. It offers opportunities for teachers to critically evaluate their teaching practices. The critical evaluations may take place during the planning period or post lesson discussion, in which through these evaluations, lesson study provides a concrete image of effective instructional practices. It is because of this, lesson study is seen not only as a useful tool to disseminate effective teaching practices but also a powerful mechanism to develop such practices (Takahashi, Watanabe & Yoshida, 2006). Lewis (2002) explored and identified the 'key pathways' that connect lesson study to the improvement of teachers' instructional practices in the United States. These 'pathways' are essential to be understood if schools are to give lesson study a reasonable try in the United States (Lewis, 2002).

Given the proven success and phenomenal spread of Lesson Study in other countries over such a short period, it is important to provide a descriptive knowledge of the process of Lesson Study and its effect on Brunei teachers and students. It is hoped that the findings of this research will give valuable information regarding the effectiveness of lesson study in changing and improving teachers' instructional practices and as a 'catalyst' in changing the 'teaching culture' in Brunei primary schools The aim of the study is to investigate the impact of Lesson Study on Brunei primary mathematics teachers' instructions. It also explored the relationships of Lesson Study and Brunei primary mathematics teachers in developing their teaching proficiency in implementing the educational reforms efficiently. The key research question is, "What is the impact of lesson study towards teachers' instructions?"

METHODS

This study has adapted a combination of both quantitative and qualitative approaches. The quantitative data were collected from two sources; the 4 research lesson classroom observations acquired from the classroom observation checklist, and teachers' questionnaire. Qualitative data were collected from the observations of planning meetings, reflective stage session, teachers' reflective journal, teachers' interview session and the study of lesson plans of the teachers.

For this study, the researchers had selected a purposive sample of teachers from 14 government schools which were involved in the Lesson Study project in 2010; a collaboration between Universiti Brunei Darussalam and the Department of Schools at the Ministry of Education, Brunei Darussalam. Four teachers from 4 schools were observed during the teaching of the research lesson using the classroom observation checklist. The purpose of using the observation checklist is to provide the necessary guidelines in observing a particular mathematics lesson. The checklist was designed to focus the researchers' and other observers' attention towards numerous teaching criteria and students' behavior that are related to the objective of Lesson Study. The lesson organization, the teachers' presentation, the teaching strategy used, the nature of teacher and students communication, assessment and students' behavior are the six areas that were observed during each research lesson. These 4 teachers were also interviewed and were required to complete a reflective journal after they have completed the Lesson Study project. The main aim of using the teachers' reflective journal was to have a clearer picture of the teacher-participants' experiences when conducting the Lesson Study processes, which include teachers' ideas, fears, mistakes, confusions and the reactions towards the experience that they have during the Lesson Study processes. Table 1 shows the demographic data of the 4 teachers from the 4 schools.

Table 1. Demographics of the 4 Teachers Involved in the Lesson Study Project

	Teacher A	Teacher B	Teacher C	Teacher D
School	SRS	SRJ	SRK	SRKT
Gender	Female	Female	Female	Female
Age-group	30-39	30-39	30-39	40-49
Highest level of education	Bachelor Degree	Bachelor Degree	Certificate of Education	Certificate of Education
No. of years as a Mathematics teacher	11-15 years	11-15 years	11-15 years	16-20 years

All 28 teachers from the 14 schools who were involved in the Lesson Study project were surveyed. The teachers' questionnaire was adapted and modified from three previous researches on Lesson Study and Learning Study, namely; the teachers' perceptions of the impact of the lesson study project upon their knowledge and their learning by White and Southwell (2003), 'The Learning Study – A Framework for Enhancing School-University Collaboration that Focuses Upon Individual Lessons' by Ling (2008), and by Fernandez (2005) entitled Exploring 'Lesson Study' in Teacher Preparation. The demographic information of the 28 teachers is presented in Table 2.

Table 2. Teachers Demographics

Description		Group 1 (N=8)	Group 2 (n=10)	Group 3 (N=10)
Gender	Male	0	1	4
	Female	8	9	6
Age	18-25	1	3	1
	26-35	2	7	8
	36-45	5	0	1

	46 and above	0	0	0
Highest Qualification	Certificate or Diploma	4	5	6
	Bachelor Degree	4	5	4
	Masters' Degree	0	0	0
Number of years as a Mathematics teacher	0-5 years	1	7	4
	6-10 years	4	2	5
	11-15 years	3	1	1
	16 years and above	0	0	0

RESULTS

Classroom Observation Checklist Analysis

To investigate whether the teachers' instructions were improving between the four 'cycles' of lesson study, a one-way ANOVA was used to analyze the differences of the four teachers' 'performance' and teaching based on the 'evaluation' and 'measurement' by observers using the classroom observation checklist. Table 3 shows the 4 teachers performance based on the mean scores of the observation checklist. It shows that there were substantial improvements in the mean score of instructions as the lesson cycles were progressing from Teacher A to Teacher B and to Teacher C. However, there was a decline of mean score of the instructions between Teacher C (M=108.56, SD=8.017) and Teacher D (M=101.08, SD=19.280).

Table 3. Descriptive One-way ANOVA for the 4 Teachers

					95% Confidence Interval for Mean			
	N	Mean	SD	Std. Error	Lower Bound	Upper Bound	Min	Max
Teacher A	15	94.80	11.602	2.996	88.38	101.22	74	116
Teacher B	8	105.00	11.084	3.919	95.73	114.27	93	122
Teacher C	9	108.56	8.017	2.672	102.39	114.72	100	126
Teacher D	12	101.08	19.280	5.566	88.83	113.33	72	126
Total	44	101.18	14.113	2.128	96.89	105.47	72	126

Questionnaire Analysis

A descriptive statistical data on teachers' perception of the impact of lesson study on 8 aspects of their development, as represented in section 4 of the teachers' questionnaire, was used to give a holistic and broad view of the impact of lesson study on the teachers' instructions. On the teachers' questionnaire, the teachers were asked to provide a rating for each item. The ratings were (1) no impact, (2) little impact, (3) moderate impact and (4) large impact. Table 4 shows the teachers' mean scores on every item in section 4 of the questionnaire.

Table 4. Descriptive Statistical Data of Teachers' Perception on the Impact of Lesson Study

Descriptive Statistics	N	Minimum	Maximum	Mean	Std. Deviation
Your professional development	28	2	4	3.43	.690
Your teaching skills	28	2	4	3.46	.693
Your self-confidence/self esteem	28	1	4	3.25	.844
Classroom management skills and techniques	28	1	4	3.21	.738
Students' assessment practices	28	1	4	3.32	.772
Questioning skills and techniques	28	2	4	3.57	.573
Content knowledge and understanding	28	1	4	3.29	.763
Knowledge and understanding of instructional practices	28	1	4	3.39	.737

Note: Valid N (list wise) = 28

Results from Table 4 suggests that the largest impact of lesson study was on the teachers' questioning skills and techniques (M=3.57, SD=0.573). The differences of the means of each items was not much and all items have the mean score of above 3 which indicates that lesson study have better than moderate impact on all 8 aspects of teachers' development. Positive impact on each of the 8 aspects of teachers' development can and may have positive impact on teachers' instructional practices. It can be concluded, from the entries above, that teachers' instructional practices may have been improved as a results of positive development of the 8 items above.

Qualitative Insights into the Impact of Lesson Study on Teachers' Instruction

Based on teachers' responses from the interviews and their journals, evidences suggest lesson study did have an impact on teachers' instructions and these are presented in the following areas.

The Development of Knowledge of Instructions

It was found that meaningful discussion about instructions between teachers and knowledgeable others has a positive impact on teachers' learning and hence to the improvement of their instructional practices. The following interview excerpt is consistent with the 'themes' of discussion above:

> *They (other group members) asked me how would I explain to students…what would I use to compare between example 3/4 and 3/8. Same numerator but different denominator... I mentioned that I'm going to use fraction chart to show which fraction is bigger. (Teacher A)*

The Development of Capacity to Observe Students

In lesson study, ability to collect related data from observation of students' responses towards any components of the teaching of the research lesson i.e. the activities, is vital for teachers not only to assess and evaluate the lesson holistically, but also it's a prerequisite for teachers to revise their lesson plan for the next research lesson. In one of the interview session, Teacher A identified and explained the benefits of observing students' learning in the research lesson:

> *For me, it is beneficial for teachers, in the first and second research lessons, we can already spot the pupils' problems and weaknesses in learning the topic. We can spot who are high achiever, talk well and do well. It teaches us to observe students…now it's very easy to observe them. (Teacher A)*

The Development of Teachers' Belief of Efficacy

It was found most teachers had developed a sense of efficacy; the beliefs that have changed in instructions can affect students' learning. The following responses illustrate that the sense of efficacy amongst teachers and students' learning had changed as a result of alterations in teaching methods:

- *Pupils' learning did change. It allowed them to think by themselves and they expressed their opinions and feelings of their work. (Teacher A's journal)*
- *I changed my teaching methods and affected my pupils' way of learning. They are more responsive, actively involved, communicate and think. (Teachers' D journal)*

CONCLUSION

From the analyses of all the research instruments, four pathways were identified that may lead to the improvement of teachers' instructions during the Lesson Study project.

1. Lesson plan development had broadened teachers' content and pedagogical knowledge.
2. Observing students' learning during the teaching of the research lessons helped the teachers' to be more conscious and sensitive towards students' learning needs and difficulties, and made them more critical in choosing the appropriate and most suitable activities in the lessons.
3. The development of teachers' self-confidence, teaching skills, questioning skills and classroom management skills during the process of teaching research lessons.
4. Comments and feedbacks from peers and the 'knowledgeable others' made them more aware of their weaknesses and strengths of their own teaching.

From this study, the teachers stated that they have gained a lot by observing students' learning during the teaching of the research lesson. Teachers indicated that by observing students' learning during the teaching of research lessons, they have developed a sense of consciousness and sensitivities towards students' learning needs and difficulties. It was also observed that the teachers' self confidence, teaching skills, questioning skills and classroom management skills were largely impacted during the process of teaching the research lesson. Furthermore, the teachers have built their courage to be able to 'perform' in front of peers and 'knowledgeable others'. From the experience of being observed, these teachers have developed a sense of confidence and may lead to positive effects in their subsequent teachings, classroom management and questioning skills.

Finally, the unique features of the reflective stages of Lesson Study helped teachers to assess their general weaknesses and strengths of their own teaching. These comments and feedbacks on students' learning and on their teaching in general were the key ingredient for teachers to realise their weaknesses and strengths in teaching the lessons.

RECOMMENDATIONS

The findings of this study suggested some useful implications for the use of a collaborative learning structure such as Lesson Study specifically in the Bruneian context. However, the qualitative data of the present study only involved the 4 schools. Other groups of the Lesson Study project that focused on different mathematics topics and different level of students were not explored qualitatively. Further researches are necessary to consider the impact of Lesson Study on Mathematics teachers concentrating on different Mathematics topics and different levels of students.

ÖZET: Bu araştırmada 2013 öğretim programına göre hazırlanmış ortaokul 5. Sınıf matematik ders kitabı incelenerek taşıması gereken özelliklere ne derece sahip olduğunun ortaya çıkarılması amaçlanmıştır. Bu amaçla literatür ve MEB'in belirlediği özellikler çerçevesinde biçimsel ve görsel tasarım, dil ve anlatım, içerik ve öğrenme alanları, konuların sunumu ve kazanımlar ile ders kitabının uyuşma yeterliği açısından ortaokul 5. Sınıf matematik ders kitabı incelenmiş ve 7 öğretmenle yarı yapılandırılmış mülakatlar gerçekleştirilmiştir. Araştırmanın sonuçları 5. Sınıf matematik ders kitabının genel olarak belirlenen niteliklere sahip olduğunu ortaya çıkarmıştır. Bunun yanında bazı özelliklerin bir kısmının göz ardı edildiği, bu nedenle bu açılardan geliştirilmesi gerektiği sonucuna varılmıştır. Bu bağlamda ön bilgilerin ortaya çıkarılmasına yönelik bazı eksikliklerin bulunduğu, teknoloji kullanımının yeterince dikkate alınmadığı, etkinliklerin azlığı ve ölçme değerlendirme sorularının üst düzey beceriler açısından geliştirilmesi gerektiği söylenebilir. Bu sonuçlardan yola çıkarak bazı önerilerde bulunulmuştur.

Anahtar sözcükler: 5. Sınıf matematik ders kitabı, öğretmen görüşü, ders kitabı inceleme

ABSTRACT: In this study the middle schools 5th grade mathematics textbook, prepared according to the 2013 curriculum, has been examined with the intention to reveal to what extent specialities are required. In terms of agreement adequacy the textbook was examined within the framework that is determined by literature and ministry of national education, which are formal and visual design, language and expression, content and learning areas, presentation of the subject and gains. In addition semi structured interviews were carried out with 7 teachers. The results of the research revealed that the 5th grade mathematics textbook possess the generally determined qualities. Also it was concluded that some qualities are ignored, which should be improved by these aspects. In this context it can be said that; there are shortcomings of revealing prior knowledge, using of technology is not sufficiently considered and the questions of assessment need to be improved in terms of high level skills. Based on these results some suggestions for improvements were made.

Key words: 5th mathematics textbook, teacher opinion, textbook examination

STUDENTS' ATTITUDES TOWARDS TECHNOLOGY EDUCATION IN FINLAND, ESTONIA AND ICELAND

ABSTRACT: This paper is based on a comparative study of craft and technology education curriculums and students' attitudes towards craft and technology in Finland, Estonia and Iceland. The study was undertaken by the Helsinki University, University of Tallinn and University of Iceland in the year 2012. Even though, the origins of craft education in Finland, Estonia and Iceland have many similarities, the Estonian and Icelandic national curriculum place greater emphasis on design and innovation, whereas the Finnish national curriculum focus on the development of students' personalities and gender issues. A quantitative survey was subsequently distributed to 493 school students in Finland, Estonia and Iceland. The questionnaire consisted of 14 questions, which aimed to ascertain students' attitudes towards craft and technology. The survey showed substantial differences in students' attitudes towards craft and technology education in the three countries. In addition, significant statistical differences were found between boys and girls. These differences may be explained by differences in the national curriculums and the different pedagogical traditions. However, these findings need to be examined further through research.

Key words: attitudes towards technology, technology education, handicraft, pedagogical traditions

INTRODUCTION

Technology is determined and guided by human emotions, motivations, values, and personal qualities. Thus the development of technology in society is dependent on citizens' attitudes towards technology, technological will to participate in and in humans' technological decisions. In this study we are trying to find out if there are differences in these attitudes between students in different countries.

The general aim of Finnish Craft and Technology education is to increase students' self-esteem by developing their skills through enjoyable craft activities; it also aims to increase students' understanding of the various manufacturing processes and the use of different materials in craft. Furthermore, the subject aims to encourage students to make their own decisions in designing, allowing them to assess their ideas and products. Students' practical work is product orientated and based on experimentation, in accordance with the development of their personality. The role of the teacher is to guide students' work in a systematic manner. They must encourage pupils' independence, the growth of their creative skills through problem-based learning and the development of technical literacy. Finnish handicraft traditions are also of importance throughout the whole curriculum (Framework Curriculum Guidelines, 2004). Analysing the Finnish curricula in a long term, a smooth development can be noted. However, the Finnish curriculum has chosen to focus on the development of students' personalities and gender equality rather than technological development.

Subjects taught in the domain of technology in Estonia enable students to acquire the mentality, ideals, and values inherent to the contemporary society. They learn to understand the options they have in solving tasks or creating new products; find and combine various environmentally sustainable techniques. In lessons, students study and analyse phenomena and situations, as well as use various sources of information, integrate creative thinking and manual activity. As a part of the study process, students generate ideas, plan, model, and prepare objects/products and learn how to present these. Students' initiative, entrepreneurial spirit, and creativity are supported and they learn to appreciate an economic and healthy life style. Learning takes place in a positive environment, where students' diligence and development are recognized in every way. Teaching develops their skills in working and cooperating, as well as their critical thinking and the ability to analyse and evaluate. (Ainevaldkond Tehnoloogia, 2011). In long term, the political situation in Estonia has considerably changed and thus there have been fundamental changes also in education, including the syllabi of craft and technology education. Nevertheless, the syllabi of the technological domain have been drawn up as a result of the developmental work in the last decades.

The present national curriculum for the subject of Craft in Iceland places an emphasis on individual-based learning. It also gives teachers the freedom to run an independent curriculum in school, which is based on the national curriculum. As in Finland, the subject is product based and students learn via traditional craft activities. Students' work is based on craft tradition rather than technology; however, innovation and idea generation are an important part of the Icelandic curriculum. There are also the aims of developing students' manual skills, instructing them in the manufacturing processes and training them to organise their own work. The national curriculum also incorporates outdoor education, working with green wood and sustainable design. When the national curriculum was revised in 2007, it was decided to minimise the technological part of the Design and Craft curriculum and the original Sloyd values were once again included in the curriculum. The curriculum moved away from the manufacturing process (i.e., mass production) and towards handicraft-based processes. However, innovation and idea generation are still an important part of the curriculum (Olafsson & Thorsteinsson, 2010).

As seen above, there are many similarities between the national curriculums in Finland, Estonia and Iceland; however there are also some differences. In the following sections, the authors will attempt to highlight these differences and will try to ascertain whether there are any differences in these three countries, with regards to students' attitudes towards craft and technology. The research questions were:

1. Are there differences in students' attitudes towards Craft and Technology in Finland, Estonia and Iceland
2. Are there differences in students' attitudes towards Craft and Technology between boys and girls?

METHODS

The aim of the empirical aspect of the research was to answer the question: Is there a difference in students' attitudes towards craft and technology in Finland, Estonia and Iceland? Dyrenfurth (1990) and Layton (1994) referred to attitudes to technology education using the concept of 'technological will'. According to these authors, technology is determined and guided by human emotions, motivation, values and personal qualities. Thus, the development of technology is dependent on the students' will to take part in lessons and on the impact of their technological decisions.

In order to evaluate students' attitudes towards craft and technology in Finland, Estonia and Iceland, a questionnaire was devised, consisting of 14 statements. For each Likert-type item, there were five options, from 'Strongly Disagree' (= 1) to 'Strongly Agree' (= 5). The questionnaire featured some questions about students' backgrounds, in addition to questions that attempted to gauge students' motivation and success, in terms of craft and technology education classes. The questionnaire was based on the PATT standards (Pupils Attitudes Towards Technology), which were designed and validated by Raat & de Vries (1986) and van de Velde (1992). Based on their work different factors were found: interest, role models, effects of technology, complexity of technology, school and technology, career plans. From this point of view the internal consistency of the questionnaire was relevant. 493 students from Finland, Estonia and Iceland took part in the survey. The age of the student-respondents was 11-13 years.

RESULTS

Some differences in students' attitudes towards craft and technology were found in the three countries. The average response in our Likert-style (1-5) questionnaire to all 14 items was among Finnish girls 3.37, Estonian girls 3.55 and Icelandic girls 3.67. Significant statistical difference was found between boys and girls, whereas the average response of boys was in Finland 3.78, Estonia 4.00 and in Iceland 3.87. Estonian boys had the most positive attitude towards technology, whereas the lowest attitude was found among Finnish girls. The difference between boys and girls was definitely the smallest in Iceland. The averages for each statement are listed in the table 1 below.

Table 1. Average (Mean) values for each statement, with regards to the measurement of students' attitudes towards craft and technology in Finland, Estonia and Iceland

Statement number		Mean FINLAND	Mean ESTONIA	Mean ICELAND
1. Is interested in engineering and the phenomena related to it	girls	3.45	3.32	3.55
	boys	4.30	4.40	4.40
2. Spends a lot of time with engineering-related hobby activities	girls	2.71	2.02	2.82
	boys	3.06	3.44	3.58
3. Newspapers, magazines, and articles from the field of engineering are interesting	girls	2.35	2.87	2.82
	boys	2.83	3.50	3.00
4. Understanding engineering-related phenomena will be beneficial in the future	girls	3.45	3.59	3.59
	boys	3.95	4.43	3.95
5. Understanding engineering-related phenomena requires a special wit	girls	3.55	3.50	3.16
	boys	3.60	4.16	3.70
6. Both boys and girls may understand engineering-related phenomena	girls	4.62	4.42	4.82
	boys	4.29	4.22	4.60
7. The mankind has rather benefited than sustained damage from the development of engineering	girls	3.85	3.89	3.98
	boys	4.25	4.29	4.23
8. In the future would like to choose a speciality or a profession related to engineering	girls	2.40	2.40	2.55
	boys	3.26	3.39	3.25
9. Parents have a lot of engineering-related hobbies	girls	2.98	2.61	3.07
	boys	3.09	2.96	2.88
10. The atmosphere in the Technology Education / Handicraft lessons is pleasant and inspiring	girls	3.56	4.32	4.07
	boys	4.24	4.11	4.03
11. Technology Education / Handicraft lessons considerably contribute to the development of manual skills	girls	3.85	4.56	4.66
	boys	4.25	4.56	4.50
12. Technology Education / Handicraft lessons develop logical thinking	girls	3.60	4.12	3.89
	boys	3.84	4.24	3.93
13. Has been successful in Technology Education / Handicraft s lessons	girls	3.49	3.99	4.55
	boys	3.80	3.93	4.25
14. Technology Education / Handicraft lessons will be beneficial in the future	girls	3.51	4.09	3.82
	boys	3.90	4.39	3.88
All 14 items	girls	3.37	3.55	3.67
	boys	3.78	4.00	3.87

The highest average values in the whole questionnaire were found in statement number:

- 6. Both boys and girls may understand engineering-related phenomena (Icelandic girls 4.82, Finnish girls 4.62, Icelandic boys 4.60).
- 11. Technology Education / Handicraft lessons considerably contribute to the development of manual skills (Icelandic boys 4.66, Estonian boys and girls 4.56, Icelandic girls 4.50).
- 1. Is interested in engineering and the phenomena related to it (Estonian and Icelandic boys 4.40, Finnish boys 4.30).
- 7. The mankind has rather benefited than sustained damage from the development of engineering (Estonian boys 4.29, Finnish boys 4.25, Icelandic boys 4.23).

The lowest values were in statement number:

- 8. In the future would like to choose a speciality or a profession related to engineering (Finnish and Estonian girls 2.40, Icelandic girls 2.55).
- 2. Spends a lot of time with engineering-related hobby activities (Estonian girls 2.02, Finnish girls 2.71, Icelandic girls 2.82).
- 3. Newspapers, magazines, and articles in the field of engineering are interesting (Finnish girls 2.35, Icelandic girls 2.82, Finnish boys 2.83,)

In addition, it was found a significant statistical difference ($p < 0.05$) between boys and girls in several items. Most remarkable differences between boys and girls were found in statement number:

- 1. Is interested in engineering and the phenomena related to it
- 8. In the future would like to choose a speciality or a profession related to engineering
- 2. Spends a lot of time with engineering-related hobby activities
- 3. Newspapers, magazines, and articles in the field of engineering are interesting
- 4. Understanding engineering-related phenomena will be beneficial in the future

CONCLUSIONS

Craft education in Finland, Estonia and Iceland originated over 140 years ago and was influenced by the Scandinavian sloyd pedagogy. In the beginning, the subjects largely focused on students copying artefacts, using a variety of handicraft tools: the purpose of this was to improve their' manual skills, rather than their thinking skills. Today, the focus is also on developing students' thinking skills, which enables them to work through various handicraft processes (from initial ideas to the final products). This work is based on the idea generation of students and is thus expected to increase their self-esteem and ingenuity.

Some differences in students' attitudes towards craft and technology were found in the three countries. Definitely, the smallest difference between boys and girls was found in Iceland. This finding corroborates with comparable results from Autio, Thorsteinsson and Olafsson (2012) which shows that Icelandic girls performed better attitudes than both Estonian and Finnish girls. Hence, Finnish and Estonian craft and technology education curriculum could also benefit from Icelandic system with two different subjects: art based textile education and innovation based technology education, compulsory for both boys and girls. This is an interesting finding as the Finnish curriculum has put large emphasis on gender equity since 1970, but still Finnish girls had the most negative attitude towards technology. Finnish girls seemed to be aware of the gender equity and their highly agree with the statement: both boys and girls may understand engineering-related phenomena. However, only a few girls are willing to challenge stereotypes about non-traditional careers for women, as it could be conducted from responses to the statement: in the future would like to choose a speciality or a profession related to engineering. In addition, only few girls seemed to have technological hobbies or had interest in technological articles. What's more in Finland the boys still want to choose technical craft studies and the girls' textiles. A practical solution to get both sexes to choose both subjects has not been found.

The Estonian boys' attitudes towards craft and technology were most positive. It indicates that the Estonian curriculum that includes two different craft subjects: the technologically based 'technology' and the art based 'handicraft and home economics is still a relatively suitable setup especially for boys. In addition, the innovation and technology part: technology in everyday life; design and technical drawing; materials and processing; home economics (study groups are exchanged); project works (girls and boys together) works fine for both boys and girls.

The critical side of the study is that the study group consisted only from 11-13 year-old students. Although students' attitudes are assumed to be rather stable during the school years (Arffman & Brunell, 1983; Bjerrum Nielsen & Rudberg, 1989), Autio, Thorsteinsson and Olafsson (2012) found that there was significant statistical difference between 11 and 13 year old Finnish girls in attitudes towards technology. Furthermore, no statistical difference was found between younger and older Finnish and Icelandic boys or between Icelandic younger and older girls.

Another critical point of the empirical part was the use of a relatively small sample of students. However, 493 students seemed to be enough as the results are consistent with previous studies (Autio, 1997; Autio, Thorsteinsson & Olafsson, 2012; Autio & Soobik, 2013). In addition, the questionnaire measures only students' attitude, not their absolute technological will which is shaped and guided by human emotions, motivation, values and personal qualities. The concept attitude is just a single one part of a larger concept, which is 'technological competence'. Attitude is a crucial part of the competence as it depends on technological knowledge and technological skills in real life situations.

The reasons behind the dissimilarities found between the three countries may be due to differences in the curriculums and in different pedagogical traditions. On the other hand, the political situation has considerably changed in Estonia and the motivation for further development seems to be ambitious also in education, including the syllabi of craft and technology education. However, further research is needed before the authors can reach their final conclusions.

Bu çalışma yan alanı matematik öğretmenliği olan fen bilgisi veya sınıf öğretmenliğinden matematik öğretmenliğine geçen öğretmenlerin matematik öğretimine yönelik görüşlerini belirlemek amacıyla yapılmıştır. Öğretmenlerin matematik eğitimi olgusunu araştırdığımız için çalışmada olgu bilim (fenomenoloji) araştırma deseni kullanılmıştır. Olgu bilim araştırma deseni derinlemesine bilgi sahibi olmadığımız olguları açığa çıkarmak amacıyla yapılmaktadır. Bu çalışmaya 5 öğretmen katılmıştır ve katılımcıların seçiminde amaçlı örnekleme yöntem türlerinden benzeşik örnekleme yöntemi kullanılmıştır. Öğretmenlerden üçü fen bilgisinden ikisi ise sınıf öğretmenliğinden matematik öğretmenliğine geçmiştir. Çalışmada veri toplamak amacıyla yarı yapılandırılmış görüşme formu kullanılmış ve görüşmeler ses kayıt cihazı ile toplanmıştır. Görüşmelerden sonra elde edilen bulgular tematik analiz kullanılarak çözümlenmiştir. Bu çalışma sonucunda fen bilgisinden geçiş yapan öğretmenlerin sınıf öğretmenlerine göre daha az sorun yaşadıkları özellikle alan bilgisinde kendilerini yeterli gördükleri ancak pedagojik alan bilgisinde özellikle de program bilgisinde yetersiz oldukları belirlenmiştir. Sınıf öğretmenlerinin ise kendilerini hem alan hem de pedagojik alan bilgisinde kendilerini yetersiz gördükleri sonucuna ulaşılmıştır.

Anahtar Kelimeler: Matematik öğretmenliği, matematik öğretimi

Bu çalışma yan alanı matematik öğretmenliği olan fen bilgisi veya sınıf öğretmenliğinden matematik öğretmenliğine geçen öğretmenlerin matematik öğretimine yönelik görüşlerini belirlemek amacıyla yapılmıştır. Öğretmenlerin matematik eğitimi olgusunu araştırdığımız için çalışmada olgu bilim (fenomenoloji) araştırma deseni kullanılmıştır. Olgu bilim araştırma deseni derinlemesine bilgi sahibi olmadığımız olguları açığa çıkarmak amacıyla yapılmaktadır. Bu çalışmaya 5 öğretmen katılmıştır ve katılımcıların seçiminde amaçlı örnekleme yöntem türlerinden benzeşik örnekleme yöntemi kullanılmıştır. Öğretmenlerden üçü fen bilgisinden ikisi ise sınıf öğretmenliğinden matematik öğretmenliğine geçmiştir. Çalışmada veri toplamak amacıyla yarı yapılandırılmış görüşme formu kullanılmış ve görüşmeler ses kayıt cihazı ile toplanmıştır. Görüşmelerden sonra elde edilen bulgular tematik analiz kullanılarak çözümlenmiştir. Bu çalışma sonucunda fen bilgisinden geçiş yapan öğretmenlerin sınıf öğretmenlerine göre daha az sorun yaşadıkları özellikle alan bilgisinde kendilerini yeterli gördükleri ancak pedagojik alan bilgisinde özellikle de program bilgisinde yetersiz oldukları belirlenmiştir. Sınıf öğretmenlerinin ise kendilerini hem alan hem de pedagojik alan bilgisinde kendilerini yetersiz gördükleri sonucuna

THE AWARENESS OF PRE-SERVİCE TEACHERS ABOUT LİVİNG THİNGS AS A FUNDAMENTAL CONCEPT ON TEACHİNG SOCİOSCİENTİFİC ISSUES

Adem TAŞDEMİR

Tezcan KARTAL

The pre-service teachers' acquisition levels are likely to have a direct effect on learning of students' concepts. Understanding the concepts in science and knowing the ways of concept learning and teaching provide invaluable knowledge and skills for teachers. Determining the students' levels of knowledge about the concepts and their misconceptions -if there are any - is very important. The opinions of pre-service teachers related to concept of living things and the relationship between independent variables were researched in this study. 384 pre-service teachers in Faculty of Education were taken as the study group which was composed randomly. To collect the data of this descriptive study, public survey was developed and performed by the researcher. As a result, pre-service teacher had misconceptions about living things. Pre-service teachers perceived animals as living things but they had difficulties to perceive plants as living. They were also observed that they feed living things for some reasons those are; interest, getting of stress and other family members' desire. On the other hand, training students weren't member of any organizations that try to protect living.

Keywords: Living things, living conscious, pre-service teachers.

PERCEPTIONS OF PRE-SERVICE TEACHERS ABOUT INSTRUCTIONAL TECHNOLOGY: THE FINDINGS OF A QUALITATIVE STUDY

Jacquelıne T. MCDONNOUGH

Adem TAŞDEMİR

The use of technology is actively situated in all levels of society in line with the requirements of today's highly technological world. Rapid changes in technology have necessitated new approaches in education. Many research findings indicated that using instructional technology (IT)of in-service and pre-service teachers is significantly limited. This study aimed to investigate the perceptions of pre-service teachers about IT as it relates to their current and future use. Determining of pre-service teachers perception about IT could be provide evidence in order to more clearly identify the barriers. In this study, qualitative data were collected in two different ways. While the focus interview was used to describe pre-service teachers' perceptions in the first stage, researchers secondly used metaphor technique to identify their perceptions from a different perspective. The study sample was comprised of selected students from a graduate education program in a mid-sized Mid-Atlantic city in the United States with using a homogeneous sampling method. The study sample included 10 pre-service teachers for the focus group interview and 43 different pre-service teachers for the metaphor. The Results of study showed that although pre-service teachers had positive perceptions with using of IT in general, some of them had concerns about it. For example, some pre-service teachers directly focused on negative experiences with technology in their courses. They had a negative attitude about their instructors' technology use. In addition, most of them emphasized inefficiencies and limitations with online courses. But, both interview and metaphors showed that pre-service teachers mostly perceived IT as facilitating the learning and teaching process, reinforcement for teaching, and helped students learn. Also, pre-service teachers wanted to enroll in IT courses to contribute the teaching career, to become a better.

THE ROLE OF BELIFS ON UNIVERSITY MATHEMATICS TEACHERS' PROFESSIONAL KNOWLEDGE DEVELOPMENT

Azimehsadat KHAKBAZ
azimehkhakbaz@ymail.com

This study aimed to explain the role of beliefs in university mathematics teachers' professional knowledge development. To this aim, a qualitative research was done. Data were gathered through phenomenological interviews with 27 mathematics university teachers in Iran and analyzed by coding and categorizing method. Analyzing data showed an explanation which included three main themes about beliefs: beliefs about the nature of mathematics, beliefs about mathematics teaching and learning and beliefs about professional teaching knowledge development. The first theme consists of three directions: mathematics as an abstract system, mathematics as tools and mathematics as a cultural coherent network. The second theme consists of two approaches: transmission of mathematics content and nurture of mathematics logic. The last theme included four orientations through professional teaching knowledge: inborn, experience without authority, skills and reflections.

Keywords: professional knowledge development, mathematics education, beliefs, higher education

INTRODUCTION

Professional knowledge development of teachers is an important subject in mathematics education research. Although we could find many research about this subject in school teaching, little is known in university teaching. This is because the context of school and university is completely different. University teachers or professors are hired and promoted because of their research success. They do not receive a curriculum about teaching knowledge development (Brogt, 2009). It seems that teaching in higher education is under the shadow of research (D' Andrea & Gosling, 2005). Meanwhile, mathematics university teachers or professors have a big influence on culture of mathematics education since they would teach mathematics to future mathematics teachers (Burton, 2004). Moreover, not only mathematics students in university level, but also many students in other disciplines are learning mathematics and all these persons would be parents, teachers and members of society who will influence on mathematics education for future generation. Therefore, mathematics professors' teaching knowledge development is highly influential but neglected.

On the other hand, to study in context of professional teaching knowledge, as Ernest (1989) asserted: “knowledge is important, but it alone is not enough to account for the differences between mathematics teachers” (p. 99). Nowadays, research in field of teachers' belief in mathematics education are more interesting, but there is little known about mathematics university teachers or professors' beliefs. They are mainly mathematicians so it seems we could not simply generalized research findings about mathematics teachers' belief from school level to university level. Therefore, the main question of this study is to explain how do different beliefs of university mathematics teachers influence professional teaching knowledge development?

To answer this question, it was essential to first clear our theoretical framework since both main aspects of this study (professional teaching knowledge development and beliefs) have rich literature. Many models and categorizations are known for both, each of which concentrate on these concepts through a different lens. This research tried to focus on professional teaching knowledge development through Shulman's (1986) introduction about pedagogical content knowledge (PCK) and also on beliefs through Ernest' s explanation (1989) which would be discussed more in the following sections of this paper.

Pedagogical content knowledge (PCK)

Pedagogical content knowledge first has introduced by Shulman (1985) as a “missing paradigm” in teaching research. In his next paper, Shulman (1986) divides content knowledge in to three parts: subject matter knowledge, pedagogical content knowledge and curricular knowledge. He explained that pedagogical content knowledge is subject matter specific for teaching. Afterwards he described PCK as a special amalgam of content and pedagogy that is uniquely the province of teachers, their own special form of professional understanding (Shulman, 1987)

The term of PCK is inherit Dewey's(1916-1964) that teachers must learn "psychologize" their subject matter for teaching to rethink disciplinary concepts and topics to make them more accessible to students (Counts, 1999).
After introduction of PCK many researchers tried to work on that concepts. One of the most influential researchers was Grossman (1988) who introduced two overarching categories: General and Specific PCK. These categories were later modified by Fernandez-Balboa & Stiehl (1995) to generic and specific. Specific PCK is particular to instruction of a specific subject or content area; and Generic PCK is common to instruction all content areas or subjects. Generic PCK refers to the fact that every discipline in higher education could have a concept of PCK. It means mathematics as a discipline has its PCK and surely this Generic PCK consist of Specific PCK, emerged from different subjects and content area.

Grossman (1990) also described four categories embodied in PCK:

- Knowledge about the purposes for teaching a given subject matter (subject matter issue);
- Knowledge about the students' understandings about the content (students issue);
- Knowledge about the order in which subject matter should be presented (curricular issue);
- Knowledge about the instructional strategies useful for teaching content (pedagogical issue).

Counts (1999) asserted that in the development of PCK, the concept of formal and practical knowledge are well documented. Formal knowledge according to Lenze (1995) might be constructed in instructional workshop, graduate pedagogy course or prior undergraduate teacher education program. Practical knowledge comes from actual teaching in classroom (Grossman,1990).
Grossman (1988) suggest at least four possible sources for PCK which some of them caused formal knowledge development and the others resulted in practical knowledge development:

- Apprenticeship of observation: refers to observation of the class as a student (Practical Knowledge)
- Disciplinary knowledge: refers to knowledge of subject matter being taught as well as related information (Formal Knowledge)
- Professional coursework: can help teachers make necessary translation from disciplinary understanding of subject matter to a more pedagogical understanding of subject matter (Formal Knowledge)
- Teaching experiences: provide the opportunity for future teachers to test the knowledge they have acquired from other sources (Practical Knowledge).

On the other hand as PCK is an academic concept for explanation of teaching, it has some limitations. Studies about PCK revealed that PCK does not consider about beliefs and values and it seems values are "missing part of the missing paradigm" (Gudmundsdottir, 1990). Shulman(1992) asserted that he forgot that important part and he referred to Fenstermacher (1992) who believed that when we talk about teaching, we should consider both manner and method.

Teachers' beliefs

Research on teachers' beliefs, emotions, attitudes, and affect has vastly increased during the last two decades. These terms, however, are not used in a uniform way in mathematics education. As Philipp (2007) defined beliefs are described as "Psychologically held understandings, premises, or propositions about the world that are thought to be true… Beliefs, unlike knowledge, may be held with various degrees of conviction" (p. 259). One of the main basic models about teachers' beliefs belongs to Ernest (1989) who explained the key belief components of the mathematics teacher are the teacher's:

- View or conception of the nature of mathematics;
- Model or view of the of the nature of mathematics teaching;
- Model or view of the process of learning mathematics.

The teacher's conception of the nature of mathematics, is his or her belief system concerning the nature of mathematics as a whole. Three kinds of beliefs are distinguished through Ernest (1989) categorization which are rooted in the philosophy of mathematics and science.

- Instrumentalist view: that mathematics is an accumulation of facts, rules and skills to be used in the pursuance of some external end. Thus mathematics is a set of unrelated but utilitarian rules and facts.
- Platonist view of mathematics as a static but unified body of certain knowledge. Mathematics is discovered, not created.
- Problem solving view of mathematics as a dynamic, continually expanding field of human creation and invention, a cultural product. Mathematics is a process of enquiry and coming to know, not a finished product, for its results remain open to revision.

The model of teaching mathematics is the teacher's conception of the type and range of teaching roles, actions and classroom activities associated with the teaching of mathematics. Many contributing constructs can be specified including unique versus multiple approaches to tasks, and individual versus cooperative teaching approaches. Three different models which can be specified through the teacher's role and intended outcome of instruction are:

- Instructors: skills mastery with correct performance;
- Explainer: conceptual understanding with unified knowledge;
- Facilitator: confident problem posing and solving.

The use of curricular materials in mathematics is also of central, importance in a model of teaching. Three patterns of use are:

- The strict following of a text or scheme;
- Modification of the textbook approach, enriched with additional problems and activities;
- Teacher or school construction of the mathematics curriculum.

Closely associated with the above is the teacher's mental model of the learning of mathematics. This consists of the teacher's view of the process of learning mathematics, what behaviors and mental activities are involved on the part of the learner, and what constitute appropriate and prototypical learning activities. Two of the key constructs for these models are: learning as active construction, as opposed to the passive reception of knowledge; the development of autonomy and child interests in mathematics, versus a view of the learner as submissive and compliant. Using these key constructs the following simplified models can be sketched, based on the child's:

- compliant behavior and mastery of skills model;
- reception of knowledge model;
- active construction of understanding model;
- exploration and autonomous pursuit of own interests model.

METHODS

This research has done in qualitative research paradigm. Data gathered mainly through semi structured phenomenological interviews about experiences of teaching and learning mathematics in university. Respondents were 19 PhD students and 8 professors in mathematics discipline who were selected from 2 universities in Iran. They were selected in pure and applied mathematics and also mathematics education. They were on a experience spectrum from juniors to seniors both in students and professors. The process of selection of respondents and gathering data from them was continued until the saturation has happened in findings from data analysis.

Data were analyzed through coding and making theme as Creswell (2008) has described in his book. The analysis had two levels. In the first level, themes which explained PCK for teaching mathematics in universities were found. On the other hand, it was found out that respondents used different resources and methods to develop their PCK for teaching mathematics at university. The second level of analysis tried to find out how beliefs of respondents influenced first level and caused different respondents showed different elements of PCK and develop it through special way by special methods and resources. The second level of analysis is what we used to answer the question of the present paper and would be explained in the following section.

RESULTS AND FINDINGS

Data analysis showed there are three main categorizes beliefs which influence on university teachers' professional teaching knowledge development:

- Beliefs about the nature of mathematics;
- Beliefs about mathematics teaching and learning;
- Beliefs about professional teaching knowledge development.

Beliefs about the nature of mathematics

One of the essential beliefs influences PCK development was beliefs about the nature of mathematics. This theme itself consists of three directions:
Mathematics as an abstract system: In this direction, existed participants who look at mathematics as an external abstract result. One of them explained:

> It needs patience to work with mathematics because we are working in a world which is not real…nothing is real in this world… everything is imagination and solitary. We want to survive in this world and try to make relationship between elements of this world.

The other one said:

> We do not have pure mathematics and applied mathematics. Mathematics is just a discipline of abstract world and some parts of this world have applications for other worlds or real world.

The persons who are in this direction, usually teach mathematics as an abstract text. They engage students with theorem and proofs.

Mathematics as tools: In contrary with the above direction, there are university teachers who believed mathematics as a tool in the life or other sciences. One of the respondents explained:

> Mathematics is alive because of its applications. If you do not have any application for a subject in mathematics, it will be disappear soon. So it is important for students to know the application of a subject which you intended to teach them.

The teachers in this direction usually engage their students with explanation of applications of a subject in mathematics, in real world or other sciences. For example, teachers who teach in economy or accounting discipline would try to explain the applications of mathematics in economy or accounting.

Mathematics as a cultural coherent network: Some of the respondents of this research who were in minority believed mathematics as a cultural coherent network. One of them said:

In my point of view, mathematics as something which some people are doing it, has its own history. Each mathematical concept has a humanistic conceptual history.

The people in this direction teach mathematics through its history and evolution of concepts. One of the participants explained:

> I believe mathematics as a discipline with connected concepts. I believe in applications of mathematics concepts but not in other sciences or real world, but in mathematics itself.

Beliefs about mathematics teaching and learning

The second kinds of beliefs which is founded is beliefs about mathematics teaching and learning. This theme consists of two main approaches:

Transmission of mathematics content: In this approach mathematics professor put his main aim of education based on transmission of mathematics content. He thinks his duty is to transfer and his students duty is to receive mathematical concept. In this approach, content is based and learners are observers. However, observer may be active or inactive and professor may just transfer the content in a solid atmosphere or motivate students to learn that, but priority is with covering and conveying content. One of the participants in this research explained:

I made a plan for covering content during the semester. Each session I know the limitation of my teaching. Then I try to make my teaching interesting by cooperating students in teaching, for example put some parts of teaching for them to make conference or make some problems to solve.

The other one said:
Students should know that you know more than them. If they know that, they would listen to your teaching and you could finish the rubric.

As explained above the first professor makes students active while second professor makes them inactive, but both of them believe in covering the content.

Nurture of mathematics logic: In contrary with the following approach, professors in this approach believed the aim of mathematics education is to nurture mathematics logic. One of the participants of this research explained:

> My aim of teaching mathematics is to help students to learn logical thinking and problem solving. This is more important than learning mathematical concepts. If they learn logical thinking and problem solving, they will learn all mathematical concepts….learning the soul of mathematics is important, I think.

In this approach we have found two other trends: those professors who implement their role as a responsible guide which have the more responsibility and try to cooperate students with them and those professors who implement as facilitators of learning who put the responsibility of learning mainly on students shoulders, trust and let them to move in the way of learning and they would follow them to help if students would need.

One of the professors who has the responsible guide role in teaching and learning process said:

> When I am teaching, I always ask my students what they think now? What is the next step? I want to make them to think. It is better than I just teach some realities without making opportunities for them to think and reflect.

The other participant who has the facilitator role explained:

> I start my teaching with the place that students are and they are the person who lead the process of teaching. I have in my mind the heart of subject of a course but they are really students who define the limitations of that and I just try to help them to make the details of each mathematical concept.

Beliefs about professional teaching knowledge development

The last category of beliefs in this research refers to beliefs about professional teaching knowledge development. Four orientations under this category are found:

Professional teaching knowledge as inborn: Some of the participants of this research believed that good teachers are inborn good teachers or they have talent of good teaching. They do not think that teachers could develop their teaching knowledge.

Professional teaching knowledge as experience without authority: In contrary with the above group, some of the respondents of this research referred that teaching knowledge could be developed but through experience. They believed that experienced teachers could teach better than new teachers and new teachers should wait to the time that they would be experienced and that time they are good teachers.

Professional teaching knowledge as skills: Majority of the participants of this research believed that they could be good teachers by learning how to teach through external resources like books, workshops, courses, receiving advice of good teachers and by experiencing. They think teaching is kind of skill that they could obtain that through some procedures.

Professional teaching knowledge as reflections: Minority of participant of this research believed development of teaching knowledge as a reflective activity. Similar to the previous group, they think knowledge of teaching could be developed, but it is not something as skills. They think teachers would create this kind of knowledge through reflection before, in and on their action.

CONCLUSION

PCK is an interdisciplinary knowledge in nature which integrate from two main elements: content (hear mathematics) and pedagogy. Therefore beliefs about mathematics and pedagogy of mathematics influence PCK. On the other hand, we wanted to study in context PCK development so beliefs about professional teaching knowledge itself would be influential. Through analysis of data in this study, it is concluded that different beliefs of university mathematics teachers influenced their PCK development as explained. Therefore PCK development is not a value-free concept and this study has provided an explanation for this claim.

RECOMMENDATION

Through results of this study, theoretical and practical recommendations is made. Practically, it is recommended to consider beliefs of mathematics professors in designing curriculum for PCK development in mathematics. Theoretically, it is recommended to find out beliefs of mathematics university teachers in other cultural contexts and try to enrich the theoretical categorization.

TURKISH CHEMISTRY TEACHERS' VIEWS ABOUT SECONDARY SCHOOL CHEMISTRY CURRICULUM: A PERSPECTIVE FROM ENVIRONMENTAL EDUCATION

Ömer Faruk İÇÖZ
Middle East Technical University
faruk.icoz@metu.edu.tr

ABSTRACT: Teachers' views about environmental education (EE) have been regarded as one of the most important concerns in education for sustainability. In secondary school chemistry curriculum, there are several subjects about EE embedded in the chemistry subjects in Turkey. This study explores three chemistry teachers' views about to what extent the subjects related with EE should be integrated into secondary school chemistry curriculum at an individual level of analysis. The findings of the study indicate that there is a consensus among teachers on the inadequacy of secondary school chemistry curriculum for providing students an effective EE. However, there is an inconsiderable divergence among the teachers' views about the placement of subjects about EE in chemistry curriculum and the integration of subjects about EE into the curriculum. Through the results of the study, policy makers and curriculum developers would gain a comprehensive insight about deficiencies in chemistry curriculum for EE from the point of view of chemistry teachers and they would have opportunity to realize the ways for the remedy of this deficiency.

Key words: environmental education, chemistry curriculum

CONTEXT

It is clear for all mankind that the decline in the vitality of the planet is almost everywhere, which mainly results from population growth, industrial discharges, consumption patterns, solid wastes disposal, and domestic wastewater discharges, etc. However, we still have the chance to recover this tendency in declining through taking the necessary precautions before it is too late. Therefore, EE takes its place as one of the key means of reacting in the face of environmental threats (Teksoz, Sahin, & Ertepinar, 2010).

Environmental education can be defined in a general view as the education process dealing with humankind's relationship with the natural and human-made surroundings, and includes the relation of population, pollution, resource allocation and depletion, conservation, transportation, technology, economic impact and urban and rural planning to the total human environment (Peterson, 2007). Thus, the concept EE involves knowledge and comprehension about ecological, social and political processes and their influences (Bartuseviča, Cēdere, & Andersone, 2004). In Tbilisi Declaration which was created in the first Intergovernmental Conference on Environmental Education, the goals of EE stated as (1) to foster clear awareness of, and concern about, economic, social, political, and ecological, interdependence in urban and rural areas; (2) to provide every person with opportunities to acquire the knowledge, values, attitudes, commitment, and skills needed to protect and improve the environment; (3) to create new patterns of behavior of individuals, groups, and society as a whole towards the environment (UNESCO, 1977). The Tbilisi Declaration has been used as a grounding document to outline what EE is and how it should be taught in various contexts.

There are many advantageous aspects of EE. The teachers perceived that EE was not only a way to teach about the environment, but also an innovative way to achieve basic educational goals like reading and student skills Besides becoming more aware of the environment and environmental issues, students would learn to care about the environment and appreciate nature, students would learn of their impact on the environment, and students would realize their responsibility for the earth (Middlestadt, Ledsky, & Sanchack, 1999).

Environmental education has a wide extent ranging from environmental pollution (water pollution, air pollution, soil pollution, noise pollution, solid wastes, and hazardous wastes), global warming (climate change), environmental cycles (C, H_2O and N_2 cycles), biodiversity, energy usage, health education, to resolution of environmental problems (recycling, renewable energy sources, population and environment) (Teksoz, Sahin, & Ertepinar, 2010). EE subjects are interdisciplinary in nature, thus the extent to which discipline-oriented teachers are able to deal with interdisciplinary subjects is the limiting factor for introducing environmental issues as an integral part of the science curriculum (Gough, 2002).The issues within the scope of EE should be integrated into the curriculum of all the natural sciences because the environmental issues are not separate from problems of chemistry, physics and biology (Bartuseviča, Cēdere, & Andersone, 2004). In addition, the issues related to

EE should be in the core of science curriculum. According to Edelson (2007), the reasons why the issues related to EE should be included in the core of secondary school science curriculum are (i) they are important for students and society; (ii) they are representative of contemporary science in ways that the disciplinary courses that currently comprise the core curriculum are not; (iii) they create an opportunity for students to experience an applied science; (iv) they are particularly engaging context for learning fundamental science. Implementation of EE in secondary school depends on both school curricula and teachers` environmental competencies.

Integrating the issues related EE into secondary school chemistry curriculum would be an effective means in order to come over the problem of discrepancy between the chemistry curriculum and the information necessary for life in modern society and to gain students a meaningful mode of chemical thinking and understanding attitude towards environmental processes and skills which are useful for practical life (Feiarebend, Jokmin, & Eilks, 2010). Therefore, in secondary school chemistry curriculum, an approach that establishes a joint between chemistry and environmental issues should be adopted by curriculum designers. Moreover, many researchers have suggested that teaching chemistry in the context of real-world issues as a way that motivates and interests students (Hofstein, Eilks, & Bybee, 2011; Holbrook & Rannikmae, 2007, 2009; Marks & Eilks, 2009, 2010). Thus, integrating more environmental issues in chemistry curriculum would provide students a better understanding about the relation of chemistry with daily-life. According to the findings of the study of Mandler, Mamlok-Naaman, Blonder, Yayon, and Hofstein, (2012) using more environmental examples in teaching chemistry increase students' awareness towards environmental issues, especially issues that are connected to their everyday lives and students see chemistry as a way of better understanding and as a better way of solving environmental problems. Moreover, a five-year evaluation report on Chemistry in the Community (ChemCom) which was published in 1992 concluded that students wanted to learn chemistry through environmental contexts (Sutman & Bruce, 1992).

According to the literature, there is a clear consensus among researchers about integrating environmental issues in science curriculum in general and in chemistry curriculum in particular (Edelson, 2007; Ernst, 2007; Hofstein, Eilks, & Bybee, 2011; Holbrook & Rannikmae, 2007, 2009; Liberman & Hoody, 1998; Marks & Eilks, 2009, 2010; Sutman & Bruce, 1992). In the last decade many studies have been conducted about the integration of EE in science education and implementation of EE in secondary schools (American Chemical Society, 2006; Benett & Lubben, 2006; Hofstein & Kesner, 2006). However, in science education literature there has not been any study that directly studies on the extent to which subjects related with EE should be integrated into science or chemistry curriculum. This study aims to fill this gap in the literature. The purpose of this study is to explore Turkish chemistry teachers' views about to what extent the subjects related with EE should be integrated into secondary school chemistry curriculum at an individual level of analysis. The findings of this study would be mainly important for curriculum designers and policy makers on the account of the fact that it reflects chemistry teachers'-as implementers of curriculum- views about how and to what extent EE can be embedded into chemistry curriculum. Through the findings of this study, policy makers and curriculum developers would have opportunity to comprehend and realize what the deficiencies are in chemistry curriculum and problems in implication of the curriculum for conveying EE in chemistry. The research question of this study is "To what extent the subjects related with EE should be integrated into secondary school chemistry curriculum according to Turkish chemistry teachers?" and the sub research questions used in this study are as follows:

(1) To what extent, do chemistry teachers regard the chemistry curriculum including subjects for environmental education?
(2) According to the chemistry teachers, which subjects about EE should be added on or removed from the secondary school chemistry curriculum and what are the reasons for those additions or removals?
(3) According to the chemistry teachers, what should be the placements of the subjects about EE in chemistry subjects in secondary school chemistry curriculum and what are the reasons for those placements?

THE STUDY

The case-study approach was chosen as a research method in the study due to its robust grounding in reality, accessibility to teachers and its ability to generate a detailed and rich narrative. Generalization takes the form of 'theoretical inference' in which the conclusions move beyond the individual cases to a more general and a theoretical level (Hammersley, 1998).

Participants

The findings presented in this paper are based on detailed interviews undertaken with three experienced chemistry teachers, Sevil, Enis and Ersin in three secondary schools located in different cities in Turkey as a part of research. Table 1 provides some brief biographical details about the participants involved. Each participant has been working in different cities in Turkey. All of the participants have never before taken any courses on EE in their undergraduate education and they also have not attended any in-service training about environmental education.

Table 1. Details of Research Participants

	Teacher 1: Sevil	Teacher 2: Enis	Teacher 3: Ersin
Years Teaching	8	11	12
Gender	Female	Male	Male
School Type	Public	Private	Public
School Size	1000	500	1200
School Situation	Urban	Urban	Urban
Age	33	35	37

Data Collection

The researcher conducted semi-structured interviews with experienced chemistry teachers for the purpose of gathering information directly from participants' mind. One-on-one interviews were conducted by telephone by using open-ended interview questions in Table 2. Therefore, the response modes used in the interview was unstructured. Each interview lasted for about 30 minutes and interview protocols were used during the interviews.

Table 2. Interview Questions in Relation to the Research Questions

Interview Questions	Relation to the Research Question
To what extent is chemistry curriculum related to environmental education?	1st research question
In chemistry curriculum which subjects include topics related to environmental education?	1st research question
Are they adequate for an effective environmental education?	1st research question
Do you emphasize sufficiently on those subjects?	1st research question
Which of the following environmental issues should be in the chemistry curriculum? Why? a. Water pollution b. Solid wastes c. Hazardous wastes d. Global warming e. Air pollution f. Loss of biological diversity g. Consumption patterns h. Deforestation i. Noise pollution j. Soil pollution k. Population and environment l. Environmental cycles (C, H_2O and N_2 cycles) m. Energy usage	2nd research question
In which chemistry subjects should those be integrated?	2nd research question
Beyond the scope of current chemistry curriculum, are there any environmental issues which are discussed in the class?	2nd research question

If yes, in which chemistry subjects should those subjects be taught? Why?	3rd research question
Do you think that environmental education should be a separate must course rather than being in chemistry curriculum? Why?	3rd research question

Analysis of Data

The Turkish secondary school chemistry curriculum was investigated in detail and related to EE the aims and the subject matters were listed in order to validate what the interviewees stated about the curriculum and the curriculum itself. During the interviews, I checked whether interviewees' statements matched up with the curriculum or not and the issues which were not overlapped were questioned to clarify whether the interviewees omitted those issues in the lessons or forgot to state to the interviewer. Moreover, in order to validate the accuracy of findings, I got feedback from participants about the final reports about the interviews. All participants affirmed the reports without a disagreement. Furthermore, an expert scholar in the field reviewed and asked questions about the study from beginning to the end.

FINDINGS

The study revealed a remarkable degree of similarity among the views of the three chemistry teachers on the inadequacy of chemistry curriculum for providing students an effective EE. Moreover, data from all chemistry teachers suggest that subjects related to EE were not taught appropriately in the lessons. However, despite their apparent agreement about inadequacy of chemistry curriculum, the picture which emerged from detailed analysis of the interview data showed that there is a disagreement about the integration of EE subjects into the chemistry curriculum and proper placements of those subjects in the chemistry curriculum.

To what extent, do chemistry teachers regard the chemistry curriculum including subjects for environmental education?

All of the teachers agreed that the chemistry curriculum was inadequate for providing students an effective EE and the chemistry curriculum did no treat environmental subjects in a wide coverage:

> I think our curriculum doesn't include subjects related with environmental issues, its relation to EE is superficial and narrow-scoped, and also it's not sufficient to develop students an understanding about environmental issues. (Sevil)
>
> The chemistry curriculum doesn't mention a lot about the importance of environment and the effects of people's behaviours on environment ... and although chemistry is very closely related to environment, the curriculum doesn't give chance for an effective environmental education. (Ersin)

Moreover, all teachers similarly stated that existing subjects related to EE were not taught appropriately due to several reasons which were the time allocated for those subjects, the placement of those subjects in the curriculum and technical reasons in that teachers could not test some subjects as they were taught after the final examination of the semester:

> There are only two subjects related with environmental education that I focus in lessons. One of them is a separate unit titled as 'Chemistry in Life'. It's the last unit of ninth grade chemistry course … I can't teach the unit in detail as it's taught after the final exam of the semester. The other one is taught as a short part in the 'Radioactivity' unit. Here, the only focus is on the effect of radioactivity on living things … These two subjects aren't adequate of course for a good environmental education. (Enis)
>
> The specified lesson hours in the curriculum for subjects related with EE are so few that it's impossible to provide students an understanding about environment and to gain them an environmental perspective… (Ersin)
>
> The only unit that wholly allocated to environmental issues is "Chemistry in Life". This is the last unit of the ninth graders and because students become tired and remain indifferent toward all lessons,

they can't learn it efficiently. If this unit hadn't been at the end of the second semester of the year, it'd probably have been more effective in terms of EE. (Sevil)

According to the chemistry teachers, which subjects about EE should be added on or removed from the secondary school chemistry curriculum and what are the reasons for those additions or removals?

There was a disagreement among teachers' views on inclusion of subjects which were related to EE in chemistry curriculum. One of the teachers (Sevil) proposed that all the subjects within the scope of EE should be in the chemistry curriculum and a comprehensive integration of EE and chemistry should be established in order to provide an effective EE claiming that chemistry is the most suitable branch of science for realization of that purpose:

> Because EE subjects are more relevant to chemistry rather than other branches of science, it should be the main platform to teach environmental issues. Moreover, all of the other branches of science should include subjects related EE as well as chemistry. … As all of the subjects of EE are closely related to chemistry, they can be taught in chemistry lessons except a few such as biological diversity and noise pollution. (Sevil)

On the contrary, the other two teachers (Ersin and Enis) suggested that some subjects related to EE should be immersed in chemistry curriculum to a certain extent. Water, soil and air pollution, consumption patterns energy usage, and climate change should be involved in the chemistry curriculum. However, they opposed EE subjects to be included in the core of chemistry curriculum due to the fact that chemistry subjects may face the danger of being undervalued and omitted in the curriculum:

> It's not possible for chemistry curriculum to cover all the environmental issues but environmental pollution and consumption patterns may be involved in the curriculum due to their importance for our life. We use up our water resources by using chemicals such as detergents and fertilizers. … Beyond the scope of curriculum, in lessons, sometimes students ask about consumption patterns and their effects on environment, and we talk over the issue. … I want my students be more aware students of environmental issues and I want to teach them some subjects about environmental issues but I'm a chemistry teacher in the first place. (Enis)

> Some subjects about EE should be taught by immersing in chemistry subjects such as water pollution, solid wastes and global warming … If the curriculum included all the subjects in the scope of environmental education, how we would achieve to teach chemistry in detail. … Will it be a chemistry lesson or an environmental chemistry lesson? (Ersin)

According to the chemistry teachers, what should be the placements of the subjects about EE in chemistry subjects in secondary school chemistry curriculum and what are the reasons for those placements?

There was not an agreement among teachers' views on both placement of the subjects related EE in the chemistry curriculum and how to teach EE subjects; through integrating chemistry course or as a separate course on EE. On the one hand, Ersin and Enis had the idea of teaching EE subjects as a separate course; on the other hand Sevil suggested that the EE subjects should be integrated into chemistry curriculum rather than being taught as a separate course for a better understanding:

> EE subjects should be taught together with chemistry subjects, in this way students will understand the scientific background of the issues and chemistry will be a more enjoyable lesson for the students. (Sevil)

The ideas of teachers about the placements of subjects in the scope of EE into chemistry subjects are shown in Table 3.

Table 3. Placement of Subjects of EE into Chemistry Subjects

Subjects Related to EE	Chemistry Subjects according to Teachers		
	Teacher 1: Sevil	Teacher 2: Ersin	Teacher 3: Enis

Water Pollution	Compounds & Solutions	Solutions	Compounds & Solutions
Solid Wastes	Chemical Reactions	Chemical Reactions	-
Hazardous Wastes	Compounds & Radioactivity	Compounds / Electrochemistry	-
Global Warming	Gaseous State	-	-
Air Pollution	Gaseous State	Gaseous State	Gaseous State
Loss of Biological Diversity	-	-	-
Consumption Patterns	Organic Chemistry	-	Compounds & Chemical Reactions
Deforestation	Organic Chemistry	-	-
Noise Pollution	-	-	-
Soil Pollution	Solutions	Compounds & Periodic Table	Compounds & Solutions
Population and Environment	-	-	-
Environmental Cycles	Gaseous State	-	-
Energy Usage	Energy in Chemical Reactions	Energy in Chemical Reactions	-

DISCUSSION AND CONCLUSION

This study confines itself to interviewing three chemistry teachers working in high schools. The scope of the study is narrowed by secondary school chemistry curriculum and its approach to environmental education. Furthermore, affective domains such as chemistry teachers' attitudes, self-efficacy beliefs, or motivations toward environmental issues are beyond the scope of this study. On the other hand, the limited number of participants can be seen as a potential weakness for the study. However, due to the fact that participants are quite experienced and they have been in the field as the implementers of the curriculum, the findings of the study can be regarded as quite valuable and significant.

In Turkey EE is still not a part of the core secondary school chemistry curriculum and adopted curriculum does not provide a means for an effective EE and what is worse, it includes only a few subjects related with environmental education. Generally these subjects even were not taught appropriately by chemistry teachers due to some reasons such as insufficiency of amount of time allocated for those subjects and the placements of those subjects in the curriculum. Although there is not a consensus about teachers on the integration of EE subjects into chemistry curriculum, previous researches indicate that through integrating EE in chemistry, students may gain a meaningful mode of chemical thinking and understanding attitude towards environmental processes and skills (Feiarebend, Jokmin, & Eilks, 2010; Hofstein, Eilks, & Bybee, 2011). Thus, curriculum designers and policy makers should take necessary measures according to the findings of the study owing to the importance of environmental education; the subjects for EE should be immersed and integrated in secondary school chemistry curriculum urgently. In order to realize this, in-service teachers should be trained on EE by Ministry of Education, and in chemistry departments of education faculties, there should be at least one undergraduate must course about environmental education.

For further researches, quantitative studies can be conducted to reveal the deficiency and the needs in chemistry curriculum from EE perspective and to assess the competence of chemistry teachers in EE. Further analysis may also reveal the differences between the Turkish curriculum and those of other countries' from the point of chemistry teachers' views through an environmental perspective.

ABSTRACT: Globalization and technological development are radically changing the landscape of higher education. Students increasingly expect to choose what they learn, how they learn and when they learn, according to their individual needs and interests. Computer applications in education system introduce unique technical, managerial and most importantly pedagogical issues. Using business discovery platform QlikView, application developed in this research, should be beneficial to both, students and professors at the university. The relation database model is based on data collected from student admission service of Faculty of Organizational Science, University of Belgrade. Application allows students to analyze current study success, but also to predict future performance success. In addition, students can use developed application as an advisor system, which can be useful in helping student plan for the upcoming semesters and also to be able to answer any questions that the student may have regarding his/her academic standing.

Keywords: knowledge-based application, student study success, higher education

INTRODUCTION

The use of modern technological resources and teaching aids, as well as the adjustment of teaching content to students, in order to achieve better results in the adoption and application of knowledge, may represent a good basis for the development of contemporary concepts of education in the 21st century. In order to achieve this, it is necessary to detect, define and analyze existing patterns of behavior and students' learning. Today, there are a large number of software products for facilitating and improving the quality of learning. Some of them are intended for students of primary schools and high schools, while the other are focused on college students. Exactly the last mentioned type of software represents interest of this paper.

In this paper, the introductory part will present related works and background of the methodology in area of educational administration software. The basic concepts of QlikView software platform and developed Academic Dashboard for Faculty of Organizational Sciences, University of Belgrade will be analyzed in the central part of the paper. The final part of the paper defines the guidelines for further development and adaptation of higher education system to the necessities of a student.

METHODOLGY AND TECHNOLOGY SUPPORT

Methodology background and related works

Technological development has provided base for developing software with new functionality. Teaching process records constant imporovement through the use of ICT (Arenas-Marquez et al, 2012). Nowadays, providing students with services they expect is more challenging than ever before. Some of those services are ability to track current students' achievements and results, planning next semester, conducting optimal selection of exams based on preferences and results, operational planning, like attending colloquia, exams, participations in projects and practices etc. Also, that kind of software is attended for professors in order to track effectiveness of students (individually, by teams or by generation) and for planning and adapting exams curriculum in order to meet future interest of students. Some of those are open source (Coll et al., 2008) and others are vendors' solutions. Software scope and architecture may vary and below is an overview of the most significant solutions.

IBM company provides personalized software package SPSS for students and teachers. This software integrates different types of data analysis, data mining trend research and quantitative methods for measuring efficiency. Students can plan obligations, track and analyze exams' results, use tools for advising etc(IBM, 2014). Beside this software, students can customize and use IBM's BI tool, named Cognos. Because of its complexity and detailed analysis, usage of SPSS or Cognos can be demanding and difficult, especially from a student point of view.

SAP offers solution to support the work of students and teachers. Integral parts of this software are: Student Lifecycle Management, Teaching and Learning, Learner achievement Measurement and Tracking and Educational Performance Analytics (SAP, 2014). This software is a feature-rich, both for the students' and teachers'work. Student can plan and monitor present liabilities in the current semester, monitor different statistics of their past achievements and use adviser in order to get proposal of exams in subsequent semesters, use distance learning etc. Moreover, students can run "what-if" scenarios to view requirements for a program being considered, including courses adequate for transfer if they changed programs. Mentioned software allows professors to plan classes and the necessary resources (personnel, classrooms, technical resources), to monitor the presence of students (status of their obligations, progress, rating), to define grade scale, to evaluate test in-time and to send test results to students, to propose future courses based on interest of students, to optimize study process and to carry out large number of statistical analyzes.

Microsoft offers multiple solutions to support students and teachers by personalizing product from the Dynamics family or using dedicated software like: Communication and Collaboration, Device Management, Web Portals, E-learning and Tracking Institutional effectiveness for Higher Education. These software solutions allow quick and easy connection and communication between students and teachers through various types of devices, easy scheduling obligations both students and teachers in accordance with number of registered students, retention of various records. Using this software, teachers can easily perform different analysis, support online teaching, testing and decision-making. Also, all of mentioned software solutions are easy to integrate with other Microsoft's products (Microsoft, 2014).

In addition to the mentioned software there are some open source solution (qOrganizer, Planbook, StudentLife, TeachersPlanner, and StudyMinder). Characteristic of all listed open sources software solutions are that they allows only a slight adjustment to a specific software system and essentially real system needs to adapt to software requirements (called personalization process). This paper will present how to develop custom applications based on both existing data, collected from student admission service of Faculty of Organizational Science (University of Belgrade) and the required functionality. Technology used for this solution is QlikView.

QlikView technology

QlikView represents new patented software engine, which compresses data and holds it in memory, where it is available for immediate exploration by multiple users. QlikView delivers an associative experience across all the data used for analysis, regardless of where it is stored, (Harmsen, 2012). For datasets too large to fit in memory, QlikView connects directly to the data source and generates new views of data on the fly. QlikView's patented core technology, associative experience, and collaboration and mobile capabilities, make able to work with a lot of questions, passing by traditional hierarchical models, with created an associative network which works similar to human brain. Empowering the information workforce to derive insights from data helps organizations streamline, simplify, and optimize decision making, (Harmsen, 2012).

In primary frontend-backend architecture, on which is based QlikView solution, as data layer (Infrastructure resource) will be used relational database to record data on students of the Faculty of Organizational Sciences. Using OLDB connections, QlikView server will establish communication with the database with students data within specific time intervals (monthly level or after completion of the exam period). Once the connection between QlikView and elementary student database is established, the application will use the Associative Query Language (AQL) to download data from the relevant tables, necessary for the operating and usage, and after that it will be stored in its own memory. In addition to downloading data, backend part of application will be provided with ability to define application logic, rules for establishing a link between the data (in accordance with already defined relational model), as well as methods and privileges for using the application. Within the frontend, according to the rights they have, each user will be able to access the application and review it available reports and data.

STRUCTURE OF DATA MODEL AND APPLICATION

Similar to QlikView usage in public or private sector, we developed QlikView Academic Dashboard for Faculty of Organizational Sciences, University of Belgrade, in order to help educational professionals and students to maximize data governance and optimize their intellectual investments by discovering how QlikView is used at a granular level in educational sector. With this application and resulting knowledge, professors and students can introduce more manageable and repeatable educational processes, as well as address data lineage and impact analysis questions on more efficient way. Approach of developing an integrated system for students and teachers has considerable benefits for improved data quality, mainly due to the fact that integration obviates the need for complex interfaces(Berkhoff et al., 2012).

The data contained within this application represents student personal, demographic and academic data, collected from student admission service of Faculty of Organizational Science, University of Belgrade. Using this data we can analyze the demographic and socio-economic student structure and success at the University. Developed relation data base model consists of 15 objects and more than 50 attributes.

Using the student grade data, an academic advisor can guide the student as to which classes still need to be fulfilled before graduation or how to improve current GPA (grade point average). Professors will be able to monitor students' achiness and success by each study program, student gender, finished high school, exam, semester or science filed. Application allow students to analyze current study success, but also to predict future success performance based on average exam performance from other students whit same background. Students in addition can use developed application as an advisor system, this data is useful in helping students plan for the upcoming semesters and also to be able to answer any questions that the student may have regarding his/her academic standing. This application, also, takes advantage of security level setup using section access to show different views of the data, including two basic views: a professor view and a single student view.

RESULTS AND FINDINGS

Professor View for Academic Dashboard for Faculty of Organizational Sciences

Academic Dashboard for Faculty of Organizational Sciences allows professor and administrative staff to view a breakdown of demographic data such as gender, ethnicity, class standing and province of residence. Using these data fields they can identify trends and also can get an overall picture of the demographic breakdown of the faculty and students.

Teaching staff will be able to monitor success of students in each of the courses for which they are responsible. Data for each subject will be available in different time units: specific examination period, semester, school year, calendar year etc. Teachers will be provided with option for tracking students' success on multiple courses, for example group of courses for which a particular teacher is in charge. As it shown in Figure 1, professors can keep an eye on data such as GPA, average study length, entrance exam points by country, region and high school type for each generation of students. That kind of observing students' success can be of great significance in determining trends in college enrollment.

Figure 1. Students' success by Region

In order to identify, for example, gender structure and study success, on each study program by different success criteria, on both global (GPA, average study length, average entrance exam points) and individual (exam, semester, specific examination period) level, just by selecting adequate view, time period and desired variable, as it shown on Figure 2. Professor can switch to a chart view of GPA and see the disbursement of current GPAs on student, course or exam level, and with that like organized data, professors can look for trends in GPAs and get a high-level view of how our students are performing. Selecting from the list boxes on the left they can filter the data down to a particular major and/or course.

Figure 2. Detailed success statistic by student gender

Observing student profile a professor or educational office stuff, as administrator, can see the academic data for any of the students enrolled in the faculty. Once the administrator identifies a single student, he/she can then get a look into that student's current academic state on more detailed level. Data such as cumulative GPA, declared major and minor, courses taken, remaining courses needed to fulfillment major requirement, and address information. As an advisor, this data is useful in helping the student plan for the upcoming semesters and also to be able answer any questions that the student may have regarding his/her academic standing. Through continuous monitoring of students during their studies, at an early stage, teachers can perceive students with good potential and students who need extra help in order to improve their results. The best students can be offered extra activities, for example additional courses, participation in scientific research and projects.

Student View for Academic Dashboard for Faculty of Organizational Sciences

Through interactive forms (and with adequate data security mechanism), students of the Faculty will be provided with the ability to monitor continuously their progress during the study (number of exams, grades etc.), as well as their ranking relative to other students from the same generation and on the same study program, as it is presented on Figure 3. This functionality commonly gives extra value for quality assurance processes in higher education (Seghedin). After completing the first year of undergraduate studies, using the application, students will be able to review the predicted potential success at the end of the study, which is certainly a good indicator and a guideline for further technical and scientific development.

Another important benefit of this software represent fact that it is provided as SaaS(Software-as-a-Service), which is defacto increasingly important paradigm in information technology and also provides education systems as a service for enhancing processes in higher education (Masud & Huang, 2013). This functionality enables students with an easy-to-use application, for which utilization they only need web browser and permitted access to application.

Figure 3. Students' success on individual level

The Student View shows a single student's academic data. Additionally, students can also use the "What-If" scenario to allow the student to hypothetically change his/her major and see the immediate impact that decision would have on the required courses necessary to fulfill the major requirements. Also, students will have ability to compare personal results (GPA or special exam grade) with success of other student in a class or with students with same demographic characteristics.

CONCLUSION

System model for recording and monitoring study performance, presented in this paper, can be used as a good basis for improving the process of higher education. The developed system aims to provide teachers with tracking functionality in order for continuously monitor students' achievements. Also, application allows them to compare students' success categorized by courses, science-education groups or exams periods. Based on these information professors can determine the patterns of students' aspirations and needs, which can directly improve the process of education.

In addition to relations that indicate dependency between of students and their success, the developed system (based on QlikView in- memory solution) allows as well identification of relationships that are not directly related to the success in studies. Example for previous would be possibility for linking student with list of elective courses and optional seminaries, that they have chosen. This possibility provides students with advisory tool for choosing courses in the following semesters, gives guidelines for further scientific and professional development of each individual and also contributes to the prediction of the expected popularity of the elective subjects in the future.

Directions for future research are further improvement of the system in terms of development of modules for prediction students success and for their positioning and ranking among other students in their generation.

ÖZET: Bir durum çalışması olarak yapılandırılan bu araştırmada sekizinci sınıf öğrencilerinin histogram oluşturma, yorumlama süreci ve sütun grafiği ile karşılaştırma sürecindeki bilişsel durumları incelenmiştir. Araştırmanın teorik alt yapısını Mooney'in (2002) karakterize ettiği istatistiksel düşünme seviyeleri oluşturmuştur. Çalışmaya Ankara ili Polatlı ilçesinde yer alan bir devlet okulunda öğrenim gören altı sekizinci sınıf öğrenci katılmıştır. Çalışmanın verileri yarı yapılandırılmış görüşmeler ile toplanmıştır. Görüşme soruları alanında uzman dört kişi tarafından incelenmiş ve pilot çalışması yapıldıktan sonra son haline getirilmiştir. Her bir öğrenciyle yapılan görüşmeler 40-60 dk arasında sürmüş ve ses kayıt cihazı ile kaydedilmiştir. Öğrencilerin verdikleri cevaplar analiz edildiğinde histogram oluşturma ve yorumlama sürecinde bazı sıkıntıların olduğu ortaya çıkmıştır. Sürekli ve süreksiz verileri ayırt etme konusunda sıkıntı yaşayan öğrencilerin histograma ilişkin kavramsal bilgilerinde eksikliklerin olduğu belirlenmiştir. Ayrıca öğrencilerin sütun grafiği ile histogram arasındaki en temel kavramsal farkları ayırt etmekte zorlandıkları ortaya çıkmıştır. Araştırmanın tüm bulguları ve ortaya çıkan birtakım eksiklerin giderilmesi için ortaya konacak öneriler detaylı bir biçimde sunum sırasında paylaşılacaktır.

Anahtar sözcükler: histogram, sekizinci sınıf öğrencileri, istatistiksel düşünme

ABSTRACT: In this case study a comparison between the eighth grade students creation and interpretation of a histogram and a bar chart was made. During this comparison the cognitive status was examined. The theoretical background of this research is inspired by Mooney's (2002) characterized levels of statistical thinking. This study was done with the participation of six eighth grade students in Ankara/Polatlı. Data was collected through semi-structured interviews. The interview questions were examined by four experts within the field and were finalized after the pilot study was made. Each interview with the students were between 40-60 minutes long and were recorded with a tape recorder. When the students answer's were analyzed, some difficulties appeared during the process of their creation and interpretation of the histogram. It has been identified that the students who have difficulties in distinguishing continuous and discontinuous data have a lack of conceptual knowledge related to histogram. In addition it has emerged that the students have difficulties in distinguishing the most basic conceptual differences between bar chart and histogram. All of the research findings and the recommendations how to overcome the deficiencies that has emerged will be shared in details during the presentation.

Key words: histogram, eighth grade students, statistical thinking

A REVIEW OF CRITERIA FOR CONTENT SELECTION IN PRIMARY EDUCATION CURRICULUM. (IN IRAN)

Ghahraman MADADLOU
Lecturer in Farhanghian University and PhD Student of Curriculum Development
madadlou@quran.ac.ir

Khadijeh Rasulli GHARAAINI
Ministery of Education Teacher

ABSTRACT: Content as an element of the curriculum plays a very important role in achieving the goals of education in society and is viewed as a key element in all approaches and perspectives. In view of the importance of content in curriculum decision-making, different criteria and measures have been offered by experts for its selection and development. This article was aimed at reviewing and analyzing these criteria and measures along with providing a set of practical criteria to select curriculum content in primary education. In this paper, after analyzing the content of books and articles available, criteria for content selection based on scientific principles of curriculum development was presented under three categories as consolidated content criteria.In philosophical criteria, appropriateness of content with the values and goals, scientific disciplines, and valid knowledge, in psychological criteria,overall growth including physical growth,etc., attention to specificlearning problems, interests and talents, and the needs of learners, in social and cultural criteria, cultural heritage, issues and needs of the local and national community, ethnic and cultural characteristics and appropriateness withglobal issues and communications,and in economic criteria, fitness ofcontent with the facilities available in the school and the region, appropriateness of content with the budget and operating costs have been recognized andpresented as criteria for the appropriateness of content selection.

Keywords: Content, Content Selection,CurriculumPrinciples

INTRODUCTION

The problem and the aim of this paper are to pay attention to the importance of content and the criteria for its selection in curriculum planning, particularly in elementary course, and providing integrative criteria based on the qualities of learners and the structure of society. Therefore, by integrating the present criteria and paying attention to the scientific principles of curriculum planning, particularly economic principles, to which there has been no attention paid in the books or essays, we can present some criteria. The main question of this paper is that whether we can present some criteria according to the present criteria and the scientific principles of curriculum planning which are undoubtedly effective in choosing and developing the content. Therefore, to present a number of integrative criteria in choosing the content, first, a list of present books concerning the subject were extracted and then, according to the present criteria in the books, lack of attention to this subject made us analyze the introduced criteria in many books and essays so that we could introduce a number of comprehensive criteria to develop the content of curriculums.

To reach the goal of this study and to present it to a number of criteria for choosing the content, we chose the following three books as samples according to the fact that to choose these three sources, there was much emphasis on the criteria in selection. These books include *Principles and Concepts of Curriculum* by FathiVajargah, *Curriculum Development: Practice Guide* by Hasan Maleki and *Procedures and Revisions in Curriculum Development* by the experts in the center for international scientific studies and collaboration of Ministry of Education. This study was performed in a review form and a comparative way and finally, considering the different views and contemplating the scientific principles of this field of study, some criteria were presented according to philosophical, social, psychological and economic principles.

THE CONCEPT OF CURRICULUM

In this section, to enlighten the place and the importance of curriculum as well as its elements, particularly the element of content, some views and definitions are explained.

Eisner (1994), a leading curriculum theorist, believes that the origin of the word “curriculum” lies in the Latin word “currerer” which means race or running course. He also believes that the elements of curriculum include aim, content, various opportunities of learning, organizing the content, the style of presentation, answering and evaluation.

The origin of the word “curriculum” is from the Latin root of “Race course” and has its roots in a course of action or the distance which needs to be travelled to reach the intended goal. According to Zeiss, the elements of curriculum include aim, content, learning activities and evaluation methods. (FathiVajargah, 2009, p. 14: Zeiss)

Using a simile between a race course and the curriculum in both of the above-mentioned views explains the two qualities attributed to curriculum. (Mehrmohammadi, 2011, p.11) First, like race courses which have definite starting and ending points, curriculums require beginnings, endings and definite and predetermined routes. The second discernible quality of the word “curriculum”, based on its root, is that as there are obstacles in the way of course runners which make it difficult for them to proceed, the curriculums gradually get more difficult too. This issue is clearly evident in students' textbooks that the selection of content and the way it's organized can cause its difficulty.

The word “curriculum” which most of translators and experts have equalized with “curriculum development”, was common in the past, but recently, it's translated as just “curriculum” since “curriculum development” is just one aspect of curriculum as a field of study and the only controller of planning process is “curriculum development” itself. (Mehrmohammadi, 2011, p. 11)

There are so many different definitions of curriculum according to different views and patterns of curriculum as a field of study. But what is important is that the definition must be comprehensive and logical. According to the present definitions of curriculum which are many in number, the most exact and comprehensive definition is that of Mr. Maleki's (2008) which is an average definition of the others: curriculum refers to formal and informal contents, content process and overt and covert instructions through which the learner gains the required knowledge, acquires the skills and changes his values and tendencies under the expert guidance of school.

According to Klein (1991), the elements of curriculum include aims, content, teaching strategies, learning, materials and resources of learning activities, methods of evaluation, the grouping of learners and time and place. (FathiVajargah, 2009, p. 129) Evaluation of other scholar's views (Ash, 1991), (Beauchamp, 1982), (Stark and Lattuca, 1997) concerning the elements of curriculum show that most of the views focus on its content and place among the elements of curriculum and regard them as the main and indispensable elements.

The reason for profusion of definitions of curriculum in field of education is different interpretations of the word “curriculum” itself and different views in field of curriculum.

CONTENT

After prioritizing learners' needs and choosing the goals, the content of curriculum is another element which needs to be chosen, designed and developed. The first step to achieve the goals is the selection of suitable educational content. (Maleki, 2008, p. 47) Therefore, in order to choose the suitable content and present the appropriate criteria for its development, we need to know the content. There are so many different definitions of content which some of them are as follows:

The content of curriculum refers to particular facts, opinions, principles and issues which are included in a particular subject matter. (Connelly & Lantz, 1991)

The content of a subject matter includes organized knowledge, terms, information, facts, rules, principles, methods, concepts, decisions, phenomena and the issues related to the same subject matter. (Ghoorchian, 1995)

To select the content, its subject matter and goals need to be determined so that we can choose the suitable content based on the goals and related subject. For instance, if our subject is empirical science education and the aim of empirical science education is to familiarize the students with different types of rocks, the content of curriculum can be chosen in written or oral form (FathiVajargah, 2009, p. 172) or in practical form, that is to say, the course concepts are explained on an excursion so it is called an observational or practical content by providing learning opportunities.

According to the fact that the content is an effective element in the process of curriculum development and its significance due to the qualities of learners in elementary course, particular criteria need to be considered in the selection of curriculum content. These criteria are different due to difference in perspectives and this paper aims to examine some of these samples and finally, some criteria for the selection of curriculum content in elementary course will be presented.

Discussing the criteria for the selection of content, most of the researchers in this field of study have emphasized on the importance of "Proportion" criteria. (Fathi, 2004, p. 122) These criteria, which have been included in *The Principles of Curriculum Development* by FathiVajargah (pp 123-127), are as follows:

1. The proportion between the content and the social factors and values
    - 1.1 The proportion between the content and culture, ideals and social expectations
    - 1.2 The proportion between the content and scientific and technological advances
    - 1.3 The proportion between the content and issues and needs of national and practical society
    - 1.4 The proportion between the content and global issues and relations
2. The proportion between the content and the learners' qualities and needs
    - 2.1 The proportion between the content and the students' abilities and learning talents
    - 2.2 The proportion between the content and the students' needs and
    - 2.3 The proportion between the content and the students' real lives
    - 2.4 The content needs to provide the context for the experiences and the future learning of students
3. The proportion between the content and the lawfulness of curriculum
    - 3.1 Content balance
    - 3.2 Content coherence

In his book, *Curriculum Development: Practice Guide* (2008, pp 116-118), Mr. Hassan Maleki introduces the following criteria for the selection of content:

1. Importance (the importance of content for solving the problems of life, enhancing the learners' subject knowledge, etc.)
2. Validity (accuracy and validity of concepts, principles and generalizations)
3. Interest (the learners should take an interest in their learning)
4. Usefulness (useful function of content)
5. Learning ability (the content should be intelligible for the learners and it needs to be within the limits of their own experiences)
6. Flexibility (selection according to time, resources, staff, political climate, etc.)
7. Attention to knowledge structure
8. Full attention to protection and promulgation of cultural heritage and value system
9. Improving the scientific level of students for constant and self-directed education
10. Contact with life, everyday experience and current issues
11. Providing good opportunities for activities and multiple learning skills

"*Procedures and Revisions in Curriculum Development*" (2001, p. 121) written by the experts in the center for international scientific studies and collaboration of Ministry of Education, presents the following items for the selection of content:

1. For the selection of content, we need to scrutinize the structure of curriculum. Therefore to do so:
    - A set of basic concepts to describe the issues and phenomena should be determined within the limits of a subject matter.
    - A method, in which the stored knowledge in that subject matter is organized, should be determined.
    - A set of methods and basic rules which provide the required evidence in a subject matter, that is to say, the particular method of scientific researches should be determined. Since every field of study is seeking for a particular knowledge, it is clearly evident that a particular method is used to find out the accuracy of its findings.
2. We need to provide an accurate list of key concepts and basic skills in that particular subject matter and then they should be divided into groups.
3. The list of content culture, key concepts and basic skills should be selected according to the following principles:
    - It should pay attention to protection and promulgation of cultural heritage and value system.
    - An example of the latest fundamental, scientific and artistic information of that particular subject matter should be reflected in the list.
    - It should be a basis for constant and self-directed education.
    - It should be directly in contact with life, everyday experiences and current issues.
    - It should be regarded as a good opportunity for multiple educational activities and skills.
    - It should provide the context for international relationships.

INTEGRATIVE CRITERIA FOR CONTENT SELECTION

According to the importance of curriculum principles in curriculum development and selection of its elements and considering the qualities of elementary students, the criteria for the selection of curriculum content were based on scientific principles. Using various classifications which were developed from the criteria for content selection, the following criteria presented in the forms of integrative criteria for the use of curriculum designers are recommended. It is worth mentioning that this classification is presented as follows based on scientific principles of curriculum, i.e. philosophical, sociocultural, psychological, economic and political principles:

The proportion between the content and economic principles

It seems that in countries suffering from economic problems, addressing the issues concerning economic principles in designing the curriculum, particularly costly contents such as providing teaching and learning opportunities, experiment and workshop, research and excursion, performing costly scientific and practical works and attention to economic principles of curriculum, is necessary. (Parvand, 2008, p. 88) It's because sometimes so many interesting contents in different forms are produced for curriculums. But due to financial problems or since the schools cannot afford to execute the content, the execution of the plan confronts a lot of problems. In this issue, addressing the following items can be regarded as the appropriate criteria of economic principles. Since in the world today, the youth education is a sort of national investment and each country which is endeavoring more in this way shall enjoy more economic and social advancements in the future. (Emadzadeh, 2006, p. 33)

Education enhances the people's production and service capacity. Education has got economic benefits and investment in it will make people, their families and society benefit from its positive values. (ibid, p. 107) Therefore, according to the economic importance of education and the central role of the content in order to realize the goals of education as well as the importance of financial issues, expenditure and facilities In terms of quantity and quality in implementation and achievement of curriculum goals, the inclusion of economic principles in development and selection of content is necessary. The criteria for the proportion between the content and the scientific principles of curriculum are as follows:

The proportion between the content and economic principles:

- The proportion between the content and facilities like workshop, laboratory, etc. in the area and school
- The proportion between the content and allocated budget to the area or school
- The proportion between the content and administrative costs

The proportion between the content and philosophical principle of curriculum:

- Attention to ideological values in selection of content
- The proportion between the content and the goals of curriculum
- The proportion between the content and valid scientific fields of study

The proportion between the content and social and cultural principles:

- Attention to culture and cultural heritage in selection of content
- Attention to problems and needs of national and local society
- The proportion between the content and global issues and relations

The proportion between the content and psychological principles:

- Attention to physical, mental and emotional growth in selection of content
- Attention to learners' specific learning problems and difficulties
- Attention to interests and talents
- Attention to the learners' needs

ÖZET: Bu çalışmada, resmi ve genel liselerde öğrencilerin 2012 - 2013 eğitim öğretim yılında uygulamaya koyulan FATİH Projesi'nin kullanım düzeyine ilişkin görüşleri belirlenmeye çalışılmıştır. Çalışmada tarama modeli kullanılmış olup araştırmanın örneklemini 2012 - 2013 eğitim öğretim yılında Antalya ili Muratpaşa ilçesinde bulunan ve FATİH Projesinin uygulanmakta olduğu 16 genel lisede öğrenim görmekte olan 375 öğrenci oluşturmaktadır. Anket çözümlemeleri için SPSS 18.0, LISREL 8.54 programlarından yararlanılarak, frekans, yüzde, aritmetik ortalama, standart sapma, t-Testi, LSD ve tek yönlü varyans analizi testleri kullanılmıştır. Araştırmadan elde edilen bulgulara göre öğrenciler, Eğitimde FATİH Projesi kullanım düzeylerine ilişkin olarak e-içerik kullanımı, eğitim gereksinimi ve kurum yeterliği boyutlarında "orta"; öğretim süreçleri, öz-yeterlik ve proje getirileri boyutlarında "yüksek" düzeyde olumlu görüşe sahiptir.

Anahtar Sözcükler: FATİH Projesi, Öğrenci Görüşleri

ABSTRACT: In this study, general high school students' opinions on the usage level of the Project FATIH were tried to be determined. Survey model was used in this research and the research's sample consists of 375 students who were selected using random method. Data collected from surveys were analysed by software SPSS 18.0 and LISREL 8.54. In the analyse process, frequency (f), percentage (%), mean ( ), standard deviation (SD), t-Test, LSD and One Way ANOVA tests were used. Findings show that students have high level of opinion on the factors "Progress of Instruction" and "Self-Efficacy and The Returns of The Project", while they have moderate opinions on the factors "The Use of E-Content", "Requirement for Education", "Adequacy of The Institution".

GİRİŞ

Kökeni itibari ile Yunanca "teknik" kelimesinden gelen ve dilbilgisi karşılığında teknik ile ilgili bilim anlamında olan teknolojiyi, bilimin somutlaşmış biçimi şeklinde tanımlamak mümkündür. (Işık, 1981:159, Alkan, Deryakulu, Şimşek, 1995:81). Teknolojinin en yoğun uygulandığı alan eğitim alanıdır. Birçok otorite tarafından teknoloji ve eğitimde yaşanacak bütünleştirme ile öğrenme ortamlarından materyallerine kadar bütün süreçler daha verimli olacak, sonuç olarak da daha nitelikli bireyler yetişecektir. (İnel, Evrekli, Balım, 2011:129). Aggarwal (2000)'a göre 21. yüzyıl eğitimi yerden ve zamandan bağımsız, amaç ve sonuca doğru yönelimli, öğrenci merkezli, aktif takım çalışması ağırlıklı, öğrenim elde etmeye yöneliktir, beceri ve dildeki farklılıkları barındırmaktadır (Yılmaz ve Horzum, 2005:110). Bu nedenle bu noktada eğitim teknolojisi kavramından söz etmek yerinde olacaktır. Alkan (1997) eğitim teknolojisinin tanımına ilişkin olarak, "eğitimin yürütülmesine ilişkin süreçlerle ilişkili olup, davranışları saptama, eğitim durumlarını belirleme ve yaşantıları kazandırma etkinlikleriyle ilgili olarak ortamı düzenleme ya da çevreyi ayarlama etkinlikleridir" ifadesiyle süreç, eğitim ortamı ve çevre arasındaki ilişkiyi eğitim teknolojisi bağlamında açıklamıştır. Toplum, toplumu oluşturan bireyler ve bilgi kendini sürekli yenilemekte dolayısıyla eğitimin de güncelleştirilmesi gerekmektedir. Bu güncelleştirme aşamasında eğitimin kendine özgü ortamları ve teknolojilerinin neler olduğu, eğitim ve öğretimde gerçekleştirilmesi gereken hedeflerin en etkili biçimde hangi yollarla gerçekleştirileceği sorularının cevaplanması eğitim teknolojilerinin uğraşısı kapsamındadır (Numanoğlu, 1995:67).

Konuya ilişkin olarak alanyazında dikkati, eğitim süreçlerine teknoloji entegrasyonunun nasıl ve ne kadar sağlandığı noktalarına çeken araştırmalar da mevcuttur. Hew ve Brush (2007) bu bütünleşmenin zorunluluğunu vurgulamış ancak okullarda böyle bir bütünleşmenin kesin bir tanımının olamayacağı fikrini savunmuşlardır. Ajjan ve Hartshorne (2008) ise internet teknolojisi ve kelime işlemci-hesaplama tablosu gibi masaüstü yazılım programlarının okullarda masaüstü bilgisayarlar ya da dizüstü bilgisayarlarda eğitim amaçlı olarak kullanımını teknoloji entegrasyonunun göstergesi olarak kabul etmişlerdir. Cuban, Kirkpatrick ve Peck(2001) bu bütünleşmenin yüksek veya düşük seviyede olabileceğini ortaya koymuşlardır. Çalışmalarına göre, düşük seviye teknoloji entegrasyonu kapsamına öğrencilerin okullarda internette araştırma gibi yalnızca basit kullanımları, yüksek seviyede teknoloji entegrasyonu kapsamına ise öğrencilerin çoklu ortam sunumları yapmaları, projeler için veri toplamaları ve açıklamaları girmektedir. Elektronik dünyasında yaşanan hızlı gelişmelerin sonucu olarak bilgisayarların yaşantımızda yer almasıyla birlikte günümüz teknolojisi ile bilgisayarların neredeyse eş anlamda kullanıldığına şahit olmaktayız. Bilgisayarların bir öğrenme-öğretme aracı şeklindeki kullanımı, diğer hizmetlerde kullanılmasından daha fazla önem taşımaktadır. Çünkü eğitim teknolojisinin temel işlevi öğrenme-öğretme süreçlerinin daha verimli ve etkili olmasını sağlamaktır. Akpınar ve arkadaşlarına göre (2005) eğitim, yıllarca öğretmenin sıkı kontrolünde gerçekleşmiş, öğretmen her zaman bilgiyi aktarmıştır. Öğrenci bilgiyi oluşturma sürecinde birincil sırayı almasıyla birlikte öğretmenin rolü de değişmiş, bilginin oluşturulması sürecinde yardım eden konumuna gelmiştir. Bilgisayar destekli öğretim ise, öğretim sürecinde bilgisayarın bir seçenek olarak değil, sistemi tamamlayıcı, sistemi güçlendirici bir etmen olarak kullanılmasıdır (Uşun, 2004:40, Bayturan, 2008:11).

Günümüze gelindiğinde MEB tarafından uygulamaya koyulan "Eğitimde FATİH (***F****ırsatları* ***A****rttırma ve* ***T****eknolojiyi* ***İ****yileştirme* ***H****areketi*) Projesi", son yıllarda eğitimde teknoloji reformu bağlamında adından sıkça bahsedilir bir konu haline gelmiştir. MEB tarafından duyurulan FATİH Projesi temelde, okulların teknolojik altyapılarının iyileştirilmesi kapsamında her dersliğe geniş bant internet erişimi, gerekli donanımların sağlanması amacını taşımaktadır. Bunun yanında eğitsel elektronik içeriğin (e-içerik) oluşturulması ve bu içeriğin öğretim süreçleri ile bütünleştirilmesi de yine projenin amaçları arasındadır. (Perkmen ve Tezci, 2011:6). Bu amaçları gerçekleştirme doğrultusunda tüm ülke çapındaki ilk ve ortaöğretim okullarına akıllı tahta ve yardımcı teknolojik cihazların sağlanacak, öğretmenlere ve öğrencilere tablet bilgisayarlar verilecek, tablet bilgisayar içine ders kitapları yerleştirilecek ve tüm bunlara ilave olarak eğitim materyallerinin birçoğuna internet üzerinden ulaşım imkânı verilecektir. (Öncü,2013:394; MEB, 2013). Proje halen tedarik aşamasında olduğu için bu uygulamaların bir kısmı gerçekleştirilmiş, bir kısmı da gerçekleştirilmeyi beklemektedir.

Yukarıdaki bilgiler ışığında bu çalışmanın amacı genel lise öğrencilerinin FATİH projesinin kullanım düzeyine ilişkin görüşlerini saptamaktır. Bu amaç doğrultusunda aşağıdaki sorulara yanıt aranmıştır:

1. Genel lise öğrencilerinin FATİH projesinin kullanım düzeyine ilişkin görüşleri nelerdir?
2. Genel lise öğrencilerinin FATİH projesinin kullanım düzeyine ilişkin görüşleri cinsiyet, alan ve öğrenim düzeyine göre farklılık göstermekte midir?

YÖNTEM

Evren ve Örneklem

Araştırmanın çalışma evrenini, 2012 - 2013 Eğitim Öğretim yılında Antalya ili Muratpaşa ilçe sınırları içinde bulunan ve Eğitimde FATİH projesi uygulanan 16 lisede öğrenim gören 14.185 öğrenci oluşturmaktadır. Alfa düzeyinin .05 olduğu dikkate alınarak yapılan örneklem hesaplamasında 16 lisenin tamamında (100%), 375 (3%) öğrenciden oluşan ve tesadüfi yöntemle oluşturulan bir örneklem alınmıştır.

Veri Toplama Aracı

Genel lise öğrencilerinin Eğitimde FATİH Projesi'nin kullanım düzeylerine ilişkin görüşleri belirlenirken, alanyazın taraması yapılmış ve alanyazında yer alan ölçekler incelenmiştir. MEB Eğitim Teknolojileri Genel Müdürlüğü FATİH Proje ekibi tarafından hazırlanan "FATİH Projesi Anketi" başlıklı anketin maddeleri öğrenciler için uyarlanmış ve bu maddelere alanyazın taraması sonucu elde edilen ilgili maddeler de eklenmiş, böylece toplamda 40 maddeden oluşan "Eğitimde FATİH Projesi'nin Kullanımında İlişkin Görüşler Anketi" başlıklı yeni bir anket elde edilmiştir. Yeniden tasarlanan anket maddeleri ile ilgili olarak uzman görüşleri de alındıktan sonra 5'li Likert tipinde olan anket öğrencilere uygulanmıştır. Nicel verilerin çözümlenmesinde likert ölçekte bulunan derecelerin çözümlenmesi 1,00 - 1,80: Çok düşük, 1,81 - 2,60: Düşük, 2,61 - 3,40: Orta, 3,41 - 4,20: Yüksek, 4,21 - 5,00: Çok yüksek, aralıklarına göre yapılmıştır.

Verilerin Analizi

Bilgisayara doğrudan girilen veriler üzerinden gerekli istatistiksel çözümlemeler için SPSS 18.0 ve LISREL 8.54 paket programları kullanılmıştır. SPSS programından yararlanarak Eğitimde FATİH Projesi'nin kullanım düzeyine ilişkin görüşleri belirlemek için; frekans (f), yüzde (%), aritmetik ortalama ($\bar{X}$), standart sapma (SS), t-Testi, LSD ve tek yönlü varyans analizi (OneWay ANOVA) testleri kullanılmıştır. Araştırmada tüm istatistiksel analizlerin değerlendirilmesinde önemlilik düzeyi 0.05 olarak kabul edilmiştir. Uygulanan açıklayıcı faktör analizine göre Kaiser-Meyer-Olkin (KMO) test değeri, .822 olarak, Barlett's sphericity test sonucu ise 5375 (p< .000) olarak görülmüş, KMO'nun .60'dan yüksek, Barlett's sphericity testinin anlamlı çıkması da verilerin faktör analizi için uygun olduğunu göstermiştir. Uygulanan açıklayıcı faktör analizi sonucu ölçek maddelerinin 5 faktör altında toplandığı görülmüştür. Tüm boyutların toplam güvenirlik düzeyi .8500'dır. Buna göre "E-İçerik Kullanımı", "Eğitim Gereksinimi", "Öğretim Süreçleri", "Öz-Yeterlik ve Proje Getirileri", "Kurum Yeterliliği" olarak belirlenen faktörlerin güvenirlik düzeyleri sırasıyla .7990, .8770, .8680, .8010, .7440 olarak tespit edilmiştir. Öğrencilerin, Eğitimde FATİH Projesi'nin kullanım düzeyine ilişkin görüşlerinin belirlendiği anketin faktörleşme yapısının doğrulanması amacıyla doğrulayıcı faktör analizi uygulanmış ve elde edilen sonuca göre uyum indeksleri [χ^2=341.78, sd=140, P<0,001], (χ^2/sd)= 2.441, RMSEA=0,075, GFI=0,88 ve AGFI=0,83 olarak bulunmuştur. Uyum indeksleri incelendiğinde, χ^2/sd değerinin kabul edilebilir bir değere sahip olduğu ve RMSEA, GFI ve AGFI değerlerinin ise kabul edilebilir uyuma çok yakın değerlere sahip oldukları gözlenmiştir. Sonuç olarak ölçeğin beş faktörlü yapısı, doğrulayıcı faktör analizi ile de desteklenmiştir.

BULGULAR VE YORUMLAR

Bu bölüm problem cümlesi ve alt problemlere ait verilen çözümlenmesi ile elde edilen bulguları ve yorumları içermektedir.

Öğrencilerin Demografik Özellikleri

Araştırmaya genel lisede öğrenim gören 370 öğrenci katıldığı görülmektedir. Öğrencilerin 193'ü (%52,2) bayan, 177'si (%49,1) erkektir. Araştırmaya katılan öğrencilerden 156'sı (%42,2) fen bilimleri alanında eğitim görürken, 110'u (%29,7) Türkçe – matematik alanında ve 13'ü (%4,3) sosyal bilimler alanında eğitim görmektedirler. Yukarıdaki dağılıma göre araştırma öğrencilerinin 89'u (%24,1) 9. Sınıf seviyesinde, 120'si (%32,4) 10. Sınıf seviyesinde, 90'ı (%24,3) 11. Sınıf seviyesinde, 71'i (%19,2) 12. Sınıf seviyesinde eğitim görmektedirler.

Genel Lise Öğrencilerinin Genel Olarak Eğitimde FATİH Projesinin Kullanım Düzeyine İlişkin Görüşleri

Genel lise öğrencilerinin Eğitimde FATİH Projesi kullanım düzeyleri e-içerik kullanımı ($\bar{X}$ =3,17), eğitim gereksinimi ($\bar{X}$ =2,84) ve kurum yeterliği boyutlarında ($\bar{X}$ =2,74), "orta"; öğretim süreçleri ($\bar{X}$ =3,57), öz-yeterlik ve proje getirileri ($\bar{X}$ =3,76), boyutlarında "yüksek" değere sahiptir. Ortalamalara bakıldığında genel lise öğrencilerinin projenin kullanımında kendilerini yeterli görüp projenin getirilerine karşı yüksek düzeyde olumlu görüşe sahipken, projenin uygulama aşamasında kurumlarını yeterli görmemektedirler.

Tablo 1. Genel Lise Öğrencilerinin Genel Olarak Eğitimde FATİH Projesinin Kullanım Düzeyine İlişkin Görüşleri

Boyut	$\bar{X}$	SS
E-İçerik Kullanımı	3,1650	,82455
Eğitim Gereksinimi	2,8422	1,22812
Öğretim Süreçleri	3,5724	,84235
Öz-Yeterlik ve Proje Getirileri	3,7591	,85966
Kurum Yeterliği	2,7419	1,01576

Genel Lise Öğrencilerinin Cinsiyet Değişkenine Göre Eğitimde FATİH Projesinin Kullanım Düzeyine İlişkin Görüşleri

Tablo 2 incelendiğinde öğrencilerin e-içerik kullanımı [$t_{(368)}$ = 0,59; p>,05], eğitim gereksinimi [$t_{(368)}$ = -0,30; p>,05], öğretim süreçleri [$t_{(368)}$ = -0,42; p>,05], öz-yeterlik ve proje getirileri [$t_{(368)}$ = 0,13; p>,05] ve kurum yeterliği [$t_{(368)}$ = -0,06; p>,05] boyutlarında cinsiyet değişkenine göre anlamlı bir farklılık bulunmamaktadır.

Tablo 2. Öğrencilerin Cinsiyet Değişkenine Göre Eğitimde FATİH Projesinin Kullanım Düzeyine İlişkin t-Testi Sonuçları

Boyut	Cinsiyet	N	$\bar{X}$	S	Sd	t	p
E-İçerik Kullanımı	Erkek	177	3,19	,84	368	,59	,553
	Kız	193	3,14	,80			
Eğitim Gereksinimi	Erkek	177	2,82	1,26	368	-,30	,760
	Kız	193	2,86	1,19			
Öğretim Süreçleri	Erkek	177	3,55	,84	368	-,42	,671
	Kız	193	3,59	,83			
Öz-Yeterlik ve Proje Getirileri	Erkek	177	3,76	,85	368	,13	,890
	Kız	193	3,75	,86			
Kurum Yeterliği	Erkek	177	2,73	1,01	368	-,06	,949
	Kız	193	2,74	1,02			

*p<.05, **p<.01, ***p<.001

Erkek öğrenciler ($\bar{X}$ = 3,19) ve kız öğrenciler ($\bar{X}$ = 3,14) derslerde e-içerik kullanımının yüksek düzeyde olmadığını belirtmiş, benzer şekilde projenin uygulanması için eğitime olan gereksinimlerinin de orta düzeyde olduğunu bildirmişlerdir. Bu durum, öğrencilerin teknoloji ile tanışma yaşlarının erken oluşu dolayısıyla teknolojik cihazları kullanma yeteneklerinin yüksek olması ile açıklanabilir. Öğretim süreçleri boyutunda, erkek öğrenciler ($\bar{X}$ =3,55) ve kız öğrenciler ($\bar{X}$ =3,59) , öğretim programları ile FATİH Projesi'nin sağlam temellere dayanan bir bütünleştirme içinde olduğu yönünde yüksek düzeyde olumlu görüş birliğindedirler. Erkek öğrenciler ($\bar{X}$ =3,76) ve kız öğrenciler ($\bar{X}$ =3,75) öz-yeterliklerinin ve FATİH Projesi'nin getirilerinin yüksek olduğu görüşünü bildirmişlerdir. Kurum yeterliği boyutunda erkek öğrenciler ($\bar{X}$ =2,73) ve kız öğrenciler ($\bar{X}$ =2,74) orta düzeyde bir görüş ortaya koymuşlardır. Bu sonuçtan hareketle erkek ve kız öğrencilerin, okullarının donanımsal yapıları hakkında olumlu görüşe sahip olmadıkları yargısı çıkarılabilir.

Genel Lise Öğrencilerinin Alan Değişkenine Göre Eğitimde FATİH Projesinin Kullanım Düzeyine İlişkin Görüşleri

Tablo 3 incelendiğinde, e-içerik kullanımı [F(2-276)= 0,819 , p<.05], eğitim gereksinimi boyutunda [F(2-276)= 0,476, p<.05], öğretim süreçleri boyutunda [F(2-276)= 0,912, p<.05], öz- yeterlik ve proje getirileri boyutunda [F(2-276)= 0,962, p<.05] ve kurum yeterliği boyutunda [F(2-276)= 2,792 , p<.05] alan değişkenine göre öğrenciler arasında anlamlı fark bulunmamaktadır.

Öğretim süreçleri boyutunda [F(3-366)= 4,926 , p<.05] öğrenim seviyesi değişkenine göre öğrenciler arasında anlamlı fark bulunmaktadır. Ortalamalara bakıldığında, 9. sınıf öğrencilerinin FATİH Projesi'nin kullanımına yönelik uygulamaların öğretim programlarına entegre edilmesine ilişkin olarak, 10., 11., 12. sınıf öğrencilerine göre daha yüksek düzeyde olumlu görüş içindedirler. Buna göre 9. sınıf öğrencileri mevcut öğretim programlarına proje bütünleştirmesinden, diğer kademelerdeki arkadaşlarına göre daha yüksek seviyede memnundurlar.

Öğrencilerin öz-yeterlik ve proje getirileri boyutunda [F(3-366)= 13,203, p<.05] öğrenim seviyesi değişkenine göre öğrenciler arasında anlamlı fark bulunmaktadır. Ortalamalar göstermektedir ki, 9. sınıf öğrencileri, diğer kademedeki arkadaşlarına kıyasla kendilerini projenin uygulanabilmesi için daha yüksek düzeyde yeterli görmekte olup FATİH Projesi'nin sunduğu materyallerin eğitime olan katkısı üzerinde daha yüksek seviyede olumlu görüşe sahiptirler. Bununla beraber, 10. sınıf öğrencileri de 11. sınıf öğrencilerine karşı öz-yeterlik ve FATİH Projesi'nin getirileri konusunda yüksek seviyede olumlu görüşe sahiptirler. Kurum yeterliği boyutunda [F(3-366)= 3,374 , p<.05] öğrenim seviyesi değişkenine göre öğrenciler arasında anlamlı fark bulunmaktadır. Aritmetik ortalamalar incelendiğinde, her ne kadar 9. sınıf ve 12. sınıf öğrencileri FATİH Projesi'nin kullanım düzeyine ilişkin kurumlarını "orta" düzeyde yeterli görseler de, 12. sınıf öğrencileri, 9. sınıf öğrencilerine göre kurumlarının yeterliliği hakkında daha olumlu görüşe sahiptirler.

SONUÇ

Öğrenciler arasında Eğitimde FATİH Projesinin kullanım düzeyine ilişkin cinsiyet değişkenine bağlı görüşler incelendiğinde hiçbir boyutta anlamlı farklılığa rastlanamamıştır. Ancak, Öz-yeterlik ve proje getirileri boyutunda erkek öğrencilerin kız öğrencilere göre daha yüksek düzeyde olumlu görüş belirtmesi Işıksal ve Aşkar (2003) tarafından yapılan çalışma sonuçları ile paralellik göstermektedir. Kurum yeterliği boyutunda hem erkek hem kız öğrencilerin düşük seviyede olumlu görüş bildirerek kurumlarını FATİH Projesi kapsamında sunulan donanımsal altyapı açısından yeterli bulmamaları, öğrencilerin yaşları itibarıyla teknoloji ile tanışmışlıklarının çok erken olması, teknoloji ile donatılmış bir yaşantılarının olması ve okul içinde de bu düzeyde yüksek teknolojik materyallerinin kendilerine sunulması yönünde beklentilerinin olması ile açıklanabilir.

Öğrencilerin alan değişkenine bağlı olarak incelenen Eğitimde FATİH Projesinin kullanım düzeyine ilişkin görüşlerinde gruplar arasında tüm boyutlarda anlamlı farklılığa rastlanamamıştır. Kurum yeterliği ve öğretim süreçleri boyutlarında istatistiksel anlamda bir farklılığa rastlanmamasına rağmen aritmetik ortalamalar bize, sosyal bilimler alanındaki öğrencilerin bu boyutlarda diğer alanlardaki öğrencilere göre daha düşük düzeyde olumlu görüşe sahip olduklarını göstermektedir. Bu sonuç, sosyal bilimler alanlarındaki öğrencilerinin yaşadığı öğretim süreçlerinin her bir unsurunda projenin içerdiği gerekli güncellemenin yeterli şekilde yapılamamış olması ve derslerde proje bileşenlerinin yeterli biçimde kullanılmadığı konusunda bize fikir vermektedir.

Öğrenciler arasında öğrenim seviyesine bağlı olarak Eğitimde FATİH Projesinin kullanım düzeyine ilişkin görüşler incelendiğinde eğitim gereksinimi boyutu hariç tüm boyutlarda anlamlı farklılıkların olduğu sonucuna varılmıştır. Tüm sınıflar öğrenim seviyesinden bağımsız olarak "orta" seviyede Eğitimde FATİH Projesinin kullanım düzeyine ilişkin eğitime ihtiyaç duyduklarını belirtmişlerdir. E-içerik kullanımı üzerine 9. sınıf öğrencileri "yüksek" düzeyde olumlu görüş bildirirken, diğer gruplar "orta" düzeyde; kurum yeterliği boyutunda ise 12. sınıf öğrencileri kurumlarını Eğitimde FATİH Projesinin uygulanabilmesi için yetersiz bulurken, diğer grupların "orta" düzeyde yeterli buldukları söylenebilir. Öğretim süreçleri boyutuna ait ortalamalar incelendiğinde ise anlamlı farklılığın 9. sınıf öğrencileri ile diğer tüm seviyedeki öğrenciler arasında olduğu görülmektedir. Her ne kadar aralarında anlamlı farklılık bulunsa da tüm seviyedeki öğrenciler öğretim süreçlerinin Eğitimde FATİH Projesinin uygulanmasına yardımcı olacak şekilde güncellenmesini yüksek düzeyde gerekli görmektedirler. Ortalamalara göre, 9. sınıf öğrencilerinin FATİH Projesi öğelerinden olan e-içerik kullanımı boyutundan en yüksek düzeyde olumlu görüş bildirmelerinin nedeni, kendi öğrenim düzeyleri için hazırlanan mevcut e-içeriklerin çok sayıda olması ile açıklanabilir. Bu e-içeriklerin miktarının çok olması ancak aynı yoğunlukta ders öğretim süreçleri ile bütünleştirilmemesi de 9. sınıf öğrencilerinin bu durumdan duydukları rahatsızlığın sebebi olarak gösterilebilir.

THE DEVELOPMENT OF AN INQUIRY BASED LEARNING UNIT FOR INTEGRAL CALCULUS: THE CASE OF VOLUMES OF SOLIDS OF REVOLUTION

Çiğdem ÖZDEMIR

Erdat CATALOĞLU, Ph.D.
Bilkent University

ABSTRACT: The latest official national curriculum published by the Turkish Ministry of Education, now formally requires high-school mathematics teachers to actively incorporate computer software in their teaching. The primary purpose of this study is to demonstrate the development of an inquiry based learning unit especially geared for high school mathematics students and teachers for the general concept of integral calculus. The main theme chosen as a case for this proposed inquiry unit, is on volumes of solids of revolution of real life daily objects. As a result, the primary purpose will provide a report about a practical example of using pedagogically driven mathematics software, 3D digital modeling coupled with hands-on real life examples all embedded in a constructivist learning environment. A secondary goal of this study is to expose pre-service high-school mathematics teachers to this inquiry unit as a teacher and student. Finally, the shared experiences about the interconnected nature of knowledge construction through a double "lens", that is as a teacher and students through collaboratively building, testing and reflecting on their learning process will be reported.

Keywords: Mathematic Education, Inquiry, Modeling, Teacher Education

INTRODUCTION

The perspective of Turkish Ministry of National Education on technology in the new curriculum

The current official Turkish high school mathematics curriculum dictates the use of technology in mathematics classrooms (MoNE, 2013). The Turkish MoNE mathematics curriculum points out the fact that, both quality and quantity of teaching software related to mathematics education has increased as a result of the constant development of computer technology. Hence, the ministry expects mathematics teachers to make use of technology in mathematics classrooms. They emphasize that the utilization of technology could provide new learning and teaching opportunities for both teachers and students alike. Accordingly, using information and communication technology effectively, students could work on mathematical problems related to real life and they could spend more time on reasoning and creative thinking rather than time consuming computations.

The new mathematics curriculum summarizes the main information and communication technologies to be used in mathematics classrooms as; dynamic geometry software, graphing software, spreadsheet software, graphing calculators, interactive smart boards and tablets, data acquisition devices, computer algebra systems, dynamic statistics software and Internet. Correspondingly, Turkish MoNE expects students to use these technologies effectively in the new curriculum. Thus, students could explore the mathematical concepts through experiencing different types of thinking skills.

Inquiry based learning

Inquiry based learning is a concept which enables students to involve in conceptual understanding and builds students' ideas through inquiry (Chapman, 2011){Formatting Citation}. The concept of inquiry based learning has grown since Dewey (1938) supported that students can learn better when they investigate the problems according to their own experiences as cited in Barrow (2006). Several studies emphasizes that inquiry based learning plays a remarkable role in mathematics education (Chapman, 2011; Hähkiöniemi, 2013; National Council of teachers of Mathematics, 2000). However, there are some challenges in implementing inquiry based teaching in mathematics classrooms (Dorier & Garcia, 2013). Teacher beliefs and attitudes towards inquiry based mathematics teaching might be the main reasons of those challenges (Engeln, Euler, & Maass, 2013). Therefore, teachers should be supported to engage students in conceptual understanding through inquiry based teaching (Hähkiöniemi, 2013).

Technology enriched inquiry based learning

Many researchers support that integrating technology into mathematics classrooms enriches inquiry based learning (Hähkiöniemi, 2013; Hakverdi-Can & Sönmez, 2012; Wentworth & Monroe, 2011). According to Hahkiöniemi (2013), particularly dynamic mathematics software promotes students' investigation and exploration opportunities. Similarly, Healy and Hoyles (2001) suggest that, with the help of dynamic mathematics software, "students move from argumentation to logical deduction" (p. 235). Moreover, students could relate one geometrical representation of a formula to another and they could build hypotheses through trial and error that they apply with dynamic mathematics software.

In this study, GeoGebra was used as the dynamic mathematics software. With the help of GeoGebra, students are able to see the relationship between the theoretical formulas and their geometric meanings. Thus, students could explore the use of those formulas in their daily lives.

Teaching integral calculus

Integral calculus is perceived as challenging by many of high school students in developing conceptual understanding because of many formal definitions. According to Orton (1983), students are struggling while solving problems that they need to notice integration as a limit process of sums. Moreover, Attorps, Björk and Radic (2013) suggest that some students perceive solving integral problems as technical ability and although they do all the calculations successfully, they may not achieve conceptual understanding. As a result, the reason why students have difficulties in integral calculus is that they fail to construct a concrete meaning of the formal definitions in their mind.

The main purpose of this study is to develop a material for teachers to provide students' conceptual understanding in integral calculus through a technology integrated inquiry based lesson. Since inquiry based learning requires to work on a concept like a scientist, first of all students should understand how scientists found integral calculus. If students could understand for which need they do the integration calculations, they could build their own hypothesis, and thus, they could achieve conceptual understanding instead of solving integral calculus problems technically.

The volume of solids of revolution

In this study, particularly volume of solids of revolution was chosen as a case for this proposed inquiry based unit plan. The volume of solids of revolution is a concept of integral calculus which is thought to high school students. To get a solid of revolution, first of all, a function $y=f(x)$ is needed on an interval $[a,b]$. When we rotate this function about the x-axis, we get a three dimensional region which is called as a solid of revolution. In order to find the volume of this solid, we use the Riemann Sums approach by which we find the area under a curve by dividing the interval into finite many small subintervals as rectangles with the width Δx and length $f(x_i)$ and summing the areas of these rectangles, passing to the limit where the length of the largest subinterval goes to zero. The representation of this sum is given by the formula;

$$f(x_i)\Delta x = ¿\int_a^b f(x)dx$$

$$\sum_{i=1}^{n} ¿A = \lim_{\Delta x \to 0} ❑$$

In the case of solids of revolution we get circular disks with the length Δx and radius $f(x_i)$ instead of rectangles, and we calculate the sum of the volumes of these disks passing to the limit where the length of the largest subinterval goes zero. The volume of each circular disks are given by

$$\pi f(x_i)^2 \Delta x$$

and the sum of these circular disks passing to the limit where Δx goes zero is given by the formula;

$$V = \lim_{\Delta x \to 0} \sum_{i=1}^{n} \pi f(x_i)^2 \Delta x$$

Finally, we use the integral formula to compute the volume V of the solid of revolution;

$$V = \pi \int_a^b f(x)^2 dx$$

This study will provide students to relate the integration formula for volumes of solids of revolution to their daily lives through hands-on activities. These activities will be done in a laboratory setting. Students will first find the volume of a solid that is obtained by revolving a curve around various lines such as glasses and bottles by a volume measuring cup. Accordingly, students will insert the image of their object on GeoGebra in correspondence with the size of real object. Then, students will find the function of the object by plotting on the borders of the object and finding the line of best fit. Thus, students could apply the integration formula for volumes of solids of revolution with that line. As a result, students will see that the result approximately corresponds with the volume that they found first. The figures below depict three examples.

	A	B	C
1	0.04	2.58	
2	0.3	2.78

***Figure 1.* Volume Of A Mug**

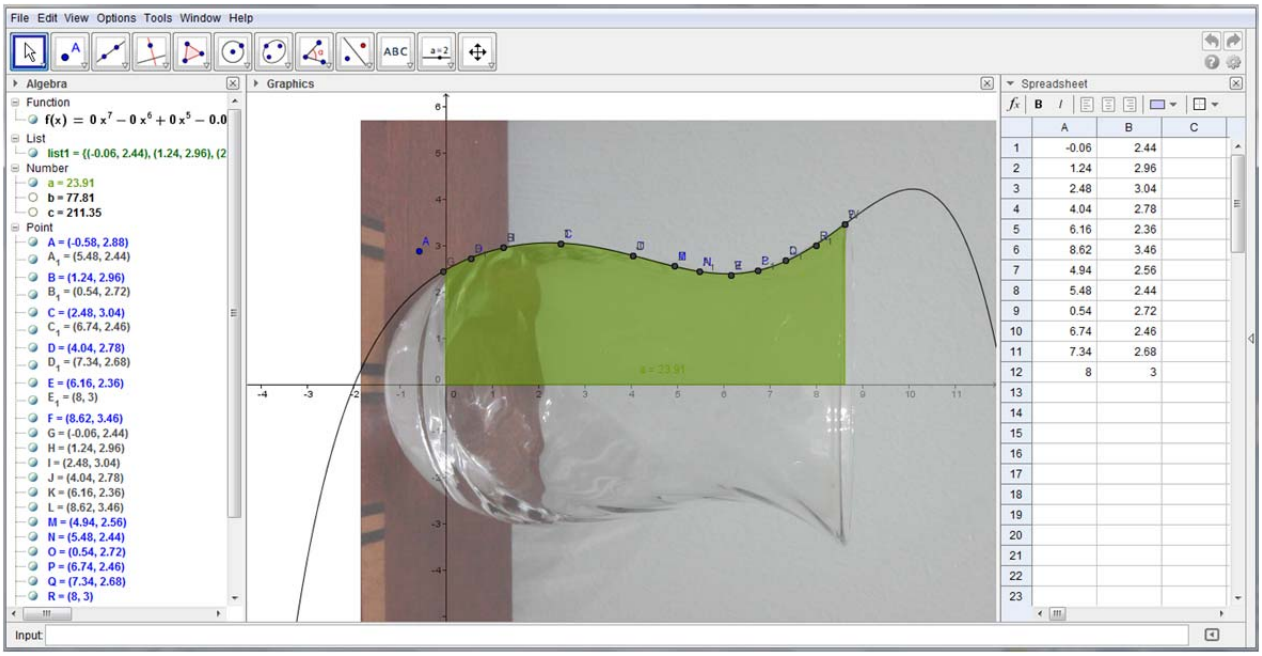

Figure 2. **Volume Of A Traditional Turkish Tea Glass.**

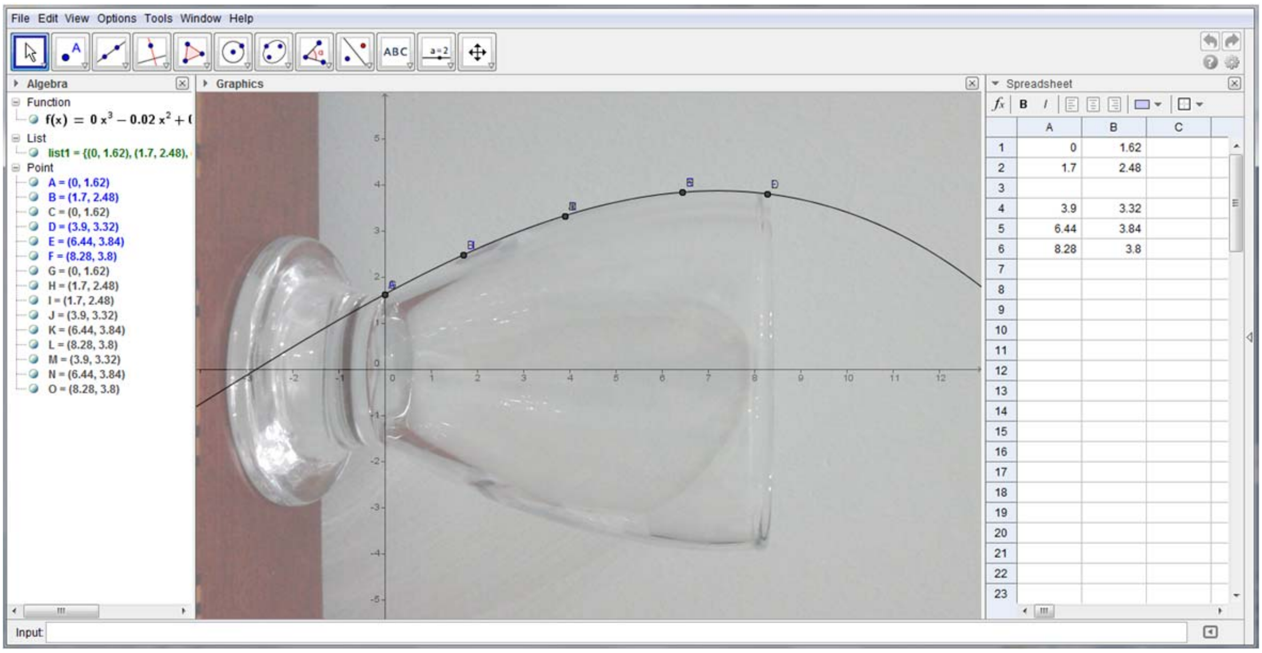

Figure 3. **Volume Of A Glass**

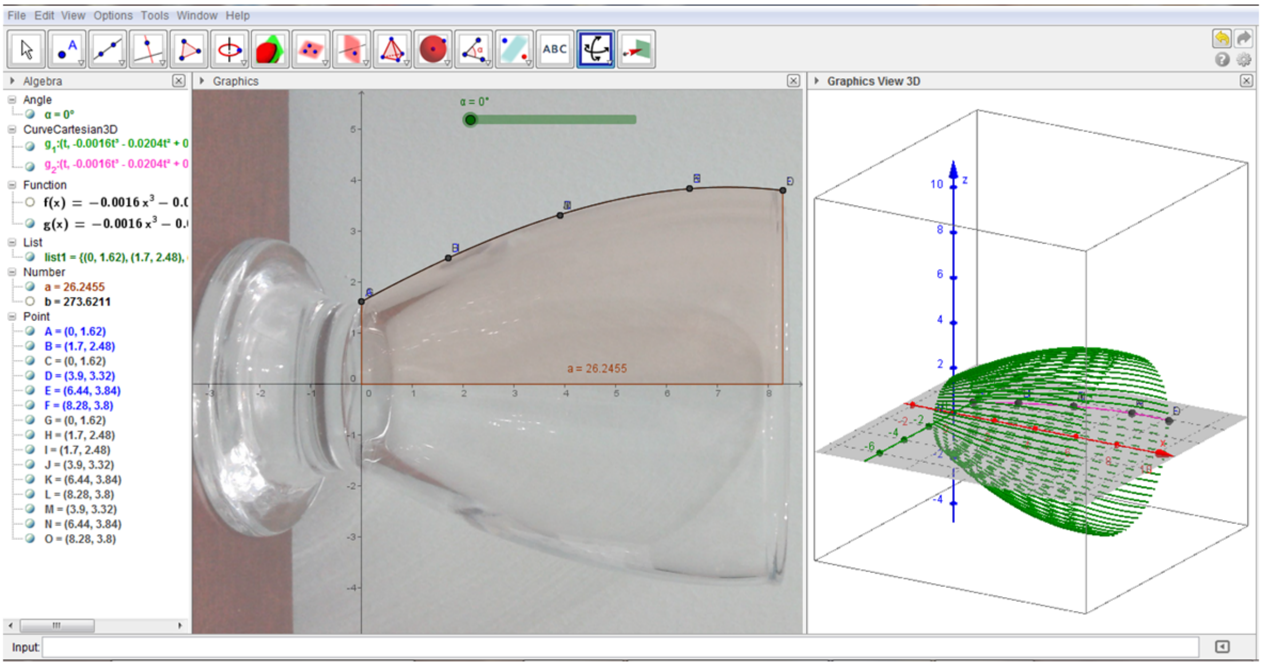

Figure4. **3D Representation Of Volume Of A Glass**

I will now explain how I had done one of these sample experiments. For example, in *Figure 3* and *Figure 4* firstly I filled the glass with water and then transferred the water into a volume measuring cup. Thus, I measured the volume of the glass as 275 ml which is equal to 275 cm^3. Then I took a photo of the glass and I inserted the image into GeoGebra as a background picture. I arranged the properties of the picture in correspondence with the length of filled part of the real glass which is approximately 8cm on the coordinate system. In order to find the curve of the border of the glass I plotted some points on the border of the glass and I entered x and y coordinates of those points on the spreadsheet view of GeoGebra. Thus, I found the line of best fit by creating a list of these points and entering them into the input box with the

FitPoly[<List of Points>, <Degree of Polynomial>]

command. I chose the degree of polynomial as three which gave the best curve of the border of the glass and I found the line of best fit function as

$$f(x) = -0.002x^3 - 0.02x^2 + 0.541x + 1.622$$

Accordingly, I calculated

$$\pi \int_0^{8.28} f(x)^2 dx$$

which is the formula for volume of solids of revolution by using input box command

Integral[<Function>, <Start x-Value>, <End x-Value>].

Consequently, the calculation gave the volume of the glass as 273.621 cm^3 which is an approximate value of the real volume of the glass.

My experiences as a student and as a teacher

In this section, I mentioned my experiences in terms of my lack of mathematics knowledge during my formal education and my difficulties in using dynamic mathematics software which I was not familiar with. Firstly, I mentioned how I was taught mathematics in particular integral calculus during my formal education. Then I remarked the importance of using dynamic mathematics software in mathematics education through my experiences. Finally, I reflected my experiences in terms of difficulties that I had during the process of doing modeling activities by using GeoGebra.

The major portion of my formal education was formed in a traditional way. As far as mathematics education was concerned, I had difficulties in abstract mathematical concepts such as integral calculus, because I always memorized the formal formulas and applied those formulas to challenging problems. Therefore, I always tried to improve my memorization skills; however I had forgotten the formal formulas in a short time. Thus, I had never learned the basic logic behind these concepts. For example, when I learned the integration formula as antidifferentiation, I did a lot of challenging exercises without knowing what I came up with. All those calculations were related to transforming one expression to another. I was successfully computing that;

$$\int \frac{4}{1-2x} dx = -2\ln|1-2x|+c$$

by using integration properties, but I did not know why I was doing these computations. However, I actually did not need to know the reason, as only successful computation was enough to get good marks from the exams.

Moreover, although I knew that $\int_a^b f(x)dx$ formula refers to the area under $f(x)$ curve between $[a,b]$ interval and $\pi\int_a^b f(x)^2 dx$ formula refers to the volume of revolution of $f(x)$ curve, I did not know how these formulas give the area or a volume. On the other hand, I was good at solving 'Find the area under $f(x)$ ' or ,'Find the volume of revolution of $f(x)$ ' types of problems, as I memorized which formula to be used for which situation, thus I applied the appropriate formula and did the appropriate calculations. Since I was studying exam orientated, I never wondered if these formulas really give an area or a volume.

As I experienced that dynamic mathematics software enable students to see the geometric representations of mathematical calculations, I was interested in using GeoGebra in teaching of integral calculus. By doing these GeoGebra experiments, I saw the instant visual geometrical outcomes of my calculations, thus I could analyze if they are meaningful or not. For example, firstly I found the volume of a glass by a measuring cup, but when I inserted the image of the glass and applied the integral formulas; I found a value which did not correspond with the real volume. Then, I realized that I did not place the image on the coordinate system in correspondence with the real glass. Moreover, as the notation of GeoGebra is similar to mathematical notation, it was easy to understand and use. Using GeoGebra also enabled me to consciously decide what operations to use as I saw the geometric representations of my operations. As a teacher, I thought that I could easily gain students curiosity through this kind of real life experiment and I could provide them with meaningful and conceptual understanding. For example, as a student I felt a great pleasure when I found the volume of the glass via Geogebra approximately same with the real volume of the glass.

On the other hand, I also had difficulties in doing the modeling activities both as a teacher and as a student. For example, I had never used dynamic mathematics software in my mathematics education; therefore it took time to get the basic logic behind GeoGebra. In order to do these kinds of experiments, firstly I had to learn the basic commands, notations and features of GeoGebra. However, there were plenty of sources that I could utilize through this process. For example I utilized from the GeoGebra Tube, GeoGebra forum, or YouTube videos created for teaching mathematics via GeoGebra. Nevertheless, sometimes it took a lot of time to find the appropriate feature that I need to use for my experiments. Although a lot of outcomes that I need to achieve are shown in applets or videos, I had difficulties in understanding which features of GeoGebra were used to achieve those outcomes. For instance, I had difficulties in finding the appropriate function that fits to the edges of my objects. Thus, I gave up many times. I needed to be patient in order to get the appropriate outcomes.

The views of pre-service high school mathematics teachers

The secondary goal of this study is to get the views of pre-service teachers' as both students and teachers through this inquiry based unit plan. Accordingly, a set of tutorials will be given to pre-service high school mathematics teachers and their learning process will be reported. Afterwards, their view of teaching integral calculus via a technology integrated inquiry based unit plan will be reported through several interviews.

WEB TASARIMI VE PROGRAMLAMA DERSİ İÇİN WEB TABANLI EĞİTİMİN ÖĞRENME ÜZERİNE ETKİSİ

THE INVESTIGATION OF THE EFFECT OF WEB-BASED TRAINING MODULE ON LEARNING FOR WEB DESIGN AND PROGRAMMING COURSE

Hüseyin Gültekin VURAL

Kubilay TAŞDELEN
Süleyman Demirel Üniversitesi Teknoloji Fakültesi Elektrik-Elektronik Mühendisliği
kubilaytasdelen@sdu.edu.tr

ÖZET: Bilişim Teknolojileri alanındaki gelişmeler sonucunda, insanoğlunun teknik, ekonomik ve toplumsal alanlardaki iletişiminde kullandığı ve bilimin dayanağı olan bilgiye erişmesi çok hızlı bir hale gelmiştir. Bilgiye erişim yollarının ve hızının artması, eğitim alanında da kendini göstermiş ve bir uzaktan eğitim modeli olan web tabanlı eğitim uygulamaların geliştirilmesine başlanılmıştır.

Web tabanlı eğitim ile bireyler arası fırsat eşitliğinin sağlandığı bir ortamda bireylerin öğrenmelerini sağlamak ve istedikleri yer ve zamanda, kişisel gereksinimlerine en iyi şekilde karşılık verebilmek amaçlanmaktadır.

Bu çalışmada, web tasarımı ve programlama dersi için web tabanlı eğitim modülü tasarlanarak, öğrencilerin istedikleri zaman ve mekânda derslerin notlarına erişme ve uygulamalarını yapabilmelerine, derste aldıkları konular ile ilgili sonuçlarını hemen görebildikleri deneme yanılmalar yapabilmelerine, eksiklerini tamamlamalarına olanak veren soruları sıklıkla çözebilmelerine, ders öğretmeni ile fikir alışverişinde bulunabilmelerine olanak sağlanmıştır. Çalışmanın sonunda öğrencilerden gelen geri bildirimler ve ders geçme notları değerlendirilerek, hazırlanan bu web tabanlı eğitim modülünün öğrenme üzerine etkisi incelenmiştir.

Anahtar sözcükler: web tabanlı eğitim, web tasarımı ve programlama

ABSTRACT: As a result of the develeopments in instructional technologies, accesibility of the information by humanbeings that is used in communication in the technical, economical and social fields, and that forms basis for science, has became faster. The increase in speed and ways to access information makes itself visible in the educational field, and web-based training application, which is a distance education model, has started to be developed.

It is aimed to provide learning of individuals in the environment in which equal oppoortunities between individuals are provided, and to respond personal needs of them in the best way at the place and the time desired with web-based training.

In this study, a web-based training module for web design and programming course were designed and with this module it is provided to students to access lecture notes at desired times and places, to make applications, to make trials and errors by seeing their results about the topics in the courses instantly, to solve questions which provide to them completing their mislearnings, and to compare notes with instructors. At the end of this study, the effect of this web-based training module on learning of students is investigated by assesing students' grades and their feedbacks.

Key words: web-based traning, web design and programming

GİRİŞ

Son yıllarda internet ve internete erişim yolları çok gelişmiştir. Eskiden internete sadece bilgisayarlar ile ulaşılabilirken şimdi tabletler, akıllı telefonlar ve smart tv'ler gibi cihazlarla da erişilebilmektedir. Bu da uzaktan eğitimin bu kanallarla da yapılmasına sebep olmuştur(Desai vd., 2009).

Eğitim olanaklarını güçlendirmek, daha verimli hale getirmek amacıyla, gelişmiş ve gelişmekte olan ülkeler eğitim sistemlerini teknolojik gelişmeler ışığında yeniden inşa etmişler ve bireylerin istedikleri yerden, istedikleri zamanda, diledikleri kadar tekrar ederek, diledikleri kadar uygulama yaparak öğrenmelerine olanak tanıyan, uzaktan eğitimin bir modeli olan Web tabanlı eğitim (WTE) uygulamalarını kullanmaya başlamışlardır.

WTE, daha önceden saptanmış hedeflerin, öğrencilere kazandırılabilmesi için, internet üzerinde oluşturulmuş, planlı ve süreli bir eğitim şekli olarak tanımlanabilir.

Ülkemizde de eğitim alanında yeni gelişmeler yaşanmakta ve öğretmen merkezli öğrenmenin aksine öğrenci merkezli, öğrencilerin derslere daha aktif katıldığı, kendi ihtiyaçlarını belirleyip, belirli bir plan içerisinde eğitimini sürdürdükleri eğitim anlayışı benimsenmiştir. (MEB, 2013).

Öğretim programlarının, Bilişim Teknolojileri (BT) destekli öğretime uyumlu hale getirilerek eğitsel e-içeriklerin oluşturulacağı bu proje ile WTE' nin önemi ve ihtiyacı vurgulanmaktadır.

Bu çalışmada Anadolu Teknik Liseleri Bilişim Teknolojileri Alanında, 11. ve 12. sınıf öğrencilerine okutulan Web Tasarımı ve Programlama (WTP) dersinin öğretimine destek olacak bir WTE modülü oluşturulmuştur. Hazırlanan WTE modülünde, öğrencilere WTP dersi için konular oluşturularak, WTP dersinin yıllık planı çerçevesinde öğrencilerin yararlanmalarına izin verilmiştir. Ders öğretmeninin yıllık planına göre anlattığı derslere katkı sağlayacağı uygulamalar ve ders notları bu modül içerisinde yer almaktadır. Modülde öğrencinin hiçbir yardımcı programa gerek duymadan yazarak ve hemen sonuçlarını gördüğü bir Java platformu bulunmaktadır. Öğrencilerin sisteme giriş ve çıkış zamanları, konuları tamamlayıp tamamlamadıkları, konuların hangi kısımlarında ne kadar zaman harcadıkları, hangi konularda zorlandıkları, hangi soruları ne kadar zamanda çözebildikleri, en çok yanlış yaptıkları uygulamalar gibi pek çok veri kayıt altına alınmakta ve ders öğretmenin bu verileri yönetici sayfasından detaylıca inceleyebildiği, öğrenci-öğretmen ve öğretmen gözetiminde öğrenci-öğrenci iletişimin sağlandığı bir sistem oluşturulmuştur. Sistemdeki tüm kodlar C# programlama dili kullanılarak oluşturulmuştur.

Oluşturulan WTE modülü 11. Sınıf öğrencilerinden seçilen 12 öğrenciye açılarak deney grubu oluşturulmuş, bu gruba alınmayan ve bir önceki eğitim öğretim yılında WTP dersini aynı öğretmen ve aynı yıllık plan ile alan öğrenciler ile de kontrol grubu oluşturulmuştur.

Çalışmanın sonunda öğrencilerden gelen geri bildirimler ve ders geçme notları değerlendirilerek, hazırlanan bu WTE modülünün öğrenme üzerine etkisi incelenmiştir.

YÖNTEM

Web Tabanlı Eğitim

Web Tabanlı Eğitim (WTE)' in anlamı üzerine pek çok görüş bildirilmiştir. Manzanares (2004), WTE sistemlerini, gelişen web teknolojileri ve bilgisayar konferans sistemleri sayesinde mekân ve zamandan bağımsız bir şekilde öğrencilerin birlikte çalışmasına olanak veren oluşumlar olarak tanımlamaktadır

Web Tabanlı Eğitimde Bulunması Gereken Özellikler

WTE' lerin web üzerindeki basit eğitim içeriklerinden ayrılabilmesi için sahip olması gereken temel özellikler vardır. Bu özelikler eğitim sisteminin amacına ve hedef kitlesine göre kimi zaman değişiklikler gösterse de genel hatlarıyla aşağıdaki fonksiyonları içermelidir.

- Kullanıcıların tanımlanması ve yönetilmesi
- Ders içeriklerinin hazırlanması
- Derslerin yönetilmesi
- Öğrenciye özel programların açılması
- Ödev ve proje verilmesi/teslimi
- Sınav ve testlerin hazırlanması ve uygulanması
- Öğrenci davranışlarının izlenmesi ve incelenmesi
- Öğrencilerin başarı durumlarının değerlendirilmesi
- Etkileşimli iletişim ortamlarının oluşturulması ve yönetilmesi(Topuz, 2010)(Al vd., 2004).

Web Tasarımı Ve Programlama Dersi

Tasarımda dikkat edilecek temel ilkeler, HTML dili komutlarını kullanma, web tasarım editörünü ve stil şablonlarını kullanarak web sayfası tasarımı yapma, betik dilini kullanma ve etkileşimli web uygulamaları için programlar hazırlama ile ilgili konularda gerekli bilgilerin verildiği derstir. Bu derste öğrenciye; HTML dili komutları ve/veya web tasarım editörü yardımıyla web sayfaları oluşturma, programlama kodlarını kullanarak etkileşimli web uygulamaları yapma yeterliklerini kazandırmak amaçlanmaktadır(TTKB, 2006).

BULGULAR

Hazırlanan WTE Modülü üç kısımdan oluşmaktadır. Bunlar tüm verilerin saklandığı ortak veritabanı ve bu veritabanını kullanan, öğretmen tarafından tüm ayarlamaların yapıldığı, istatistiklerin incelenebildiği sunucu yazılımı ile öğrencilere, sistemde var olan derslere erişme ve bu derslerden faydalanma haklarının verildiği istemci yazılımıdır.

WTE Modülü içerisindeki önemli özelliklerden birisi de hem öğrencilerin birbiri ile hem de öğretmen ile haberleşme imkânının bulunmasıdır. Ancak tüm haberleşme trafiği ders öğretmeni tarafından gözlemlenebilmektedir.

WTE Modülündeki dersler öğretmenin belirleyeceği takvime göre öğrencilerin kullanımına açılmaktadır. Sisteme giren öğrenciler bu takvim içerisindeki derslerin ders notlarına erişebilmektedirler. Dersle ilgili uygulamalar yaparak dersi daha iyi kavramaları sağlanmaktadır. Ders notlarından elde ettikleri bilgiler ve uygulamalardan edindikleri tecrübelerden sonra öğrenciler değerlendirmeye alınmaktadır. Dersin değerlendirmesinde başarılı olunursa ders tamamlanmış olarak işaretlenmektedir. Eğer başarılı olunamaz ise ders değerlendirme işlemi, ders tamamlana kadar tekrar etmektedir. Gerek dersin tamamlanması gerekse tamamlanamaması durumlarında da derse ait uygulama ekranı ve ders notları her daim öğrenciye açık tutulmaktadır. Dersin tamamlanması durumunda ise dersin değerlendirme soruları yeniden çözülebilecek şekilde öğrenciye sunulmaktadır. Bu süreç sistemdeki tüm dersler tamamlanana kadar, zamanı gelen ders için devam etmektedir.

Sunucu (Server) Yazılımı

Gerçekleştirilen uygulamada tüm ayarların yapıldığı ve sonuçların gözlemlendiği bölümdür. Yönetim bölümü sadece öğretmen tarafından kontrol edilmekte olup öğrencilerin girişine kapalıdır.

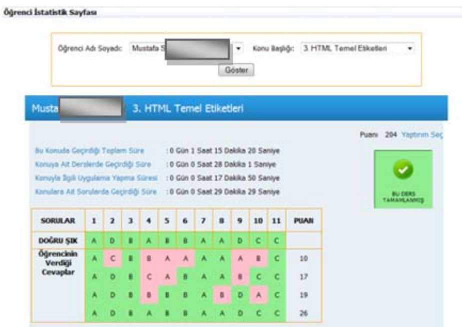
Sunucu Yazılımının Çalışması Ve Kullanılması

Bu bölümde öğretmene, ders başlangıç - bitiş tarihlerini belirleyebilme, sisteme öğrenci ekleyebilme, öğrenci bazında bireysel istatistikleri takip edebilme, sınıfın gelen istatistiğini gözlemleyebilme, gereken öğrenciye yaptırım uygulayabilme ve mesaj trafiğini kontrol edebilme hakları tanımlanmıştır.

Bireysel İstatistikler Ve Yaptırımlar

WTE modülünde kendisine tanımlanan ve süresi içerisinde tamamlanması gereken derslerde öğrenciler dersin notlarını okumalı, kendin yap bölümünde uygulamalar yapmalı, varsa uygulama sınavına katılmalı ve son olarak bölüm sonu değerlendirme sorularını çözmelidir.

Öğretmen her bir öğrencinin WTE modülündeki ilerleyişini ders bazında Şekil 1' de gösterilen öğrenci istatistik sayfası ile görebilmektedir.



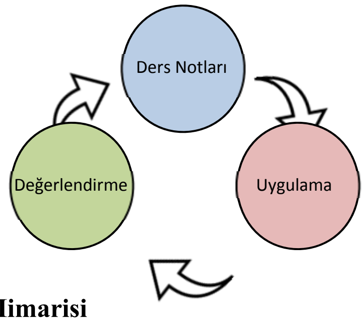
Şekil 1. İstatistik Penceresi

Sınıfın Genel İstatistikleri

WTE modülünü alan tüm öğrencilerin genel olarak istatistikleri grafiksel olarak gözlemlenebilmektedir. Sadece öğretmen kullanıcısının erişmesine izin verilen genel durum grafikleri öğrencilerin derslere katılım gerçekleştirmeleri ile eş zamanlı olarak değişiklik göstermektedir.

İstemci (Client) Yazılımı

İstemci yazılımı WTE Modülünün öğrenciler tarafından kullanılan yüzüdür. Bu kısım, derslere ait kaynak notlar, uygulama ekranı ve değerlendirme sınavından oluşmaktadır. Bu yazılım ile öğrencilere, sistemde var olan derslere erişme ve bu derslerden faydalanma hakları verilmiştir. İstemci yazılımının genel mimarisi Şekil 2' de gösterilmiştir.



Şekil 2. İstemci Yazılımının Genel Mimarisi

Öğrenci İşlemleri

Sisteme giren öğrenci, WTE modülünü kullanmak üzere öğrenci ana sayfasına ulaşır. Bu sayfada öğrenciye, sistemde var olan tüm derslerin listesi, WTE modülündeki ilerleyişini gösteren bilgi çubuğu, sistemdeki derslerin tamamlanma oranı, şimdiye kadar topladığı puan bilgisi ve içerisinde, öğretmenine ve arkadaşlarına mesaj gönderebileceği, öğretmeninden ve arkadaşlarından gelen mesajları okuyabileceği ve şifresini değiştirebileceği bir menü sunulmaktadır. Öğrenci ana sayfası Şekil 3' de gösterilmiştir.

Şekil 3. Öğrenci Ana Sayfası

Derslerin Kaynak Notları

Hazırlanan WTE Modülü içerisindeki tüm derslerde, seçilen derse ait kaynak notlar bulunmaktadır. Bu kaynak notlar MEB tarafından hazırlanmış WTP dersinin modülleri ve ders öğretmeninin hazırladığı ders notlarıdır. Bu notların içerisinde bilgi ve örnekler bulunmakta olup uygulamanın öğrenci tarafından "Kendin Yap" bölümünde yapılması istenmektedir.

Derslerin Kendin Yap Bölümü

WTE modülünün en önemli özelliği öğrencilerin dersler ile ilgili uygulama yapmalarını sağlayan kendin yap bölümüdür. Kendin yap bölümü Şekil 4' de gösterilen, bir tarafta kodların yazıldığı, bir tarafta da sonuçlarının gösterildiği ikiye bölünmüş bir pencere olup gerçek zamanlı çalışan bir yapıya sahiptir.

Bu bölümde öğrenci ikiye bölünmüş ekranın, üst kısmına kodları yazmakta ve bu kodların sonuçlarını, her bir tuşa bastıkça aşağıdaki diğer kısımda hemen görmektedir.

Şekil 4. Kendin Yap Bölümünün Çalışması

Derslerin Uygulama Sınavları

WTE modülünün içerisinde yer alan derslerde kendin yap bölümlerinin dışında öğrencilere uygulama sınavları sunulmaktadır. Öğrenciye yöneltilen uygulama sorularında boş bırakılan yerlerin öğrenci tarafından doğru olarak doldurulması istenmektedir. Öğrencinin cevaplarını vermesi ile uygulama sınavı cevap ekranında, doğru olarak doldurulan boşluklar yeşil renkle boyanırken, yanlış cevap verilen alan kırmızı renkle işaretlenmektedir.

Derslerin bölüm sonu değerlendirme sınavları

WTE modülü içerisindeki tüm dersler bölüm sonu değerlendirme sınavlarına sahiptir. Modül içerisindeki derslerin tamamlanmasının şartı öğrencinin bu bölüm sonu değerlendirme sınavından yeterli puanı almasıdır.

SONUÇ

Bu çalışma, uygulandığı gruptaki öğrencilerin, sözlü ve proje notları hariç ders geçme notlarına göre değerlendirildiğinde; sistemin kullanım oranı ile öğrencinin ders geçme başarısının bir biri ile doğru orantılı olduğu, sistemi en çok kullanan öğrencinin ders geçme notlarında en yüksek sonucu aldığı görülmüştür.

Çalışma, uygulandığı gruptaki ve diğer öğrencilerin ders geçme notları ile kıyaslanıp değerlendirildiğinde; WTE Modülü uygulanan grubun sözlü ve proje notları hariç, yazılılardan aldıkları notların aritmetik ortalaması 51,5 iken WTE Modülü uygulanmadan derslerine devam eden öğrencilerin oluşturduğu diğer grubun ortalamasının 43,15 olduğu görülmüştür. Dolayısıyla WTE Modülü uygulanan grubun WTP dersindeki başarısında %19,35 puanlık bir artış görülmüştür.

WTP dersi için hazırlanan ve dersin öğrenilmesine olan etkisinin araştırıldığı bu çalışmada, gerek anket sonuçlarına, gerek öğrencilerin ders geçme notlarına ve gerekse diğer grup ile karşılaştırılma sonuçlarına bakıldığında, hazırlanan WTE Modülünün WTP dersinin öğrenilmesine olumlu yönde etki ettiği görülmüştür.

Hazırlanan WTE Modülünün WTP dersi için kullanılabilir olduğu sonucuna varılmıştır.

SINIF ÖĞRETMENLİĞİ ÖĞRENCİLERİNİN TEKNOLOJİK PEDAGOJİK ALAN BİLGİSİ ÖZ YETERLİK DURUMLARININ BELİRLENMESİ

DETERMINATION OF CLASSROOM TEACHER TRAINING CANDIDATES' SELF SUFFICIENCY IN TECHNOLOGICAL PEDAGOGICAL CONTENT KNOWLEDGE

Nazmiye BAŞER

Murat DEMİRBAŞ

Harun ÇELİK
Kırıkkale Üniversitesi Eğitim Fakültesi

ÖZET: Bu araştırmanın amacı üniversite öğrencilerinin teknolojik pedagojik alan bilgisi öz yeterlik algılarını belirlemektir. Çalışmada survey yöntemi kullanılmıştır. Öğrencilerin pedagojik alan bilgisi öz yeterlik durumunu belirlemek için, Kaya vd. (2011) tarafından Türkçe' ye uyarlanan, ''TPAB'' anketi kullanılmıştır. Elde edilen verilerin analizi SPSS-21 istatistik programı aracılığıyla yorumlanmıştır. Çalışmada betimsel istatistiksel analizlere ek olarak bağımsız gruplar t-testi ve ANOVA testi yapılmıştır. Araştırmanın örneklemini Kırıkkale Üniversitesi Eğitim Fakültesi'nde öğrenim görmekte olan 1. 2. ve 3 sınıf öğrencilerinden toplam 391 Sınıf Öğretmenliği bölümü öğrencileri oluşturmaktadır. Analiz sonuçlarına göre öğretmen adaylarının cinsiyet değişkeniyle ilgili olarak öz yeterlik seviyeleri arasında pedagojik bilgi (PB), alan bilgisi (AB) ve pedagojik alan bilgisi (PAB) alt boyutlarında kız öğrenciler lehine anlamlı fark olduğu görülmektedir. Teknolojik bilgi(TB) boyutunda ise erkek öğrenciler lehine anlamlı bir farklılık olduğu sonucuna ulaşılmıştır. Ayrıca sonuçlara göre, öğretmen adaylarının öz yeterlik seviyeleri arasında sadece teknolojik bilgi alt boyutlarında okudukları sınıfa göre anlamlı bir farklılık görülmüştür.

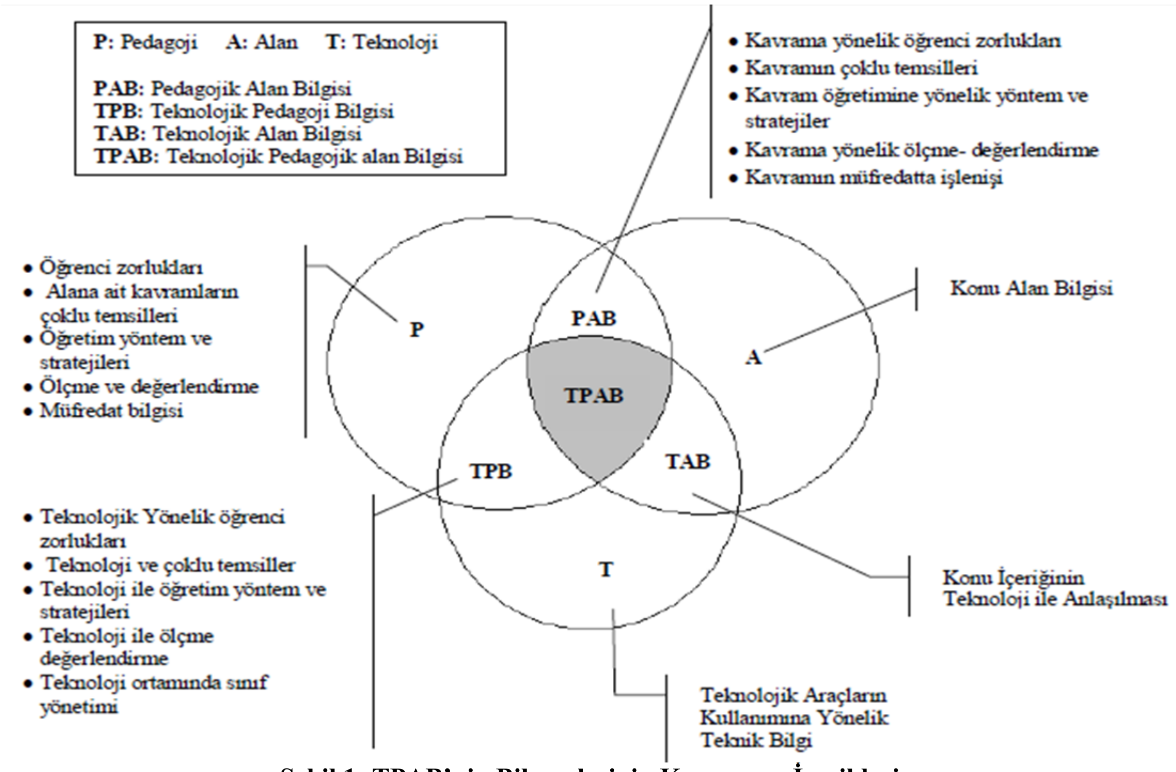
Anahtar sözcükler: Öz-yeterlik, Teknolojik Pedagojik Alan Bilgisi, Fen öğretimi, Sınıf öğretmen adayları

ABSTRACT: The aim of the study is to determine university students' sense of self sufficiency in technological pedagogical content knowledge. Survey method was used in the study. To determine students' self suffiency in pedagogical content knowledge, the survey of "TPAB" which was adapted by Kaya (2011) et al. was used. The gathered data was interpreted using SPSS-21 Program. In addition to descriptive statistical analyses, independent t-test and ANOVA were applied. The sample of the study constituted of 391 students who attend 1.,2, and 3. grades in the department of Classroom Teacher Training in Kırıkkale University. As a result of analysis, it was found that there is a significant difference between teacher candidates' gender and self-efficiency in the sub-dimensions of pedagogical content knowledge and field knowledge for girls. In the dimension of technological knowledge, an important difference was found for boys. Moreover, it was found that grades were only an important factor in the sub-dimension of technological knowledge.

Key words: Self-sufficiency, technological pedagogical content knowledge, science teaching, classroom teacher training candidates.

GİRİŞ

İnsan yaşamının teknolojiyle biçimlenmesinin hızlı bir gelişme gösterdiği yirmi birinci yüzyılda, teknolojinin kullanım alanlarından birisi de eğitimdir. Öğrenme kuramlarındaki gelişmeler, eğitimde teknoloji kullanımının gerekliliğini ortaya koymaktadır. Özellikle her öğretmenin mesleğinde başarılı olabilmesi için iletişimde ve eğitimde kullanılan araç, yöntem ve tekniklerin neler olduğunu, bunların birbirleriyle ilişkilerini, belirli hedef davranışları oluşturacak yaşantıların nasıl seçileceğini ve bunları kazandıracak öğretim durumlarının nasıl düzenleneceğini bilmesi bir zorunluluk olarak ortaya çıkmaktadır.(Çilenti 1984; Akt:Yaman, 2007). Bu doğrultuda Shulman (1986) tarafından literatüre kazandırılan pedagojik alan bilgisi (PAB)ne teknoloji bilgisi boyutu eklenerek yapılandırılan Teknolojik Pedagojik Alan Bilgisi (TPAB) ön plana çıkmaktadır. Bu yapılanmada teknoloji, pedagoji ve alan bilgisinin birleştirilmesi ile oluşan 7 bilgi alanı yer almaktadır. Bunlar; Alan bilgisi, Pedagoji bilgisi, Teknoloji bilgisi, Pedagojik alan bilgisi, Teknolojik alan bilgisi, Teknolojik pedagoji bilgisi ve Teknolojik pedagojik alan bilgisi şeklindedir(Mishra ve Koehler, 2006; Akt. Horzum, 2011). Bu yapı şekil 1'de yer almaktadır(Mishra ve Koehler, 2006; Akt: Konokman vd. 2013).



Şekil 1: TPAB'nin Bileşenlerinin Kapsam ve İçerikleri

Bu model öğretmenlere, öğretmen eğitimcilerine sınıflarda teknolojinin kullanımı ve bilgilerini yeniden değerlendirmelerine neden olmuştur(Bal ve Karademir, 2013). TPAB sinin bileşenleri:

Alan Bilgisi (AB): Alanda yer alan ve öğrenilecek ya da öğretilecek bir konudur.
Pedagojik Bilgi (PB): Öğretim yaklaşımlarının ve öğretilecek konuya hangi yaklaşımın uygun olacağının bilgisidir.
Teknolojik Bilgi (TB): Kara tahta, kitap gibi standart veya dijital video, hikâyeleme, internet gibi daha gelişmiş teknolojiler hakkındaki bilgisidir.
Pedagojik Alan Bilgisi (PAB): Konunun (alan) öğretimi bilgisidir.
Teknolojik Pedagojik Bilgi (TPB): Teknolojilerin öğrenme ve öğretim ortamlarında kullanmanın ve bu teknolojilerin öğretimi nasıl değiştireceğinin bilgisidir.
Teknolojik Alan Bilgisi (TAB): Teknoloji ve alan bilgisinin karşılıklı olarak ilişkili olduğu bilgisidir.
Teknolojik Pedagojik Alan Bilgisi (TPAB): Teknoloji, pedagoji ve alan bilgisinin bileşiminden oluşan ve bu bilgilerin ayrı ayrı formunun çok ötesinde bilgi bütünüdür.

TPAB gelişmiş olan öğretmenler sınıflarında bilgiyi daha çok teknolojik araçları kullanarak sunabilir, öğrencilerinin anlama ve düşünme seviyelerinin farkına varabilirler. Öğrencinin bilişsel seviyesini anlayan ve bu doğrultuda açıklamalar yapan örnekler veren, benzetmeler ve farklı öğretim stratejileri kullanan öğretmenler, daha iyi bir şekilde bilgiyi sunabilirler (Bal ve Karademir, 2013). Bu nedenle öğrenme-öğretme sürecinde öğretmenlerin birçok işini kolaylaştırmada teknolojinin önemi yadsınamaz. Bu yüzden öğretmen adaylarımızın bilgi ve iletişim teknolojilerini doğru ve etkili bir şekilde kullanmaları, mesleki hayatlarında etkin olarak kullanmaları oldukça önemlidir.
Bu çalışmanın amacı, Eğitim fakültelerinin sınıf öğretmenliği bölümünde okuyan 1.,2. Ve 3. sınıflarındaki öğrencilerin teknolojik pedagojik alan bilgileri algılarını farklı değişkenler (sınıf, cinsiyet) açısından incelemektir.

Araştırma Soruları

1. Sınıf öğretmen adaylarının sahip oldukları TPAB öz-yeterlik seviyeleri, cinsiyetleri açısından anlamlı bir farklılık göstermekte midir?
2. Sınıf öğretmen adaylarının sahip oldukları TPAB öz-yeterlik seviyeleri sınıf seviyeleri açısından anlamlı bir farklılık göstermekte midir?
3.

YÖNTEM

Mevcut araştırmada Kırıkkale Üniversitesi'nin İlköğretim Bölümü Sınıf Öğretmenliği Ana Bilim Dalı'nda öğrenim gören 1., 2., ve 3. sınıflardaki öğretmen adaylarının teknolojik pedagojik alan bilgisi (TPAB) konusunda özyeterlik seviyeleri arasındaki ilişki belirlenmeye çalışıldığı için tarama modeli kullanılmıştır. Tarama modeli, geçmişte ya da halen var olan bir durumu var olduğu şekliyle betimlemeyi amaçlayan bir araştırma yaklaşımıdır (Balcı, 2001; Karasar, 2009).

Çalışma Grubu

Bu araştırmanın çalışma grubunu 2012-2013 eğitim-öğretim yılında Kırıkkale Üniversitesi Eğitim Fakültesi Sınıf Öğretmenliği Bölümü 1,,2., ve 3. sınıfında öğrenim gören 391 sınıf öğretmen adayları oluşturmaktadır.

Veri Toplama ve Analizi

Veri toplama aracı olarak, Kaya vd. (2011) tarafından Türkçeye uyarlanan teknolojik pedagojik alan bilgisi (TPAB)" adlı likert bir ölçek kullanılmıştır. 24 likert maddeden oluşan anket, pedagojik bilgi (PB), teknolojik bilgi (TB), alan bilgisi (AB), teknolojik alan bilgisi (TAB), pedagojik alan bilgisi (PAB), teknolojik pedagojik bilgi (TPB) ve teknolojik pedagojik alan bilgisi (TPAB) olmak üzere toplam yedi faktörden oluşmaktadır. Çalışmada TPAB'ın yedi bileşeni için "Çok kötü-Çok iyi" şeklinde 5'li likert yapı kullanılmıştır.

Verilerin Analizi

Sınıf öğretmen adaylarının TPAB'ı oluşturan bileşenler açısından sahip oldukları öz yeterlik seviyelerinin belirlenmesinde ve kişisel bilgiler anketindeki verilerin analizinde, betimsel istatistikî testler olan yüzde ve frekans analizleri yapılmıştır. Ayrıca öğretmen adaylarının sahip oldukları TPAB öz-yeterlik seviyelerinin, cinsiyetleri ve öğrenim gördükleri sınıf değişkenleri açısından anlamlı bir farklılık gösterip göstermediğini belirlemek için bağımsız gruplar t-testi uygulanmıştır. TPAB öz yeterlik seviyelerinin bu değişkenler açısından bir farklılık gösterip göstermediğini belirlemek için de tek-yönlü ANOVA analizi kullanılmıştır. Elde edilen verilerin analizi SPSS-21 istatistik programı aracılığıyla yorumlanmıştır.

BULGULAR

Bu bölümde, araştırma sonuçlarına ilişkin elde edilen bulgular tablolar halinde sunulmuş ve değerlendirilmiştir.

Tablo1: Araştırmaya Katılan Öğrencilerin Cinsiyet Durumlarına Göre Dağılımı

Cinsiyet	f	%
Kız	295	75,4
Erkek	96	24,6
TOPLAM	391	100

Tablo 1 incelendiğinde; araştırmaya katılan sınıf öğretmenliği bölümü öğrencilerinin % 75,4'ünün kız(295) ve % 24,6'sının da erkek(96) öğrencilerden oluştuğu görülmektedir. Araştırmaya katılanların çoğunluğunu kız öğrenciler oluşturmaktadır.

Tablo2: Araştırmaya Katılan Öğrencilerin Okudukları Sınıflara Göre Dağılımı

Sınıf	f	%
I.sınıf	199	50,9
II.sınıf	125	32,0
III.sınıf	67	17,1
TOPLAM	391	100

Tablo 2 incelendiğinde; araştırmaya katılan sınıf öğretmenliği öğrencilerin % 50,9'unu I. Sınıf öğrencileri(199), % 32'sini II.sınıf öğrencileri(125) ve %17,1'ini ise III. Sınıf öğrencileri(67) oluşturmaktadır.

Tablo3: Araştırmaya Katılan Öğrencilerin Okudukları Sınıfların Cinsiyete Göre Dağılımı

Sınıf	Cinsiyet	f	%
I.sınıf	Kız	146	73,4
	Erkek	53	26,6
	TOPLAM	199	100
II.sınıf	Kız	100	80,0
	Erkek	25	20,0
	TOPLAM	125	100
III.sınıf	Kız	49	73,1
	Erkek	18	26,9
	TOPLAM	67	100

Tablo 3 incelendiğinde; araştırmaya katılan sınıf öğretmenliği I. sınıf öğrencilerinin 146'sı kız, 53'ü erkek; II. Sınıf öğrencilerinin 100'ü kız, 25'i erkek; III. Sınıf öğrencilerinin 49'u kız, 18'i erkek öğrencilerden oluştuğu görülmektedir.

Tablo4: Araştırmaya Katılan Öğrencilerin Cinsiyet Durumlarına Göre TPAB Özyeterliklerine İlişkin Bağımsız Gruplar İçin t -Testi Sonuçları

Değişkenler	Cinsiyet	N	$\bar{X}$	S	sd	t	p
Genel Toplam	Kız	295	89,37	12,35	389	1,391	.165
	Erkek	96	87,38	11,35			

TPAB puan ortalamalarında kız öğretmen adaylarının puanlarının ortalamaları $\bar{X}$ = 89,37 erkek öğretmen adaylarının ortalamaları $\bar{X}$ = 87,38'dir. Ayrıca her iki grup için standart sapmalar sırasıyla Ss=12,35 ve Ss=11,35 olarak hesaplanmıştır. Hesaplanan t değeri ve %95 güven aralığına göre ($p<.05$); kız ve erkek öğretmen adaylarının genel toplamdan aldıkları puanlar cinsiyet değişkeni açısından incelendiğinde gruplar arasında anlamlı bir farklılık olmadığı anlaşılmaktadır. [$t(389)=1,391$ ve $p>.05$].

Tablo7: Sınıf Öğretmenliği Öğrencilerinin Sahip Oldukları TPAB Özyeterlik Seviyelerinin Okudukları Sınıfa Göre ANOVA Sonuçları

Tablo7'deki ANOVA analizi sonuçlarına göre sınıf öğretmenliği öğrencilerinin teknolojik bilgi puanlarının ortalamaları arasında anlamlı bir farklılık bulunmuştur.(F=3,748, p<0,05). Bu farklılığın hangi gruplar arasında olduğunu belirleyebilmek için yapılan Scheffe testi sonuçları tablo 8'de görülmektedir.

Tablo8: Sınıf Öğretmenliği Öğrencilerinin Sahip Oldukları Teknolojik Bilgi Boyutundaki Scheffe Testi Sonuçları

Teknolojik Bilgi				
Grup	$\bar{X}$	**Sınıf I**	**Sınıf II**	**Sınıf III**
Sınıf I	9,74			*
Sınıf II	9,45			
Sınıf III	8,73			

Tablo 8'de görüldüğü gibi sınıf öğretmenliği I. sınıf öğrencilerinin teknolojik bilgi($\bar{X}$ =9,74) boyutunda sınıf öğretmenliği III. sınıf öğrencilerinin teknolojik bilgi($\bar{X}$ =8.73) boyutuna göre anlamlı bir farklılık göstermektedir.

SONUÇ

Araştırmanın sonuçlarına bakıldığı zaman öğretmen adaylarının genel olarak yüksek teknolojik pedagojik alan bilgisi (TPAB) öz yeterlik seviyelerine sahip oldukları görülmektedir. Yine araştırma sonuçları dikkate alındığında cinsiyet değişkeni ile öğretmen adaylarının TPAB öz yeterlik seviyelerinde farklılık olmadığı görülmektedir. Ancak öğretmen adaylarının TPAB bileşenlerinden en başarılı oldukları alan açısından cinsiyet değişkeni dikkate alındığında kız öğrenciler ile erkek öğrenciler arasında pedagojik bilgi (PB),alan bilgisi (AB) ve pedagojik alan bilgisi (PAB) alt boyutlarında anlamlı fark olduğu görülmektedir. Araştırmada erkek öğretmenlerin kendilerini teknolojik bilgi konusunda daha yeterli gördüğü söylenebilir. Buna karşın erkekler ve kızların teknolojik bilgi konusunda görüş puanları arasında anlamlı fark olmadığını da gösteren çalışmalar da mevcuttur. Ancak bu çalışmalarda da erkeklerin görüş puanlarının yüksek olduğunu görülmektedir (Ekici 2008;

Gezer ve Sevim, 2006); akt. Bal ve Karademir, 2013). Bu durum erkeklerin teknolojik gelişmeler konusunda daha ilgili olmaları ve bu konuya daha fazla zaman ayırmaları ile açıklanabilir. Ayrıca öğretmen adaylarının okudukları sınıf derecesi arttıkça sahip oldukları teknolojik bilgilerinde de artış olduğu görülmektedir. Bu durum ise teknolojik araçların eğitim alanında kullanılma durumu ile açıklanabilir. Bu noktadan hareketle öğretmen eğitiminde teknolojik pedagojik alan bilgisi olgusunu geliştirmek için, adaylara teknolojik araçların eğitim ortamında etkin kullanılabileceğini ve bunun önemi vurgulanmalıdır. Teknolojik araçların avantajları ve bunları kullanmada karşılaşabilecekleri sıkıntıları tanımaları, bu sıkıntıları gidermede çözüm yolu üretebilecekleri bir eğitim süreci adaylara sağlanmalıdır. Alan eğitiminde kullanabileceği teknolojik araca hakim olan ve bu konuda olumlu tutumu olan bir öğretmen adayının gelecekte bu teknolojiyi dersinde kullanması muhakkaktır(Bilgin vd. 2012).

EXAMINATION OF VISUALS IN MIDDLE SCHOOL SCIENCE TEXTBOOKS

Hasan Ozgur KAPICI

Funda SAVASCI-ACIKALIN

Particulate nature of matter(PNM) is one of the crucial topics in science education owing to the fact that it constitutes fundamentals of many other subject such as chemical bonding and reactions,solutions and matter phases.For this reason,it is important to teach PNM effectively to middle school students.To teach the topic successfully,teachers and textbooks have vital roles through learning process.Textbooks are primary sources for most of teachers in classrooms(Chiappetta&Fillman,2007).Due to the fact that its importance in educational context,they should include accurate scientific knowledge as much as possible.Textbooks not only involve texts but also contain visuals.This is called multimedia learning which occurs when students receive information presented in more than one mode, such as in pictures and words(Mayer,1997).

On the other hand,Johnstone(1993) introduced three basic levels(macroscopic,submicroscopic and symbolic) in chemistry and Gabel(1993)emphasized that level of achievement in the science lectures,which include these three types of representations,is higher.While macroscopic level comprises things that can be observed by naked eyes,submicroscopic level involves that cannot be seen naturally such atoms,molecules and so on.Symbolic level implies that equations,symbols,etc.

In this study,researchers aimed to examine visuals in middle school textbooks and research questions were determined as below:

1)What kind of representations are there in the unit of PNM in middle school science textbooks?
2)In what degree are there relationships between text and visuals in the unit of PNM in middle school science textbooks?
3)Are there captions that were used for the representations appropriate in the unit of PNM in middle school science textbooks?

In the study,document analysis was used.1166 visuals in the 8 textbooks were examined.

Analyses of data are on progress.

NON-MATHEMATICS STUDENTS' REASONING IN NON-ROUTINE CALCULUS TASKS

Ljerka Jukić MATIĆ
Department of Mathematics
University of Osijek
ljukic@mathos.hr

ABSTRACT: This paper investigates reasoning of first year non-mathematics students in non-routine calculus tasks. The students in this study were accustomed to imitative reasoning during their schooling in primary and secondary education. In order to move from imitative reasoning toward more creative reasoning, the non-routine tasks were implemented as the part of the calculus course. Using qualitative strategy in a form of interview, we examined reasoning of six students in the middle of the calculus course and at the end of the course. Analyzed data showed that creative reasoning develops slowly even when students are exposed to the non-routine tasks. Also, we have found several negative met-befores and met-afters affecting students' knowledge and interfering with the reasoning process.

Keywords: calculus, reasoning, non-mathematics students

INTRODUCTION

Society today highlights mathematical literacy as an important educational goal. Mathematical literacy means that one should possess certain mathematical competencies. Niss (2003) distinguishes eight, distinct and clearly recognizable competencies: thinking mathematically, posing and solving mathematical problems, modelling mathematically, reasoning mathematically, representing mathematical entities, handling mathematical symbols and formalisms, communicating in, with and about mathematics and making use of aids and tools. These mathematical competencies should be developed not only through primary and secondary education, but in tertiary education as well. This is surely in line with demands of industries and businesses worldwide; mathematics provides a powerful tool to understand, to investigate and to make predictions in the solution of a wide range of problems, therefore it is important to produce employees who are both mathematically capable and trained (Chinnappan et al., 2009). But, we can ask ourselves what competencies students are developing in tertiary education when they are given the same types of tasks in the exams as they have met in the mathematics courses. When it comes to exam requirements, students actually do expect this kind of situation to happen. Their expectations are anchored in previous accessible exams copies, and this is usually part of didactical contract between students and lectures (Lithner, 2010). The reasoning which students employ in such situations Lithner (2003) calls imitative reasoning. This kind of reasoning is founded on copying task solutions, for example by looking at a textbook example or remembering an algorithm. Examining final exams from the introductory calculus courses at Swedish universities, Bergqvist (2007) found that most of the tasks can be solved using imitative reasoning. Investigating teachers' view on the reasoning requirements in the calculus exams, Bergqvist (2012) found that teachers were concerned with the exam passing rate, therefore majority demanded imitative reasoning. The situation is no different in Croatian universities as well. Even though there are no published studies, browsing exams and course material accessible on the web pages of different Croatian universities, one can reach the similar conclusion, especially when it comes to calculus courses for non-mathematics students.

Lithner (2008) points out that even after many years of research, students still do inefficient rote thinking and rely on imitative reasoning. Guided with the aforementioned concerns, we examined reasoning of several non-mathematics students who have been exposed to non-routine calculus tasks. Our goal was to see how the non-routine tasks affected students' reasoning.

THEORETICAL FRAMEWORK

In the mathematics education literature, there can be found many definitions describing the term reasoning. Lithner (2008) defined reasoning as the line of thought that is adopted to produce assertions and to reach conclusions when solving tasks. It is not necessarily based on formal logic, nor restricted to proof. It may even be incorrect as long as there are some sensible reasons (to the reasoner) supporting it and can be seen as thinking process, as the product of these processes, or as both. It can have characteristics of high and low quality. In this paper we adopt aforementioned definition of reasoning.

Lithner (2008) distinguishes two types of mathematical reasoning: imitative and creative mathematically founded reasoning. Everything that includes rote learning reasoning is in fact imitative reasoning, and the opposite reasoning is creative reasoning. Creative mathematically founded reasoning fulfills following criteria: novelty, plausibility, flexibility and mathematical foundation. *Novelty* includes new reasoning sequence that is created or recreated if forgotten. *Plausibility* can be described as using arguments to support the strategy choice and/or strategy implementation. *Flexibility* admits different approaches and adaptions to the situation and it does not suffer from fixation that hinders the progress. *Mathematical foundation* means the argumentation is founded on intrinsic mathematical properties of the component involved in the reasoning. Creative reasoning does not have to be a challenge as problem solving but conceptual understanding is deeply anchored in it, unlike in imitative reasoning.

Imitative reasoning consists of several different types of superficial reasoning. *Memorized Reasoning (MR)* is when the strategy choice is founded on recalling an answer and the strategy implementation consists of writing this answer down with no further consideration. *Algorithmic Reasoning (AR)* is implemented when the strategy choice involves recalling a certain algorithm (set of rules) for solving the given problem. The strategy implementation is trivial, straightforward once the rules are recalled. AR has several variants: familiar algorithmic reasoning, delimiting algorithmic reasoning and guided algorithmic reasoning. The strategy choice in *Familiar AR* is founded on recognizing the task as being familiar, which can be solved by a corresponding known algorithm. In *Delimiting AR*, an algorithm is chosen from a set that is delimited through surface relation with the task. Following the algorithm carries out the implementation of the strategy. If this implementation does not produce desired outcome, the algorithm is abandoned and a new one is chosen. In *Guided* AR, the reasoning is mainly guided by two types of sources that are external to the task. In person-guided AR, a teacher pilots the student's solution. In text-guided AR, the strategy choice is founded on identifying, in the task to be solved, similar surface properties to those in a text source (e.g., a textbook).

The main problem with algorithmic reasoning is not that students do not learn creative reasoning, but that they do not develop the conceptual knowledge necessary for learning different aspects of mathematics (Lithner, 2004). Cox (1994) argued that many first-year university students obtain good grades by concentrating on routine topics, instead of aiming at deep understanding of fundamental topics. Schoenfeld (1991) pointed out that while many teachers are trying to reduce complexity of mathematical concepts and processes, students are trying to cope with curriculum goals so they often use quicker short-cut strategies to learning and passing exams. Lithner (2008) claimed that the most frequent type of reduction of complexity is focused on algorithmic procedures that can solve advanced task and not using conceptual understanding or creative reasoning at all. He supported Tall's (1997) conclusion on "vicious circle" of procedural learning and teaching where, for example, calculus lecturers focus on the differentiation and integration on symbolic level and ask similar question in examinations.

Met-befores and met-afters

A met-before is a mental construct that person uses at a given time based on prior experiences (Tall, 2006). Using met-befores can sometimes be an advantage when person is learning a new mathematical concept and sometimes it can be an obstacle which causes severe difficulties. Hence, met-befores affect learning of new concepts, but new mathematical concepts may also affect older knowledge. Such mental constructs are called *met-afters* (Lima & Tall, 2008). Met-afters are those experiences met at the later time that affect the retention of old knowledge. Met-afters can also be both positive and negative, and the negative effect of some met-after shows fragility or inconsistency of the earlier learned knowledge.

New knowledge that builds on previous knowledge is much better remembered, but concepts that do not fit into earlier experience are learned temporarily and easily forgotten or not learned at all. According to McGowen and Tall (2010), this can be observed when student, for instance, is interested only in algorithmic reasoning, relying on well-established procedures or algorithms. If there is no conceptual meaning, this kind of knowledge is stored improperly and is very fragile when person tries to adapt it to new situation. This previous knowledge makes it difficult to understand new subject matter, since the student is trying to distinguish among accessible rules and is trying to imbed new knowledge into his fragmented knowledge structure.

Setting up the scene

The tasks that are given to students within some mathematics course can be categorized as routine and non-routine tasks. The main difference between the non-routine and routine task is that in the former the solver has to, at least partially, construct his/her solution method, while in the routine task, the method is already known by the solver or provided by an external source such as the book or the teacher (Lithner, 2012). To be able to determine if a task is routine or not, it is insufficient to consider properties of the task alone, but the relation between the task and the solver has to be considered (Schoenfeld, 1985).

In order to move from aforementioned "vicious circle", where university calculus courses promote procedural knowledge and imitative reasoning, the non-routine tasks were implemented in a calculus course given to one group of civil engineering students at one university in Croatia. Selden et al. (1998) suggested that the non-routine tasks should be implemented as the explicit part of the curriculum in traditional calculus courses, not at the end, but throughout the course in the exercises sessions or in the homework. This group of civil engineering students obtained two or three non-routine tasks for homework in each exercise session. The homework should have been handed over to the teaching assistant of the course. The homework tasks were solved sometimes in the next exercise session, and sometimes the solution was only commented. The routine calculus tasks, which were given to the students in the course, asked for the application of some procedure that was shown to them either by lecturer or teaching assistant, while the non-routine tasks asked for more conceptual understanding. For instance, the routine tasks, that students solved in exercise session, asked for evaluation of function limit at some point e.g. "Find $\lim_{x\to 1}\frac{1-x^3}{1-x}$", while the corresponding non-routine task given for a homework had the following form "Is there an a such that $\lim_{x\to 3}\frac{x^2+x-ax-a+4}{x^2-2x-3}$ exists? Explain your answer."

Since Hiebert (2003) argues that students learn when they are given an opportunity to learn, we wanted to see if, and how, the non-routine tasks influenced on students' reasoning.

METHODOLOGY

Participants

This study was conducted at one university in Croatia, and participants were the first year students who belonged to the civil engineering study program. The participants were chosen according to the scores obtained in the calculus mid-term exam. We have chosen students who scored between 65% and 70% in the exam, and we have classified them as average students, i.e. students who possessed some knowledge, were far from failing the exam, but also were not close to excellent scores. Their scores represent the most common results in the calculus exam among civil engineering students. In order to pass the calculus course, the students in this study program have to pass both written exam and oral exam. Moreover, the written exam consists of the mid-term exam and the final exam. In the written exam students have to solve various tasks, while the oral exam puts emphasis on the mathematical theory. Participating in the study was voluntary and students had right to withdraw from the study at any time, therefore we believe that students invested a significant effort into solving given tasks. The students in this study will be named only with the capital letters of their names in order to assure their privacy.

Method

The empirical data was collected from six task-based interviews. The students were interviewed in pairs. Arksey & Knight (1999) argue that this method is better for establishing an atmosphere of confidence with two students being interviewed at the same time and because the interviewees may 'fill in gaps' for each other. Also, students' interaction may also be of interest. Schoenfeld (1985) gives support for this kind of interview, stating that two-person protocols often provide better insight and information about students' reasoning and knowledge.

In order to estimate if there were any changes in students' reasoning, students were interviewed in two occasions: in the middle of the course, just after the mid-term exam, and after passing the course. In the interview, the participants were given specific non-routine tasks designed in collaboration with lecturer and teaching assistant of the course. At the start of the interview, participants were given directions how to behave when solving given tasks. They were asked to talk to each other when solving the task, to state out loud everything they are thinking at the moment, not to plan what to say, and to behave like they are alone in the room working together on their homework or any other assignment. Similar directions were recommended by Ericsson & Simon (1993) in order to initiate the student's thinking out loud.

In both occasions, the interview was separated into two parts. In the first minutes, the author only reminded the participants to keep talking if they were silent for a while. If the students struggled with the given tasks more than several minutes, the author asked direct questions, trying to get the students to explain what they were doing and why they were doing it.

The interviews were video-taped, transcribed and analyzed together with the students' written work. We videotaped students work because we wanted to see their gestures, type of interaction between the students and their tone of voice. We believe this plays an important part in the student's behavior and can say something about the student's mathematical reasoning. However, in this paper we will focus more on the verbal expressions.

Tasks

Before the interviews took place, we examined participants' results and solutions in the mid-term exam and in the final exam where they had to solve several routine tasks from differential calculus. This was necessary to determine whether the students had the requisite calculus knowledge to solve the non-routine tasks.
The routine tasks in the-mid-term asked students to:

- calculate the limit of the function at the point,
- examine whether or not the function is continuous at the point
- determine extreme values for the given function

The routine task in the final exam asked students to investigate all properties (domain, zero points, continuity, asymptotes, extremes, intervals of decrease and increase, the point of inflection, intervals of concavity) of certain function given with algebraic expression and to draw the graph of the function accordingly.
In the interview, students were given the non-routine task with concepts that emerged in the routine tasks in the exercise sessions and in the exams. However, there were no concrete algebraic expression for the functions in the tasks, wherefore those tasks asked for flexibility and creative reasoning.
Following tasks were given to students:

1. It is given function $f: R \rightarrow$R. Let $f'(x_0) = 0$ for only one point x_0. Also let $x_0 > 0$ and $f(x_0) < 0$. If $\lim_{x\to+\infty} f(x) = \lim_{x\to-\infty} f(x) = +\infty$, how many zero points does function *f* have?
2. Sketch the graph of a function *f* which satisfies the following conditions:
   a. f is discontinuous at $x = 0$ and $f(0) = 1$;
   b. $f''(x) < 0$ for all $x < 0$ and $f''(x) > 0$ for all $x > 0$;
   c. $f'(-1) = 0$ and $f'(x) \neq 0$ for $x \neq -1$.

The first task was given to students after the mid-term exam, and the second task was given after passing the course. Students were given sheets of papers for solving tasks. Also they could use their notebooks if they felt they should look something up.

RESULTS

Here we will not provide only students' answer to non-routine tasks, but we also will describe the whole process of solving to be able to observe students' reasoning.

Task 1
Firstly, we will report on Task 1, given in the middle of the course, and afterwards we will report on Task 2, given to students after passing the course.

Students D&P

Task 1 was given to students D&P when they were in the middle of the calculus course. When confronted with the task, students sat in a silence for a while and then student P gave his solution to the task where he identified $f'(x_0) = 0$ as zero point of the function and consequently concluded how this function had only one zero point. Furthermore, he placed this zero point in the origin of coordinate system.

> P: It is equal with zero so… When we search for zero point of the function, it is in fact first derivative. Here it says $f'(x_0) = 0$, therefore it means that we have only one zero point. And it's 0. This point is in the origin of coordinate system.

Student D did not interfere while student P was explaining his solution; however, his face mimic implicated that he was not sure that this solution was right. Some time elapsed since students spoke, so interviewer started the second part of the interview. Here the interviewer asked students if they have ever met derivatives and where derivatives were used in the course. Student P interpreted $f'(x_0) = 0$ again as zero point of the function, and even when interviewer explained that in fact x_0 represents critical point of the function, student P resumed with reasoning in wrong way. However, student D claimed that x_0 was point of inflection:

I (interviewer): Have you ever used a first derivative? What for?
P: Yes, we have. It's point in which graph of the function crosses x-axis.
I: Hm…What if I say it's, in fact, a critical point. What would that be?
P: Zero point.
I: Hm… Have you ever used another derivative?
P: Yes, second. When something is maximum or minimum.
D: I think $f'(x_0) = 0$ says x_0 is point of inflection.
[silence]

Even with significant guidance from the interviewer, students D&P could not move in the reasoning sequence. They claimed the task was too difficult pointing out the fact they had never met task phrased this way, and that task was created for mathematics students. Although students had experienced tasks without calculation, they eventually gave up, not examining other given conditions and claiming there are no concrete numbers to work with.

I: Hm…Let's try this way...Where is this point? What else is given?
D: It's in the origin.
I: Do you have some other information?
P: I do not understand. I have never met task like this.
D: It' too difficult. I know to calculate zero point for the function but this way no… We are not mathematics students.
I: But you met tasks without calculation in the course, didn't you?
P: Yes.

Students N&M

Students N&M solved task without any assistance or prompts from the interviewer. They had read the task silently and afterwards they commented the amount of the written text in the tasks. Their whole reasoning process lasted very shortly, but they also experienced some difficulties in the process: the student N identified x_0 as the zero point, and the student M situated the point in the wrong part of the coordinate system, namely the first quadrant:

N: Too much text [laughs].
M: Hm, well…
N: How many zero points does function f have?
M: So for only one x we have $f'(x_0) = 0$ … Aha, it means that function has only one extreme.
N: Zero point.
M: Zero point and extreme are not the same.
N: Oh, yes yes… It's about extreme values.
M: This extreme value is here [shows first quadrant].…
N: No... x_0 is here [point at positive part of the x axis]… and $f(x_0)$ is negative…. so the point is in fourth quadrant.

Students got the idea to separate function limit in two parts and to see what each part represents. Student M said that function values go to the positive infinity for all positive x-values, and students N concluded the same for negative x-values. They made the figure of the given function in their head and this enabled them to give answer to the posed question. Interestingly, when the reasoning went in the wrong direction, the students helped each other; one member of the pair steered the reasoning process on the right track.

Students B&J

The student B had read Task 1 out loud, and both students had the same reaction to the given task, namely they were intimidated with the amount of data in the task. When students began to interpret the given data, student B concluded that $f'(x_0) = 0$ is a derivative of the constant, but student J corrected him.

J: This is weird…Never seen something like this....this information…too much data.
B: Yes. I agree… Much data…. It [tasks] says that derivative of the constant is zero.
J: No, that's critical point.
B: Hm…

[silence]

The interviewer asked students to express out loud what they were thinking that moment, but the students stayed silent for several minutes. In order to stimulate the reasoning process, the interviewer gave students a prompt:

I (interviewer): Go on... What seems to be the problem?
B: Do not know what to do with the data.
I: What about drawing what is given in the task?

Even with this prompt, students were not able to move further in the reasoning sequence, and the task was solved with a significant guidance from the interviewer. The interviewer asked what the given data represented and the students responded accordingly. The students B&J alternated in data interpretation, but none of them was independent in the reasoning process. The point $(x_0, f(x_0))$ was drawn in the correct quadrant, and students concluded that the function values go to infinity:

I: Where does the point $(x_0, f(x_0))$ lie?
B: In the second quadrant [pointing at the fourth quadrant] because x_0 is positive and that is on the right from the origin on x- axis, and $f(x_0)$ is negative and that is down on y-axis.
I: What about next piece of data? What does it says?
B: That everything goes to infinity.

At the end of the task, student B concluded that he can sketch parabola from the given data but he was uncertain how to draw it because there is only one point given in the task. However, student J took initiative and made drawing.

B: Hmm… this is kind of parabola... (laughs). But where to put it? I have only one point at disposition.
J: [takes pencil and draws] You do not need another point. See? If you connect all conditions, you get graph.
B: Oh… and there are two zero points

Task 2

Here we will present detail of students' solution for Task 2. This task was given to students shortly after they passed the calculus course. Here we will also provide detailed descriptions of students' reasoning and excerpts.

Students D&P

Initial behavior of students D&P was similar as in Task 1, but this time student D was involved in solving from the start. Student P stated that function crosses over x-axis when the function has discontinuity in zero, and student D stated that second derivative is usually used for calculating minimum and maximum of some function.

P: [draws coordinate system] This means that function in 0 would cross axis. [draws small circle in the origin of coordinate system]
D: Second condition....We used this when we calculated minimum and maximum.
[silence]

Students stopped after interpretation of two conditions. It seemed that they did not know what to do next, so after several minutes of silence, the interviewer asked them to explain the role of the first and second derivative when examining properties of the function. The students remained silent, so the interviewer tried another approach asking them how they determined intervals of concavity for some function. It was only after this prompt that students connected concavity and second derivative. Later student P interpreted -1 as the zero point of the function in third condition $f'(-1) = 0$, but student D corrected him. However, the students could not incorporate all conditions to sketch the figure.

I (interviewer): How did you determine where the function is concave upward or concave downward?
P: It' s concave upward when second derivative is less than zero.
D: Hm...no... I think is concave downward in that case.
P: [draws graph of function where certain parts are concave upward and concave downward] So let's look at parabola… second derivative… greater than zero here where [it] is concave upward, and concave downward here [pointing to the figure]
[silence]

I: What about next condition? What does -1 represent?
P: It's zero point.
D: Hmm… no it's maximum. See here at the figure [pointing to upper figure]… the derivative is zero in the critical point and then it follows it's maximum form other given conditions
[silence]
I: And now, can you incorporate all condition in your sketch?
P: I cannot make figure in my head.

Students N&M

After several months, when faced with Task 2, students N&M employed the same strategy as they had in Task 1. They read the task silently and then they started to interpret conditions like they are talking to each other. First of all, student N decided to draw the coordinate system. Then student M said that the function f had a hole in 0 and student N sketched that hole in the coordinate system as an empty circle at the point (0,0) and drew a full black circle at the point (0,1). Then they interpreted condition b. Student M concluded that condition b. described when the function was convergent or divergent, and student N concluded that function increased or decreased at given intervals. On the other side of the paper, student M drew his sketch of divergent and convergent functions. In fact, those figures represented curves being concave upward and concave downward. Student N pointed out that discontinuity should be incorporated in the drawing, and it should be where the function was changing its shape from concave downward to concave upward. But, this remark had disturbed the reasoning sequence of student M. He became puzzled with the outcome, but student N took over and drew that part of figure.

M: Second condition... It could be … [silence]
I (interviewer): Where have you used second derivative?
M: When something is convergent and divergent….but I do not remember when you use the first thing and when the second
N: For intervals of decrease or increase.
M: That is the first derivative, the second is used for that when something converges or diverges [draws a figure of curves being concave upward and concave downward]
N: Ok, you mean concave upward and downward…Discontinuity is here where the function changes its shape.
M: Well, no… that would mean… when $f''(x) > 0$, it is concave upward, when $f''(x) < 0$, it is concave downward.
N: See, here where $y = 1$, it fits… it goes like this [corrects figure, draws curve looking like parabola, having minimum]

The students M&N switched to condition c. identifying -1 as the only extreme value of this function. They changed their figure according to a new condition, and again the student M was a bit puzzled if new figure was correct solution of the task. The student N explained that new figure fulfills all conditions, but the student M expressed his doubts once more because that graph did not look alike any other graph he had ever seen:
M: But we have two functions now...
N: We fulfilled all conditions. It's alright.
M: So it's ok that we have two parts?
N: The function has discontinuity in 0.
M: Hm…I tried to imagine something I have seen before, and now I see it doesn't make sense.

Students B&J

In Task 2, the students B&J decided to draw the coordinate system firstly, and then they read the rest of the task. Reading out loud the condition a., the student B noticed there are some points in the text and drew them in the coordinate system. The points, he marked, had following coordinates (1,0) and (0,0). He said that condition b. was about intervals of increase and decrease of that function, and then he stopped looking puzzled. During that time, student J was silent, examining the task. Since both students did not say a word for longer time, the interviewer got involved asking questions about given condition. Those questions served as an aid in the reasoning sequence. The student B corrected his drawing by marking point (0,1) instead of point (1,0), but he interpreted condition b. again in the same manner. This time student J got involved and corrected him.
I (interviewer): Are you sure you drew it correctly?
B: Well...no [corrects his drawing]

I: What about condition b.?
B: We had this at maximum and minimum. When f'' is less than zero, than we have maximum. When f'' is greater than zero we have minimum.
J: No. This [condition] says when the function is concave upward and when the function is concave downward…
[silence]
I: Where the function is concave upward and where the function is concave downward?
J: On the left side of x-axis is concave upward and on the right side is concave downward.
[silence]

Students B&J discussed how shapes of concave upward and concave downward looked like, trying to decide what shape parabola $y = x^2$ has. After discussion, the student J drew the graph of function that satisfied condition b. Students moved to condition c. However, this new information caused confusion when students tried to incorporate it with other data they had. The aid of interviewer was needed again in the form of leading questions. At the end of the task, the students did not adjust their figure so that all conditions were met. Moreover, drawing represented the graph of the function with two extrema; having maximum on the left side of x-axis, and having minimum on the right side of x-axis. In this part of interview, students J had took the lead role.

I: What does the third condition says?
J: That's critical point.
I: Where?
J: On the negative part of the x-axis.
I: What property does function have there?
J: It's concave upward
I: So what kind of point we have there.
J: Hm … It's maximum. [puts the pencil down]
I: Is this solution?
B: Yes.

DISCUSSION

These non-routine tasks do not represent problems in terms of Schoenfeld (1985), but can be characterized as the moderately non-routine tasks. The interviews given in two occasions highlighted some difficulties, which students can encounter when solving such non-routine tasks. Also, we were able to detect if there were changes in the students' reasoning as they progressed through the course.

Students D&P experienced significant difficulties in the process of reasoning in both occasions. The absences of computation in the given tasks prevented students to rely on procedures and to use algorithmic reasoning to which they were more accustomed. Their reasoning in Task 1 had erroneous base from the start what disabled them to move further from the first condition. In the beginning, student P used familiar AR when he concluded that the function in fact has one zero point. Here he relied on superficial property, namely the expression where the function f was equal with the zero. Student D also used imitative reasoning when he concluded that x_0 is the point of inflection. He relied on recalling something he has seen before, not giving any arguments why he reached such conclusion. The students experienced significant frustration because they could not interpret the given condition in the right way and this reflected on their reluctance to examine other conditions. They pointed out that they knew how to calculate derivatives, but that the tasks without any calculations were only for mathematics students. Certain difficulties appeared also in Task 2, where students, only after the intervention, could move on further in the task. The students showed they were quite dependent on the external guidance in their reasoning. But, if we compare students' reasoning examined in two occasions, in the middle of the course (Task 1), and the other after the course (Task 2), we can see some positive shifts in the sequence of reasoning. Reasoning in the second task is in some part local creative since students did use argumentation and considered intrinsic properties of problematic components all together.

We identified some negative met-befores and met-afters in the base of their knowledge structure, which hindered their reasoning sequence. For example, student P interpreted $f'(x_0) = 0$ or $f'(-1) = 0$ as x_0 or -1 were the zero point of the function, and that had a stopping effect in his further reasoning. Calculation of zero points of some function is frequently done in high school mathematics, wherefore student P disregarded a sign for the derivative and identified this expression with commonly seen expression $f(x_0) = 0$ and this triggered familiar AR. On the other hand, in this calculus course, students learn about the concepts of critical points and extrema before the concept of point of inflection. Therefore identifying the expression $f'(x_0) = 0$ in Task 1 as a property which satisfies the point of inflection can be considered as the met-after which, we believe, influenced on student D's reasoning.

Students M&N solved given tasks themselves with almost no assistance from the interviewer in both occasions. They complemented their reasoning in both tasks and together reached conclusions that were anchored in relevant mathematical properties of the concepts they were reasoning about. In Task 1, student positioned given point in the right quadrant and concluded it was a critical point from the relations that were provided. They reached meaningful conclusion about function values after separating the function limit in two parts and they verified their solution at the end of the task. In Task 2, they interpreted all conditions in the right way, and sketched required graph of the function. But, in Task 2, it became more evident that student M aspired toward something he had seen before, showing the desire toward familiar AR. Even though students relied on conceptual understanding, the puzzlement of student M at the end of the task exposed his uncertainty. The obtained graph did not resemble any graph he had seen before and he believed this was not the right solution.

We identified certain negative met-befores in their knowledge structure. In Task 1, those were interpretation of x_0 as zero point in $f'(x_0) = 0$ (student N), and placing the point $(x_0, f(x_0))$ in the first quadrant (student M). The first is similar as in the case of students D&P, and the latter can be connected with presentation of many function graphs in the textbooks and lectures. Usually, when the lecturer (either at university or secondary school) sketches graph of arbitrary function as an example to show some property, it is mainly placed in the first quadrant, or the major part of the graph is sketched there. In Task 2, student N identified the second derivative with properties of increase or decrease of the function. In this calculus course, usage of first derivative for intervals of increase and decrease is taught before the second derivative and its connection with concavity. This met-before indicates that concepts related to the first and second derivatives were not properly understood. But, it seems that this mental construct did not have negative effect on solving the tasks in calculus exams, because student did pass the course. Even though these met-befores were evident in students' knowledge, their reasoning was not suppressed like in the case of students D&P. The members of the pair corrected each other, and consequently, produced a valid solution for the tasks. The question that remains unanswered is whether students alone would be able to solve the tasks, and whether these negative met-befores would stop them to proceed further in the reasoning process.

Reasoning of students B&J was guided with the assistance of the interviewer in both occasions (in the middle of the course and after the course). Moreover, in Task 1, students showed inability to move further beyond their inference about the amount of the text and data in the task. Besides giving a prompt for drawing data in the coordinate system, the interviewer asked what the certain piece of data represents, but did not participate in the interpretation. Therefore components of the local creative reasoning can be found in students' reasoning sequence. Using their conceptual understanding, students obtained the right solution, but the final conclusion could not be reached without interviewer's initial help. In Task 2, students showed more initiative, namely they were more creative, but the interviewer again served as the support and the guidance in the reasoning sequence. The students were reluctant to express their thinking out loud and to continue their reasoning, what can be inferred from silence gaps in the process. However, we would not say that students lacked resources or knowledge for the tasks. Students used arguments that are mathematically founded to provide validity of their conclusions. Their reasoning was anchored in intrinsic properties of the components in the reasoning: the relation between the property of function being concave upward or downward and the shape of parabola to determine what shape given function has, or the relation between critical point and the shape of the function to conclude what extreme value is given.

Some negative met-befores were found in knowledge structure of student B. At the end of the Task 1, student B identified graph of the function as the graph of well-known quadratic function. This interpretation of the obtained graph does not have to be necessarily problematic met-before, but it certainly can have negative impact in other situations. Here we see another met-before as much more problematic and that is a need for "formula" i.e. concrete expression which should help the student to draw "parabola". According to Tall (2006), seeking for a function that person has already met and the need for formula hinders the development of advanced mathematical thinking. Another negative met-before is the interpretation of condition *b*., namely connecting $f'' < 0$ with the property of increase or decrease of some function, what together with the interpretation of $f'(x_0) = 0$ as the derivative of the constant, indicates that student did not quite understand the topic of first derivative and related concepts of: extrema and intervals of increase and decrease. However, the student did pass the calculus course with the average grade, what indicates that these problematic met-befores were not visible in reasoning that was required in the calculus exams.

CONCLUSION

The students in this study frequently used imitative reasoning during their schooling in primary and secondary education. The aim of the study was to examine if meeting the non-routine tasks in the calculus course had any effect on their reasoning. The results of the study showed that creative reasoning was developing slowly. When solving the non-routine tasks, students showed tendency to be guided in the reasoning sequence even at the end of the course, or more likely, after passing the course. Also, they expressed the need for concrete expressions to work with. On the other hand, what students had met before and after learning some mathematical topic had a wide impact on their reasoning. Negative met-befores and met-afters stopped students in further task solving, or turned them to imitative reasoning. However, our intention is not to classify all met-befores and met-afters that can appear in students' knowledge and that can inhibit creative reasoning, but to caution to their existence. The students in our study passed the calculus course, what indicates that those met-befores and met-afters did not prevent them to successfully solve tasks that asked for imitative reasoning. We based our conclusion also on students' mid-term and final exams that we have examined before each interview session.

When faced with new situations, students tend to look for something familiar, and usually seek for a remedy in the form of imitative reasoning, like searching the textbook for similar solutions or going through their recollection of similar tasks (e.g. Boesen et al., 2010, Haavold, 2012). Selden et al. (1998) pointed out that students lack tentative solution starts, i.e. general ideas for beginning the process of finding a solution, and that, together with mental constructs of met-befores and met-afters, provides significant obstacle for creative reasoning. We argue that mathematics educators and lecturers should take this into consideration when teaching students. On the other hand, creative reasoning is beneficial to investigate students' understanding and to check the quality of their long-term knowledge. In imitative reasoning, students do not consider intrinsic properties of the objects they are reasoning about, and frequently they rely on well-established procedure, mimicking, almost unconsciously, its every step (Lithner, 2012). Even though imitative reasoning provides reduction of complexity in the course requirements, students do not construct appropriate meaning in such process. The remedy is not avoidance of non-routine tasks, but quite opposite, facing students with new situations. The non-routine tasks and creative reasoning can uncover negative met-befores and met-afters which students are oblivious to when they perform imitative reasoning. This uncovering is important for the sequencing courses that build upon previous courses, i.e. where new knowledge is building up previous acquired and mastered concepts.

But is it possible that the non-routine tasks become more visible in the course, not only as the part of the homework, but also as the part of exercise sessions? And to whom does this matter? Giving answers to these questions is not simple. In the calculus course that our participants took, the non-routine tasks were implemented mainly in the homework part. The course syllabus is overloaded, and it is difficult to explicitly deal with non-routine task on regular basis. During the course, students showed the resistance toward non-routine tasks that demanded more of their invested time than usual routine tasks. But we as educators argue that it does matter, because we want to build up working force that can adapt to any requirements business and economy demand today. We believe that flexible thinking and creative reasoning are part of this ability. Looking from the students' position, this question does not have unique answer. Students, not only in this study program, but in many other science and technical study programs, have many requirements in the courses more related to their profession. They usually lack time for deeper engagement in mathematics, but at the same time they want to pass the mathematics course and would like to know how to apply gained mathematical knowledge (Jukić Matić, 2013). There is no simple solution to this problem and these facts put us in very difficult position. We conclude this paper with a note that the non-routine tasks, besides being part of the homework, became the part of the oral exam in this study program.

ÖZET: Bu çalışmada, 5.sınıf fen bilimleri dersi “Vücudumuz Bilmecesini Çözelim” isimli ilk ünitesine ilişkin öğrencilerin başarılarını belirlemede etkili olabilecek geçerli ve güvenilir bir başarı testi geliştirilmesi amaçlanmıştır. Çalışma grubunu 2013-2014 eğitim-öğretim yılında 5. sınıflarda öğrenim gören 76 öğrenci oluşturmaktadır. Testin geliştirilmesi sürecinde öncelikle öğretim programı dikkate alınarak bir kazanım listesi hazırlanmış, kapsam geçerliliği için belirtke tablosu oluşturulmuş ve bu kazanımlara uygun sorular seçilmiş, üç uzman ile altı öğrencinin görüşleri alınarak testin uygulama süresi ve anlaşılmasında zorluk çekilen kısımlar tespit edilerek gerekli düzeltmeler yapılmıştır. Daha sonra Vücudumuz Bilmecesini Çözelim Ünitesi Başarı Testi (VüBiÇöT) çalışma grubuna uygulanmıştır. Analizler sonucunda testin, ortancası 21, ortalaması 19.72, modu 26, ortalama güçlüğü 19.33, standart sapması 5.99 ve KR-21 güvenirliği ise 0.839 olarak hesaplanmıştır. Bu doğrultuda geliştirilen VüBiÇöT’ün öğretmen, öğrenci ve araştırmacılar tarafından kullanılabilecek geçerli ve güvenilir bir test olduğu sonucuna varılmıştır. Çalışma sonunda ilgililere uygulanabilirliği ve geliştirme sürecine ilişkin öneriler sunulmuştur.

Anahtar Kelimeler: vücudumuz bilmecesini çözelim, test geliştirme, başarı testi.

ABSTRACT: In this study it is aimed to develop an available and reliable achievement test that is able to be effective to define the success of students related to the first unit Science of 5th grades named “Our Body: Let’s Solve the Puzzle” 76 students, studying in 5th grade during 2013-2014 academic year generating the workgroup. In the process of developing test; considering curriculum, an acquisition list was prepared, for content validity a table of specifications was made and questions suitable for these acquisitions were chosen, duration of test application and some parts of the test that were difficult to understand were determined and necessary corrections were made with the received options of three specialist and six students. Thereafter, the achievement test of the unit “Our Body:Let’s solve the puzzle” (VüBiÇöT) was carried out to workgroup. In the consequence of analyses; median 21, mean 19.72, mode 26, avarage difficulty 19.33, standart deviation 5.99 and KR-21 reliabity was calculated as 0.839. Accordingly, it was cocluded that (VüBiÇöT) was a valid and reliable test that can be used by students, teachers and researchers. At the and of the study, suggestions were presented about precticability and development process for those concerned.

Key Words: our body:let’s solve the puzzle, test development, achievement test.

GİRİŞ

Sınavlar, eğitim sistemimizin ayrılmaz ve önemli bir parçasıdır (İpek Akbulut & Çepni, 2013). Dünyanın birçok yerinde ve ülkemizde eğitim sisteminin kontrolü ölçme ve değerlendirme yardımı ile yapılabilmektedir. Eğitim kurumlarında ölçme ve değerlendirme yapmanın birçok nedeni vardır. Eğitimde ölçme ve değerlendirme yapmanın ana nedeni, “hedeflerin gerçekleşme düzeyi nedir?” sorusuna cevap aramaktır (Özhan & Odabaş, 2009). McDonald (2002), öğretmenlerin ölçme yaparken doğru aracı seçmelerinin eğitimde doğru kararlar almak için önemini vurgulamıştır. Eğitimde kullanılan ölçme araçları bilişsel alan, duyuşsal alan ve devinişsel alana göre farklılık gösterir. Bilişsel alan ölçme araçları; yazılı sınavlar, kısa cevaplı testler, doğru yanlış tarzı sorular, çoktan seçmeli testler, eşleştirmeli testler, sözlü sınavlar, ödev ve projeler; duyuşsal alan ölçme araçları; ilgi ölçekleri ve tutum ölçekleri; devinişsel alan ölçme araçları; iş-performans testleri, rubrikler, derecelendirme ölçeği ve kontrol listeleridir (Özhan ve Odabaş, 2009). Günümüzde en yaygın kullanılan ölçme aracı çoktan seçmeli testlerden oluşan araçlardır (FEM, 2011). Bunun nedeni, çoktan seçmeli testler nesnel olması ve aynı zamanda kolay puanlanmasıdır (Bağcan Büyükturan & Çıkrıkçı Demirtaşlı, 2013). Milli Eğitim Bakanlığı, 2013-2014 öğretim yılından itibaren fen bilimleri dersi öğretim programında araştırma-sorgulamaya dayalı öğrenme yaklaşımı temel alınarak hazırlanan yeni müfredat programını uygulamaya geçirmiştir. Bu program, 2004 yılındaki öğretim programının revize edilmiş şeklidir. Araştırma-sorgulamaya dayalı öğrenme sürecinde; genel olarak öğrencilerin öğrenmesinden kendilerinin sorumlu olduğu, öğrenme sürecine öğrencinin aktif katıldığı, öğrencinin bilgiyi kendi zihinlerinde yapılandırmaya olanak tanıdığı bir strateji benimsenmiştir (MEB, 2013). Bu yeni programın ölçme-değerlendirme anlayışına göre, öğrenciler öğrenme süreci içerisinde izlenmeli ve yönlendirilmelidir. Öğrenme sırasında oluşabilecek güçlükler belirlenerek giderilmeli, anlamlı ve kalıcı öğrenmeyi tam olarak sağlamak için öğrencilere geri bildirim yapılmalıdır. Bu nedenlerden dolayı biçimlendirici (formative) değerlendirme biçimi bu programa göre ön plana çıkmaktadır. Formal eğitim kurumlarında biçimlendirici değerlendirmeler ünite sonu değerlendirmeleri, dönem içi sınavları şeklindedir. Ünite sonu değerlendirmeleri için her üniteye uygun geçerli ve güvenilir başarı testlerinin geliştirilmesinin ölçme ve değerlendirmeyi objektif kılacağı düşünülmektedir. İlgili alan yazınına baktığımızda ülkemizde pek çok başarı testi geliştirme çalışmalarının olduğu görülmüştür (Uzunöz & Buldan, 2012; Şen & Eryılmaz, 2011; Börekci, 2010; Çoşkun, 2010; Bağcan Büyükturan & Çıkrıkçı Demirtaşlı, 2013; Güngör & Özgür, 2009; Gül & Yeşilyurt, 2011, Yurdabakan & Olğun, 2011). 5.sınıf Vücudumuz Bilmecesini Çözelim Ünitesine dair ülkemizde geliştirilmiş ölçüm araçları incelendiğinde sadece bir tane çalışma ile karşılaşılmıştır (Güngör & Özgür, 2009). Bu ölçüm araçları başlı başına ölçme aracı geliştirmek için değil de, diğer değişkenlerle korelasyona bakılmak için geliştirilmiş ve kullanılmıştır.

Yapılan bu çalışma ile 5.sınıf Vücudumuz Bilmecesini Çözelim Ünitesi'ne yönelik bir başarı testi geliştirilerek ilgili alan yazınındaki eksikliğin giderileceği, fen bilimleri öğretmenlerine biçimlendirici ve tanılayıcı değerlendirme yapmaları için yardımcı olunacağı ve 5.sınıf öğrencilerine ünite ile ilgili soru kaynağı olacağı düşünülmektedir. Yapılan bu çalışmada 2013 yılında revize edilen fen bilimleri dersi öğretim programının, 5.sınıf Vücudumuz Bilmecesini Çözelim Ünitesi kazanımlarına uygun olarak sorular içeren geçerli ve güvenilir bir ölçüm aracı geliştirilmesi amaçlanmıştır.

YÖNTEM

Evren ve Örneklem

Araştırmada 5.sınıf Vücudumuz Bilmecesini Çözelim Ünitesine dair bir başarı testi geliştirilip geçerlik ve güvenirlik incelemeleri yapılması için üniteye ait kazanımlar 2013 fen bilimleri öğretim programına paralel olarak hazırlanmıştır. Bu kazanımlara uygun sorular araştırmacı tarafından bizzat hazırlanmıştır. Test son şeklini almadan önce uzman görüşleri alınmış, altı ortaokul 5.sınıf öğrencisine pilot uygulama için hazırlanan sorular çözdürülmüştür. Öneriler doğrultusunda teste son şekli verilip 76 ortaokul 5.sınıf öğrencisine uygulanmış ve veri analizleri tamamlanmıştır. Çalışmadaki örneklem, kolaylık örneklemi (convenient sampling) yoluyla seçilmiştir. 2013-2014 eğitim-öğretim yılının birinci döneminde Tokat ili merkezindeki 5 ortaokuldan seçilen toplam 76, 5.sınıf öğrencisi bu çalışmanın örneklemini oluşturmaktadır.

VüBiÇöT'nin Geliştirilme Süreci

5. sınıf Vücudumuz Bilmecesini Çözelim Ünitesi Başarı Testi (VüBiÇöT) araştırmacı tarafından öğrencilerin bu ünitedeki başarılarını değerlendirmek amacı ile geliştirilmiştir. Bu ünite 5.sınıf fen bilimleri dersinde 13 kazanımdan oluşmaktadır. VüBiÇöT, 30 tane çoktan seçmeli, dört seçenekli sorulardan oluşan bir testtir. Soruların hepsi çoktan seçmeli olarak hazırlanmıştır. Bunun nedeni; çoktan seçmeli soruların diğer soru tiplerine göre daha kolay ve hızlı bir şekilde uygulanabilir olması ve bu tip soruların araştırmacının, sonuçları daha nesnel bir şekilde değerlendirmesine yardımcı olmasıdır (Gronlund & Linn, 1990; Akt: Şen & Eryılmaz, 2011).

VüBiÇöT geliştirilmeden önce 2013 fen bilimleri dersi öğretim programında olan Vücudumuz Bilmecesini Çözelim Ünitesine ait bütün üniteyi kapsayan 13 maddelik bir kazanım listesi hazırlandı. Daha sonra araştırmacı tarafından fen bilimleri öğretim programına konulması gerektiği düşünülen 7 kazanım da bu kazanımlara eklenerek toplam 20 kazanım oluşturuldu. Kazanım listesi bir fen eğitimi uzmanı tarafından iki kez revize edildi. Bu 20 kazanımın toplam 36 soru ile ölçülmesi planlandı. Daha sonra ilgili kazanımlarla örtüşen maddeler araştırmacının kendisi tarafından titizlikle yazıldı. Sadece sorulardaki şekiller www.fenokulu.net internet adresinden alınmıştır. Daha sonra, kazanımların ve ilgili soruların 5.sınıf Vücudumuz Bilmecesini Çözelim Ünitesini tam olarak kapsadığından emin olmak için bir belirtke tablosu oluşturuldu. Bu tablo aynı zamanda testin içerik geçerliği için de bir kanıt oluşturmaktadır. Hazırlanan belirtke tablosundaki sorular ve kazanımlar Bloom Taksonomisi'nin bilişsel alanına göre hazırlandı. Duyuşsal ve psikomotor (devinişsel) öğrenme alanları test tekniği ile ölçülemeyeceğinden, bu alanlara yönelik sorular, öğrencilerin sahip olması gereken alt bilgilerini ölçecek tarzda yazılmıştır. Bu doğrultuda sorular test belirtke tablosu da göz önünde bulundurularak bir fen bilimleri öğretmeni tarafından son kez gözden geçirildi. Testin kapsam geçerliğini sağlamak için üniversitelerin İlköğretim Fen Bilgisi Eğitimi alanında görevli öğretim üyesi ve iki fen bilimleri öğretmeni tarafından içerik ve format yönünden, iki Türk Dili uzmanı tarafından da yazım kuralları ve dil bilgisi açısından incelenmiştir. Uzmanların değerlendirmeleri ışığında testte gerekli düzeltmeler yapılmıştır. Bu işlemler sonucunda uzmanlar, geliştirilen başarı testinin bütün üniteyi temsil ettiğini, dil açısından öğrencilerin seviyesine uygun olduğunu, yazı ve şekillerin 5.sınıf öğrencilerinin seviyesine uygun olduğunu ve bir ders saati içinde testin uygulanabileceğini belirtmişlerdir. Testin ilk halinde, test 36 sorudan oluşmaktadır. Soruların tümü çoktan seçmeli soru olarak yazılmıştır. Bazı sorular kazanımlarda olmasına rağmen yapılan analizlerde madde ayırt ediciliği düşük çıkmasından dolayı testin ikinci halinden çıkarılmıştır. Her bir kazanımın en azından bir soru ile ölçülmesi ve Vücudumuz Bilmecesini Çözelim Ünitesinin tüm konularının testte temsil edilmesi zorunlulukları göz önünde bulundurularak testin ikinci hali için toplam soru sayısı 30 olarak belirlenmiştir.

BULGULAR

Geliştirilen VüBiÇöT, Vücudumuz Bilmecesini Çözelim Ünitesi işlendikten sonra pilot çalışma olması açısından 6 öğrenciye uygulanmıştır. Pilot çalışmada öğrencilerin 1 ders saati (40 dakika) içerisinde soruları çözebildikleri gözlemlenmiştir. Öğrencilerin kelimeleri, cümleleri, şekilleri vb. anlayıp anlamadıklarına bakılmış, testin zorluğu hakkında düşünceleri alınmıştır. Öğrenciler testin dilinin anlaşılır olduğunu ve 1 ders saati içinde çözebildiklerini belirtmişlerdir. Pilot çalışmanın ardından Vücudumuz Bilmecesini Çözelim Ünitesini tamamlayan, 5 ayrı okulda öğrenim gören toplam 76 öğrenciye VüBiÇöT uygulanarak veriler toplanmıştır. Daha sonra her bir soru için madde ayırt edicilik ve madde güçlük indeksleri hesaplanmıştır. Madde ayırt edicilik indeksleri 0.40'dan büyükse madde çok iyi, 0.30-0.39 arasında ise oldukça iyi, 0.20-0.29 arasında ise düzeltilmeli ve 0.20'den küçükse madde testten çıkarılmalıdır (Büyüköztürk ve diğerleri, 2010). 6 adet sorunun madde ayırt edicilikleri zayıf bulunmuştur. Bu sorular testten çıkarılmıştır. Bu soruların kapsadığı kazanımları ölçen başka sorular da olduğu için, bu soruların testten çıkarılması, testin kapsam geçerliğini etkilememiştir. Bu maddelerin ayırt edicilik ve madde güçlükleri Tablo 1. de verilmiştir.

Tablo 1. Testten Çıkarılan Maddelerin Madde Ayırt Edicilik ve Güçlük İndeksleri

Soru No.	Madde Ayırt Edicilik Gücü	Madde Güçlük Düzeyi	Soru No.	Madde Ayırt Edicilik Gücü	Madde Güçlük Düzeyi
1	D=0.09 ZAYIF	P=0.95 KOLAY	15	D=0.14 ZAYIF	P=0.98 KOLAY
2	D=0.19 ZAYIF	P=0.90 KOLAY	18	D=0.10 ZAYIF	P=0.96 KOLAY
7	D=0.14 ZAYIF	P=0.36 ORTA	22	D=0.10 ZAYIF	P=0.96 KOLAY

Tablo 1. de görüldüğü gibi 1., 2., 7., 15., 18. ve 22. soruların madde güçlük ve ayırt edicilikleri belirtilen sınırın altında olduğu için test dışında tutulmuştur. Bu sorulardan 1., 2. ve 15. sorular duyuşsal öğrenme alanı, 7. ve 18. sorular Bloom Taksonomisi'nin bilişsel öğrenme alanının uygulama basamağı, 22. soru Bloom Taksonomisi'nin bilişsel öğrenme alanının değerlendirme basamağını temsil eden sorulardır. Madde güçlük ve ayırt edicilik indeksi en iyi çıkan soru 29. soru olarak temsil edilen sorudur. Bu sorunun madde ayırt ediciliği 0.80 ve madde güçlüğü 0.45 olarak hesaplanmıştır. Bu soru Bloom Taksonomisi'nin bilişsel alanının uygulama basamağını temsil etmektedir.

Test, örnekleme bir kez uygulandığı zaman güvenirlik katsayısı, testin varyansına dayalı yöntemler ve testi yarılama yöntemi kullanılarak hesaplanır (Büyüköztürk ve diğerleri, 2010). Ayrıca test puanları arasındaki iç tutarlılığı anlamak amacıyla da, Kuder-Richardson-20,21 (KR-20,21) ve alfa katsayıları kullanılır (Büyüköztürk, 2007). KR-21 formülü çoktan seçmeli maddeler ve ölçekler için kullanılır (Şencan, 2005). Bu nedenle çalışmada Kuder-Richardson 21 (KR-21) kullanılmıştır. Bu yöntemi kullanırken her bir maddeye verilen cevaplar doğru ise 1, yanlış ise 0 verilerek puanlanmıştır. Testin KR-21 puanı ise; 0.839 olarak hesaplanmıştır. Şencan (2005), KR-21 değerinin 0.70'den büyük olması gerektiğini belirtmiştir. Hesaplanan değer 0.70'den büyük olduğu için geliştirilen bu test güvenilirdir ve aynı zamanda iç tutarlılığa da sahiptir.

Bütün bu bilgiler ışığında VüBiÇöT analiz sonuçları Tablo 2.'deki gibidir.

Tablo 2. VüBiÇöT Analiz Sonuçları

N	$\overline{X}$	SS	Ortanca	Mod	Varyans	Ort. Güçlük	KR-21
76	19.72	5.99	21	26	35.88	19.33	0.839

Tablo 2.'yi incelediğimizde ortanca (21) ile ortalama (19.72) birbirine yakındır. Ancak mod (26) ortanca ve ortalamadan büyüktür. Bu duruma göre testin sola çarpık olduğunu söyleyebiliriz. Testin ortalama güçlüğü 19.33, standart sapması 5.99 ve KR-21 güvenirliği ise 0.839 olarak hesaplanmıştır. Eldeki verilere bakıldığında geliştirilen test, kullanılabilecek özelliğe sahiptir.

SONUÇ

5.sınıf fen bilimleri dersi 'Vücudumuz Bilmecesini Çözelim' ünitesi kazanımlarına uygun olarak sorular içeren bir başarı testi geliştirilerek ortaokul fen bilimleri öğretmenlerinin sınıf içi değerlendirme süreçlerinde kullanabilecekleri geçerli ve güvenilir bir ölçüm aracı geliştirilmesi amaçlanarak bu çalışma gerçekleştirilmiştir. Hazırlanan belirtke tablosuna bakıldığında, yeni kazanımların daha çok üst düzey becerileri kapsadığını görülmüştür. 2004 yılı fen ve teknoloji dersi öğretim programındaki kazanımlarla, 2013 yılı fen bilimleri öğretim programı kazanımlarını karşılaştırırsak 2013 yılı öğretim programındaki kazanımların üst düzey becerileri daha çok içerdiği görülmektedir (MEB, 2004; MEB, 2013). Berk (1996), alan yazını incelediğinde birçok çalışmanın çoktan seçmeli testlerin üst düzey becerileri ölçemeyeceğini belirttiğini, ancak üst düzey becerileri ölçecek çoktan seçmeli bir test geliştirdiğini ve bu testin başarılı olduğunu ortaya koymuştur. Ayrıca Burton, Sudweeks, Merrill ve Wood (1991), çoktan seçmeli testlerin basit ve karmaşık becerileri ölçmede çok iyi bir araç olduğunu belirtmişlerdir (Akt. İpek Akbulut & Çepni, 2013). Bu doğrultuda üst düzey becerilerin de çoktan seçmeli test maddeleriyle ölçülebildiği sonucu çıkarılabilir.

Yapılan analizler sonucunda madde ayırt ediciliği "zayıf" olarak nitelendirilen 6 soru testten çıkarılmıştır. Bu soruların madde ayırt ediciliklerinin zayıf çıkmasının nedeni olarak soruların çeldiricilerinin güçlü olmasından dolayı kaynaklandığı düşülmektedir. Testten çıkarılan soruları niteleyen kazanımları başka sorular da kapsadığı için, testtin kapsam geçerliğinde herhangi bir değişiklik olmamıştır. Analizlerdeki ortanca (21) ile ortalamanın (19.72) birbirine yakın olduğu tespit edilmiştir. Ancak mod (26) ortanca ve ortalamadan büyüktür. Bu duruma göre testin sola çarpık olduğunu söyleyebiliriz. Yani test öğrencilere kolay gelmiştir. Testin ortalama güçlüğü 19.33, standart sapması 5.99 ve KR-21 güvenirliği ise 0.839 olarak hesaplanmıştır. Yapılan analizler ışığında testin öğretmen, öğrenci ve araştırmacılar tarafından kullanılabilecek geçerli ve güvenilir bir test olduğu sonucuna ulaşılmaktadır.

ÖNERİLER

Yapılan bu araştırma sonucu aşağıdaki öneriler geliştirilmiştir.

1) İlkokul ve ortaokul fen bilimleri dersinin bu ünitesi ve diğer üniteleri ile ilgili yeni başarı testleri geliştirilebilir.

2) Geliştirilen başarı testleri internet ortamında paylaşılarak öğretmen ve öğrencilerin testten faydalanması sağlanabilir.

3) Öğretmen adaylarına test geliştirme dersleri verilerek, meslek hayatlarında geçerli ve güvenilir testleri kendilerinin geliştirilmesi sağlanabilir.

4) Öğretmenlere hizmet içi kurslarla test geliştirme konusunda dersler verilebilir.

THE EFFECT OF INTERDISCIPLINARY NATURE EDUCATION PROGRAM ON GIFTED AND TALENTED STUDENTS' PROBLEM SOLVING SKILLS

Aims of this study are a) to develop an interdisciplinary nature education program that will help children discover that learning is a part of daily life; develop consciousness for the environment and nature by actively participating to fun and educative activities, b) to examine the effect of this program on gifted students' problem solving skills.

This study has a one group pretest-posttest design. The program developed for this study was implemented with 20 voluntary primary school students who were identified as gifted. Implementation took place in Nezahat Gökyiğit Botanical Garden, which is a natural life and teaching environment, and lasted a total of 30 hours; 6 hours a day for 5 days. The program is learner centered and based on active learning principle. It was differentiated and enriched via observations, workshops, nature themed games, empathy activities, experiments and thinking activities. Children worked individually and as a group during the activities.

The effect of the program was measured by a five point likert type scale called "Problem Solving Inventory for Primary School Children", developed by Serin, Serin and Saygılı (2010) who also conducted the reliability-validity analyses for the scale. Interviews conducted with children and observation reports written by the educators were taken into account.

Data analysis revealed that children's problem solving scores were improved significantly ($t=3,580$; $p = 0,002 < 0,05$). It was observed that the implemented program made a positive impact on children's problem solving skills.

SYNTHESIS, SPECTROSCOPIC, AND BIOLOGICAL STUDIES OF CHROMIUM(III), MANGANESE(II), IRON(III), COBALT(II), NICKEL(II), COPPER(II), RUTHENIUM(III), AND ZIRCONYL(II) COMPLEXES OF N1, N2 - BIS (3 - ((3 - HYDROXYNAPHTHALEN - 2 - YL) METHYLENE - AMINO) PROPYL) PHTHALAMIDE

ABSTRACT: Novel chromium(III), manganese(II), iron(III), cobalt(II), nickel(II), copper(II), ruthenium(III), and zirconyl(II) complexes of N^1,N^2-bis(3-((3-hydroxynaphthalen-2-yl)methylene-amino)propyl)phthalamide (H_4L, 1) have been synthesized and characterized by elemental, physical, and spectral analyses. The spectral data showed that the ligand behaves as either neutral tridentate ligand as in complexes 2-5 with the general formula $[H_4LMX_2(H_2O)]\cdot nH_2O$ (M=Cu(II), Ni(II), Co(II), X = Cl or NO_3), neutral hexadentate ligand as in complexes 10-12 with the general formula $[H_4LM_2Cl_6]\cdot nH_2O$ (M=Fe(III), Cr(III) or Ru(III)), or dibasic hexadentate ligand as in complexes 6-9 with the general formula $[H_2LM_2Cl_2(H_2O)_4]\cdot nH_2O$ (M = Cu(II), Ni(II), Co(II) or Mn(II), and 13 with general formula $[H_4L(ZrO)_2Cl_2]\cdot 8H_2O$. Molar conductance in DMF solution indicated the non-ionic nature of the complexes. The ESR spectra of solid copper(II) complexes 2, 5, and 6 showed $g_{\|}>g>g_e$, indicating distorted octahedral structure and the presence of the unpaired electron in the $d_{x^2-y^2}$ orbital with significant covalent bond character. For the dimeric copper(II) complex $[H_2LCu_2Cl_2(H_2O)_4]\cdot 3H_2O$ (6), the distance between the two copper centers was calculated using field zero splitting parameter for the parallel component that was estimated from the ESR spectrum. The antibacterial and antifungal activities of the compounds showed that, some of metal complexes exhibited a greater inhibitory effect than standard drug as tetracycline (bacteria) and Amphotricene B (fungi).
Keywords: Complexes, Synthesis, Schiff base, Magnetism, Biological studies

INTRODUCTION

Schiff base transition metal complexes have been of great interest for many years since they are becoming increasingly important as biochemical, analytical and antimicrobial reagents.[1] Many of metal complexes were showed anticancer and antimicrobial activities.[2-4] It was reported that, some drugs have greater activity when administered as metal complexes than that as free organic compounds.[5] So, Schiff base complexes might an untapped reservoir for drugs. Synthetic model studies involving magnetically coupled binuclear transition metal systems had attracted much interest because these studies provided deeper insights into complex biological processes. Also, homo binuclear lanthanide(III) complexes with isonicotinoyl hydrazone ligand had been prepared and characterized.[6] Polyamino carboxylate groups had been used for the design of polydentate ligands such as ethylenediamine tetraacetic acid and diethylenetriamine penta acetic acid, generally showed high affinity for metal cations.[7] These ligands were widely used as chelating agents in fundamental research[8] or as diagnostic tools in the pharmaceutical industry[9] and they are particularly suitable for magnetic resonance imaging (MRI).[10,11] A majority of Schiff base complexes incorporating five- or six-membered metallocycles are represented by N. O- ligand environment have been published.[12] The aim of this work is the preparation, characterization and antimicrobial activity of chromium(III), manganese(II), iron(III), cobalt (II), nickel(II), copper(II), ruthenium(III), and zirconyl (II) complexes of N^1,N^2-bis(3-((3-hydroxynaphthalen-2yl)methylene amino)propylphthalamide (H_4L).

EXPERIMENTAL

All chemicals and solvents were reagent grade commercial material and used as received. Elemental analyses for (C, H, N, Cl) were determined at the Analytical Unit of Cairo University, Egypt. Standard analytical methods were used to determine the metal ion content.[13] IR spectra of the ligand and its metal complexes were measured using KBr discs with a Jasco FT/IR 300E Fourier transform infrared spectrophotometer covering the range 400-4000 cm^{-1} and in the 500-100 cm^{-1} region using polyethylene-sandwiched Nujol mulls on a Perkin Elmer FTIR 1650 spectrophotometer. Mass spectrum of the ligand recorded using a JEOL JM-S-AX-500 massspectrometer. Electronic absorption spectra in the 200-900 nm regions were recorded on a Perkin-Elmer 550 spectrophotometer.

Magnetic susceptibilities were measured at 25 ^oC by the Gouy method using mercuric tetrathiocyanato-cobaltate(II) as the magnetic susceptibility standard. The magnetic moments were calculated from the equation: $\mu_{eff.} = 2.84\sqrt{\chi^{corr}_M \cdot T}$. Molar conductance was measured on a Tacussel type CD_6NG conductivity bridge using 10^{-3} M DMF solutions. Thermal analyses (DTA and TG) were carried out in air using a Shimadzu DT-30 thermal analyzer. The ESR spectra of the solid complexes at room temperature and at 77 K were recorded using a Varian E109 spectrophotometer (Leicester University, Engeland). DPPH was used as the marker. TLC was used to confirm the purity of the prepared compounds.

Preparation of the ligand

Ethylphathalate was prepared using a published procedure.[14]

Preparation of N^1,N^2-bis(3-aminopropyl)phthalamide: The N^1,N^2-bis(3-aminopropyl)phthalamide was prepared (Fig. 1) by the dropwise addition of ethanol solution (50 cm^3) of ethyl phthalate (5.0 g, 0.22 mol) to the ethanolsolution (25 cm^3) of 1,3-diaminopropane (3.33 g, 0.044 mol) with gentle warming and stirring for one hour. The white precipitate formed was filtered off, washed with ethanol, and dried under vacuum over anhydrous $CaCl_2$.

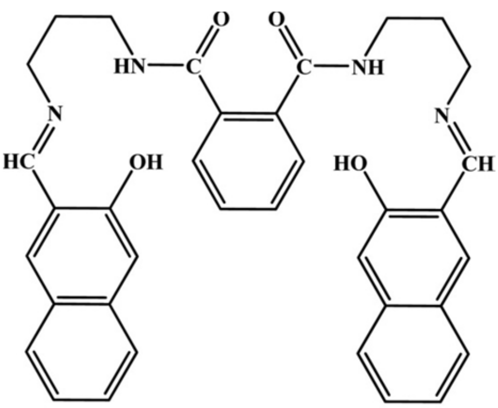
Fig. 1.



N^1,N^2-bis(3-((3-hydroxynaphthalen-2-yl) methyleneamino)propyl)phthalamide

Fig. 2. Structure representation of the ligand.

Preparation of the ligand (H_4L, 1): The ligand (H_4L, 1) (Fig. 2) was prepared by adding hot ethanol solution (50 cm^3) of N^1,N^2-bis(3-aminopropyl)phthalamide (5.0 g, 0.018 mol) to a hot ethanol solution (50 cm^3) of naphthaldehyde (6.19 g, 0.036 mol). The mixture was refluxed for two hours and left to cool at room temperature. The yellow product was filtered off, washed with ethanol and dried under vacuum over anhydrous $CaCl_2$.

Preparation of metal complexes

Complexes 2-5 were prepared by the dropwise addition of a hot (60 ^oC) methanol solution of $CuCl_2\cdot 2H_2O$, $NiCl_2\cdot 6H_2O$, $CoCl_2\cdot 6H_2O$ or $Cu(NO_3)_2\cdot 2.5H_2O$ to a hot (70 ^oC) ethanol solution of the ligand in molar ratio

1:1M/L (Metal/Ligand). The mixture was refluxed for four hours. The precipitates formed after coaling were filtered, washed with ethanol, then with diethyl ether and dried under vacuum over anhydrous $CaCl_2$.
Complexes 6-13 were prepared by mixing a hot (60 ^oC) methanol solution of $CuCl_2\cdot 2H_2O$, $NiCl_2\cdot 6H_2O$, $CoCl_2\cdot 6H_2O$, $Mn(Cl)_2\cdot 4H_2O$, $FeCl_3.6H_2O$, $RuCl_3.3H_2O$, $CrCl_3$. $6H_2O$ or $ZrOCl_2.8H_2O$ with a hot (70 ^oC) ethanol solution of the ligand in molar ratio 2:1 M/L (Metal/Ligand). The mixture was refluxed for four hours. The precipitates formed after coaling were filtered, washed with ethanol, then with diethyl ether and dried under vacuum over anhydrous $CaCl_2$.

In-vitro antibacterial and antifungal activities

The investigation of the biological activities of the newly synthesized Schiff base ligand, its metal complexes and their corresponding metal salts were carried out in the Botany Department Lab. of microbiology, Faculty of Science, El-Menoufia University. The antibacterial and antifungal activities were investigated by disc diffusion method.[15,16] The antibacterial activities were done using Escherichia coli and Aspergillusnigerat 2000 ppm concentrations in DMSO. DMSO poured disc was used as negative control. The bacteria were subcultured in nutrient agar medium which was prepared using ($g\cdot L^{-1}$ distilled water) NaCl (5 g), peptone (5 g), beef extract (3 g), agar (20 g). The fungus was subcultured in Dox's medium which was prepared using ($g\cdot L^{-1}$ distilled water) yeast extract (1g), sucrose (30 g), $NaNO_3$, agar (20 g), KCl (0.5 g), KH_2PO_4 (1 g), $MgSO_4\cdot 7H_2O$ (0.5 g) and trace of $FeCl_3\cdot$ $6H_2O$. These mediums were then sterilized by autoclaving at 120 ^oC for 15 min. After cooling to 45 ^oC the medium was poured into 90 mm diameter Petri dishes and incubated at 37 ^oC or 28 ^oC, respectively. After few hours, Petri dishes were stored at 4 ^oC. Microorganisms were spread over each dish by using sterile bent loop rod. The test is carried out by placing filter paper disks with a known concentration of the compounds on the surface of agar plates inoculated with a test organism. Standard antibacterial drug (tetracycline), antifungal drug (Amphotricene B) and solution of metal salts were also screened under similar conditions for comparison. The Petri dishes were incubated for 48 h at 37 or 28 ^oC, respectively. The zone of inhibition was measured in millimeters carefully. All determinations were made in duplicated manner for each of the compounds. An average of the two independent readings for each compound was record.

RESULT AND DISCUSSION

All the prepared compounds are colored, non-hygroscopic, crystalline solid and stable at room temperature. The complexes are insoluble in non-polar solvents but soluble in polar coordinating solvents such as DMSO and DMF. Elemental analyses, physical data, Table 1, and spectral data, Tables 2 and 3 are compatible with the proposed structures shown in Fig. 4. To date, no diffractable crystals have been grown.
N^1, N^2-bis(3-((3-hydroxynaphthalen-2-yl)methyleneamino)propyl)phthalamide (H_4L) can exist in the keto form (I), keto-enol form (II), enol form (III), Fig. 3. 113

H- and C-NMR spectra of 1

The ^1H-NMR spectrum of the ligand (H_4L, 1) in d^6DMSO shows signals consistent with the proposed structure (Fig. 2) and indicated that, the ligand is present in its ketonic form.[17] This conclusion was supported by the presence of peaks due to NH groups appearing at 8.62 ppm (s, 2H)[18,19] and azomethine group HC=N appearing at 8.12 ppm (s, 2H).[20] The peak appeared at 10.1 ppm, may be due to the proton of hydroxyl groups (s, 2H).[21] The peaks appearing in the 7.04-7.85 ppm range may correspond to protons of the aromatic hydrogen (16H). The signals at 3.96, 3.51 and 2.1 ppm may be assigned to terminal $-CH_2-N=C$, terminal $-CH_2-NH$ and middle $-CH_2-$ groups. The ^{13}C-NMR spectrum showed different peaks appearing at 182.1 and 160.23 ppm. These peaks can be due to -CH=N- and -C-OH groups respectively,[21] however the peaks at 127.63-140.2 ppm range assigned to the carbon of aromatic ring.[21] The peaks appearing at 60.22 and 31.52 ppm may be due to terminal $-CH_2-N-$ and middle
$-CH_2-$ group carbons.[22]

Fig. 3.

Mass spectra

The mass spectrum of the ligand reveals the molecular ion peak (m/z) 587 a.m.u consistent with the molecular weight of the ligand. The most fragments appear at (m/z) 77, 144, 163, 170, 248 and 417 a.m.u corresponding to $[C_6H_5]$, $[C_{10}H_8O]$, $[C_{10}H_{13}NO]$, $[C_{11}H_8NO]$, $[C_{14}H_{20}N_2O_2]$, and $[C_{25}H_{27}N_3O_3]$, respectively (Fig. 5). However copper(II) complexes 2 and 6 show molecular ion peaks (m/z) at 739 and 908a.m.u., consisted with the molecular weights of 739.15 and 908.79 respectively.

Conductivity measurements

The molar conductance values of the complexes in DMF (10^{-3} M), lie in the 12-23.2 Ω^{-1} $mol^{-1}cm^2$ range, Table 1, indicating that, all the complexes are not electrolytes. These confirmed that the anion is coordinated to metal ion.[23,24]

IR spectra

The IR spectral data for the ligand (H_4L, 1) and its metal

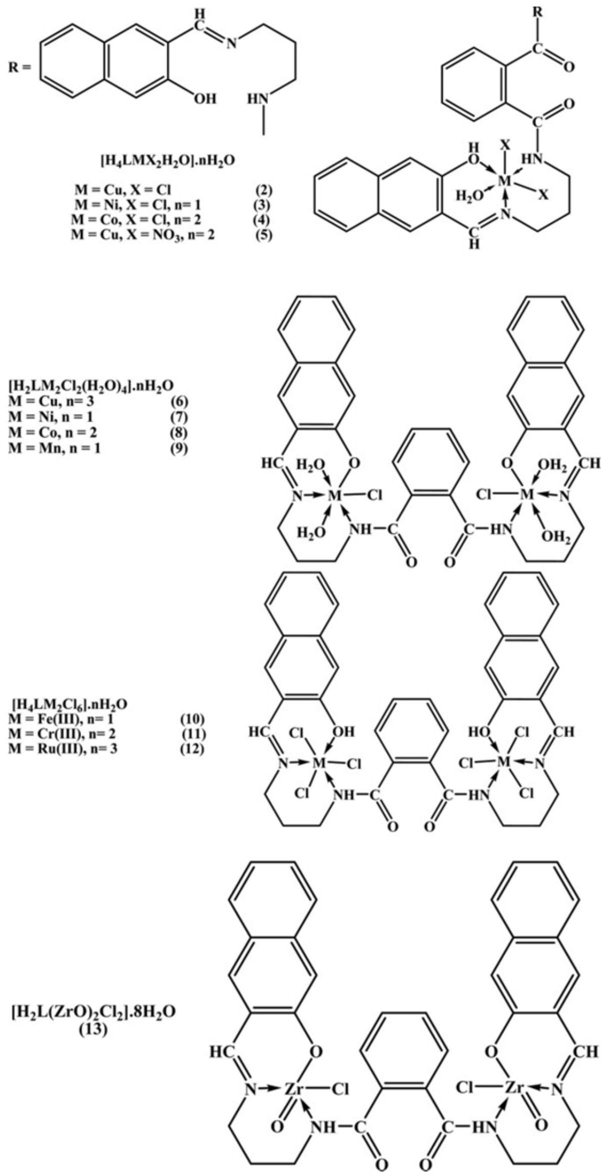

Fig. 4. Structure representation of metal complexes.

complexes are presented in Table 2. The IR spectrum of the ligand showed bands at 3360 and 3252 cm^{-1}may be due to u(OH) and u(NH) group.[19] However, broad, medium bands were observed in the 3450-3200 and 31802600 cm^{-1} ranges, attributed to intra-and intermolecular hydrogen bonding between -OH and -C=N, -NH and -C=O groups respectively[19,25] thus, the higher frequency band is associated with a weaker hydrogen bond and the lower frequency band with a stronger hydrogen bond. Also, the spectrum shows bands at 1656 and 1620 and 1586 cm^{-1} which were assigned to υ(C=O), υ(C=N) and $(C=C)_{Ar}$ respectively.[26,27] The spectra of solid complexes are compared with those of the ligand in order to know the mode of bonding. The spectra showed that the ligand behaved either as:

Neutral tridentate ligand, coordinating through OH, C=N, and NH of one arm of the ligand as in case of complexes 2-5, the mode of coordination was suggested by the following evidence: i) the bands due toone OH, C=N, and NH were shifted to lower wave number with decreasing their intensities, while the other ones found almost at their original place, indicating that, only one of each pair were involved in the coordination,[19,25,28-30] ii) one band of the two C-O bands was shifted to a higher wave number while the other is found almost at its original place, indicating that, only one phenolic oxygen was involved in the coordination,[28] iii) the band of both carbonyl groups found as one band almost at its original place in the ligand indicating that they are not involved in the coordination,[18,26,27] iv) the simultaneous appearance of new bands in the 656690 and 560-570 cm^{-1} regions are due to the υ(M-N) and υ(M-O) vibrations,[31,32] respectively.

Bibasichexadentate ligand, coordinating through all O^-, C=N and NH groups as in case of complexes 6-9 and 13, the mode of coordination was suggested by the following evidence: i) the disappearance of the band of the two OH groups,[28] ii) the bands of C=N and NH groups were shifted to lower wave number with decreasing their intensities, indicating that, all C=N and NH groups were involved in the coordination,[19,25,29,30] iii) the band of two C-O groups were shifted to higher wave number, indicating that, both phenolic oxygen atoms were involved in the coordination[28] iv) the bands of both carbonyl groups were observed as single band at its original place in the ligand indicating that, they are not involved in the coordination,[18,26,27] iv) the simultaneous appearance of new bands in the 650-690 and 550-590 cm^{-1} regions are due to the υ(M-N) and υ(MO) vibrations, respectively.[31,32]

Neutral hexadentate ligand, coordinating through all OH, C=N and NH groups as in case of complexes 10-12, the mode of coordination was suggested by the following evidence: i) the bands of C=N, OH and NH groups were shifted to lower wave number with decreasing their intensities, indicating that, all C=N, OH and NH groups were involved in the coordination,[19,25,28-30] iii) the band of both C-O groups were shifted to higher wave number, indicating that, all hydroxyl groups were involved in the coordination[28] iv) the bands of both carbonyl groups were observed as single band at its original place in the ligand indicating that, they are not involved in coordination,[18,26,27] iv) the simultaneous appearance of new bands in the 650-670 and

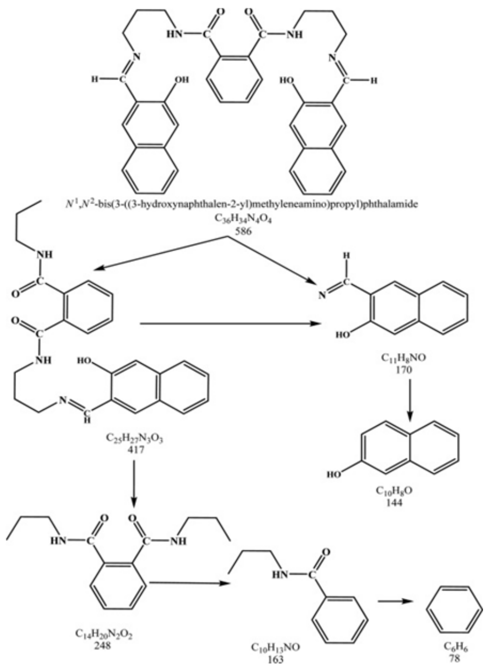

Fig. 5. The fragmentation pattern of the ligand.

570-605 cm^{-1} regions are due to the υ(M-N) and υ(M-O) vibrations, respectively.[31,32] All complexes except complex 5, show band in the 375-413 region, assignable to υ(M-Cl).[19,28] The broad bands in the 3600-3400 cm^{-1} region are due to coordinated water or water of crystallization. Complexes 2-9 showed a band in the 400-600 cm^{-1} region indicating the presence of coordinated water, but the absence of these bands in the spectra of complexes 10-13 indicate the presence of hydrated water rather than coordinated ones. The presence of water molecules within the coordination sphere in the hydrated complexes 2-9 is further supported by the presence of bands in the 34803494, 1605-1610, 940-950 and 613-630 cm^{-1} regions due to OH stretching, HOH deformation, H_2O rocking and H_2O wagging, respectively.[33,34] The spectrum of the complex 5 showed bands at 1465 cm^{-1} (υ_1), 1050 cm^{-1} (υ_2), 1377 cm^{-1} (υ_4) and 710 cm^{-1} (υ_5) with υ_1-υ_4 separation of 88 cm^{-1}, characteristic of monodentate nitrato group.[35] Zirconyl(II) complex 13 shows band at 825 cm^{-1} assigned to Zr=O.[19]

its metal complexes in DMF solution are summarized in Table 3. The ligand (H_4L, 1) showed two bands at 370 and 320 nm which may be assigned to n→π* and π→π* transitions respectively.[32] In the metal complexes, the spectra showed bands in the 345-290 nm range, due to intraligand transitions. Copper(II) complexes 2, 5, and 6 in DMF solution showed bands in the 430-460, 580-590 and 625640 nm range, which were assigned to ligandcopper(II) change transfer, $^2B_1\rightarrow{}^2E$ and $^2B_1\rightarrow{}^2B_2$ transitions indicating a distorted octahedral structure.[36,37] Nickel(II) complexes 3 and 7 showed bands in 490-510, 600-610 and
865-870 nm ranges respectively, which are attributable to
3 3 3 3 3
$A_{2g}(F)\rightarrow T_{1g}(P)$ (ν_3), $A_{2g}(F)\rightarrow T_{1g}(F)$ (ν_2) and $A_{2g}(F)\rightarrow 3\ T_{2g}(F)$ (ν_1) transitions indicating octahedral nickel(II) complexes.[38,39] The ν_2/ν_1 ratio for these complexes were 1.41 and 1.45 respectively, which is less than the usual range of 1.5-1.75, indicating distorted octahedral nickel(II) complexes.[37] The cobalt(II) complexes 4 and 8 showed bands at 455-475, 590-610 and 650-665 nm ranges, which were assigned to $^4T_{1g}(F)\rightarrow{}^4T_{1g}(P)$, $^4T_{1g}(F)\rightarrow{}^4A_{2g}$ and 4 4
$T_{1g}(F)\rightarrow T_{2g}(F)$ transitions respectively, corresponding to high spin cobalt(II) octahedral complexes.[19,40] Manganese(II) complex 9 showed bands at 430, 480 and 590 nm, these bands were corresponding to $^6A_{1g}\rightarrow{}^4E_g$, $^6A_{1g}\rightarrow{}^4T_{2g}$ and $^6A_{1g}\rightarrow{}^4T_{1g}$ transitions which are compatible to an octahedral structure for manganese(II) complexes.[41,42] Iron(III) complex 10 gave bands at 400 and 600 nm are due to charge transfer and $^6A_1\rightarrow{}^4T_1$ transitions, suggesting octahedral structure.[19,36,42] Chromium(III) complex 11
showed bands at 460 and 540 nm which are attributed to charge transfer and $^4A_2\rightarrow{}^4T_1$ transitions of six coordinate chromium(III) complex.[43,44] Ruthenium(III) complex 12 showed bands at 460 and 665 nm, are due to LMCT transition and the other one is assigned to $^2T_{2g}\rightarrow{}^2A_{2g}$ transition. These band were similar to those observed for octahedral ruthenium(III) complexes.[19,45,46] Zirconyl(II) complex 13 shows bands (Table 3) were due to intraligand transitions.

Magnetic moments

The room temperature magnetic moments of complexes 2-14 are present in Table 1. Copper(II) complexes 2, 5 and 6 show values 1.73, 1.7 and 1.5 B.M.. These values are correspond to one unpaired electron in an octahedral structure.[19] Nickel(II) complexes 3 and 7 show values 2.8 and 1.87 B.M., indicating octahedral nickel(II) complexes.[19,47,48] Cobalt(II) complexes 4 and 8 show values 4.8 and 2.83 B.M., indicating high spin octahedral cobalt (II) complexes.[19,38] Manganese(II) complex 9 shows 3.8
B.M., suggesting octahedral geometry around the manganese(II) ion.[19,38] Iron(III) complex shows 3.69 B.M., indicating high spin iron(III) octahedral geometry.[19,50] Chromium(III) complex 11 shows 2.85 B.M., which is lower than the spin-only value, implying an operation of spin-exchange interactions take place between chromium (III) ions.[44] The ruthenium(III) complex 12 shows a magnetic value of 1.67 B.M., indicating an octahedral ruthenium(III) structure.[19,51] Zirconyl(II) complex 13 shows diamagnetic property.[19] The complexes 6-11 showed low magnetic moment values indicating spin exchange interactions take place between the two ion centers.[19,47,49]

ESR spectra

The ESR spectra of solid copper(II) complexes 2, 5 and 6 at room and at liquid nitrogen temperatures were characteristic of a d^9 system and having an axial symmetry type of a d_{x2-y2} ground state.[52] On lowering the temperature to liquid nitrogen, the spectra were not changed, suggesting that, the geometry of the complexes is not changed on cooling. The g-values suggest octahedral geometry for complexes 2, 5 and 6. The complexes show $g_{\|}>g_{\perp}>g_e$, indicating a d_{x2-y2} ground state, and spectral features were characteristic of axial symmetry.[53] The ESR parameters for 2 is $g_{\|}$ = 2.27, $g_{\perp}$ = 2.05, g_{iso} = 2.13, G = 5.4, $K_{\perp}^2$ = 0.64, $K_{\|}^2$ = 0.68, K^2 = 0.65 and K = 0.81, for 5 is $g_{\|}$ = 2.24, $g_{\perp}$ = 2.06, g_{iso} = 2.12, G = 4.0, $K_{\perp}^2$ = 0.81, $K_{|}^2$ = 0.61, K^2 = 0.74 and K = 0.86, for 6 is $g_{\|}$ = 2.26, $g_{\perp}$ = 2.08, g_{iso} = 2.14, G = 3.25, $K_{\perp}^2$ = 1.02, $K_{\|}^2$ = 0.67, K^2 = 0.9 and K = 0.95. Kivelson and Neiman[54] show that, the $g_{\|}$-value in the copper(II) complexes can be used as a measure of covalent character of the metal-ligand bond. If this value is greater than 2.3, the environment is essentially ionic and the value less than this limit indicate a covalent environment. All complexes showed covalent bond character.[19,54,55] The gvalues were related by the expression,[56] $G = (g_{\|}-2)/(g_{\perp}-2)$, if G > 4.0 then local tetragonal axes were aligned parallel or only a slightly misaligned, if G < 4.0, significant exchange coupling is present. Complexes 2 and 5 show value ≥ 4.0, however complex 6 shows G = 3.25, indicating spin-exchange interactions take place between the copper(II) ions, which is furthered confirmed from the magnetic moment value (Table 1). Also, the g-values of copper(II) complexes with a $^2B_{1g}$ ground state ($g_{\|}>g_{\perp}$) may be expressed.[35,57]

$$K_{\perp}^2 = (g_{\perp} - 2.002)\Delta E_{xz}/2\lambda^o \quad (1)$$

$$K_{11}^2 = (g_{11} - 2002)\Delta E_{xy}/8\lambda_o \quad (2)$$

$$K^2 = (K_{11}^2 + 2K_{\perp}^2)/3 \quad (3)$$

Where $K_{\|}$ and $K_{\perp}$ were the parallel and perpendicular components respectively of the orbital reduction factor (K), λ^o is the spin-orbit coupling constant for the free copper, ΔE_{xy} and ΔE_{xz} were the electron transition energies. From the above relations, the orbital reduction of covalency[35,57]] can be calculated for an ionic environmental, K=1 and for a covalent environment K<1, the lower the value of K, the greater is the covalent character. The K-values of the complexes 2, 5, and 6 were lower than 1.0, confirming covalent bond character.[19,35,58] The ESR spectra of 4, 9, and 10 showed isotropic type with g_{iso}= 2.21, 2.012 and 2.0035, indicating octahedral geometry around Co(II), Mn(II), and Fe(III) ions respectively.[54,57]

The zero field splitting parameter (D) for the parallel components of the dimmer complex 6 was estimated from the spectrum, and is equal to 414. The distance between two copper centers was calculated using the following equation.[59]

$$D = (3\mu_B / 2R^3)*(3 \cos_2 \theta - 1) \quad (4)$$

Where m_B is the magnetic moment of the electron and R is the distance (Å) between two electrons. For parallel component (D), θ=0, by substitution in equation 4, D is equal to 3 $\mu_B/2R^3$. For a diradical system in the triplet-state, it is found that, D for the parallel components is equal to 402 G and the distance between the two radicals is equal to 5.2 Å. From these data, the distance between the two copper(II) centers was calculated and is equal to 5.3 Å. This value is close to that for a dimeric copper(II) compound in the triplet state.[60]

Thermal analyses (DTA and TG)

The results of TG and DTA analyses of complexes were shown in Table 4. The results showed good agreement with theoretical formula as suggested from the analytical data (Table 1). All complexes except complex 2, lost hydration water molecules in the temperature 78-90 ^oC range and were accompanied with an endothermic peak. The coordinated water molecules were eliminated from these complexes at relatively higher temperature; 110142 ^oC, than those of the hydrate water molecules (Table 4). The removal of HCl molecules was observed for allcomplexes in the temperature 190-240 ^oC range, which was accompanied by an endothermic peak. The complexes decompose through degradation of the Schiff base ligand at a temperature over than 400 ^oC leaving metal oxides (480-590) range.

Biological activity

The antibacterial and antifungal activities of the ligand and its metal complexes were screened on bacterial and fungal strains using the disk diffusion method. It is important to note that the ligand and most of its metal complexes exhibit more antifungal inhibitory effects than the Standard antifungal drug (amphotricene B) and most of the metal complexes more active than parent ligands and the solution of metal ions. It is also clear that the ligand and its metal complexes have more antifungal activity than antibacterial activity. The inhibition zone diameter of the compounds is shown in Figs. 6 and 7. The order of antifungal activity of the compounds is 9, 10 > 6, 11 > 12 > 5 > Ligand > Amphotricene B > 7, however, the order of antibacterial activity of the compounds is Tetracycline > 11, 12 > 9 > 6 > 5 > 7. The increased activity of the metal complexes can be explained on the basis of chelation theory.[61] It is known that the chelation tends to make the

ligand act as more powerful and potent fungicidal and bactericidal agents, thus killing more fungi and bacteria than the ligand. It is known that, in a complex, the positive charge of the metal is partially shared with the donor atoms present in the ligands, and there may be π-electron delocalization over the whole chelating system,[62] this increases the lipophilic character of the metal chelate and favors its permeation through the lipoid layer of the membranes. There are other factors which also increase the activity, which are solubility, conductivity, coordination mode and bond length between the metal and the ligand. The variation in the effectiveness of different compound against different organisms also depends either on the impermeability of the cell of the microbes or differences in ribosomes of microbial cells.[63,64] The variation of biological activity of the complexes may be due to change in electronic configuration of the metal and also, the environment around the metal ion.

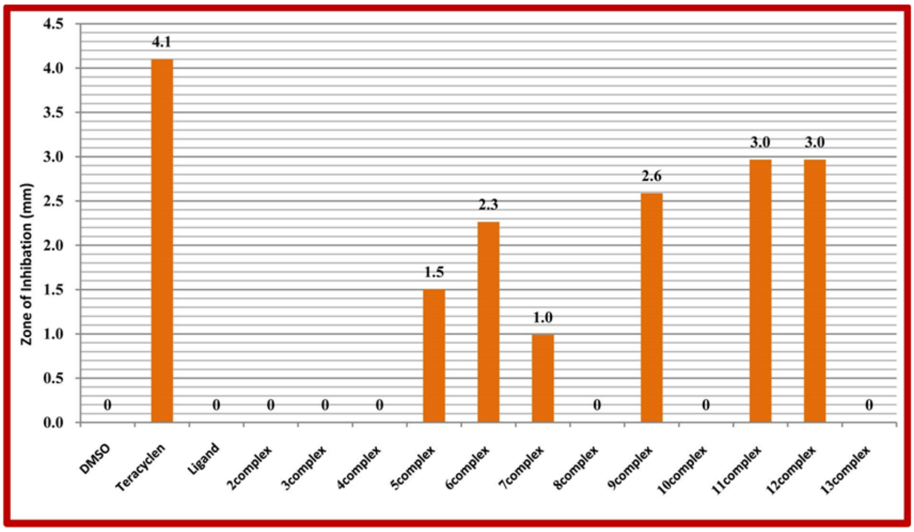

Fig. 6. Antibacterial activity of the ligand and its metal complexes against gram-negative bacterium (E. coli).

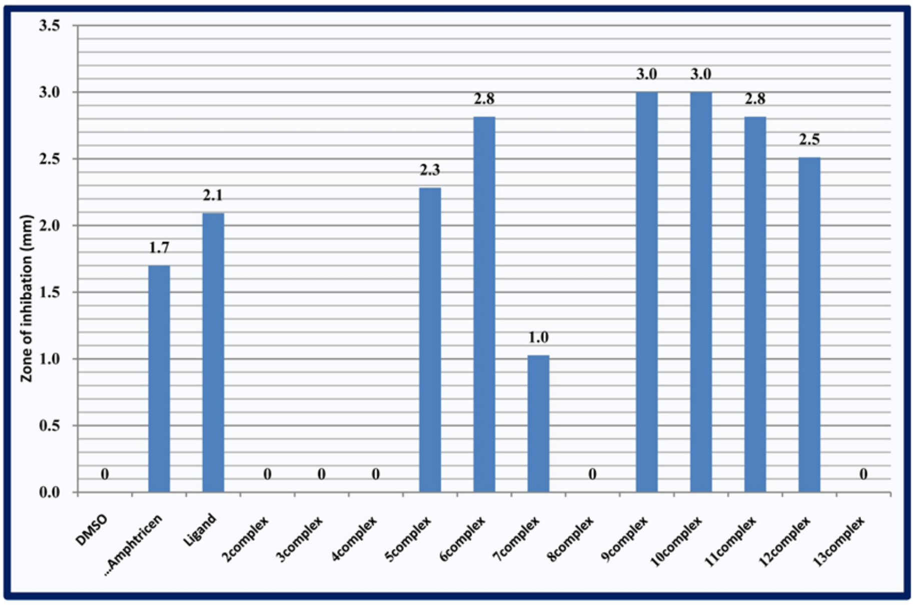

Fig. 7. Antifungal activity of the ligand and its metal complexes against Fungus (Aspergillusniger).

SUMMARY

The chromium(III), manganese(II), iron(III), cobalt(II), nickel(II), copper(II), ruthenium(III) and zirconyl(II) complexes of N^1,N^2-bis(3-((3-hydroxynaphthalen-2-yl)methyleneamino)propyl) phthalamide has been synthesized and characterized by elemental and thermal analyses as well as spectroscopic techniques. The analyses data showed that, the ligand behaves as a neutral tridentate, neutral hexadentate, dibasic tridentate or dibasic hexadentate ligand bonded to the metal ion/ions through azomethine nitrogen atoms, protonated or deprotonated hydroxyl groups and protonated or deprotonated amine groups. The metal complexes have a distorted octahedral, square planer or octahedral geometry. The ESR spectra of solid copper(II) complexes 2, 5, and 6 show $g_{\parallel} > g_{\perp} > g_{e(2.0023)}$, indicating octahedral structure with significant covalent bond character. The biological studies showed that the ligand biologically in active against Gram negative bacterium (Escherichia coli), and its metal complexes have mild activity in comparing with Standard antibacterial drug (Tetracycline) but has strongly biological activity against Fungus (Aspergillusniger) in comparing with Standard antifungal drug (Amphotricene B).

Meilinda.unsri@gmail.com

The main purpose of this research is to produce a prototype model of learning based typical local materials from South Sumatra to develop student environment literacy on junior high school in Indonesia. The purpose of the first year of the research one is identifying the material locally which are local wisdom, potential local and typical local problems of South Sumatra which can be utilized for the development students environment literacy model of learning which was done. Sampled area in this research is based on topography and demography divided into three district namely munacipilty palembang represent urban areas, regency muara enim represent mountainous regions and regent ogan ilir represent of coastal marshes and transition. The result showed that on each sampled district for many locals material that could be used in learning biology especially to form characters environment literacy. Local content in the form of local wisdom are Tunggu Tubang, Lebak lebung, Siring System. Being locally potential are productive forest area, waterfalls Curug, Swamp forest, River, Musi River and other tributaries, punti forest wood,/Kemaro island as well as the coal mining, petroleum. Local wisdom and local potential can be utilized for learning on learning topics (Interaction between living organisms, pollution, Global warming, Increasing population, technology products) which relate to develope environmental literacy.

Keywords: local Materials, South Sumatra. The Learning Model, Enviroment Literacy;

Education environment since 1991 been entered curriculum all education level in indonesia.The aim is to raise awareness of and passion for the environment and to learners having attitude care and not harm the environment (nurjhani, 2003). The entry of the living environment in education, obligatory national curriculum becomes an alternative of the most rational for the success of the management of the environment and also become important means in producing human resources that can carry out the principle of sustainable development (Rowe.D., 2002; Martin *et al*., 2006; Trevor,D., 2009; Trevor, D.,2010).

After 22 years, teaching material of environmental education applied in the study should have produced a real manifestation of attitudes and behaviour of environmentally conscious society (Adisenjaya,Y.H, 2009). But based on the research universities adelaide (Corey j.a. , 2010), Indonesia, including in four big countries most contribute to the environmental damage after brazil, united states and china. Seven an indicator used in the research is deforestation, the use of chemical fertilizers, water pollution, carbon emissions, catching fish, and the threat of species of plants and animals, as well as transition land green to commercial land such as mall, or the center of trade and also an estate.Above an indication of the fact that the purpose of education environment haven't completely achieved. Yet to achieve educational objectives on the environment because the application of environmental education at all levels of education, ranging from elementary school smp, smas even in college has undergone disorientation. Likewise can be seen from learning and the process of material substance. On the substance of material ranging from Elementary, Junior high scholl and even in College, the material being taught more reflect the substance of the material science material substance yet ecological environment that is becoming a core staple on environmental education, even though substantially between ecology and environmental sciences is very different. The difference lies in viewpoints where ecology looked notch human being out system nature contrarily scienceto a human environment viewed as inevitably a part of a system of nature. As the impact, strategy implementation of learning which used teacher or lecturer in teaching also be improper especially when viewed as achieving educational objective environmental oriented to development side affective learners psychomotor and learners form of attitude concern of the environmental experiencing shift into just a source of information cognitive form of knowledge only (Martin et al, 2006; adisendjaja, y.h.2009; Leksono et al. , 2012).

According to some studies, cognitive information conveyed to students anything separated from the environmental condition students who lived and do not touch the aspect of mental students actively in fact of learning environment dna-based local matter is a recommendation on the agenda of 21 (Joseph et al. , 2007; Adisendjaja, 2009; Leksono et al. , 2012, Burn d.p. et al. 2009), the impact of all of these things is learning biology of the environment only limited to only hapalan only and does not provide any change in the attitude of students**.** Attitude affected by three things: knowledge (cognition) fondness (afeksi) and intention to commit (Conation). Knowledge affect conception.A conception of different, with the concept of if the concept is regarded as a collection of systematic knowledge that which is constituted or notion that are meaningful and agreed upon between scientists, then conception often regarded as' in a receptive manner a konsep' that is spatially subjective (Rustaman and Widodo, 1997). Other view expressed by pratt (1992) quoted Devlin (2006): one-twelve that conception is the specific signification given to a phenomenon and further show a response someone in represent and apprehends a phenomenon and learn according to konstruktivis is change conception (conceptual change).

Based on the above issues, it needs to be developed based on the constructivist model of learning biology with local materials typical of South Sumatra with the aim of cultivating the attitude of care environment (Enviromental Literacy) especially in the junior high school students because the students of junior high school have the subjects of biology and research results Hess and Torney (1967) found that childhood is an important period for the development of the concept of self and sensitivity to be responsible citizens. Research also shows that after graduated from high school just get knowledge that is spatially fragmentation (Adisendjaja y.h. 2009).

Formulation of the Problem

Based on the description above, the outline of the research problem is how is the development of models of biological learning and local materials typical of South Sumatra which can Foster Literacy in students Enviroment.

Research Method

This research is development research, therefore the approach used also follow turnarounds development Research (Borg&Gall,1989) consisting of ten steps: 1) needs analysis and the study of literature; 2) product planning; 3) development of a prototype product; 4 limited Testing); 5 major product Revisions); 6) field testing; 7 Product Improvements); 8) Trial Court; 9) Revision of Final Products; and 10) dissemination and implementation. On this paper will be discussed at the third stage, namely the development of prototype products.

This research purposes to develop kind of classroom biology with local matherial typical south sumatra to grow enviromental literacy students. Research purposes are:
a. Identify local material typical south sumatra form of the local wisdom, natural resources and problem of environment typical south sumatra.
b. Develop blueprint model aimed to develop character enviroment literacy students

RESULTS AND FINDINGS

Model of Learning

According to Orr (1992, p.92), environmental literacy is the 'knowledge necessary to comprehend relatedness, and an attitude of care or stewardship [An environmentally literate] person would also have the practical competence required to act on the basis of knowledge and feeling'. UNESCO-UNEP (1989) suggests that 'environmental literacy' is the ultimate goal of environmental education. Orr (1992) argues that environmental literacy is primarily concerned with '*knowing, caring* and *practical competence*'. To this end, Orr (1992) argues that the environmentally literate person understands the dynamics of the environmental crisis which includes a thorough understanding of how people (and societies) have become so destructive.

Attitude is a term first used by Hebert Spencer (1862) which refers to a person's mental status (Azhar, 2013) in its development there are three frameworks of thought about the attitude that is defined as a form of feeling attitude favoring or impartial person on a certain object, both represented by Chave stating that attitude is a kind of readiness to react to an object with certain ways, readiness is a potential tendency to react in a certain way when the individual is exposed to a stimulus which requires the presence of response. The group third oriented scheme triadik stating that attitude is kontelasi components cognitive, affective and konatif who interact in the understanding; feel and behaves toward an object.Approach oriented to scheme triadik is known also -named tricomponent.Aspect attitude to be developed in this kind of classroom adheres to understand scheme triadik but the placement third component konitif, affective and konatif this views on tripatite model namely attitude somebody already can be known from see one course of that response but description fully on attitudes of individuals should be obtained from seeing third response the full.

According to understand behaviouris, learning is a change in attitude (Behaviour Change) to make changes in the attitude of students required physical stimuli from the outside in the form of reinforcement (reinforcement), practice and external learner motivation are viewed passively while according to constructivism, learning is a change in the concept of (Conceptual Change). On the change of concept going on several stages the first stage called assimilation and the second stage is called accommodation. In order to assimilation and accommodation required terms such as dissatisfaction against the concept that there is a new concept, should be able to understand, rational and able to resolve the issue or phenomenon that is changing the concept of the ultimate goal of learning behaviour is changing the attitude of the students but the student how to change no further explanation other than just the conditioning of a learning environment while on approach to triadik scheme or third case involving attitude tricomponent i.e. cognitive, affective and konatif. Kontruktivisme focus on cognitive structure changes according to Posner (1982) there is a change in learning concepts, the concept of change there is assimilation and accommodation. Assimilation is the use of concepts that have existed for dealing with the phenomenon or new concepts while accommodation is a change concept radically because of incompatibility with the new phenomena encountered.

One of the constructivist learning model developed from constructivist theory of Vygotsy and Ausabel is Learning 5E Learning Cycle (root, 2005) model consists of 5 stages of Engagement, Exploration, Explanation, Elaboration and Evaluation (Bybee, 2009) while the conceptual changes in the models developed Joseph i. Stepan consists of 6 phases i.e. Commit to a position or learning outcomes, Exposé of limiting beliefs, beliefs, Confront Acommodate the concept, Extend the concept, Go beyond. On **first phase commit to a positions or outcome,** students invited to explore his mind own by sought response over a question or completion a problem. **On both phases expose belief students** with discussed and share ideas, reason, predictions against a problem with my one class or one group before they try to test the idea with a activity. **Thirth is confront student belive early ideas** they have experimented with conspiring to test conception early. Gregarious this experiment it might be working with tools and materials, collected data or consult on affairs. **At fourth phase acommodate the concept students accommodate views,** concept, and new skills in various ideas and situation.**At phase fifth extend the concept students** apply and make the relation between concept or new skills for the situation and a new idea. **The sixth phase of the Go beyond students** to apply these new ideas in their daily lives, from the analysis of the third theory above, developed a new learning model based on local materials to improve student literacy enviroment.

Identification Local Matter Typical South Sumatra

Learning science that uses a source of learning from local matter or environment around on a variety of studies (yuniatuti, 2013; mariantini, 2005; suratsih, 2010) can increase the competency basic science students in addition to that content of learning developed not from the environment distinctive about students led to students only gain knowledge technical course without impact of long-term with the students.This happens because the students who are at the age of smp are still facing the development of the ability of reflective and metakognitif and so students can not distinguish between information that is both factual and analyses the possibility because the students could not put different things reported in the same category (fleischer.S, 2010)

Typical local South Sumatra material identified in this research include local wisdom. Local wisdom is the agreement of local communities in the form of a series of values, rules and norms that are considered good and maintained hereditary. Local potentials identified in this research is artificial and natural resources in a region that is preserved as a local problem is all the negative aspects of human activities that have an impact on the physical environment include climate change, the loss of natural resources and pollution. The identification of local wisdom can be seen in table 1.

Table 1. Some Potential The Local Wisdom Typical South Sumatra To Build Character Enviroment Literacy

No	Potential wisdom	Location
1	Stage house	Most of the territory sumsel
2	Auction System of Lebak Lebung	OKI dan OI
3	Tekiang System	Semendo Territory
4	Tebat Mandian	Semendo

According to Sudjana and Ahmad (2009) learning resource requirements are: a) economical, economical low prices do not mean, can also Fund for procurement of learning resources is quite high but due to its utility for the long term so it could economically; b) practical and simple, c) easy to obtain; d) is flexible,; e) components in accordance with the purpose, process and support the achievement of the learning objectives, can stir up motivation and interest in students learning. Those conditions can be pervaded by the stage.The stage is home construction fleld raised with traditional stories from surface soils with poles as penopangnya.Building stage is an adaptation, humans against environmental conditions e.g. when the tide water not come into the house.Building material is kayu derived from nature. Adaptation and of natural resources utilization examples human interaction with environment.This line with opinion Siswanto (2009) that the construction of a stage indirectly care environment is attitude may benefit in maintaining ecological to stay up earth ecosystems. It relates with the construction of buildings on the underside of the stage that is empty land, the water flow and keep water absorbs.Level responsife building in anticipation influence of temperate to tropical humid demonstrating ability building in interact in in its environment.The same advanced by Main (2013) that home traditional built and developed by considering environmental conditions around is the local wisdom because knowledge arif it obtained either from earlier generations or of his experiences relating to people and environment others and to finish problem.Interaction of human and its environment affecting the manner of construction house so house kept feel comfortable as the residence besides remain a harmonious with the environment. The same is expressed by Main (2013) that traditional home built and developed taking into account the environmental conditions surrounding the local wisdom as knowledge that is obtained either from arif the previous generation as well as from her experiences dealing with environmental and other community as well as to resolve the issue at hand. Human interaction and the environment affect the way the construction of the House so the House still felt comfortable as a residence in addition to remain harmonious with the surrounding environment. Such circumstances can be used as an object of discussion between teachers and students through a contextual approach, in particular regarding the adaptation and dependency towards nature which is a form of interaction of living things and the environment.

Ogan Ilir Regency, the Government issued local regulations (Perda) related fisheries in lebak lebung namely lebak lebung auction system. Lebak lebung auction system that is a way of getting the right system or an attempt to get a business license fishing for one year's time (Thys Michels, 2009). Lebak lebung is an area rich in nutrient elements that many aquatic plants are a source of natural fish fodder. Auction system of lebak lebung identified in this research is worthy as a learning resource. These can be seen from eligibility for compliance with the concept of the curriculum and learning materials science. According to the Department of national education science learning concept covers four main elements that: 1) attitude: curiosity about benda, natural phenomena, living beings, and relations for consequence to cause new problems that can be resolved through the correct procedure; 2) the process: procedure problem-solving through scientific method; 3) of: form of fakta prisip, theory and law; 4) application: the application of scientific method and concept science in daily life.Fourth concept learning science can be pervaded by bidding system lebak lebung good of solving a problem or kesesuaiannya with competence curriculum Yunior high school in Indonesia

Staple food semende society is rice and most district semende is sawah.In the provision of food usually people semende hemped-up rice crop in tengkiang.Tengkiang is a typical the barn rice semende.Existence morein tengkiang closely related to food security.The purpose of making tengkiang semende is by society as a reserve supply of food when the lean season arrives.This conformable to law no 7 1996 about food which dictates that the government along the people responsible externalisehis food security.The construction tengkiang nearly the same as breadbasket konstruksi rice in general is sustained by poles so as not to disturb water catchment area underneath. According to sartini (2004); custom basically capable in naturally and it is valued both, because those habits is a social repeated and had been increasing (reinforcement).Wisdom society semende tengkiang make effort in food security is a the local wisdom that shows the need humans against natural resources.

Tebat mandian is one of the utilization of water resources by society countryside muara calm by with menampungnya in two pool equipped with the circulation of water is good.Wisdom semende people in water resources management among others can be seen from making two pool shelter that serves as source of drinking water and toilet activity maintain clean environment around pond source of drinking water to prevent water from contaminated.Wisdom semende people in water resources management indicative of the human need for water and the interaction between humans and the environment in the utilization of natural resources.

CONCLUSION

Blue Print that development by this research are **first phase commit to a positions or outcome, On both phases expose belief students. Thirth is confront student belive early ideas** they have experimented with conspiring to test conception early.. **At fourth phase acommodate the concept students accommodate views,** concept, and new skills in various ideas and situation.**At phase fifth extend the concept students** apply and make the relation between concept or new skills for the situation and a new idea. **The sixth phase of the Go beyond students** to apply these new ideas in their daily lives, from the analysis of the third theory above, developed a new learning model based on local materials to improve student literacy enviroment. **Some Potential The Local Wisdom Typical South Sumatra To Build Character Enviroment Literacy are** Stage house, Auction system of lebak Lebung, tekiang system and tebat mandian.

RECOMMENDATIONS

This result from the fisrt year of research. Need more time to validity the model that developed. Thank you for DIKTI to funding this research in HIBAH BERSAING Year 2013.

KO TE ARO WHAKAMURİ KİA ANGA WHAKAMUA. REFLECT ON THE PAST İN ORDER TO FORGE THE FUTURE.

Leeana HEREWİNİ

Roslyn BARTOSH

This paper is a critical reflection on our involvement and experience in Pāngarau Education (or Mathematics Education) in Aotearoa (New Zealand) which is how mathematics is constructed and taught through the medium of New Zealand's indigenous language, Māori. Pāngarau education has been described as contributing to and being firmly located within the overall context of Māori development which includes the maintenance and revitalisation of the Māori language (Christensen, 2002).

We have been actively involved in Pāngarau education for 15 years through our work as professional learning and development facilitators in schools throughout the country. Pāngarau education has undergone significant changes during this time. Some of the key highlights during the 15 years have been the focus given to mathematical literacies and the links to information and communication technologies. This paper examines some of these changes and highlights and proposes some ways for the continued growth and development of Pāngarau education in the future.

ÖZET: Çevre sorunları kapsamında karşılaşılan büyük tehlikelerden biri yeraltı ve yerüstü sularında görülen azalmadır. Son yıllarda nüfusun hızla artması, iklim şartlarının ve artan sanayileşmenin kısıtlı olan su kaynaklarını olumsuz şekilde etkilemesi nedeniyle yeryüzünde bir su kıtlığı sorunu baş göstermiştir. Kuzey Kıbrıs'ta çevre problemleriyle ve iklimle bağlantılı olarak belirginleşen su sıkıntısı için "Asrın Su Projesi" hazırlanmış ve çalışmalara başlanılmıştır. Ada'nın da içinde bulunduğu yerkürede ortaya çıkan çevre ve su problemlerine getirilen çözüm önerilerinden en önemlisi ve kalıcı olanı şüphesiz insanların eğitilmesidir. Bu çalışmada Kuzey Kıbrıs'ın batısında yer alan ve proje alanı olan Güzelyurt yöresinde ortaöğrenime devam eden öğrencilerin çevreye yönelik bilinçleri ile suyun önemine yönelik tutumlarının belirlenmesi hedeflenmiştir. Çalışma betimsel türde bir araştırmadır ve ilişkisel tarama deseniyle yürütülmüştür. Veriler "Çevreye Yönelik Bilgi ve Bilinç Ölçeği" ve "Su Tutum Ölçeği" ile elde edilmiştir. Sonuçlar istatistiksel olarak yordanmış, iki ölçek arasındaki korelasyon ve öğrencilerin demografik bilgileri ile ilişkilendirilmiştir.

Anahtar sözcükler: Asrın Su Projesi, Kuzey Kıbrıs, su tutumu, çevre bilinci.

ABSTRACT: One of the dangers met within environmental problems is the decrease in surface and ground waters. In the recent years, shortage of water has appeared because the population has increased rapidly and climate conditions and rising industrialization have had a negative effect on limited water sources. In Northern Cyprus, for the water problems which have arisen in relation with environmental problems and climate, "The Water Project of the Century" has been prepared and put into practice. The most important and lasting solution offer brought for the water and environmental problems which have appeared in the hemisphere where the Island is also in, is undoubtedly educating people. In this study, it is aimed to determine the attitudes of environmental consciousness and the importance of water of the students who attend high school education in Güzelyurt in the west of the island and where the project area is. This is a descriptive study and it has been designed with correlational survey model. The data has been gained with "The Scale of Environment Oriented Knowledge and Consciousness" and "Water Attitude Scale". The Results have been expected statistically and have been related with the correlation between two scales and students' demographic knowledge.

Key words: The Water Project of the Century, North Cyprus, water attitude, environmental consciousness.

GİRİŞ

Çevre, insanın sosyal, biyolojik ve kimyasal bütün faaliyetlerini sürdürdüğü bir ortamdır (Aydoğdu ve Gezer, 2009). Belirli bir dönemde direkt veya dolaylı bir şekilde şahsı etkileyen, onun maddi manevi gelişmesini ve yaşam şartlarını belirleyen biyolojik, coğrafik ve toplumsal olayların tamamına çevre denir. Çevre bugün doğal ekonomik ve kültürel değerlerin bütünü olarak algılanmakta ayrıca insanla birlikte bütün organik ve inorganik varlıklarla canlı varlıkların her çeşit eylem ve davranışını etkileyen fiziksel, kimyasal, biyolojik ve toplumsal nitelikteki unsurların bütünü olarak değerlendirilmektedir (Bozkurt, 2010). Çevre toprak, su ve hava küre şeklinde üç geniş kavramı ifade etmektedir. İnsanlar, bitkiler ve hayvanlar ile bunların yaşadıkları çevre ile olan ilişkilerini inceleyen bilim dalı ise Çevre Bilimi veya Ekoloji olarak adlandırılmaktadır (Özey, 2009).

Su, biyosfer için en gerekli maddelerin başında gelmektedir. Toplumsal yaşamda suyun yeri hiçbir madde ile ikame edilemez. Yaşamın, iklimin, havanın, toprağın, bitkilerin, canlı organizmaların fiziksel ve kimyasal özelliklerinin biçimlenmesinde suyun rolü oldukça büyüktür (Güney 2008). Su ile toprak, ülkelerin gelişme süreçlerinde birincil olarak başvurulan kaynaklar olma özelliklerine sahiptir (Tomanbay, 2008). Su, atmosfer döngüsü süreci içerisinde doğal dengenin sağlanmasında ve canlı yaşamının devamı için gerekli temel unsurların başında gelmektedir. Su, bu özelliği sayesinde hidrolojik, ekonomik, hukuk, politika ve biyoloji gibi çeşitli bilim dalları tarafından da incelenmektedir. Su sadece oksijen ve hidrojen kaynağı değildir. Bunun yanında canlıların temel yapı maddesi olup, insan kütlesinin %60'ını, bitkinin %95'ini, tahılların %79'unu, mantarların %80'ini oluşturur. Yeryüzünün ise 2/3'si (363 milyon km^2) sudur (Akman, Ketenoğlu, Kurt, Düzenli, Güney; 2012).

Yeryüzünde bulunan toplam su miktarı 1600000 x 103 km^3'tür. Bunun 220000x103 km^3'ü kimyasal olarak bağıl su, geriye kalan 1380.000x103 km^3'ü ise serbest sudur. Toplam su miktarının %97'si tuzlu su olup bu miktar insanların kullanımı için uygun değildir. Karalardaki toplam tatlı su miktarı %3 olup bu miktarı yer altı suları, kar/buz, yüzey tatlı suları ve atmosferdeki su buharı oluşturmaktadır (Özdemir, 1997).

Su kaynakları son yüzyılda büyük problemlerle karşı karşıya kalmıştır. Su kıtlığı probleminin yanında su kalitesinin de hızla bozulmakta olması dünya genelinde bir alarm konusudur (WWAP, 2009). Bu sorunlar sadece ekolojik anlamın yanında, sosyal ve ekonomik açıdan domino etkisi yaparak pek çok soruna sebebiyet verdiklerinden oldukça önemlidirler (Brody, 1995). Özellikle içme ve kullanma suyu elde edilen su kaynakları, evsel ve endüstriyel özellikli atıklar, aşırı gübreleme, bilinçsiz kullanılan zirai mücadele ilaçları, aşırı nüfus artışı ve şehirleşmenin etkisi altındadır (UNEP, 1987; WWAP, 2006; 2009).

Çevre ve Su Eğitimi

Çevre eğitiminin amacı, insanların ekolojik çevrelerini ve bunun içerisindeki yerini kavramalarına, buna paralel olarak kişilerin insan toplumlarının dünyamızla nasıl uyum içerisinde yaşayabileceklerine ilişkin görüş geliştirmelerine, etkin ve sorumlu bir katılım için lüzum olan gerekli becerileri kazanmalarına yardım etmektir (Aydoğdu ve Gezer, 2009). Su eğitimi ise, insanlara su bilinci ve suyu dikkatli kullanma alışkanlığı kazandırmayı hedeflemektedir. Çevre ve su sorunlarının çözümünde "eğitim" önemli bir yer tutmaktadır. Su ve çevre problemlerinin çözümü için özellikle öğrenim çağındaki bireylerde bazı davranış değişikliklerinin sağlanması ve buna bağlı olarak bir farkındalığın gerçekleştirilmesi gerekmektedir. Çevre ve su eğitiminde hedef kitle sadece öğrenciler değil, tüm insanlardır. Fakat eğitimin amacına ulaşmasında bireylere küçük yaştan itibaren istendik yönde davranış kazandıran örgün eğitim sisteminin temel yapısı okullara büyük görevler düşmektedir.

Çevre eğitimi, çevre koruma ile ilgili bir eğitimdir. Çevre sorunları ile ilgilenme çevre eğitiminin çekirdeğini oluşturur. Bu süreç, birlikte yaşamanın kuralları, çevrenin kuramları, yaşama alanlarının planlanması, yeni ekolojik görüş açısının ön plana alındığı bir eğitim sürecidir. Çevre eğitimi, çevre ile ilgili konuların çok özele indirgenmeden ve fazla bilgi bombardımanına tabi tutmadan yapılmasıdır. Kiziroğlu (2001), çevre eğitimi ile ilgili aşağıdaki yargılara varmıştır:

- Çevre eğitimi, bireyin ekolojik davranış biçimini şekillendirir,
- Çevre eğitimi, okulda öğrencilerden istenen doğal, sosyal ve yapay çevre ile olan davranış ilişkilerini kapsar,
- Çevre eğitimi, okulda sorunların çözümü için gerekli yeteneğin öğrenciye kazandırılmasına yardımcı olur, ilerde siyasi yaşama katılımını sağlar,
- Çevre eğitiminin interdisipliner düzeyde verilmesi gerekir,
- Çevre eğitimini öğrenci, aile, kitle iletişim organları, sivil toplum örgütleri, okul yönetimi ve öğretmenler birlikte çalışarak şekillendirmelidir.

Su Tutumu

Tutum, sosyal psikologlar tarafından kişilerin gözle görülmeyen kişi, nesne veya olaylara bağlı duygu, düşünce ve davranışlarını birleştiren eğilimleri olarak ifade edilmiştir (Aydın, 2007). Tutum sahibi olan birey olumlu veya olumsuz tepkileri gösterme eğilimine sahiptir. Dolayısıyla birey sahip olduğu düşünce ve davranışların olumlu ve olumsuzluğuna bakmadan zamanını düşünmekle, ilgilenmekle ve ilişkili konularla uğraşmakla geçirir (Tezbaşaran, 1997). Bireylerin su tüketimi ve su kullanımına yönelik tutumlarının olumlu yönde gelişmesi, suyun önemi, yaşam kaynağı olarak su, metabolizma ve su, küresel ısınma, yer altı ve yer üstü suları, sulardaki kirlenme ve azalma gibi konularda bilinçlendirilmeleri ve eğitilmeleri ile mümkündür. Auriault (1998) su eğitiminin amaçlarını aşağıdaki gibi belirtmiştir:

- Su kaynakları, kullanımı, kirliliği, korunması ve yönetimi konularında bilgi kazandırmak.
- Suyun tasarruflu kullanımı ve su kaynaklarının korunması üzerine tutum ve davranışlar kazandırmak.
- Su kaynaklarının korunması ve kirliliğin azaltılması üzerine kişisel ve toplumsal sorumluluk kazandırmak ve bireylerin katılımını sağlamak.

Çevre Bilinci

Fiziki ve beşeri çevrenin bozulması halinde birey ve birey topluluklarının büyük problemlerle karşılaşacağını bilmesi ve algılaması için her türlü eğitim imkanlarından yararlanarak onlara çevre bilincinin verilmesi gerekmektedir. Çevre bilincine erişmede en önemli şart ise kişinin sosyal davranışlarının temelden değişmesidir. Bu da ancak verilecek etkili ve kapsamlı bir çevre eğitimi ile mümkündür (Sipahioğlu, Yıldız ve Yılmaz; 2009).

Bilinç, çevre ile ilgili kararları, ilke ve yorumları kapsayan düşüncelerden ve bunların hayata aktarılması olan davranışlardan ve tüm bunlarla ilgili çeşitli duygulardan meydana gelir. Çevre bilinci, kişilerin geçmişi, bugünü ve geleceği aklından çıkarmadan hem kendine hem de doğaya saygılı olabilmesi demektir. Çevre bilincinin düşünsel, duygusal ve davranışsal boyutları mevcuttur (Türküm, 1998). Çevre bilincinin kazandırılmasında etkili olan faktörler aşağıda sunulmuştur.

- Kişilerde çevreye yönelik olumlu bir tutumun gelişmesini sağlayacak uygun ortam, uygun model ve uygulamalar sağlanmalıdır.
- Fikir, düşünce ve mesajlar; propaganda, dayatma ve dikte etme tarzında verilmeye çalışılmamalıdır. Yöntem olarak alternatifler sunarak, uygun yollar önererek bireylerin meseleyi anlamasını ve benimsemesini sağlamaya çalışılmalıdır.
- Süreç içinde uygun sıklıkta tekrar yapılması sağlanmalıdır.
- Bireylerin mümkün olduğu oranda doğayla iç içe olması sağlanmalıdır.
- Sadece teorik bilgiler ve mesajlarla kalmayıp, mesajlarda görselliğe önem verilmelidir.
- Çevre, çevre konusunda bilgilendirme, eğitim ve sorumluluk görevleri sadece kamu kurum ve kuruluşlarına yüklenmemeli, sosyal sorumluluk kapsamında özel sektörün de desteği olmalıdır.
- Uyarıcıların çok yönlü olması, güven ve inandırıcılığı artıracaktır (Türk, 2011).

Araştırmanın Amacı

Kıbrıs Adası, yarı kurak (Subtropikal) iklim kuşağının Akdeniz İklim Tipi içerisinde yer almaktadır. Bu özelliği ile, Kuzey Kıbrıs'ta yıllık yağış ortalaması 285mm ile 550mm arasında olup, en az yağış adanın batısındaki Güzelyurt Yöresine düşmektedir. Yörede yağış azlığı ve yer altı su aküferinin tarımda ve içme suyu temin etmede sürekli kullanılması, suların ve toprağın tuzlanmasına ve yer altı su aküferinin zayıflamasına ve dolayısı ile adanın en büyük yer altı su rezervine sahip olan yöresinde büyük su sıkıntısı yaşanmasına neden olmaktadır. Kuzey Kıbrıs'ta çevre problemleriyle ve iklimle bağlantılı olarak belirginleşen su sıkıntısı için "Asrın Su Projesi" hazırlanmış ve çalışmalara başlanılmıştır. Bu proje ile Kuzey Kıbrıs'a sulama ve içme suyu aktarılması hedeflenmiş ve deniz seviyesinden 250m derinliğinde askı borularla yıllık 75 milyon m^3 su aktarımı yapılması amaçlanmıştır. Bu noktadan hareketle, bu araştırma, ada batısında bulunan Güzelyurt Yöresinde yaşayan ortaöğretim öğrencilerinin bu proje ile gelecek olan suyun çevre üzerindeki etkisine bağlı olarak, çevre bilinç düzeyleri, su tutumları ve bunun neticesinde çevre ve su farkındalıklarının ne düzeyde olduğunun tespit edilmesi amacı ile yapılmıştır. Araştırmanın genel amacı doğrultusunda belirlenen alt amaçları aşağıda verilmiştir:

- Öğrencilerin "Çevreye Yönelik Bilgi ve Bilinç Ölçeği" puanları ile "Su Tutum Ölçeği" puanları ne düzeydedir?
- Öğrencilerin "Çevreye Yönelik Bilgi ve Bilinç Ölçeği" puanları ve "Su Tutum Ölçeği" puanları cinsiyetlerine, okul türlerine, sınıflarına ve anne – baba eğitim durumlarına göre değişkenlik göstermekte midir?
- Öğrencilerin "Çevreye Yönelik Bilgi ve Bilinç Ölçeği" puanları ile "Su Tutum Ölçeği" puanları arasında anlamlı bir ilişki var mıdır?

YÖNTEM

Proje alanı olan Güzelyurt Bölgesinde yaşayan ve öğrenimlerine devam eden lise öğrencilerinin çevreye yönelik bilinçleri ile su tutumlarını inceleyen bu araştırmada korelasyonel tarama araştırma deseni kullanılmıştır. Karasar (2007), ilişkisel tarama modellerini iki veya daha çok sayıdaki değişken arasındaki değişimin varlığını ya da derecesini belirlemeyi amaçlayan araştırma modelleri olarak tanımlamaktadır.

Çalışmanın evreni Asrın Su Projesi alanı olan Güzelyurt Bölgesinde öğrenimlerine devam eden 9, 10, 11, 12. sınıf öğrencilerdir. Örneklem olarak 1 kolej, 1 meslek lisesi ve 1 düz lise seçilmiştir. Çalışmaya örneklem kapsamına dahil edilen Güzelyurt Türk Maarif Kolejinden 68 öğrenci, Güzelyurt Meslek Lisesinden 53 öğrenci ve Kurtuluş Lisesinden 78 öğrenci olmak üzere toplamda 199 öğrenci katılımcı olmuştur. Öğrencilerin 115'i kız, 84'ü erkektir. Çalışmaya katılan öğrecilerden 60'ı 9. sınıf, 36'sı 10. sınıf, 52'si 11. sınıf ve 51'i 12. sınıftır. Çalışmaya katılan örneklem grubunun anne eğitim durumu ilkokul mezunu 41 kişi, ortaokul mezunu 33 kişi, lise mezunu 90 kişi, üniversite mezunu 22 kişi, yüksek lisans – doktora mezunu 4 kişi ve okuryazar olmayan 9 kişidir. Çalışmaya katılan örneklem grubunun baba eğitim durumu ise ilkokul mezunu 43 kişi, ortaokul mezunu 38 kişi, lise mezunu 88 kişi, üniversite mezunu 21 kişi, yüksek lisans – doktora mezunu 9 kişidir.

Araştırmada veri toplama aracı olarak "Çevreye Yönelik Bilgi ve Bilinç Ölçeği" ve "Su Tutum Ölçeği" kulanılmıştır. Çevreye Yönelik Bilgi ve Bilinç Ölçeği Özpınar tarafından 2010 yılında geliştirilmiştir. Araştırmacı tarafından Kuzey Kıbrıs'a uyarlaması yapılan ölçek, geçerlik ve güvenirlik hesaplamalarının ardından 26 madde ile uygulamaya konulmuştur. Arkış (1992) tarafından hazırlanan Su Tutum Ölçeği ise, 3lü likert tipinde 24 maddeden oluşmaktadır. Ölçeğin Cronbach alfa güvenlik katsayısı .79 olarak belirtilmiştir. Araştırmacı tarafından tekrar değerlendirmeye alınan ölçeğin Cronbach alfa güvenlik katsayısı .813 olarak belirlenmiştir. İki ölçekten oluşan anket formunun en başına araştırmacı tarafından hazırlanan demografik bilgiler kısmı eklenmiştir. Anket sorularına verilen cevapların analizleri SPSS 16.00 paket programı ile yapılmış ve değişkenler ile katılımcıların çevreye yönelik bilinçleri ve su tutumları istatistiksel olarak karşılaştırılmıştır. Veriler aritmetik ortalama, frekans-yüzde dağılımı, t-testi, anova ve Pearson Correlation analizi kullanılarak çözümlenmiştir.

BULGULAR VE TARTIŞMA

Bu bölümde çalışmanın verilerine ait istatistiksel analizler çalışmanın alt amaçları doğrultusunda sunulmuştur. Öncelikle katılımcıların cevapladıkları ölçeklerin genel bir değerlendirilmesi yapılmıştır. Değerlendirme sonuçları Tablo 1'de belirtilen aralıklar doğrultusunda değerlendirilerek Tablo 2'de sunulmuştur.

Tablo 1. Ölçek Aralıkları

	İyi	Orta	Kötü
Çevreye Yönelik Bilgi ve Bilinç Ölçeği	78-61	60-44	43-26
Su Tutum Ölçeği	72-57	56-41	40-24

26 maddeden oluşan Çevreye Yönelik Bilgi ve Bilinç Ölçeği'nden alınabilecek en düşük puan 26, en yüksek puan ise 78'dir. 24 maddelik Su Tutum Ölçeği'nde ise en düşük puan 24, en yüksek puan 72'dir. Düşük puan aynı zamanda düşük bilinç ve tutumu, yüksek puan ise yüksek bilinç ve tutumu göstermektedir.

Tablo 2. Ölçek Ortalama Puanları

	Mean	Std. Deviation	N
Çevreye Yönelik Bilgi ve Bilinç Ölçeği	57,9383	5,92718	199
Su Tutum Ölçeği	61,3272	7,20750	199

Analiz sonucunda Çevreye Yönelik Bilgi ve Bilinç Ölçeği'nin genel madde ortalaması 57,94 olarak bulunmuştur. Bu değer katılımcıların ölçeğe "orta" düzeyinde görüş bildirdiklerini göstermektedir. Su Tutum Ölçeği'nden alınan puanların ortalaması ise 61,33'tür. Bu puan "iyi" düzeyinde olup, Güzelyurt yöresinde yaşayan ve eğitim alan katılımcıların su tutumlarının, çevre bilinçlerinden daha olumlu ve yüksek olduğunu göstermektedir. Ünal'ın 2011 yılında yaptığı "İlköğretimde Sürdürülebilir Çevre Eğitiminde Suyun Yeri" adlı çalışmasında, çevre eğitiminin öncelikle ailede, bunu takip eden süreçte okullarda ve yaşam boyunca devam ettiği tespiti yapılmış, sürdürülebilir çevre eğitiminin önemli konusunun ise yaşam kaynağı olan su olduğu belirtilmiştir. Ayrıca çalışmada öğretmen ve öğrenciler için çevre eğitim programlarının değiştirilmesi veya düzenlenmesi gerektiği tespiti yapılmıştır. Şimşekli'nin (2004) "Çevre Bilincinin Geliştirilmesine Yönelik Çevre Eğitimi Etkinliklerine İlköğretim Okullarının Duyarlılığı" adlı çalışmasında, konuya dahil olan ilköğretim öğrencilerinin çevre konularına dikkatleri çekilmiş, bu konuda düşünmeleri ve fikir üretmeleri sağlanmış fakat çevre eğitimi duyarlılıklarının istenilen düzeyde çıkmadığı saptanmıştır.

Tablo 3. Çevreye Yönelik Bilgi ve Bilinç Ölçeği ile Su Tutum Ölçeğinin Cinsiyete Göre Değerlendirilmesi

		N	$\overline{X}$	SS	F	Df	P
Çevre	Kız	115	55,08	5,89	.137	197	.375
	Erkek	84	55,84	5,98			

Su	Kız	115	62.96	6,60	6,170	197	.297
	Erkek	84	61,86	7,94			

Tablo 3, katılımcıların Çevreye Yönelik Bilgi ve Bilinç ile Su Tutum ölçeklerinden aldıkları puan ile cinsiyetleri arasındaki ilişkiyi göstermektedir. Tablolar incelendiğinde Çevre Bilinci ve Su Tutum ölçekleri sonuçlarının cinsiyetler üzerinde anlamlı bir fark yaratmadığı görülmektedir. Aslan, Sağır ve Cansaran (2008), "Çevre Tutum Ölçeği Uyarlanması ve İlköğretim Öğrencilerinin Çevre Tutumlarının Belirlenmesi" adlı çalışmasında, kız ve erkek öğrencilerin çevreye yönelik tutumları arasında istatistiksel olarak anlamlı bir fark bulamamıştır. Buna karşın Kaya, Akıllı ve Sezek (2009), "Lise Öğrencilerinin Çevreye Karşı Tutumlarının Cinsiyet Açısından İncelenmesi" adlı çalışmalarında, çevre tutumunda cinsiyetin kız öğrenciler lehine anlamlı olduğu tespitini yapmışlardır.

Tablo 4. Çevreye Yönelik Bilgi ve Bilinç Ölçeği ile Su Tutum Ölçeğinin Okul Türüne Göre Değerlendirilmesi

	Varyansın Kaynağı	**Kareler Toplamı**	**Sd**	**Kareler Ortalaması**	**F**	**P**	**Anlamlı Fark**
	Grupları Arası	210,317	2	105,158	3,055	0,049	Var*
Çevre	Gruplar içi	6745,712	196	34,417			2-3
	Toplam	6956,030	198				
	Grupları Arası	1992,434	2	996,217	23,544	0,00	Var*
Su	Gruplar içi	8293,284	196	42,312			1-3, 2-3
	Toplam	10285,718	198				

* p<.05,

- 1: Düz Lise , 2: Kolej , 3: Meslek Lisesi
- Çevre: X= '1' 55,30 , X= '2' 56,50 , X= '3' 53,92
- Su: X = '1' 64,55 , X= '2' 64,29 , X= '3' 57,26

Tablo 4, katılımcıların Çevreye Yönelik Bilgi ve Bilinç ile Su Tutum ölçeklerinden aldıkları puan ile okul türleri arasındaki bağlantıyı göstermektedir. Öğrencilerin her iki ölçekten aldıkları puanlar ile eğitim gördükleri okul türleri arasında anlamlı bir fark olduğu görülmektedir. Çevre Bilinç ölçeğine göre devlete ait olan ve sınavla seçilen kolej öğrencilerinin, meslek lisesi öğrencilerine göre daha yüksek bilgi ve bilinç düzeyine sahip oldukları tespit edilmiştir. Su Tutum ölçeği puanlarına göre düz lisenin, meslek lisesine ve kolejin, meslek lisesine göre manidar bir fark yarattığı görülmektedir. Bunun nedeninin kolej ve düz liselerde uygulanan ders programlarında çevreye yönelik temalara daha fazla ve kapsamlı yer verilmesi olduğu düşünülmektedir. Meslek liselerindeki ders programları ve ders sayıları, öğrencilerin seçtikleri mesleklerle ilgilidir. Yavuz (2006), "Proje Tabanlı Öğrenme Modelinin Kimya Eğitimi Öğrencilerinin Çevre Bilgisi İle Çevreye Karşı Tutumlarına Olan Etkisinin Değerlendirilmesi" adlı çalışmasında, öğrencilerin hazır bulunuşluk ön test ve son test puanları arasında son test lehine anlamlı bir farklılık olduğunu saptamış ve bunun sonucu olarak çevre ile ilgili önceden alınan eğitimin yetersiz olduğu yönünde görüş bildirmiştir. Diğer bir çalışmada Dervişoğlu ve Kılıç (2012), eğitimde öğrencileri su tasarrufuna teşvik edecek eğitim etkinliklerine yönelik programların geliştirilebileceği ve öğretim programında bu konuda yapılabilecek düzenlemelere katkı sağlanabileceği yönünde önerilerde bulunmuştur.

Tablo 5. Çevreye Yönelik Bilgi ve Bilinç Ölçeği ile Su Tutum Ölçeği Puanlarının Sınıfa Göre Değerlendirilmesi

	Varyansın Kaynağı	**Kareler Toplamı**	**df**	**Kareler Ortalaması**	**F**	**P**	**Anlamlı Fark**
	Grupları Arası	78,254	3	26,084	0,739	0,529	Yok

	Toplam	10285,718	198				

* p<.05

- 1: 9.sınıf, 2: 10.sınıf, 3: 11.sınıf, 4: 12.sınıf
- Su: X= '1' 60,68 , X='2' 61,64 , X='3' 62,31 , X='4' 65,49

Tablo 5, katılımcıların Çevreye Yönelik Bilgi ve Bilinç ile Su Tutum ölçeklerinden aldıkları puan ile sınıfları arasındaki bağlantıyı göstermektedir. Sınıflara göre Çevre Yönelik Bilgi ve Bilinç ölçeği incelendiğinde anlamlı bir farkın olmadığı görülmekte fakat Su Tutum ölçeğinde 12. sınıfların diğer bütün sınıflara göre anlamlı bir fark yarattığı görülmektedir. Çevreye yönelik bilincin sınıflara göre değişiklik göstermemesinin sebebinin müfredatta çevreye yönelik özel bir dersin olmaması ve sosyal ve fen bilimleri derslerinde çevre temalarına yeteri kadar yer verilmemesinin bir sonucu olduğu düşünülmektedir. Su tutumlarında anlamlı fark olmasının sebebinin ise, artan sınıf düzeyi ile birlikte bölgenin gerek yıllar öncesinden sahip olduğu küçük barajın, gerekse uygulamaya konulacak olan su projesinin bölge insanlarının su kullanımına yönelik bilinç ve duyarlılıklarını arttırmasından kaynaklandığı düşünülmektedir. Fırat, Sepetcioğlu ve Kiraz (2012), "Öğretmen Adaylarının Yenilenebilir Enerjiye İlişkin Tutumlarının İncelenmesi" başlıklı araştırmalarında öğretmen adaylarının sınıf düzeyleri ile çevre davranışları arasında artan sınıf düzeyi lehine anlamlı bir farklılık olduğunu bulmuşlar ve bu farklılığın ders programında yer alan çevre derslerinin artmasıyla doğru orantılı olduğunu ileri sürmüşlerdir. Cappellaro, Çoban, Akpınar, Yıldız ve Ergin (2011) "Yetişkinler İçin Yapılan Uygulamalı Çevre Eğitimine Bir Örnek: Su Farkındalığı Örneği" adlı deneysel çalışmalarında, eğitim ile su kullanımına yönelik davranış ve tutumların olumlu yönde etkilendiği, çevre bilincinin anlamlı düzeyde geliştiği, ancak bu olumlu etkilerin sınırlı düzeyde kalıcı olduğu sonucuna varmışlardır.

Tablo 6. Çevreye Yönelik Bilgi ve Bilinç Ölçeği ile Su Tutum Ölçeği Puanlarının Anne Eğitim Durumuna Göre Değerlendirilmesi

	Varyansın Kaynağı	Kareler Toplamı	df	Kareler Ortalaması	F	P	Anlamlı Fark
Çevre	Grupları Arası	383,140	5	76,628	2,250	0,049	Var*
	Gruplar içi	6572,890	193	34,056			1-3, 2-3, 1-6,
	Toplam	6956,030	198				2-6
Su	Grupları Arası	425,907	5	85,181	1,667	0,144	Yok
	Gruplar içi	9859,811	193	51,087			
	Toplam	10285,718	198				

* p<.05

- 1: İlkokul , 2: Ortaokul , 3: Lise , 4: Yüksek Lisans Doktora , 5: Okuryazar değil , 6: Üniversite
- Çevre: X='1' 53,80 , X='2' 53,42 , X='3' 56,40 , X='6' 56,91

Tablo 6, katılımcıların Çevreye Yönelik Bilgi ve Bilinç ile Su Tutum ölçeklerinden aldıkları puan ile anne eğitim durumu arasındaki ilişkiyi göstermektedir. Çevreye ilişkin ölçekte anne mezuniyet durumunun ilkokul ile lise, ortaokul ile lise, ilkokul ile üniversite ve ortaokul ile üniversite mezunları arasında farklılaştığı görülmektedir. Artan eğitim seviyesinin çevreye yönelik bilinci de artırdığı düşünülmektedir. Su tutum ölçeğinden alınan puanlar, anne eğitim durumu ile su kullanımı arasında bir ilişki olmadığını göstermektedir. Annelerin eğitim düzeyleri, çocuklarının su kullanımı ve su tasarrufu davranışlarını etkilememektedir. Kabaş (2004), "Kadınların Çevre Sorunlarına İlişkin Bilgi Düzeyleri ve Çevre Eğitimi" adlı çalışmasında, deney gurubuna uyguladığı ön test ve son test sonuçlarında, son test lehine anlamlı bir farklılık elde edildiği ve eğitimle bayanların çevreye yönelik tutumlarında olumlu gelişmeler sağlanabileceği bulgusuna ulaşmıştır.

Tablo 7. Çevreye Yönelik Bilgi ve Bilinç Ölçeği ile Su Tutum Ölçeği Puanlarının Baba Eğitim Durumuna Göre Değerlendirilmesi

	Varyansın Kaynağı	Kareler T Oplamı	df	Kareler Ortalaması	F	P	Anlamlı Fark
Çevre	Grupları Arası	485,722	4	121,430	3,640	0,007	Var*
	Gruplar içi	6470,307	194	33,352			1-6, 2-3, 2-4,
	Toplam	6956,030	198				2-6
Su	Grupları Arası	601,981	4	150,495	3,014	0,019	Var*
	Gruplar içi	9683,737	194	49,916			2-3, 2-4, 2-6
	Toplam	10285,718	198				

* p<.05

- 1: İlkokul , 2: Ortaokul , 3: Lise , 4: Yüksek Lisans Doktora , 5: Okuryazar değil , 6: Üniversite
- Çevre: X='1' 54,60 , X='2' 52,82 , X='3' 56,15 , X='4' 57,33 , X='6' 57,81
- Su: X='2' 59,08 , X='3' 63,40 , X='4' 63,11 , X='6' 64,48

Tablo 7, katılımcıların Çevreye Yönelik Bilgi ve Bilinç ile Su Tutum ölçeklerinden aldıkları puan ile baba eğitim durumu arasındaki ilişkiyi göstermektedir. Çevreye yönelik ölçekte ilkokul ve üniversite arasında üniversite lehine, ortaokul ile lise arasında lise lehine, ortaokul ile yüksek lisans-doktora arasında yüksek lisans-doktora lehine ve ortaokul ile üniversite arasında üniversite lehine anlamlı bir farkın olduğu söylenebilir. Su Tutum ölçeğinde ise ortaokul ile lise arasında lise lehine, ortaokul ile yüksek lisans-doktora arasında yüksek lisans-doktora lehine ve ortaokul ile üniversite arasında üniversite lehine anlamlı bir farkın olduğu görülmektedir. Babaların eğitim seviyesinin artmasıyla, çocukların suya yönelik olumlu davranışlarının da arttığı görülmektedir. Bunun yanında Güzelyurt yöresine gelecek olan suyun babaların eğitim seviyesi etkeniyle birlikte suya yönelik duyarlılıklarını ve buna paralel olarak su tutumlarını da yükselttiği söylenebilir. Ayrıca bu sonuçlar, babaların çocuklarının eğitiminde etkili bir yere sahip olduğunu düşündürtmektedir. Köse (2010), “Lise Öğrencilerinin Çevreye Yönelik Tutumlarına Etki Eden Faktörler” adlı çalışmasında, anne-babaların öğrenim düzeyinin çevre tutumu üzerinde anlamlı bir etkisinin olmadığını ancak anne-baba öğrenim düzeylerinin arttıkça öğrencilerin çevreye karşı tutumunda iyileşme olduğu tespitini yapmıştır. Kızılaslan ve Kızılaslan (2005) “Çevre Konularında Kırsal Halkın Bilinç Düzeyi ve Davranışları” adlı çalışmalarında, araştırma bölgesinde çevre bilincinin yeterli olmadığı, okul programlarından başlamak üzere yaygın eğitim kapsamında da çevre eğitiminin alınması gerektirdiği sonucuna varmışlardır.

Tablo 8. Öğrencilerin Çevreye Yönelik Bilgi ve Bilinç Ölçeği Puanları ile Su Tutum Ölçeği Puanları Arasındaki İlişki

Correlations		Çevre	Su
Çevre	Pearson Correlation (r)	1	,391**
	Sig. (2-tailed)		,000
	N	199	199
Su	Pearson Correlation (r)	,391**	1
	Sig. (2-tailed)	,000	
	N	199	199

** Correlation is significant at the 0.01 level (2-tailed).

Tablo 8’de öğrencilerin “Çevreye Yönelik Bilgi ve Bilinç Ölçeği” puanları ile “Su Tutum Ölçeği” puanları arasındaki ilişkiye bakılmıştır. Tablodan görüldüğü gibi öğrencilerin çevreye yönelik bilgi ve bilinç düzeyleri ile su tutumları arasında pozitif yönde bir ilişki vardır. Öğrencilerin çevreye yönelik bilinçleri arttıkça, su tüketimi ve suyun önemine yönelik tutumlarının da arttığı görülmektedir.

SONUÇ VE ÖNERİLER

Bu araştırma, Ada batısında bulunan Güzelyurt yöresinde yaşayan, Güzelyurt Türk Maarif Koleji, Güzelyurt Kurtuluş Lisesi ve Güzelyurt Meslek Liselerindeki 9, 10, 11. ve 12. sınıflarında eğitim alan ortaöğretim öğrencilerinin, Asrın Su Projesi bölgesinde yaşama ve eğitim alma sebebi ile çevre bilinç düzeyleri, su tutumları ve buna bağlı olarak çevre ve su farkındalık düzeylerinin tespit edilmesi amacı ile yapılmıştır. Çalışmada büyük su projesi ile tanışan ve proje öncesi küçük bir baraj bölgesi olarak kullanılan yörede yaşayan öğrencilerin çevre ve su davranışları cinsiyet, okul türü, sınıf ve anne-baba eğitim düzeyi değişkenleri paralelinde incelenmiştir.

Araştırma sonucunda katılımcılar Çevreye Yönelik Bilgi ve Bilinç Ölçeğine “orta” düzeyinde görüş bildirmişlerdir (genel madde ortalaması 57,94). Su Tutum Ölçeği ise “iyi” düzeyinde yanıtlanmıştır (genel madde ortalaması 61,33). Bu puan Güzelyurt Bölgesinde yaşayan ve eğitim alan katılımcıların su tutumlarının, çevre bilinçlerinden daha olumlu ve yüksek olduğunu göstermektedir.

Katılımcıların Çevreye Yönelik Bilgi ve Bilinç Ölçeği ile Su Tutum ölçeklerinden aldıkları puan ile cinsiyetler arasındaki ilişkiye bakıldığında anlamlı bir farkın olmadığı görülmektedir. Kız ve erkek öğrencilerin çevre ve su davranışlarının eşit düzeyde olduğu saptanmıştır.

Katılımcıların her iki ölçekten aldıkları puan ile eğitim aldıkları okul türleri arasındaki ilişki incelenmiştir. Bulgular değerlendirildiğinde öğrencilerin gerek çevre, gerekse su davranışlarının okul türüne göre anlamlı bir şekilde değişkenlik gösterdiği, kolej ve düz lisenin meslek liselerine göre daha olumlu sonuçlar verdiği saptanmıştır. Öğrencilerin Çevre Bilgi ve Bilinç Ölçeği ortalama puanları, düz lise: 55.30, kolej: 56.50, meslek lisesi: 53.92 ve Su Tutum Ölçeği ortalama puanları ise düz lise: 64.55, kolej: 64.29 ve meslek lisesi: 57.26 şeklinde hesaplanmıştır. Genel olarak kolej ve düz lisede okuyan öğrencilerin ortalamalarının yüksek olduğu görülmektedir.

Araştırmada yer alan ve 9, 10, 11 ve 12. sınıfta öğrenim gören öğrencilerin Çevreye Yönelik Bilgi ve Bilinç Ölçeği ile Su Tutum ölçeklerinden aldıkları puanlar ile sınıfları arasındaki ilişki değerlendirilmiştir. Sınıflara göre çevreye yönelik davranışlarda anlamlı bir farkın olmadığı anlaşılmıştır. Su projesi bölgesinde uygulanan Su Tutum Ölçeği sonuçlarında artan sınıf düzeyine göre ortalamaların yükseldiği (9. sınıflarda 60.68, 10. sınıflarda 61.64, 11. sınıflarda 62.31 ve 12. sınıflarda 65.49) ve 12. sınıfların diğer bütün sınıflara nazaran anlamlı fark yarattığı bulunmuştur.

Katılımcıların Çevreye Yönelik Bilgi ve Bilinç ile Su Tutum ölçeklerinden aldıkları puan ile annenin eğitim durumu arasındaki ilişki incelenmiştir. Annelerin eğitim seviyeleri arttıkça, çocukların çevre bilinçlerinin de anlamlı bir şekilde yükseldiği, fakat anne eğitim durumu ile su davranışları arasında manidar bir ilişki olmadığı saptanmıştır.

Katılımcıların Çevreye Yönelik Bilgi ve Bilinç ile Su Tutum ölçeklerinden aldıkları puan ile babanın eğitim durumu arasındaki ilişkiye bakıldığında artan eğitim seviyelerinin her iki ölçekte de anlamlı farklar yarattığı görülmüştür. Çevreye Yönelik Bilgi ve Bilinç ölçeğinde baba eğitim durumu değişkeni kapsamında üniversitenin ilk ve ortaokula, lise ve lisanüstü eğitim seviyesinin ortaokula; Su Tutum Ölçeğinde ise lise, üniversite ve lisansüstü eğitimin ortaokula baskın olduğu görülmüştür.
Öğrencilerin "Çevreye Yönelik Bilgi ve Bilinç Ölçeği" puanları ile "Su Tutum Ölçeği" puanları arasındaki ilişkiye bakılmış, aralarında pozitif bir korelasyon olduğu belirlenmiştir. Bu korelasyonla öğrencilerin çevreye yönelik bilinçlerinin artmasıyla, su tüketimi ve suyun önemine yönelik tutumlarının da arttığı görülmüştür..

Araştırma sonuçları genel olarak incelendiğinde katılımcıların su davranışlarının, çevre davranışlarından daha olumlu ve yüksek bilinçte olduğu görülmüştür. Bu durumun, Güzelyurt yöresinde hem tarım, hem kullanma ve hem de içme suyuna olan ihtiyaçtan ve bu alanlarda yaşanan ve yaşanacak olan sorunların katılımcılarda yarattığı endişeden kaynaklandığı düşünülmektedir. Bu etkiler ile Türkiye'den gelecek olan suyun önemi, halkın konuya olan duyarlılık seviyelerini artırmış ve suya karşı olan tutumlarının yükselmesine neden olmuştur. Bu bilgiler doğrultusunda Yöredeki yerel yönetimden sorumlu olan belediye ve kaymakamlığın gerekli planlama çalışmalarını bitirmiş olmaları, yörede yer alan okullarda görevli eğitimcilerin öğrencilere çevre ve su duyarlılıkları artırıcı, bilinçlendirici ve bilgilendirici eğitim vermeleri gerekmektedir. Ayrıca çevre bilinci ve su tüketimi konusunda ailelerin de eğitimi sağlanmalıdır. Yörede yer alan sivil toplum örgütlerinin ve medyanın da konu ile ilgili duyarlılık seviyesini yükseltmek amacıyla çalışmalarını artırarak devam ettirmeleri ve sadece proje bölgesinin değil, tüm ada halkının çevre ve su konusunda bilinçlenmelerini sağlamaları önerilmektedir.

ABSTRACT: Interactive Whiteboards (IWBs) are a relatively new tool that provides interesting affordances in the classroom environment, such as construction of visualizations and multimedia. These affordances make IWBs an innovative tool with high potential for mathematics instructional environments. The research involved a small group of Italian mathematics teachers in secondary schools and aimed at exploiting the distinctive role of IWBs in mathematics teaching. Three essential elements were considered: the mathematical tasks on which students work, the discourse activities in the classroom and the support that IWBs give to the previous two elements. Analysing a first series of video recorded lessons, the teachers and the researcher engaged in a discussion about possible improvements relating the IWB use to enhance high-level mathematical tasks and productive discourse interaction. Outcomes of the discussion were used to design and enact a new set of lessons, again video recorded and analysed. Outcomes were compared with those of the previous set. Results show significant improvements in the tasks' quality, in the classroom dynamics and in the exploitation of IWBs affordances. What emerged from the study is that IWBs technology may be used to enrich the lessons' experience and that an attentive orchestration by the teacher leads to the construction of an effective and beneficial learning and teaching environment.

Keywords: Interactive Whiteboards, Mathematics Education, Teaching/learning Strategies.

INTRODUCTION

Interactive whiteboard (IWB) systems comprise a computer linked to a data projector and a large touch-sensitive electronic board displaying the projected image. IWBs are equipped with dedicated software, but might also be considered as a digital hub which allows the integration of Internet or other hardware resources, as orchestrated by the teacher and the students.

Objects from other technologies, such as geometric dynamic software, can easily be displayed on the IWB, and can be directly manipulated by teachers and students to provide an interactive experience in lessons that is accessible to all. Results from these manipulations can also be stored and retrieved in future lessons to further discussions (Mercer, Hennessy & Warwick. 2010).

Today, the IWB is an increasingly popular educational technology all over the world; in 2013 globally one in eight elementary and secondary classrooms (34 million teaching spaces) had an IWB and by 2015, one in five will have one (Hennessy & London, 2013). It is found in 80% of British classrooms and its prevalence is rapidly increasing in a number of other countries too, notably the Netherlands, Denmark, Australia and the United States. Further rapid growth is expected in the next few years (Hennessy & London, 2013).

Different studies highlighted the IWB potentialities. Many teachers have found the IWB to be an important and highly motivating teaching resource (Warwick & Kershner, 2008). Several studies (e.g. Higgins et al., 2005; Moss et al., 2007, Somekh et al., 2007) state that IWBs aid the teaching of difficult, abstract and complex ideas, improve students' motivation to learn, increase lessons' pace, promote classroom interaction and reinforce conceptual learning through the use of animation or visual representation. Different authors (e.g., Beauchamp, Kennewell, Tanner & Jones, 2010; Glover, Miller, Averis & Door, 2007; Jewitt, Moss & Cardini, 2007) presented classroom observations in which teachers working with IWBs developed their own technological fluency, promoted students' group work activities for authentic problems, and for innovative processes of exploration. Other studies (e.g. Jewitt et al., 2007; Kennewell, Tanner, Jones, & Beauchamp, 2008; Miller & Glover, 2007) reported improvements in students' conceptual and cognitive understanding. The IWB is argued to provide collaborative opportunities for reasoning, hypothesis testing and interpretation that go well beyond those afforded by more established classroom devices. Hennessy, Deaney, Ruthven and Winterbottom (2007) stated it provides a "dynamic and manipulable object of joint reference which offers new forms of support for interactivity" (Hennessy et al., 2007, p. 284).

Despite these positive observations current evidence from the literature (Glover et al., 2007; Miller & Glover, 2010; Smith, Hardman & Higgins, 2006) points to teachers' limited acquaintance with the educational potential of IWBs; many teachers seem to use the IWB merely as a large-scale visual blackboard or presentation tool. So, often teachers do not succeed in exploiting the above-mentioned more innovative pedagogical advantages of IWBs (Moss et al., 2007, Somekh et al., 2007). In fact, if IWBs are merely used in a presentation mode, they may induce teachers to teach in an expository way, reducing rather than stimulating students' activity and interactivity and exploiting the affordances of a media-rich content only for surface aims. Thus the use of IWBs may have no significant impact on teachers' existing pedagogy and more specifically on enhancing high quality interaction and thinking processes.

The pedagogy associated with IWBs use requires further investigations and in-depth analyses to understand better what underlies teachers' difficulties with exploiting the affordances offered by IWBs and to stimulate the design of new kinds of learning environments (Glover & Miller, 2009; Kennewell et al., 2008, Warwick, Mercer, Kershner & Kleine Staarman 2010). Hennessy and London (2013, p.13) observe that "IWBs are deceptively complex and to fully utilise the interactive aspects of the technology, teachers must invest time to build confidence, design resources, adapt practices and learn to harness their power". Teachers need time to develop the knowledge to exploit technology in ways that effectively enhance student learning.
The research reported here aimed at exploring and exploiting the distinctive role of IWBs in teaching environments, for supporting and contextualising productive dialogue and other forms of interaction in the classroom and developing opportunities for students' learning, in the domain of mathematics education.

THEORETICAL FRAMEWORK

Besides technology, two other basic factors for learning are the tasks in which students are engaged and the nature of classroom activities (Collins, Brown, & Newman, 1989). Therefore, in constructing the theoretical framework for the research, three elements were individuated as essential ingredients of the development of an IWB-supported interactive environment for mathematics teaching and learning:
the quality of the interaction with the mathematical content, i.e. tasks in which students are engaged;
the quality of discourse interaction between the teacher and the students and amongst the students, intended as indicator of classroom activities;
the support that IWB may provide to the two previous elements, i.e. mathematical content and discourse interaction.

The first element refers to the modality and the quality of the mathematical tasks addressed in the classroom. Most mathematics educators have argued that full understanding of mathematics consists of more than knowledge of mathematical concepts, principles, techniques, procedures (e.g. Schoenfeld 1992). It is important to teach students that doing mathematics not only consists in applying standard procedures generally explicated in school textbooks, but in engaging in the processes of mathematical thinking, in reasoning about main mathematical concepts and in solving and managing mathematical problems. Mathematics learning is an essentially constructive activity (Schoenfeld 1992). In effective mathematics instruction a teacher assists students to engage productively with a problem (Hiebert & Grouws, 2007). Teachers have an important role in guiding students' mathematical development by discerning and making explicit the key mathematical ideas in different tasks, deciding which solution strategies displayed by students are worth, and encouraging consideration of those that merit further inquiry (Silver et al., 2005). Hiebert and Grouws (2007) analysed in depth the different approaches to mathematics teaching. They discerned between *teaching for skill efficiency*, that is accurate, smooth and rapid execution of mathematical procedures, and *teaching for conceptual understanding*, i.e. "the mental connection among mathematical facts, procedures and ideas" (Hiebert & Grouws, 2007, p.380). In the pattern of teaching for developing conceptual understanding they individuated two different key feature: *teachers and students attending explicitly to concepts*, i.e. treating mathematical connections in an explicit way, discussing the mathematical meaning underlying procedures, attending to the relationships among mathematical ideas, etc., and *students struggling with important mathematics*, i.e. expending efforts to make sense of mathematics, figuring something out that is not immediately apparent, solving problems "that are within reach and grappling with key mathematical ideas that are comprehensible but not yet well formed" (Hiebert & Grouws, 2007, p.387).

The framework used for classifying the mathematical tasks was elaborated by Stein, Grover and Henningsen (1996). Stein et al. (1996) define a *mathematical task* as a classroom activity the purpose of which is to focus students' attention on a particular mathematical idea; the kind of mathematical tasks with which students become engaged determines not only what substance they learn but also how they come to think about, develop, use, and make sense of mathematics. According to Stein et al. (1996), "the tasks used in mathematics classrooms highly influence the kinds of thinking processes in which students engage" (p.462). So, their concept and operationalization of mathematical task is well-suited for analysing the first element of our theoretical framework as described above. Stein and Smith (1998a) classify tasks at two levels in four categories of cognitive demand:

Low level tasks (corresponding to *teaching for skill efficiency* by Hiebert and Grouws, 2007):
- *Memorization*: committing facts, rules, formulas or definitions to memory;
- *Procedures without connections to concepts or meaning*: the use of formulas, algorithms, or procedures *without connection* to concepts, understanding, or meaning;

High level tasks (corresponding to *teaching for conceptual understanding* by Hiebert and Grouws, 2007):
- *Procedures with connections to concepts and meaning*: the use of formulas, algorithms, or procedures *with connection* to concepts, understanding, or meaning;
- *Doing mathematics*: including complex mathematical thinking and reasoning activities such as making and testing conjectures, framing problems, looking for patterns, and so on.

Furthermore, mathematics learning is conceived as an inherently social (as well as cognitive) activity (Collins, et al., 1989; Schoenfeld, 1992). Therefore, the second aspect of the theoretical framework concerns the discourse interaction within the classroom between the teacher and the students and amongst the students.

Discourse interaction grounds on the concept of 'dialogic teaching' (Alexander, 2008; Mercer, 2004) as a means to promote and enhance students' learning. Basically (Wolfe & Alexander, 2008), a dialogic approach is collective (teachers and students addressing the learning task together), reciprocal (teachers and students listening to each other to share ideas and consider alternative viewpoints), and cumulative (teachers and students building on their own and each others' ideas to chain them into coherent lines of thinking and enquiry). Often directive forms of teaching consist of closed teacher questions, short student answers which teachers do not build upon, and superficial feedback (Mercer et al., 2010). The dialogic approach to teaching aims to orchestrating classroom talk and activity through open-ended tasks, high level open questioning, high level classroom discussions, topics explorations, sharing ideas and co-constructing interpretations.

A peculiar modality of discourse interaction is enacted in the problem solving work developed by students in small groups, and its presentation in front of the whole classroom for further discussion. According to Collins et al. (1989) and Schoenfeld (1983), small group problem solving sessions favour discussion and argumentation in choosing alternative solution methods, improve students' collaboration and self-confidence and encourage more critical and elaborated contributions from pupils. Besides solving problems in small groups other forms of dialogic teaching promote an active involvement of the students, such as high quality whole class discussion in which students engage in the same problem and compare the different ways they solved it, or explore different problems with similar solution methods.

Analysis of discourse interaction based on the framework developed by Smith et al. (2006). Grounding on the concept of 'dialogic teaching', they conducted a study in which they looked specifically at the different types of discourse moves, and consequently at the different teaching styles in an IWB environment. The scheme of their analysis primarily focused on the three-part IRF structure of a discourse unit (Sinclair & Coulthard, 1975): an *Initiation*, usually in the form of teacher's explain or a question submitted to the students, a *Response* in which students attempt to answer the question and a F*eedback*, in which the teacher provides some form of feedback to the student's response. Each of the three parts is further divided into more detailed elements. *Initiation* includes *closed questions, open questions, students' questions,* and *explain. Response* includes *single student answer, choral response, spontaneous contribution* and g*eneral discussion.* Finally, *Feedback* includes *Repeat question* (questions that shape the course of implementation provide teacher with specific ways of focusing students on the key mathematical ideas leaving less "in the moment" decision-making regarding next instructional moves), *Uptake question* (teacher incorporate students' answers into subsequent questions), *Probe* (teacher stimulates students for further elaboration), and *Refocus* (get students back on task).

The third central element refers to different kinds of support that IWBs may provide to the previous two aspects, mathematical tasks and discourse moves.

IWBs provide a multimodality environment wherein images, texts, objects from other software can be combined and manipulated directly on the screen by teacher and students. It might also be considered as a digital hub which allows the integration of Internet or other resources, as orchestrated by the teacher and the students. Tools provided as part of the IWB software package include, besides general functions, also some specific mathematical tools, such as a calculator, numbers line, Cartesian axis, etc.

Thus, the IWB affords a flexible powerful environment, where both teachers' modelling and coaching activities and students' exploring activities can be easily included. In mathematics lessons, the affordance to use external software, such as dynamic geometrical software (e.g., Geogebra) or spreadsheets in combination with functions as highlighting and annotating, is especially valuable. The potentialities of the dynamic geometry software are emphasized by employing it in an IWB setting rather than being used on individual computers, allowing affordances for whole class discussion and reflection. As the IWB becomes the centre of the classroom activities, it allows a dynamic use of the resources that favours the creation of a learning environment in which the participants actively communicate and engage in the practice of solving problems in a cooperative way. Students can get engaged in the discussion about the topics presented at the IWB and improve their critic abilities monitoring the line of reasoning. Furthermore, IWBs can favour collaborative students' group activities guided and mediated by the teacher (Warwick et al. 2010). Reflection is enhanced by the IWB affordance to store and retrieve the course of the lesson (including transformed objects); saved lessons may be 'replayed' for further discussion.

The tool used for analysing the third element of the theoretical framework, namely the different kinds of support that IWBs may provide to the previous two elements, mathematical tasks and discourse moves, is based on the work of Kennewell and Beauchamp (2007), who investigated how teachers used features of IWBs to enhance learning activities in a set of observed lessons. These activities concerned learner–IWB interaction, teacher–IWB interaction, learner–teacher and learner–learner interaction through the IWB. The authors identified teacher and learner actions supported by IWB features and built a classification framework concerning the impact of these actions on learning. These actions included *Composing* (using IWB as a tool to elaborate or record ideas), *Editing* (easily changing the data stored and displayed), *Selecting* (choosing resources or procedures), *Comparing* (comparing features of same object from different views or comparing different items), *Retrieving* (easily using stored resources), *Apprehending* (students interpreting the display, i.e. text, images, sound, diagrams), *Focusing* (drawing attention to particular aspects of a process or representation), *Transforming* (changing the way data are displayed), *Collating* (bringing together a variety of items from different sources), *Annotating* (adding notes to a process or a representation), *Repeating* (iterating an automated or stored process), *Modelling* (simulating a process by representing relationships between variables), *Revisiting* (returning to an activity with a different focus), *Undoing* (reversing an action). As in mathematics lessons external software is often used, the framework was adapted in this study by dividing the action *Composing* in two categories, C*omposing using software* (indicates the elaboration through external software) and *Composing without software* (elaboration without external software).

The three analytic tools are summarized in Table 1.

Tab. 1. Frameworks Used In The Analysis.

Mathematical tasks *Low level tasks* • *Memorization* • *Procedures without connections to concepts or meaning* *High level tasks* *Procedures with connections to concepts and meaning*: *Doing mathematics*
Discourse moves *Initiation:* *Teacher's open question* *Teacher's closed question* *Student's question* *Explain*

Retrieving	*Revisiting*
Apprehending	*Undoing*

In line with these three elements of the theoretical framework, this study addressed the following three research questions:

how can the teacher enhance the quality of the interaction with mathematical tasks in an IWB supported mathematics lesson?
how can the teacher improve the discourse interaction within the classroom between the teacher and the students and amongst students in an IWB supported mathematics lesson?
what precise kinds of support IWB may contribute to the quality of mathematical tasks execution and to the discourse interaction?

METHOD

The research involved five Italian mathematics teachers in secondary schools, in the period February-May 2013, who volunteered to participate in discussing the design and in video-recording lessons. The research went through two phases of video-recorded lessons in the classrooms, interlaced by discussion between the researcher and the teachers and design of a new set of lessons, as detailed below. Comparison between the first and the second lessons set helped to understand which kind of configuration would better support mathematical understanding and interactive learning.

The classrooms in which the lessons were video recorded were all provided with a stable IWB, and students were accustomed to use it. The range of the students' age varied from twelve to seventeen years old (High School grades 2 to 7).

The research went through four different phases. In the first phase (February) the five teachers involved in the research developed one or two lessons about a mathematics topic in order to exploit IWB affordances that they considered effective. Lessons were developed by each teacher individually, and the topic was chosen freely and differently by each of them. The lessons were taught in the presence of the researcher and video recorded by him. The researcher analysed the lessons and coded them on the basis of three main variables, i.e., mathematical tasks, discourse interaction and support provided by IWB, following for each element the proposed classification. The three kinds of coding were carried out by registering what was happening in the classroom every 30 seconds, from the beginning to the end of the lesson. An independent observer coded randomly chosen fragments of about ten minutes of each of the taught lessons. The achieved intercoder reliability was calculated using the criterion that the observer's coded responses were considered equivalent only if they are identical (Lombard, Snyder-Duch, & Bracken, 2002). For the analysis of mathematical tasks reliability was complete, with 100% equivalent responses; for discourse interaction reliability averaged 90% and for IWB support 92%.
In the second phase the teachers' group jointly with the researcher discussed some fragments of the lessons and the results of the researcher's classification. The fragments were selected upon indication of the teachers and the researcher, choosing the most significant in the use of IWBs. Three discussion groups were held in March. Teachers and researcher engaged in discourse about students' levels of thinking and achievement of the mathematical tasks, about the role they had in stimulating students' contribution in the lesson context, and about the IWB contribution to the classroom interactivity.

In the third phase, grounding on the analysis of the previous phase, the joint group of teachers, guided by the researcher, designed the main lines of a new set of lessons to teach, again about different topics. General outlines of the lesson design were decided upon collectively, but each teacher refined then her/his own lesson highlighting the important role of the IWB in its design.

In the fourth phase (May) each teacher taught the lesson she/he prepared. These were again video recorded and recordings were analysed using the same analytic tools than in the first phase of the analysis. The researcher compared then the first set (February) with the second set (May) of lessons, checking changes and improvements in mathematical tasks, dialogue interactivity and IWB support. Results from this comparison were briefly discussed with the teachers (the team intends to carry on with the work) and are presented in the following section.

RESULTS

Findings show considerable changes between the two sets of recorded lessons.

Mathematical Tasks

In February lessons topics concerned ellipse's construction, sinus function, derivative calculus, exponential growth and geometry properties of parallels. All the lessons were accurately prepared. The mathematical tasks were classified by the researcher as *procedures with connections to concepts and meaning* in all the lessons except one. In some of them the teacher linked the lesson to previously developed dynamic geometrical files, operating with them in front of the classroom and showing connections between different variables and between different important mathematical concepts; in other lessons the teacher started from a geometrical concept and developed it through the lesson, building geometrical constructions and linking them to real world objects, and guiding students in explorations of the inherent mathematical properties.

In the discussions held in March, February lessons were generally considered rather 'directive' and teacher centred. In this regard one teacher observed: "IWB poses many constraints in the teacher's work and lesson's preparation. I feel freer when I do not use the IWB. When I prepare an IWB lesson I feel obliged to follow the prepared scheme and I give less space to the students' suggestions. This is an aspect that may favour a teacher centred lesson."

Nevertheless, all the participants (teachers and researcher) agreed about the appropriateness to move the centre of the lesson focus from the teacher to the students and improve the collaboration between students and teacher and between students themselves. A possible solution was individuated shifting the mathematical tasks from the level *procedures with connections to concepts and meaning* to the level *doing mathematics,* i.e. problem solving. Interactivity in the lessons might take advantage of this shift providing students more opportunities to develop their potential while struggling with stimulating problems. The discussion engaged in affordances and difficulties to use problem solving in the curriculum, due to lack of time and different lessons' organisation. Problem solving activities require from teachers a considerable effort, in terms of the interactive demands on them during the lesson. During the discussion, one teacher observed that "students are not accustomed to problem solving, and often require teachers to explain". A second teacher remarked how "perhaps students should be given more time to reflect and carry on with their own answers". Finally, the whole group decided to develop lessons through this kind of task. The group also highlighted and approved the utility of working on realistic tasks, situating abstract tasks in more authentic contexts, so that students could understand the relevance of the work.

The May topics concerned exponential law, derivative calculus, geometry properties of the triangle, statistic indexes. All the mathematical tasks were classified as *doing mathematics.* They required students to analyze the task and actively examine alternative solution strategies and solutions, exploring and understanding the nature of mathematical concepts, processes, or relationships. All the tasks required complex and non-algorithmic thinking, where a pathway is not explicitly suggested by the task, task instructions, or a worked-out example. To promote the maintenance of high-level cognitive demands (Schoenfeld, 1992; Schoenfeld, 2006; Stein & Smith, 1998b), teachers encouraged students in engaging in cognitive effort, in making reasoning explicit, in drawing conceptual connections and in struggling with the tasks. In three lessons (over five) the tasks were based on real world problems.

Discourse Interaction

Analysing the discourse interaction through the tool presented in the theoretical framework, the February lessons resulted rather teacher centred, with a prevalence of teacher's explain, closed questions and single student's answer. To increase students' participation and involving them in cooperation and co-constructing knowledge, during the March discussions the team decided to organize students in small groups working in problem solving. These groups had to present their solutions at the IWB, discussing them with the entire classroom, and were encouraged by the teacher to give justifications, explanations and meaning of their solutions. The aim was to involve more directly students in the implementation of the lessons, increasing cooperation and communication among students. Indeed, students were generally given more space in the course of the May lessons. From February to May *initiation* decreased from 42.2% to 20%, *responses* increased from 32.4% to 60.2%, mainly because of *spontaneous contribution,* and *feedback* passed from 24.8% to 20%. *Initiation* showed a significant increase of *open questions* (7.8% → 12.6%) and a strong decrease of teacher's *explain* (23% → 5.6%), *closed questions* and *student's questions* practically disappeared. In *Responses,* the prevalent modality was *spontaneous contributions*, intended as students reporting findings of the work groups at the IWB (2.6% → 44.8%), *general discussions* increased (1.2% →8.8), while *single student answers* drastically decreased (24%→4.4%). In *Feedback*, the percentage of *uptake questions* (in which teacher stimulates further elaboration starting from students' answers) was the higher (9.2%). The difference between discourse moves in May and February lessons is statistically significant (χ^2= 133.68; $p < .0001$). Results are shown in Table 2.

Tab. 2 Changes In Discourse Moves From February To May (% Over Total Lessons)

	February (N=497)	May (N=501)
Discourse moves	**Mean percentages**	**Mean percentages**
Initiation		
open questions	7.9	12.5
closed questions	6.6	0
students questions	2	1
explain	23.1	5.6
direct	2.8	0.8
Subtotal	42.4	19.9
Response		
Single student answer	24.1	4.4
Choral response	4.6	2.2
spontaneous contribution	2.6	44.7
general discussion	1.3	8.8
Subtotal	32.6	60.1
Feedback		
repeat questions	6.6	4.2
uptake questions	7.7	9.2
probe	8.1	5.2
refocus	2.6	1.4
Subtotal	25	20

IWB Support

The third element of the theoretical framework, IWB support, was analysed using the tool based on the work of Kennewell and Beauchamp (2007), presented above. Results from analysis showed that in February the IWB mainly supported the teacher's discourse and was directly managed by her/him. Even when students were involved they were always directed by the teacher, acting rather as teacher's assistants. Teachers mostly used the IWB as a normal blackboard (*composing without software*) or as a mean to show students different texts or images. Nevertheless, they also made large use of external software, i.e. Geogebra, for geometrical constructions and algebraic elaborations.

During the March discussions all participants stressed the IWB relevance in modelling the shape of the lesson as strong centre of attention and reflection, and in enhancing mathematical understanding, especially using external software, and exploiting the multimodality IWB affordances. Different teachers stated that IWB concentrates attention on the salient points, that lessons are prepared more accurately, that IWB favours more cooperation and discussion with respect to a lesson with a normal blackboard or to a computer laboratory. IWB use did not exclude the use of other didactical instruments (textbook, hands work, drawings, cardboards, etc.). Orchestrating

IWB lessons requires a considerable effort from the teachers, both in terms of lesson preparation and the interactive demands on them during the lesson.

An important aspect stressed by all is the need of having the IWB available in the daily work in the classroom. Analysing the different IWB actions and their use in the implementation of the lesson, some actions appeared to be more effective in developing mathematical tasks and supported more than other an interactive, multimodal use of IWB fostering mathematical conceptual understanding:

composing using software typically dynamic geometry software as Geogebra or spreadsheet as Excel; the software Geogebra is managed for exploration and elaboration, looking for connections or theorem demonstrations. As one teacher said, ‘it gets students used to see mathematical objects move’;

comparing, i.e. same object are analysed from different points of view;

transforming, i.e. changing data representations;

modelling, simulation of a process by representing relationships between variables.

During the lessons recorded in May, presenting their works students’ groups made large use of these effective actions, displaying multiple representations in a dynamic way often through mathematical software, such as Geogebra or Excel. Their solutions were presented to the whole classroom, inviting other students to participate, to criticize and to suggest better ways to solve the problems. The IWB was used constantly during all the lessons (93% of the total lessons time), except for some short periods in which students worked in small groups to elaborate their answers.

A comparison of the data in February and in May shows a relevant decrease in *composing without software* (27.8% → 17.8%) and in *apprehending* (26% → 14.2%), actions which might connote a more traditional IWB use. On the other hand, actions significant for an interactive and multimodal IWB use increase: *composing using software* 22% → 26.2%; *modelling* 10.6% → 17; *comparing* 2.2% → 5.2%; *transforming* 2% → 7.6%; %. Overall, actions significant for an interactive and multimodal IWB use cover 56% of the lesson time, while in February it was only 36.6%. The difference between IWB actions in May and February lessons is statistically significant (χ^2= 64.90; $p < .0001$).
Data are shown in Table 3.

Tab. 3 Changes In IWB Actions (% Over Actions Total In All Lessons)

	February (N=503)	**May (N=499)**
Action	**Mean percentages**	**Mean percentages**
Composing without software	27.5	17.9
Composing using software	22	26.2
Editing	0.2	2.6
Selecting	0	0.2
Comparing	2.2	5.2
Retrieving	6	4
Apprehending	25.8	14.3
Focusing	0.6	2.2
Transforming	2	7.6

Annotating	2.2	1.4
Repeating	0	0
Modelling	10.5	17
Revisiting	0.4	1.2
Undoing	0.6	0

DISCUSSION AND CONCLUSIONS

By relating the IWB use to the design of mathematical tasks and ways of discourse interaction, teachers have been stimulated to look for effective ways of exploiting its interactive and multimodal features to support the enhancing of two main elements of the classroom practice.
In the first set of lessons, the IWB mainly supported the teachers’ discourse. IWB offered teachers a powerful instrument for the kind of high-level mathematical tasks defined as *procedures with connection to concepts and meaning*. The limit was that lessons were mainly teacher centred: though students were often involved in co-

operating with the teacher, directly manipulating objects and annotating texts, the thread of the discourse was mainly directed by the teacher.

To increase students' participation the challenge was to design and implement a teaching and learning environment in which students would be more involved in handling the lesson and in building knowledge. As a first step, based on the teachers' critical reflections on the February lessons supported by the theoretical/analytic framework provided by the researcher, the team decided to try to change the kind of mathematical tasks from *procedures with connection to concepts and meaning* to *doing mathematics*, i.e. activities of problem solving. This change in mathematical tasks helped also in modifying the discourse interaction. Students were more actively involved in managing the lesson. Direct intervention of the teacher, in form of explanations, and questioning in form of closed questions played a minor role, while open questioning and, overall, students' spontaneous contributions, in the form of exposition and elaboration of the group works, had a preeminent part in the development of the classroom discourse; the teacher assisted students in engaging productively with a problem, increasing interaction amongst students and with the teacher.

In addition, when looking for ways to make the quality of the interaction better, the teachers came up with the idea of working with group work, directly involving students in the development and implementation of the lessons. So doing, the teachers promoted an environment in which students were expected to serve as resources to each other in working on mathematical problems, collaborating to develop solutions and sharing their strategies with each other. Therefore, students worked on the tasks in small groups and jointly presented the group solutions at the IWB, discussing them with the entire classroom and in this way improving also a high-quality discussion in the whole classroom.

In February the IWB mostly supported the teacher discourse. In May students were much more involved in using the IWB by their own. They used the IWB exploring geometrical properties of an object, researching the best mathematical model of physical and demographic phenomena, investigating different strategies of solving difficult calculus problems. In these activities students compared different data representations, symbols, tables, charts, graphs, transforming from one representation to the other and looking for the best one. This use was at least partially sustained by teachers' scaffolding whenever students needed guide in discerning and choosing different mathematical strategies or lacked technological experience. The difference between February and May is reflected by the change in IWB actions employed in the lessons. In elaborating their group works students made large use of multimodal IWB actions, such as simulation of processes, comparison between different ways to represent a phenomenon, use of dynamic external software. Actions that might characterize a more traditional use of the IWB, such as displaying texts or images and composing like in a traditional board, decreased significantly. The IWB was exploited like a 'laboratory' for a better understanding of mathematical tasks and connections. Collective reasoning was actualised within a range of evolving multimodal representations that could beneficially be managed, organised, interpreted, saved and revisited so that connections and elaborations were created cumulatively over time. Of course the IWB offers students a large range of affordances, but also involves the necessary competencies, both in manipulating objects from other technologies, e.g. software as Geogebra or Excel, and in managing the tools included in the same IWB.

What emerges from this study is that IWBs technology may be used to enrich the lessons and the students' experience of challenging mathematical situations. Teachers may enhance the quality of interaction with mathematical tasks through an accurate balancing between theoretical attention to mathematical concepts and problem solving activities that involve students more directly. The discourse interaction may be improved basing less on direct explain and closed questions and leaving more space to students' discussions and autonomous works. The IWB sustains the two previous elements affording flexible and powerful tools and actions that allow students to visualize multiple representations, analysing, comparing and modelling relationships between variables. Mathematical tasks, discourse interaction and IWB support play each an important role but it is their attentive orchestration and combination by the teacher that leads to the construction of an effective and beneficial learning and teaching environment,

As stated by Hennessy and London (2013), the key difference between the IWB and a set of desktop computers is that the IWB allows technology to be used flexibly, and it brings technology firmly into the classroom and away from confinement to centrally located computer labs.

Resources and findings described in this paper may be useful in stimulating discussion about pedagogical practices in classrooms where the IWB is currently used and in improving a wider professional development for in-service teachers and pre-service teachers.

Surely, further research is needed to understand what important aspects of applications and modelling are touched (or not touched) upon by the technological environment and how the culture of the classroom is influenced by the presence of this technological device.

ACKNOWLEDGEMENTS

We are very grateful to the teachers and students who willingly participated in the study.

FATİH PROJESİYLE İLGİLİ AMPİRİK ÇALIŞMALARIN ANALİZİ: BİR LİTERATÜR TARAMASI

THE ANALYSIS OF EMPRICAL STUDIES RELATED TO FATIH PROJECT: A LITERATURE REVIEW

ÖZET: Bu çalışmanın amacı 2010 yılı Kasım ayından itibaren Milli Eğitim Bakanlığı tarafından yürütülmekte olan teknoloji entegrasyonu "FATİH Projesi" kapsamında yapılmış bilimsel araştırmaların taranması ve irdelenmesi yoluyla projede ulaşılan ilk çıktıları, etkileri, sorunları ve paydaş görüşlerini değerlendirmektir. Literatür taraması metodu kullanılarak ulusal ve uluslararası dergilerden, lisansüstü tez veritabanlarından ve internet arama motorlarından ilgili çalışmalara ulaşılmıştır. Yapılan taramalarda "FATİH projesi", "bilişim teknolojileri", "Tablet PC" ve "akıllı/etkileşimli tahta" gibi anahtar kelimeler kullanılmıştır. Araştırmalar 2011-2014 yılları arasında yayınlanmış olan güncel çalışmalarla sınırlandırılmıştır. Tarama sonucunda elde edilen bütün ampirik çalışmalar içerik analizi yöntemiyle ayrıntılı bir şekilde incelenmiş ve gözden geçirilmiştir. Araştırmalar, konuları ve örneklemlerindeki benzerlikler dikkate alınarak (a) öğretmenler ve (b) öğrenciler üzerine yapılan çalışmalar olmak üzere iki ana tema altında toplanmıştır. Sonuç olarak, yapılmış araştırmaların genellikle donanımsal araçların kullanımına yönelik tutum ve algıların ölçülmesine yönelik olduğu görülmektedir. İleriki çalışmalarda projenin yöntem, içerik ve süreci bakımından daha kapsamlı ele alınmasına ve projede dağıtılmış olan teknolojilerin öğrencilerin motivasyon, başarı ve düşünme becerileri gibi bilişsel ve duyuşsal çıktılar üzerinde etkilerinin araştırılmasına önem verilmesi önerilmiştir.

Anahtar sözcükler: FATİH Projesi, Tablet PC, Akıllı Tahta, Teknoloji Entegrasyonu, Literatür Taraması

ABSTRACT: The aim of this study is to evaluate first outputs, problems and stakeholder's views reached in FATIH Project, a technology integration initiative carried out by Turkish Ministry of National Education since November, 2010. Literature review methodology was employed to obtain related research studies from both national and international journals, graduate thesis databases, and Internet search engines. Such keywords as "FATIH Project", "Tablet PC", and "Smardboard" were used in searching the literature. Since the project is relatively new, research studies were limited to those published from 2010 to beginning of 2014. A content analysis was conducted to deeply examine empirical studies gathered from the literature survey. Based on the similarities in their scopes and samples, the studies were categorized under two main themes as (a) research on students and (b) research on teachers. Overall, it was revealed that the studies conducted so far were devoted to measure mostly attitudes and perceptions about the use of hardware tools. The findings suggest that future studies should give priority to intensive examination of the method, content and process of the project as well as investigation of potential effects of technologies distributed within the project on students' cognitive and affective characteristics such as motivation, achievement, and thinking skills.

Key words: FATIH Project, Tablet PC, Smart Board, Technology Integration, Literature Review

GİRİŞ

Dünyada gelişen teknoloji karşısında her alan gibi eğitimde kaçınılmaz bir değişimin içerisine girmiştir. Sanayi toplumundan bilgi toplumuna geçiş ve aynı zamanda teknolojideki sürekli gelişim, hayatın hemen her alanına yansımıştır. Teknolojinin günlük yaşantılarla bütünleşmesiyle birlikte dijital okur-yazarlık, dijital vatandaşlık, dijital uçurum, dijital yerlilik ve dijital göçmenlik gibi kavramlar toplum yaşantısında önem kazanmaya başlamıştır. Sürekli olarak gelişen ve bu gelişimle birlikte değişen dünyada bireylerin bu gelişmelere ayak uydurabilmesi, çağın beklentilerine cevap verip bunun yanında araştırıp, sorgulayan ve kendini gerçekleştirmiş, özgüven duygusu gelişmiş bireyler yetiştirmek ve davranışlarındaki değişiklikleri kalıcı hale getirebilmek ancak eğitimle mümkün olmaktadır (Akgün, Yılmaz ve Seferoğlu, 2011).

FATİH Projesi

Eğitim kurumları toplumsal gelişmeleri başlatan ve yönlendiren kurumlardan birisi olarak teknolojik gelişmeleri takip edip kullanmakla birlikte bu teknolojilerin kullanımını da öğretmek zorundadır (Akkoyunlu, 1995). Devlet politikası olarak ülkemizde okullarda bilgi ve iletişim teknolojileri (BİT) entegrasyonu uzun zamandır sürdürülmekte ve bu süreçte gelişim ve değişim yeni projelerle birlikte devam etmektedir. Milli Eğitim Bakanlığı (MEB) tarafından 2010 yılı Kasım ayında duyurulan Fırsatları Arttırma ve Teknolojiyi İyileştirme Hareketi (FATİH) projesi bunlardan birisidir. Projenin temel amacı okullardaki teknolojiyi iyileştirmek ve eğitim ve öğretimde fırsat eşitliğini sağlamaktır (MEB, 2014). Proje kapsamında okul öncesi, ilköğretim ve ortaöğretim düzeyindeki tüm dersliklere LCD panel etkileşimli tahta ve internet ağı alt yapısı sağlanarak BİT araçlarının öğrenme-öğretme sürecinde daha fazla duyu organına hitap edilecek şekilde, derslerde etkin kullanılması hedeflenmektedir. Ayrıca her öğretmen ve öğrenciye tablet bilgisayar dağıtılmasının yanı sıra öğretmenlere hizmet içi eğitimler verilecek ve öğretim programları BİT destekli öğretime uygun hale getirilerek eğitsel e-içerikler oluşturulacaktır (MEB, 2014). Proje (a) donanım ve yazılım altyapısı sağlanması, (b) eğitsel içeriklerin geliştirilmesi, (c) öğretim programlarında BİT kullanımı, (d) öğretmenlerin eğitimi ve (e) bilinçli, güvenli ve ölçülebilir BİT kullanımı şeklinde beş ana bileşenden oluşturulmuş ve beş yılda tamamlanacak şekilde planlanmıştır.

Projenin pilot okullarda başlamasıyla birlikte ilgili akademik ve bilimsel araştırmalarda ivme kazanmıştır. Bu çalışmalar projenin yürütülmesi sürecinde proje paydaşları (öğretmenler, öğrenciler, yöneticiler vb.) üzerinden veriler toplanarak projenin gidişatı, etkileri ve projeden beklentilerin belirlenmesinde önemli bir role sahiptir. Çalışmalardan elde edilen bulgular ve öneriler projenin biçimlendirici değerlendirilmesinde kullanılarak projeye yön vermede ve aksaklıkların giderilmesinde yürütücülere yardımcı olacaktır. Dolayısıyla bu çalışmanın amacı 2010 yılı Kasım ayından itibaren Milli Eğitim Bakanlığı tarafından yürütülen FATİH Projesi kapsamında yapılmış bilimsel araştırmaların taranması ve irdelenmesi yoluyla projede ulaşılan ilk çıktıları, etkileri, sorunları ve paydaş görüşlerini değerlendirmektir.

YÖNTEM

Çalışma önceki araştırmaların incelenmesini kapsayan literatür taraması şeklinde desenlenmiştir. Ulusal ve uluslararası dergilerden, Yükseköğretim Kurulu (YÖK) lisansüstü tez veri tabanından ve Google arama motorundan yararlanılarak kapsamlı bir yayın araması yapılmıştır. Elektronik ortamlarda yapılan taramalarda "FATİH projesi", "bilişim teknolojileri", "Tablet PC" ve "akıllı/etkileşimli tahta" gibi anahtar kelimeler kullanılmıştır. Proje başlangıç tarihi 2010 yılının Kasım ayı olduğu için araştırmalar 2011-2014 yılları arasında yayınlanmış olan güncel çalışmalarla sınırlandırılmıştır. Tarama sonucunda elde edilen bütün ampirik çalışmalar ayrıntılı bir şekilde incelenmiş ve gözden geçirilmiştir. Araştırmalar, konuları ve örneklemlerindeki benzerlikler dikkate alınarak (a) öğretmenler üzerine yapılan çalışmalar ve (b) öğrenciler üzerine yapılan çalımalar olmak üzere iki ana tema altında toplanmıştır.

BULGULAR

Öğretmenler Üzerine Yapılan Çalışmalar

FATİH Projesi hakkında öğretmenler ile yapılan çalışmalar incelendiğinde BİT kullanımına yönelik bilgi, beceri ve duyuşsal yeterlikleri noktasında ortaya iki farklı sonuç çıktığı görülmektedir. Yapılan araştırmaların çoğunluğu öğretmen ve öğretmen adaylarının BİT kullanımına hazır veya yeterli olmadığı sonucuna ulaşırken (Akıncı, vd., 2012; Bulut ve Koçoğlu, 2012; Çiftçi vd., 2013; Dinçer, 2011; Dinçer vd., 2012; Gürol vd., 2012; Kayaduman vd., 2011; Korkmaz ve Aktürk, 2013; Tekedere, 2013; Türel, 2012), diğer araştırmalar BİT kullanımına kısmen de olsa hazır ve yeterli düzeyde olduklarını belirtmektedir (Oktay ve Çakır, 2012; Tekerek vd., 2012).

Türel'in (2012) İstanbul ili Anadolu Yakası'ndaki çeşitli ilköğretim okullarının orta düzeyinde (6, 7 ve 8. sınıflar) farklı dallarda ders vermekte olan 210 öğretmenin katıldığı çalışmada, öğretmenlerin teknik bilgi eksikliği, içerik yetersizliği ve teknik sorunlar nedeniyle akıllı tahtaları kullanamadıkları sonucu ortaya çıkmıştır. Yine benzer bulguların ortaya çıktığı Adıgüzel ve arkadaşlarının (2011) yaptığı çalışmada akıllı tahtaların kullanımı için öğretmenlerin daha kapsamlı bir eğitim almaları gerektiğini vurgulamaktadır. Gürol ve arkadaşlarının (2012) Elazığ ili Merkez ilçede yer alan ilköğretim okullarında görev yapan sınıf öğretmenleri ile yapmış olduğu çalışmada da FATİH projesi hakkında öğretmenlerin olumlu düşündüklerini ama bilgi eksikliği ve yeterlilik gibi konuların problemli olduğuna değinmişlerdir. Gök ve Yıldırım (2013) öğretmenlerin FATİH projesi kapsamındaki teknolojilerin kendilerine sağlanmasında ve ihtiyaçlarının belirlenmesinde görüşlerinin alınmamasını bu teknolojileri kullanmada olumsuz bir etken olarak gördükleri bulgusuna ulaşmıştır.

Öğretmen adayları ile yapılan çalışmalarda da paralel bulgular elde edilmiştir. Örneğin, Dinçer'in (2011) Çukurova Üniversitesi Eğitim Fakültesi'nde öğrenim gören öğrencilerin örneklemi oluşturduğu çalışmada FATİH projesi hakkında olumlu görüş belirttikleri ama uygulama açısından kendilerini yetersiz buldukları sonucuna ulaşılmıştır. Yine Demirer ve arkadaşlarının (2011) Selçuk Üniversitesi, Bilgisayar ve Öğretim Teknolojileri Eğitimi Bölümünde öğrenim görmekte olan öğretmen adayları kendilerini yetersiz bulduklarını, bilgi eksikliği ve teknik donanımdan kaynaklı problemler yaşadıkları ve FATİH Projesinin amacı ve kapsamı hakkında yeterli bilgiye sahip olmadıklarını belirtmişlerdir. Korkmaz ve Aktürk'ün (2013) Kilis 7 Aralık Üniversitesi Eğitim Fakültesi Sınıf Öğretmenliğinde okuyan 165 öğretmen adayı ile yaptığı çalışmada benzer bulgulara rastlanmıştır. Bilgisayarların öğretimde kullanılmasının gerekliliği, öğrenciye ve öğretmene sağladığı faydalar ve zararlar ile ilgili tutumlarına göre verilere bakıldığında, öğretmenliğe adım atacak öğretmen adaylarının halen düşük seviyede olduğu bulgusuna ulaşılmıştır.

Diğer taraftan öğretmen ve öğretmen adaylarının FATİH projesi kapsamında BİT kullanımına hazır ve yeterli olduğunu gösteren çalışmalara bakıldığında ise bu araştırmaların sınırlı sayıda olduğu görülmektedir. Tekerek ve arkadaşlarının (2012) Kahramanmaraş Sütçü İmam Üniversitesi Eğitim Fakültesi BÖTE bölümü ve İnönü Üniversitesi Eğitim Fakültesi BÖTE bölümü öğrencileri üzerinde yaptığı çalışmada öğretmen adaylarının proje kapsamındaki teknolojilere karşı tutum ve algı boyutunda olumlu cevap verdikleri görülmüştür. Oktay ve Çakır'ın (2012) Amasya ili Suluova ilçesinde devlete bağlı ilköğretim kurumlarında farklı dallarda görev yapan 222 öğretmen üzerinde yaptığı çalışmada yine benzer bulgulara ulaşılmıştır. Öğretmenlerin FATİH projesinde dağıtılmış teknolojilerin kullanımına karşı tutum ve algı boyutunda olumlu cevap verdikleri görülmüştür. Öğretmenlerin teknolojiyi benimsedikleri ama teknolojinin sürekli gelişme gösterdiği bir ortamda öğretmelere sürekli eğitimlerin verilmesi ve teknolojiyi yakından tanımaya yönelik çalışmaların artırılması ön görülmüştür.

Öğrenciler Üzerine Yapılan Çalışmalar

FATİH Projesinin kapsamı hakkında öğrenciler üzerinde yapılan ampirik çalışmalara bakıldığında; Sünkür ve arkadaşlarının (2011) Malatya ilindeki ilköğretim okullarında akıllı tahta uygulamalarından yararlanan II. kademe (6, 7 ve 8. sınıf) öğrencileri üzerinde yapmış olduğu çalışmada öğrencilerin akıllı tahtayı kullanmaları ile ilgili olumlu düşünce belirttikleri görülmüştür. Yine benzer sonuçlara Zengin ve arkadaşlarının (2011) 2010-2011 bahar yarıyılında Elazığ'da merkeze bağlı bir ilköğretim okulunun 6. Sınıf öğrencileriyle yapmış olduğu çalışmada akıllı tahta kullanımının BİT 'e karşı tutuma olumlu yönde katkı sağlamakla birlikte, başarıyı da arttırabileceği görüşüne vurgu yapılmıştır. Fakat algı ve tutum kavramlarının zamanla oluşmasından dolayı önümüzdeki yıllarda tekrar araştırma yapılmasının önemli olduğu belirtilmektedir. Ayrıca, Alanay ve Arkadaşlarının (2013) iki pilot lisede yaptıkları araştırmada öğrencilerin projeye hakkında olumlu bir yaklaşım sergilemesine karşın, yaşanan bir takım aksaklıkların (yazılımsal ve donanımsal), e- içeriklerin eksikliğinin ve öğretmenlerin teknoloji kullanımı konusundaki eksiklikleri, öğrencilerin proje hakkındaki düşüncelerini olumsuz olarak etkilediği görülmektedir.

Ağır ve Arkadaşlarının (2013) proje kapsamında 9-12. sınıf Coğrafya dersi için hazırlanan e-içerik ile ilgili yapmış olduğu çalışmada paralel bulgulara ulaşılmıştır. Öğrencilerin kazanım bazlı coğrafya videosu (etkileşimli tahtada öğretmen anlatımı ve bu anlatım esnasında 3 boyutlu animasyonlar, belgeseller, çeşitli orijinal çizimler, haritalar, animasyonlar vb.) hakkında oldukça olumlu düşündükleri, bu videoların öğrenmelerine kolaylaştıracağını, aldıkları eğitimin kalitesini artıracağını, motivasyonlarını artıracağını ve dersi daha ilgi çekici/eğlenceli kılacağını vb. düşündükleri kanısına ulaşılmıştır. Ayrıca öğrencilerin neredeyse tamamı kazanım tabanlı videoda yer alan pek çok nesnenin (3 boyutlu animasyon, akıllı tahta kullanımı vb.) yer almasını istemektedir. Öztürk ve Can'ın (2013) 2011–2012 eğitim-öğretim yılı İstanbul ili Gaziosmanpaşa ilçesinde bir devlet ilköğretim okulunun 5.sınıfında öğrenim gören öğrencilerle yapmış olduğu çalışmada e-kitapların kolay taşınabilmesi, herhangi bir zamanda rahatça okunabilmesi(durakta, otobüste, seyahat halinde vb.) ve e-kitap özelliklerinin(sesli okuma, yazıların büyütülmesi vb.) teknolojiyi benimsemelerine yardımcı olduğu bulgusuna ulaşılmıştır.

Öte yandan FATİH projesi kapsamında dağıtılmış BİT'lerin (Tablet PC, etkileşimli tahta vb.) nasıl ve ne düzeyde öğrenciler tarafından kullanıldığını araştıran çalışmalarda bulunmaktadır. Akbay ve Küçük'ün (2013) Kars ilinde FATİH projesi kapsamındaki pilot okullardan birinde öğrenim gören 9. sınıf düzeyindeki öğrenciler ile yapmış olduğu çalışmada, öğrencilerin tablet bilgisayarlarını e-kitap olarak genellikle evde sözel dersler için kullanıldığı bulgusuna ulaşılmıştır. Ayrıca öğrenciler sayısal derslerle ilgili e-materyallerin yetersiz olduğunu belirtmişlerdir. Pamuk ve arkadaşlarının (2013) FATİH projesi kapsamında 11 pilot okulda 918 öğrenci ile yaptığı çalışmada benzer bulgulara ulaşılmıştır. Proje kapsamında dağıtılan tablet PC'lerin kullanım alanı bakımından sınırlı olduğu ve e-içerik bakımından yetersiz olduğu bulgusuna ulaşılmıştır.

SONUÇ

FATİH Projesi hakkında yapılan ampirik çalışmalara bakıldığında çalışmaların genelinde algı ve tutumu ölçen çalışmalar bulunmaktadır. Yapılan bu çalışmalarda ise FATİH Projesi kapsamında dağıtılan donanımsal araçların kullanımına karşı tutum ve algı ölçülerek yorum yapıldığı görülmektedir. Bulgular öğretmen boyutunda incelendiğinde öğretmenlerin genel olarak projeye olumlu baktıkları söylenebilir. Öğretmenlerin teknik bilgi ve beceri yetersizliği, e-içerik eksikliği ve teknik sorunlar projenin önünde bulunan öncelikli engeller olarak görülmektedir. Bu bağlamda, proje yürütücüsü ve paydaş kurumların öğretmenlerin sıkıntı yaşadıkları ve kendilerini yetersiz bulduğu alanlarda destek verebilecek birimlerin kurulması ve eğitim programlarının geliştirilmesi üzerinde ivedilikle çalışılmalıdır. Örneğin, il genelinde kurulacak bir merkezde BİT ve alan/branş öğretmenlerinin uzmanlarla birlikte e-içerik geliştirerek projeye aktif katılımları sağlanabilir. Ayrıca proje kapsamındaki her okulda teknik personel istihdam edilerek BİT öğretmenlerinin teknik iş ve sorumlulukları azaltılmalıdır. Böylece BİT öğretmenlerinin diğer branş öğretmenlerine yapacakları tekno-pedagojik rehberliğin ve desteğin arttırılması sağlanmalıdır.

Öğrenci boyutundaki bulgular incelediğinde ise öğrencilerin proje hakkında genel olarak oldukça olumlu düşündükleri görülmektedir. Hatta öğretmenlerden daha fazla ilgili ve istekli oldukları söylenebilir. Fakat öğrencilerin olumlu karşılamasının projeden elde ettikleri kazanımlardan mı yoksa öğrencilerin yeni bir araç kullanmasına karşı merak uyandırmasından mı kaynaklı olduğunun araştırılması ve bu tür çalışmaların belirli periyotlar halinde tekrarlanması gerekmektedir. İncelenen çalışmalarda öğrencilerin dağıtılmış BİT'leri daha verimli kullanmaları için mevcut e-içeriklerin arttırılması sağlanmalıdır.

Alanyazın incelendiğinde şimdiye kadar yapılmış araştırmaların donanımsal araçların kullanımına yönelik tutum ve algıların ölçülmesine yönelik olduğu görülmektedir. Bundan sonraki çalışmaların projenin yöntem, içerik ve süreci bakımından daha kapsamlı ele alındığı çalışmalara önem verilmelidir. Ayrıca projede dağıtılmış ve kullanılması istenmiş olan BİT'lerin öğrencilerin motivasyon, başarı ve düşünme becerileri gibi bilişsel ve duyuşsal çıktılar üzerinde etkilerinin araştırıldığı deneysel ve boylamsal çalışmalar yapılmalıdır.

ADAPTATION OF TECHNOLOGICAL PEDAGOGICAL CONTENT KNOWLEDGE (TPACK) AND TECHNOLOGY INTEGRATION SELF-EFFICACY SCALE (TISE) INTO TURKISH

Changes in technology directly affect educational process. Integration of technology into teaching and learning process is considered an important part of today's learning. In particular, teachers' role in the adaptation of technology into education and instruction is crucial. Teachers are responsible for preparing technologically literate students in the technology era. In order to achieve this, teachers should be technologically literate and integrate their technology, pedagogy and content knowledge (TPACK) into their instruction. Technology principle of National Council of Teachers Mathematics (2000) also emphasizes the role of teachers in technology integration because the effective use of technology in mathematics depends on knowledge and technological skills of mathematics teachers. However, technology knowledge is not enough. Teachers should make a decision about when and how to use technology in instruction effectively. In Turkey, there are some attempts to integrate technology into mathematics such as FATIH project.

Although the importance and necessity of technological pedagogical and content knowledge (TPACK) are emphasized, there is currently no comprehensive survey to evaluate TPACK. Moreover, to integrate technology into their pedagogy and curriculum successfully, teachers must develop confidence in their abilities to integrate technology in the classroom because the integration of technology affects how much students learn in the classroom (Bunch et al., 2012b). So, the aim of the study is adaptation of the TPACK scale which was developed by Handal et al. (2013) and TISE scale developed by Wang et al. (2004) to Turkish. The former instrument consists of 30 items and three dimensions: TCK, TPK and TPCK. The latter scale included 21 items. In order to adapt the scales, firstly scale items were translated to Turkish by the researchers. Then, translation form was further modified by specialists. Also, back translation was done by experts. English and Turkish forms of scale were both filled by pre-service secondary mathematics teachers in education. Turkish version of the scale was applied the same group after 4 weeks. After that, the data was analyzed by using SPSS. In this paper, the results of the pilot study which is the first part of more comprehensive study will be presented.

.

THE DERİVATİVE GRAPHAS WİTH NUMERİC AND GRAPHİCS APPROACH

Jose CARLOS

Cortes ZAVALA

Several researchers point to the importance of introducing the concept of rate of change as a bridge to reach the intuitive concept of derivative . Based on this initial idea design and software development , which we called "Functions and Derivatives " . The proposed software activities that highlight differerence, increments , and rationale increments aspects first with a numerical approach and subsequently using graphical approaches highlight visual ideas involving numerical - graphical relationship is incorporated .

The numerical and graphic treatment is rarely used and when it is only serves as an introduction without a proper connection to the algebraic process. Proposals such as Duval (1988.1993 and 1995) , withFry (1993) , Scher (1993) , Mejia (1997) , Hitt (2002) and Pluvinage (2005) mention the importance it has for the learner , the graph management and numeric. Numeric , graphic and algebraic aspects are representations of mathematical objects and each presents certain information object also allow certain types of cognitive activities in the subject. When only one type of representation is used there is a risk , as mentioned by Duval (1988) , to confuse the object representation , so as methodology, this research proposes the use of multiple representations of an object.

Each representation leaves visible types of information, but also hides another and each of them allows us to perform certain types of operations . Both textbooks and in classroom work , these representations are given partially concealing information that allows us to make the right connections ; Taking into account the above is that we propose the construction of the graph starting from the numerical , but emphasizing that there is hidden information in such numerical representation

Keywords: differences, ration of increments, derivative function

DEVELOPING INNOMATTS TO IMPROVE MATHEMATICS TEACHERS' PEDAGOGICAL AND PROFESSIONAL COMPETENCES: AN INDONESIAN PERSPECTIVE

Mohammad ASIKIN
Mathematics Department of Semarang State University Indonesia

iwanjunmat@gmail.com

ABSTRACT: This project proposes an integrated model of mathematics teacher training which is developed based on the real need and potential of Indonesian mathematics teachers in improving mathematics learning. The main objective of this research is to develop the training model called INNOMATTS which has characteristics of independency, innovative, sustainable and problem solver in providing wider chance for mathematics teachers to improve their pedagogical and professional competences. This study employs R&D design using 10 steps of development model of Gall. This article describes the result of exploration study, model validation and practical testing. A sample of 30 mathematics teachers from various schools joined the INNOMATTS and were tested of pedagogical and professional competences. The results indicate that INNOMATTS is a promising training model for mathematics teachers' improvement in pedagogical and professional competences.

Key words: professional development, mathematics teacher training model, INNOMATTS model

INTRODUCTION

Teacher as a profession needs to be developed through several training methods. We see teacher as the one who organize learning and determine the quality of students. That is why teachers should have high competences and excellent characters to run their duties (Kunandar, 2007:40). The government of Indonesia has imposed a certification program for professional teachers. Teachers who can perform well in teaching and have high competences in pedagogy, social, personality and professional would be awarded by a significant insentive.

In order to run the program, the government provides several programs of professional development such as in-service training. However, these efforts can not significantly impact the improvement of teachers' quality. There are two reasons of why the training can not improve the quality of the teachers. The first is because the training was not based on the real problem in the classrooms. It seems that the program saw teachers from various regions in the same capacity and equal background while most of them came to the training with the different problems. The second is in the level of teacher practice, the knowledge or skill they got from training is not impelemented in their classrooms (Hendayana, 2007). This condition leads to the idea that teachers always need a sustainable training which provides follow up in order to make sure that the training can significantly impact toward the improvement of teaching practice.

This issue is strengthened by the result of Teacher Competence Test in 2012. This test was conducted by the Minsitry of Education and Culture to evaluate the certification program and to know whether the program brought significant impact toward teachers competence. The participants of this test were all certified teachers and those who have participated in in-service training held by the government. The result is not too satisfying. Among 217,766 teachers joined this test, the national average score is 49,57 which is below expectation with the minimum score is 0 and, maximum score is 95 and deviation standard 11.41.

The result in Central Java and Semarang City suggests the same condition as shown in Table 1. From the table, we can learn that the certified teacher, even those who have joined in-service training, still can not perform optimally in pedagogy and professional competence. In mathematics education, for instance, there are a lot of skill that the mathematics teacher should master, some of which are skill of organizing the appropriate mathematics class, skill of conducting classroom action research, and skill of analyzing the students' learning result. Those skills have not optimally covered in the recent training conducted by government.

Table 1. The Result of Junior High School (JHS) Teacher Competence Test 2012

Score of UKG	Central Java	Semarang City	Semarang City (Mathematics Teacher of JHS)
Average score of pedagogy and professional	53,99	55,22	69,71
Maximum	90	82	91,2
Minimum	0	21	26,3
Averageof pedagogy	14,72	14,91	55,41
Maximum of pedagogy	29	27	86,96
Minimum of pedagogy	0	2	8,7
Averageof professional	39,28	40,31	70,48
Maximum of professional	70	63	94,74
Minimum of professional	0	15	29,82

Several studies of mathematics instruction suggests that the mathematics teaching practices in Indonesia still have not promoted either the innovative learning or innovative assessment (Ardhana, 2005; Iswahyudi, 2010; Marsigit, 2007). Most of them caused by the lack of knowledge and willingness to conduct and to explore various innovative mathematics instruction. From that condition, professional competence of teachers, especially mathematics teachers, should be paid attention by conducting in-service training or on job training based on the root problems in the classrooms. The training shall also be feasible to conduct independently by the teacher association and shall not always depend on the government program.

Teachers always question about a 'what next' program after such training conducted. This question commonly happens because most of training end up by less application in the classrooms. This phenomenon suggests that such training should accomodate the feasibility and empowerment that lead to the sustainability of the problem. It can be understood that once the program ended without any follow up to guarantee the sustainability, then the skills will be lost and the knowledge will be forgotten. In another hand, one of the keywords of professionalism is the capability to apply innovative learning in order to increase the learnng quality. Thus, any training for teachers would be meaningful if it also accommodates the innovative learning.

Now we have keywords of what kind of training that mathematics teachers demand. It is a training which have characteristics of independent, problem solver, innovative and gives sustainable impacts and wider chance for mathematics teachers to improve their competences. This article proposes INNOMATTS which stands for Innovative Mathematics Teaching Study. INNOMATTS training model is a model of professional development for mathematics teacher inspired by several professional development philosophies and has characteristics which are suitable with the grass-root problems of Indonesian mathematics teaching practice.

Research Problems

The problems of this research are: (1) what kind of professional development training that matematics teachers demand? (2) is the INNOMATTS model valid based on experts appraisal? and (3) how does it engage the teachers to improve their practice?

Professional Development Training Model

The establishment of INNOMATTS inspired by various professional development training model ideas. Some of which are:

(1) Pauline Roger Model;
It is believed that teachers need time to apply changes in their teaching and critically respond the changes. This process needs support from the mathematics education expert. In the end, if the changes positively impact the students' learning result, then the teachers' belief would also positively change, and conversely.

(2) Problem Solving Cycle (PSC) Model;
PSC believes that mathematics teacher profession development needs a long sustainable program. An iteration of PSC consists of 3 integrated workshops which allow teachers to share their experience.

(3) Lesson Study;
The idea of lesson study is collaboration in designing, observing, and reflecting the learning. There are 7 keywords in lesson study, namely profession development, learning analysis, collaboration, sustainable, collegial, mutual learning, and learning community.

(4) RCC Model;

The structure of RCC consists of 2 components, namely collective meeting and assignment both at classroom and at home. The main activities in the collective meeting are structure variation, group meeting, class taping, assignment discussion, sharing, and designing the next learning.

(5) Guskey Model;
The purpose of this model is to understand the trend as dynamic changes in learning. The model suggests that teachers experience determine the instruction changes. Once teachers see that the changes they made in their learning positively impact the students learning result, then the teachers' paradigm will change, too.

Characteristics of High-quality Teacher Professional Development

Burns (2011) stated that the professional development of teachers should have characteristics as follows.

(1) Be competency-based, focused on helping teachers develop the knowledge, skills, attitudes, and dispositions demonstrably shown to improve teaching;
(2) Be based on an understanding of teachers' needs and of their work environments;
(3) Focus on deepening teachers' content knowledge and pedagogical skills;
(4) Model the exact behaviors teachers are supposed to employ in their own classrooms;
(5) Include opportunities for practice, research, and reflection;
(6) Use information related to student learning for teacher development;
(7) Be embedded in educators' workplaces and take place during the school day;
(8) Be sustained over time;
(9) Be grounded in a sense of collegiality and collaboration among teachers and between teachers and principals to solve important problems related to teaching and learning;
(10) Build professional learning communities (technical and social support provided by professional learning communities helps to overcome inertia of status quo and helps teachers make complex changes);
(11) Build teacher leadership and distributed leadership;
(12) Focus on a small number of student learning goals; and
(13) Match adult learning processes to intended outcomes.

Furthermore, NCTE (2009) said that any effort to strengthen teachers' professional practice must equally respect them as professionals. This includes matters of training in content and approach, how trainings are announced and how they are implemented. Programmes must build on and strengthen the teacher's own identity as a professional teacher and in many cases also establishand nurture the linkage with the academic disciplines of their interest. Programmes that compromise on the professional identity of the teacher and his/her autonomy will be unsustainable in the long run, providing very little psychological motivation for teacher to internalize what they have been 'told' in their practice.

METHODS

The steps of research followed the R&D design of Gall (2007:571). There are 10 steps of researchadapted from the Gall design, namely: (1) Theoretical analysis; (2) Management analysis of the training implementation; (3) Exploration study; (4) Designing hipothetical model; (5) Designing the philosophical ground, purposes, characteristics and principles of the model; (6) Designing the strategy of implementation; (7) Designing the devices; (8) Evaluation (validation, practical testing, and effectiveness); (9) Revision; and (10) Final product. While this article focus on the desription of the result of exploration study, validation process, and practical implementation testing.

Exploration Study

Exploration study is the initial step of R&D. The main purpose is to collect information as a provision to develop INNOMATTS. The objects considered are: theoretical framework of teacher training model, mathematics learning theories, the description of the learning implementation, the description of mathematics teacher competences, factors influencing the mathematics learning, and the other supporting learning factors.
The participants of the exploration study are 40 mathematics teachers in Semarang Central Java Indonesia who join the mathematics teacher council in Semarang. They were asked about their perception toward professional development training that they have ever joined and toward INNOMATTS through questionnaire and interview. The study also explored phenomena of teachers and students activities by using observation sheet.

Validation of Hipothetical Model Design

The INNOMATTS hypothetical model is validated by using Delphi technique. The validation was conducted in two phases. Delphi technique is a way to get consensus among experts by using intuitive approach. This technique has two advantages, namely it can accommodate subjective opinion of each individual and enable the opinion expressed freely without any domination. The steps of validation process are:(1) preparation; (2) expert determination which consists of 3 academic experts (professors), 5 policy makers (school principals and assessors), and 10 teachers; (3) instrument development, (4) distribution; (5) data collection; and (6) analysis. The second phase was the follow up of the revision after the model was validated in the first phase.

Practical Implementation Testing

The INNOMATTS training model was being tested to train mathematics teachers in Semarang city. There were 30 teachers joined the training for 3 months. The teachers divided into 5 clusters, each cluster consists of 6 teachers. They were all required to produce lesson plan and implement the instruction in their classes in 4 meetings. In the beginning and the end of the training, the participants were assessed by using teacher assessment guidance from the Development Center of Teacher Profession Development of the Ministry of Education and Culture 2011. They were also tested by using Teacher Competence Test based on the guidance of mathematics teacher competence test 2013. The data was collected through direct observation and video taping. The competence is considered as good if they get score above 75.

RESULTS AND FINDINGS

The exploration study suggests the perception of mathematics teachers as shown in the table 2.

Table 2. The Contribution of Training toward the Improvement of Mathematics Teacher Competence

No.	Contribution	Percentage
1.	Motivation to join the training came from another party	72,5 %
2.	The suitability of training material toward the need of teachers	75%
3.	Experiencing the benefits of training	90%
4.	Demanding the innovative training based on the demand of the age	97,5%
5.	Demanding the character development training	97,5%
6.	Demanding the assistance of colleagues, supervisor, expert in improving teachers' competence	92,5%
7.	Joining training only if it is funded by central or regional government	60%
8.	Understanding the training principles joined	70%
9.	Understanding the training strategies joined	40%
10.	Understanding training model joined	37,5%
11.	Understanding training characteristics joined	37,5%

Based on the table above, it can be described that mathematics teachers in Semarang city need innovative training which answers their real problems. Before this research, they only joined training if there was government program which required them to join certain training. They also demand assistance from experts in improving their competences. The table also suggests that less than 50% of the training participants really understand the strategy, model and characteristics of the training they joined.

Table 3. Training Management in Improving Mathematics Teachers' Competences

No.	Contribution	Percentage
1.	Understanding the planning of the training	22,5%
2.	Understanding the consensus initial planning of the training	17,5%
3.	Understanding the purpose and target of the training	52,5%
4.	Understanding the supporting resources in the training	55%
5.	Understanding the way to analyze and identify activities or tasks to reach the target	45%
6.	Providing management activities and coordination in every level of responsibility	52,5%
7.	Evaluating the implementation of training	55%
8.	There is evaluation to see the impact of planning and result of training toward the related parties	55%
9.	There is evaluation process of training by giving comment about the suitability of result and expectation	57,5%
10.	There is a follow up program after the training	27,5%

From the table above, only 22,5% of mathematics teachers in Semarang understand the planning, only 52,5% who understand the purpose of the training, and only 27,5% who suggests that there is follow up program of the training they ever joined. The result of exploration study suggests that mathematics teachers need training which gives deeper understanding toward purpose, strategy, evaluation mechanism and management activities of the training. In addition, they also demand follow up of training.

INNOMATTS Training Model

INNOMATTS training model is a model of professional development for mathematics teacher and has characteristics which are suitable with the grass-root problems of Indonesian mathematics teaching practice.

The Philosophical Ground

The INNOMATTS training model also have philosophical foundation according to the condition of Indonesian mathematics instructions below.

(1) There are 4 components that should be concerned in constructing teachers' mathematics knowledge, they are knowledge of content, general pedagogy, specific pedagogy, and contextual pedagogy.
(2) Any professional development program for teachers should be based on the government policy.
(3) Any professional development program for mathematics teachers should be based on the consructivist and innovative paradigm.
(4) Any professional development program for mathematics teachers should support the trend of mathematics education, especially the implementation of the 2013 curriculum.
(5) Any professional development program for mathematics teachers should accommodate the aspiration and needs of mathematics teachers. Thus, the program should be flexible and accommodative.
(6) Any professional development program for mathematics teachers should be in a form of collegial training, instead of individual.

The purposes of INNOMATTS model training are:

(1) To facilitate mathematics teachers in order to reach the required competences,
(2) To facilitate mathematics teachers in order to conduct innovative learning,
(3) To motivate mathematics teachers in order to keep committing to do the main duties as professional teacher,
(4) To give chance for mathematics teachers to share ideas, to help each other, and to give feed back,
(5) To increase the knowledge and skill of innovative learning, and
(6) To raise the image and dignity of mathematics teacher profession as well as the pride and respect toward the profession.

The INNOMATTS in Action

Based on the philosophical foundations above, the INNOMATTS is developed by the following ideas.

(1) The INNOMATTS can be initiated by policy maker (government), professional organization (teacher council), or teacher directly request to the regional council.

(2) The initiator analyzes the need and problems of the teachers dealing with the improvement of teachers' competence.
(3) The need analysis is then matched with the INNOMATTS.
(4) The government/teacher council establishes a team to design the INNOMATTS training based on the need analysis in a form of in-service training.
(5) The next is the in-service training in a group. The result of this step is the design of cluster activity in a form of lesson study.
(6) Implementing the on-service training in a form of Do and See parts of lesson study. The implementation of *Do* and *See* in this *cluster* is done by team consisting of 5 - 6 teachers. Each team can do the activities in different schools.
(7) The result of *Lesson Study* is then designed to be applied individually in teacher's own school.
(8) The result of *See* process in each cluster is used as the review material to design the next *in-service* activities. This cycle ends until the end of the proposed program.

The action of INNOMATTS can be explained as follows. The input of the model is Junior High School mathematics teachers. Within the model, cyclic activities happen in the first circle within the small IN circle, the activities are: (1) explanation about INNOMATTS model, (2) sharing ideas about desire, hope and problems in classrooms (3) material presentation, (4) initial data collection of teacher competence, and (5) designing the ON activities. The ON activities is the implementation of what designed in the IN. ON activities conducted in the cluster to implement lesson study. After that, the cluster implement R activities which is reviewing the implementation of ON activities. The ilustration about the IN, ON, and R activities can be seen in Figure 1.

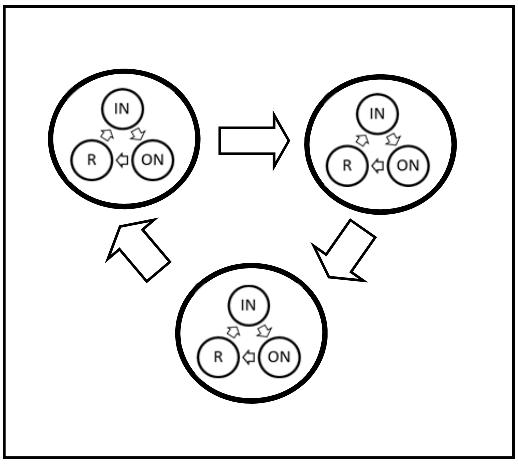

Figure 1. The IN, ON, and R cycles

From the figure above, there are three cycles of IN, ON, and R activities. In the second circle, what will happen in the IN, ON and R activities are the continued activities of the first circle, with IN is the designing, ON is the implementation and the R is the review activities.

In the third circle, we collect data of teacher competence in IN activities. After that, we collect data of students' learning result in each school, conducting interview with the principal, teachers and students in ON activities; and at last, we conduct R activities by reviewing the entire training activities and designing the follow up program.

In order to smoothen the implementation of INNOMATTS training model and to reach the training goals, we need several strategies as follows:
(1) INNOMATTS training model can be implemented in a scheduled program within mathematics teacher association, or else, it can be conducted under the authority of education foundation or another teacher association.
(2) INNOMATTS training model is designed and implemented in cyclic model (applying Deming cycle P-D-C-A/ *Plan-Do-Check-Act*).
(3) The training activities conducted in a group based project or in an individual project.
(4) The training provides expert advisor during the activities.

The structure of the INNOMATTS training program is shown in Table 4.

Table 4 The Structure of INNOMATTS

No	Subject	Theory (IN)	Practice (ON/ Cluster)	Practice (ON /Class)	Review (R)
A	GENERAL				
	Government policy about the curriculum and teacher professional development	3			
B	BASIC				
	1. The 2013 mathematics curriculum for JHS	6	2 x 3		
	2. Sustainable professional development for teacher	3			
	3. Brain storming about selected topics of mathematics teachers' need and problems	4	4 x 2

	2. Follow up program	5			
IV	EVALUATION			6	

The Result of Validation

The validation process includes assessment toward the guidance of the implementation of INNOMATTS and the prediction of the result after the implementation of the training. Among the indicators, the percentage of item which is considered as good and very good (scored 3 and 4) is reaching 95%. Based on the validation, several recommendations addressed to revise the model as follows:

(1) The innovation should be expressed clearly;
(2) Evaluation after training shall be added;
(3) Several detail such as table of content, layout, the use of symbols, the meaning of several pictures shall be clear;
(4) The time allocation shall be wisely arrange and clear;
(5) It is necessary to add the advanced material such as mathematics Olympiad material;
(6) The monitoring and evaluation activities shall be well planned;
(7) The senior teachers shall be involved;
(8) The characteristics and steps shall be cleared

All the recommendation has been accommodated at above design by doing revision. Overall, the result of validation process suggests that among 34 indicators, they are considered as good and very good.

Furthermore, the result of Kruskall Wallis hypothesis testing shows that there is no difference assessment given by academic experts, policy makers, nor teachers. Below is the output of 3 independent samples testing of mean difference Kruskall Walis.

Researcher formulated hypothesis as follows:
H_0 :There is no significant difference among academic experts, policy makers, nor teachers
H_1 : There is significant difference among academic experts, policy makers, or teachers

Then we got output as shown in Table 5, Table 6, and Table 7 respectively.

Table 5. Descriptive Statistics Kruskall Wallis SPSS Output

	N	Mean	Std. Deviation	Minimum	Maximum
Data	41	3.4002	.30673	2.91	3.97
Validator	41	2.44	.776	1	3

From the table, there are 41 validators engaged in this validation process which the result shown in detail in Table 6 and Table 7.

Table 6. Ranks of Kruskal-Wallis Test

	Validator	N	Mean Rank
Data	1	7	23.00
	2	9	21.28
	3	25	20.34
	Total	41	

Among 41 validators, 7 validators came from academic experts, 9 validators came from policy makers, and the rest came from teachers.

Table 7. Test Statistics[a,b]

	Data
Chi-square	.276
df	2
Asymp. Sig.	.871

a. Kruskal Wallis Test
b. Grouping Variable: Validator

Based on Table 7, we gain *p value* of Kruskal Wallis is $0.871 > 0.05$. It means that the H_0 is accepted. This result suggests that there s no revision for instrument validation.

Practical Implementation Testing Result

The result of practical implementation of INNOMATTS training model is shown in Table 8.

Table 8. Practical Testing Result

Cluster	Lesson plan (1 – 4)	Implementation (0-100)	Assessment Before Training (0-100)	Assessment After Training (0-100)	Competence Test
A	3.6	89	71	82	82
B	3.8	92	70	86	88
C	3.7	90	70	84	83
D	3.5	87	73	83	85
E	3.6	86	72	87	82

The result for each cluster shows that teachers improve their teaching and got their score of competence more than 75, which is good.

The Improvement of Pedagogical and Professional Competence

Teacher competence is defined as knowledge, skill, and behavior that shall be possessed, internalized, mastered, and actualized by teacher (Depdiknas, 2004:7). The pedagogical competence is the teachers' ability to understand their students and learning including: (1) wide perspective of larning foundation, (2) students understanding, (3) curriculum development, (4) planning of learning, (5) educated learning, (6) the use of information and computer technology, (7) evaluation, and (8) promoting students potential. While the professional competence is teachers' ability in mastering knowledge, technology, arts and culture in their field, including: (1) mastering the material based on curriculum, (2) mastering concepts related to their discipline, (3) application of concepts in life, (4) competing professionally in global context.

INNOMATTS is inspired by the principles of various models of professional development adapted with the need of Indonesian mathematics teachers. The principles of the implementation of INNOMATS include:

(1) Effective and efficient;
Mathematics teachers have chance and ability to see and discuss their teaching practice in intensive discussion by using the facilities in INNOMATTS. The parameter of effectiveness measured by the accomplishment of the goal of training, while the parameter of efficiency measured by the ability of the model to use and to empower all the supporting potential either human resources, equipment, or leadership in order to save the fund and time to reach the goal.
(2) Problem solving oriented;
INNOMATTS is formulized based on the need of mathematics teachers in implementing their learning, thus it is supposed to be able to encounter the core problem of mathematics learning.
(3) Easy to conduct;
The structure program of INNOMATTS is simple.
(4) Innovative;
Though it is inspired by various model of teacher professional development, the essence of INNOMATTS training model is philosophically different with the other model of professional developments. The excellent characteristics is in the IN, ON, and R activities which gives wider chance for teachers to develop and to improve their practices. The innovation can also be seen through the program structure and the material which promotes the innovation in mathematics learning.

The Characteristics of INNOMATTS

Based on the INNOMATTS principles, we can describe the characteristics of the training model as follows. First, INNOMATTS is a problem solver training model. Before the program structure of INNOMATTS constructed, the initiator of the training conduct a need analysis which can identify the core problems faced by mathematics teachers. Once the problems have been identified, then the training program can be formulated.

Second, INNOMATTS is independent. It means that whether the government can fund or support the program or not, INNOMATTS can be initiated and conducted by teachers community at schools, foundation, or association.

Third, the structure and programs of INNOMATTS accommodate the trend and innovation in mathematics learning. Patel (2011) suggests that innovation in teaching mathematics can be diversified in terms of methods, pedagogic resources and mastery learning strategy. Thus the training structure is designed in a hierarchy cycles, starts from the classical meeting, cluster activities or individual practice in each school. It is supposed that after the training, teachers can master the skills such as designing and implementing innovative learning model, namely *problem based learning*, *project based learning,* RME/*Realistic Mathematics Education*, MEA/ *Model Eliciting Activities*, and so on.

The forth is sustainability. INNOMATTS provides post-training program as a follow up of the training.

CONCLUSION

From the analysis about characteristics and implementation above, we learn that: (1) Indonesian mathematics teachers demand on the sustainable training to developtheir pedagogical and professional competences, (2) INNOMATTS training model is considered as valid based on theoretical framework by academic experts, (3) INNOMATTS can facilitate mathematics teachers to develop good practice in mathematics teaching and to improve their pedagogical and professional competences. Mathematics teachers get wider chance to design, discuss, and solve their problems in mathematics learning through cluster activities and collegial practice at schools. INNOMATTS can be an alternative training model which is excellent and feasible to be conducted independently through teacher association.

RECOMMENDATIONS

The INNOMATTS training model has been conceptualized and discussed through various teacher forum. Thus, it makes INNOMATTS a promising training program to improve the pedagogical and professional mathematics teachers.There are yet several questions which need to be addressed through further reasearch. We need more empirical evidence to claim the effectiveness of this model in order to accomplish the goal of Indonesian teacher professional development.Furthermore, we need to disseminate the model in order to spread the advantages and opportunities for mathematics teachers.

STUDENTS' PERCEPTIONS TOWARDS CONCEPTS OF DOMAIN, CODOMAIN AND IMAGE OF DOMAIN

Tuğba HANGÜL

İlyas YAVUZ

The purpose of this study is to identify undergraduates' perceptions of domain, codomain and image of domain of functions and their preferences in using different representations of the function concept. To do this, an open ended questionnaire linked to the function concept was asked to 77 first graders at a university during the fall semester of the 2013-2014 academic year . In this paper, only results of the analysis of students' answers to one question is presented. The results of this study revealed that students preferred verbal, diagram, graph and numerical representations of functions. In addition, it was seen that students had lack of knowledge about the concept of function and classification of numbers as well as had problems translating among multiple representations of the function concept and using of mathematical language correctly.

Keywords: Multiple representations, codomain, function concept, image of domain, domain

İLKOKUL 4.SINIF MADDEYİ TANIYALIM ÜNİTESİNE YÖNELİK BİR BAŞARI TESTİ GELİŞTİRME ÇALIŞMASI

ÖZET: Çalışmanın amacı, ilkokul dördüncü sınıf fen programında bulunan "Maddeyi Tanıyalım" ünitesine yönelik öğretmenlerin öğretim sürecinde ve araştırmacıların çalışmalarında yararlanabilecekleri geçerli ve güvenilir çoktan seçmeli bir ölçme aracı geliştirmektir. Bu doğrultuda ünitedeki mevcut kazanımlar Bloom Taksonomisi'ne göre analiz edilmiş, yetersiz olduğu düşünülen bazı kazanımlar eklenerek, bu kazanımları ölçecek çoktan seçmeli dört seçenekten oluşan 30 soruluk Maddeyi Tanıyalım Başarı Testi (MTBT) hazırlanmıştır. İlgili kazanımların ve soruların belirtke tablosu düzenlenerek alan eğitimi uzmanlarına ve konu alanı öğretmenlerine sunulmuş ve onların görüşleri doğrultusunda kapsam geçerliği sağlanmıştır. Bundan sonra pilot çalışması yapılarak, teste son hali verilmiştir. Test 200 öğrenciye uygulanmıştır. Uygulama sonrasında her bir maddenin madde güçlüğü, madde ayırt ediciliği, standart sapma, aritmetik ortalama, varyans gibi değerler hesaplanmıştır. Bununla birlikte yapılan diğer hesaplamalarla KR 20 güvenirlik katsayı 0,89; KR 21 değeri 0,88 olarak bulunmuştur. Madde analizi ile testin ortalama madde güçlük ve ayırt edicilik endeksleri sırasıyla 0,51 ve 0,40 olarak hesaplanmıştır. Araştırmanın sonunda ilkokul 4. Sınıf düzeyinde Maddeyi Tanıyalım ünitesine yönelik öğretmenlerin ve araştırmacıların kullanabileceği geçerli ve güvenilir bir ölçme geliştirilmiştir. Araştırmanın yürütme sürecinde karşılaşılan durumlarla ilgili bazı önerilerde bulunulmuştur.

Anahtar Kelimeler: Başarı Testi, Geçerlik, Güvenirlik, Maddeyi Tanıyalım

ABSTRACT: The aim of this study is to develop a reliable and valid measurement tool for primary school 4th graders by taking the course "Properties of Matter" as the basis. For this purpose, the questions were prepared according to the achievements gained in the course together with the gains aimed. The questions prepared were presented to expert opinions first, and then the table of specifications of the test was created. After the pilot study, the final test was applied to 200 students. After the application of each item difficulty, item to distinguish the spur, the standard deviation is the arithmetic mean, the variance calculated values such as.The KR 20 reliability coefficient of the test results was found as 0.89, and the KR 21 value was 0.88. And the item analysis revealed the average item difficulty and differentiation indexes as 0.51 and 0.40, respectively. At the end of primary school survey 4 th the class level, getting to know the unit, use the current teachers and researchers for the item, and developed a reliable measurement. Based on the results obtained, we have made certain proposals.

Keywords: Achievement Test, Validity, Reliability, Properties of Matter

GİRİŞ

Gelişmiş veya gelişmeyi hedefleyen her ülke, mevcut eğitim sisteminin kalitesini ölçme ve değerlendirme işlemleriyle gerçekleştirir. Değerlendirme sonuçlarına dayanarak mevcut eğitim sistemini devam ettirme ya da reform yapma gerekliliğine odaklanır. Dolayısıyla değerlendirmenin amacı ve rolü daima öncelikli bir konu olmuştur. Resmi eğitim programı sorumluları ya da değerlendirme uzmanları her yıl yeni bir eğitim programı konusu geliştirmezler ama öğretmenler daima öğrencilerine mevcut programı sunmak için yeni yollar denerler. Bu nedenle öğrenciler aslında sürekli bir biçimde öğretim programı deneyimi yaşarlar. Bu deneyim veya değişiklikler oldukça ufaktır ve değişik eğitici rutinler içerir. Fakat aynı zamanda yapılan resmi öğretim programı değişimlerinden de çok etkili olabilir (Orpwood, 2001). Dolayısıyla sınıf ortamında öğretmen tarafından verilen bilgilerin öğrenciler tarafından ne düzeyde öğrenildiği ancak geçerlilik ve güvenirliği sağlanmış ölçme araçlarıyla yapılabilir (Gönen, Karakaya ve Kocakaya, 2011). Bu anlamda başarı durumlarının ölçülmesi ve değerlendirilmesine ihtiyaç hissedilen konu veya ünitelerde bir takım ölçme araçlarının kullanılması yoluna başvurulur. Araştırmacıların genel olarak öğretmenlere tavsiye ettikleri değerlendirme biçimi formative (süreç) değerlendirme ve summative (erişi) değerlendirmedir. Ancak bu şekilde öğrenci öğrenmeleri üzerinde geri bildirimler sağlanabilir. Daha etkili olduğu düşünülen metotlar, öğretmenin yaratıcılığı için pratikte daha az kalabalık bir sınıf ortamı gerektirir ve bu metotlar çok fazla zaman alırlar (Treagust, 2006). Bu durumda klasik bir ölçme aracı olarak karşımıza çoktan seçmeli testlerin çıktığını görmekteyiz. Test sonuçlarının puanlanmasının kolay olması, konu alanı bilgisini ölçmede geniş bir alanı tarayabilmesi, öğrenci tarafından cevaplanmasında zaman kaybı olmaması, soru analizlerinin kolay olması, soruların amaca uygunluğunun ölçmede kolaylık tanıması gibi nedenlerin çoktan seçmeli testlerin kullanılma nedenleri olduğunu söylemek mümkündür (Bahar,2001). Mevcut eğitim sistemine bakıldığında bu anlamda yapılacak bir başarı testinin hemen her alanda bir ihtiyaç olduğu görülebilir. Özellikle Fen ve Teknoloji alanında yapılan testlerin genel amacı; bugüne kadar değinilmiş olan önemli olgu, kavram, ilke ve yasaları kapsayan dayanıklı bilgi birikimlerini ve gözlem veya deney yapma, düzenleme, yorumlama ve genellemeyi kapsayan verimli bilgi yollarını ölçmektir (Özçelik, 2013). Bu noktadan hareketle ilkokul 4.sınıf Fen ve Teknoloji dersi "Maddeyi Tanıyalım" ünitesi temel alınarak geçerlilik ve güvenirliği hesaplanmış bir başarı testi geliştirme çalışması içine girilmiştir. Madde ve maddenin tanecikli yapısı, günlük hayatta pek çok olayın açıklanmasında kullanılan mikroskobik ve soyut özellikte bir konudur (Kaya, 2006:6). Pek çok eğitimci özellikle "maddenin yapısı" konusunu teorik kimyanın kalbi olduğu yönünde anlaşırlar. Çünkü maddenin yapısı pek çok bilim eğitimi programında, anaokulu yıllarından başlayarak ikinci kademedeki okulların çeşitli safhalarına kadar devam eden anahtar bir yapıya sahiptir. Ancak bilim öğrenme sürecinde öğrencilerin pek çok hata yaptığı ve kavram yanılgılarına sahip olduğu konu da yine madde ve yapısıdır. Tüm bu öneminden dolayı son otuz yılda maddenin doğası hakkında pek çok çalışma yapılmıştır (Özmen, 2011). Maddenin yapısı konusunda; ülkemizde ilköğretim öğrencilerinden başlanarak, öğretmen adaylarına kadar yapılan pek çok çalışma mevcuttur (Ayas ve Özmen, 2002; Nakiboğlu, 2001; Demircioğlu, Akdeniz ve Demircioğlu, 2004; Kavak, 2007; Eroğlu ve Öztuna Kaplan, 2010;Kocaarslan, 2012; Karaduman ve Emrahoğlu, 2011; Özalp ve Kahveci, 2011;Canbazoğlu ve Demrelli, 2010; Özmen, Ayas ve Coştu, 2002). Benzer biçimde yurt dışındaki alan yazı incelendiğinde de bu konuda yapılan çalışmalar dikkat çekmektedir (Gabel, Samuel ve Hunn, 1987; Novick ve Nussbaum, 1981; Novick ve Nussbaum, 1987; Dorothy, 1993; Brook, Briggs ve Driver, 1984;Valanides, 2000; Yezierski ve Birk, 2006). Ancak yapılan çalışmalar incelendiğinde madde ve yapısı ile ilgili olarak kavram yanılgıları incelenmiş, tespit etme yoluna gidilmiş, bu yanılgıları gidermek için öneriler sunulmuş ya da ünite öğretiminde farklı metotlar denenmiştir.

Bu çalışmada ilgili alan yazında ilkokul 4. Sınıf düzeyinde eksik olduğu düşünülen; test geliştirme basamakları dikkate alınarak ilkokul 4.sınıf öğrencilerinin "Maddeyi Tanıyalım" ünitesine yönelik geçerlik ve güvenirlik çalışması yapılmış çoktan seçmeli bir başarı testi geliştirmek amaçlanmıştır.

YÖNTEM

Bu çalışmada test geliştirme basamakları dikkate alınarak, ilkokul 4. Sınıf seviyesinde Maddeyi Tanıyalım ünitesine yönelik 2005 Fen ve Teknoloji, 2013 Fen Bilimleri Öğretim Program'larında kullanılabilecek, öğrencilerin başarılarını ölçebilen bir test geliştirilmiştir. Soruların hazırlanması, kazanımların belirlenmesi gibi çalışma aşamalarında doküman analizi yönteminden yararlanılmıştır. Araştırmanın örneklemini 2013-2014 eğitim öğretim yılında Tokat ili ve ilçelerinde öğrenim gören toplam 200 ilkokul dördüncü sınıf öğrencisi oluşturmaktadır. Çalışmanın uygulandığı okullara göre öğrenci dağılımı Tablo 1'de gösterilmiştir.

Tablo 1. Öğrenci Sayılarının Okul ve Cinsiyete Göre Dağılımı

	Cinsiyet	
Okul Türü	Kadın	Erkek
İl merkezi	52	38
İl merkezine bağlı köy/kasaba	16	18
İlçe merkezi	15	20
İlçeye bağlı köy/kasaba	20	21
Toplam	103	97

Çalışmada ayrıca verilerin toplanması aşamasında geniş bir doküman analizi yapılmıştır.

MTBT'nin Geliştirilme Süreci

Maddeyi Tanıyalım Ünitesi Başarı Testi, araştırmacılar tarafından belirtilen ünitede öğrenci başarılarını ölçmek amacıyla geliştirildi. Test geliştirilmeden önce ilköğretim Fen ve Teknoloji dersi (4 ve 5.Sınıflar-2005) öğretim programı temel alınarak, belirtilen ünite ile ilgili kazanımlar ele alınmış, Bloom taksonomisinde yer alan bilişsel düzeylere göre sınıflandırılmıştır. Olması gerektiği düşünülen alanlarda bilişsel düzeyde kazanımlar eklenmiştir. Ünite ile ilgili belirtke tablosu oluşturularak, soru havuzu hazırlanmıştır. Sorular hazırlanırken, farklı yayınevine ait kitapçık ve testler, ders kitapları, elektronik kaynaklar ve daha önce yapılmış sınav sorularından yararlanılmıştır. Havuzda yer alan sorular üç tane Fen ve Teknoloji öğretmeni, daha önce derse girmiş dördüncü sınıf öğretmeni ve bu alanda ders veren öğretim üyelerine incelettirilerek kapsam geçerliği sağlanmıştır. Elde edilen taslak başarı testinde toplam 30 sorunun yer almasına karar verilmiştir.

Uygulama ve Veri Analizi

Kapsam geçerliği için uzman görüşü alınan ve belirtke tablosu oluşturulan soruların son şekli verilmeden önce pilot uygulaması yapılmıştır. Pilot uygulama sonucu elde edilen dönütlere göre soru köklerinde veya resimlemelerde bir takım değişiklikler yoluna gidilmiş ve 4 şıklı 30 soru içeren bir test oluşturulmuştur. Ardından son hâli verilen başarı testi toplam 200 öğrenciye uygulanmıştır. Puanlama 100 üzerinden yapılmış olup küsuratlı ifadeler onluk yuvarlama hesabına göre tam sayı ifadelerine çevrilmiştir. Elde edilen veriler teker teker okunarak bir sınıflamaya tabii tutulmuştur. Buna göre elde edilen veriler düşük puandan yüksek puana göre sıralanmış ardından verilerin %27'si alt grup, %27'si üst grup olmak üzere iki gruba ayrılmıştır. Alt ve üst gruplardan elde edilen verilere dayanarak maddelerin ayırt edicilik ve güçlük dereceleri hesaplanmıştır. Buna göre ayırt ediciliği 0, 25'in altında kalan iki soru testten çıkarılmıştır. Testten soruların çıkarılmasının ardından testin iç tutarlılığına yönelik olarak; arzulanan cevaplar verilmişse "1", yanlış veya boş bırakılmışsa "0" puan verilerek KR 20 ve KR 21 güvenirlik hesaplamaları yapılmıştır.

BULGULAR

Hazırlanan başarı testi, uygulamadan sonra bir takım istatistikî çözümlemelere tabii tutulmuştur. Yapılan analizler sonucunda madde ayırt ediciliğinin 0,35 ile 0,70 arasında değiştiği tespit edilmiştir. Ancak ayırt ediciliği 0,25'in altında olan iki sorunun (12. ve 15.sorular) diğerleri kadar başarılı olmadığı görülmüştür. Dolayısıyla ayırt ediciliği 0,25'in altında kalan soruların testten çıkarılması gerektiğine karar verilmiştir (Çepni, Bayrakçeken, Yılmaz, Yücel, Semerci, Köse, Sezgin, Demircioğlu ve Gündoğdu,2008). Testten çıkartılan 12. madde doğal, işlenmiş ve yapay madde ile ilgili analiz düzeyinde bir soru olup ayırt ediciliği düşük düzeyde bir sorudur. Testten çıkarılan diğer soru ise ısınma soğuma sürecinin ısı alış verişi ile gerçekleştiği kazanımına dayanan değerlendirme düzeyinde bir sorudur. Testin ortalama güçlük düzeyi 0, 51; ayırt ediciliği ise 0,40dır. Bu değerlere bakarak testin nihai olarak amacına hizmet ettiğini söyleyebiliriz. Çoktan seçmeli bir test olması nedeniyle, başarı testi iç tutarlık hesaplamalarına tabii tutulmuştur. Testin 1-0 puanlama yapısında olması nedeniyle KR 20 ve KR 21 güvenirlik katsayıları hesaplanmıştır. Buna göre KR 20 sonucu 0,89; KR 21 sonucu ise 0,88 olarak hesaplanmıştır. Genellikle ölçeklerde kabul gören güvenirlik düzeyi 0,70 olarak tavsiye edilir (Tezbaşaran, 1996) dolayısıyla geliştirilen testin güvenilir ve amacına hizmet ettiği söylenebilir. Aşağıda bu çalışmada elde edilen veriler özetlenmiştir.

Tablo 2. Başarı Testi İçin Elde Edilen İstatistikî Sonuçlar

	Başarı Testi Verileri
Soru Sayısı	30
Uygulanan Kişi Sayısı	200
Aritmetik Ortalama	15,905
Standart Sapma	6,95
Ortalama Madde Güçlüğü	0,51
Ortalama Ayırt Ediciliği	0,40
KR 20 Değeri	0,89
KR 21 Değeri	0,88

Tablodan elde edilen verilere göre testin ortalama güçlüğü 0,51 ve ortalama ayırt ediciliği ise 0,40'dır. Bu verilere göre testte kullanılan maddelerin iyi çalıştığı söylenebilir. Testin iç tutarlılık katsayılarına bakıldığında ise testin güvenilir bir ölçme aracı olduğu görülmektedir. Testte ayırt ediciliği yüksek ve çeldiricilerin işlerliğinin yüksek olduğu maddeler aşağıdaki tabloda sunulmuştur.

Tablo 3. Testte Yer Alan Çeldirici İşlerliğine Göre Madde Analizi

	Madde Güçlüğü En İyi Olan Madde (Madde No.4)	Madde Güçlüğü Düşük Olan Madde (Madde No.12)	Madde Ayırt Ediciliği En Yüksek Olan Madde (Madde No.26)	Madde Ayırt Ediciliği Düşük Olan Madde (Madde No.15)
Alt Grupta Çeldiriciye Yakalanma Oranı	%14	%68	%74	%83

Üst Grupta Çeldiriciye Yakalanma Oranı	%5	%59	%11	%75

Tabloya göre testten madde güçlük düzeyi oldukça düşük olan (p=0,35) ve madde ayırt edicilik oranı düşük olan (d=0,07) soruların çeldiricilerinin iyi işlemediği yani alt ve üst grupta çeldiricilere yakalanma oranlarının birbirine oldukça yakın oldukları görülmektedir.

SONUÇ VE ÖNERİLER

Bu çalışmada ilkokul 4.sınıf öğrencilerine yönelik olarak geçerlik ve güvenirliği sağlanmış, madde analizleri yapılmış Maddenin Yapısı ünitesine yönelik bir başarı testi geliştirilmeye çalışılmıştır. Bunun için uzman görüşleri alınarak ve pilot uygulaması yapılarak test geliştirme süreci içine girilmiştir. Elde edilen sonuçlara dayanılarak bir takım yargılara ulaşılmıştır. Varılan sonuçlara dayanarak, hazırlanan başarı testinin ülke genelinde kullanılabileceğini söylemek mümkündür. Mevcut eğitim sistemine dayanarak çoktan seçmeli testlerin kullanıldığını ve bu uygulamanın uzun bir süre devam edeceğini söylemek yanlış olmayabilir. Dolayısıyla üzerinde çalışılmış ve geliştirilmiş bir başarı testine olan ihtiyacı yadsımak mümkün olmayabilir. Yapılan çalışmanın öğretmen ve uzmanlar için fayda getireceği ümit edilmektedir. Geliştirilmiş olan başarı testinden elde edilen verilere dayanarak araştırmacılar için bir takım öneriler aşağıda sunulmuştur.

1. Geliştirilen başarı testi uygulamaları esnasında erime ve çözünme konusunda ve karışımı oluşturan maddelerin saflık durumları ile ilgili bir takım kavram yanılgıları tespit edilmiştir. Ancak tespit edilen kavram yanılgıları giderilme yoluna başvurulmamıştır. Sonraki aşamada tespit edilen kavram yanılgılarını giderme çalışmaları hazırlanıp uygulanabilir.
2. Yapılan çalışma farklı sınıflarda ve farklı ünitelerde benzer biçimde örnek teşkil edebilir.
3. Hazırlanan çalışma belirlenen ünitedeki eksiklikleri görme ve giderme amacıyla da kullanılabilir.
4. Testte ayırt ediciliği ve madde güçlüğü düşük olan soruların düzeyleri incelendiğinde üst bilişsel düzeyde hazırlanan sorular olduğu görülmüştür. Bu noktadan hareketle özellikle üst grupta yer alan öğrencilerin çeldiricilere yakalanma oranlarının yüksekliği göz önüne alınıp, benzer düzeyde ve ilgili kazanımda farklı ölçme araçları uygulanarak maddenin neden yanlış cevaplandırıldığı tespit edilebilir.
5. Pilot uygulama esnasında öğrencilerin çok büyük bir kısmı tarafından ilgili sorularda yer alan "tortu, suni çim ve kâse" kelimelerinin anlamları sorulmuş ve uygulayıcı bu kelimelerin anlamları üzerinde açıklama yapmak durumunda kalmış, esas uygulamada farklı kelimeler kullanma yoluna gidilmiştir. Öğrenciler ders esnasında sadece ders kitaplarında yer alan örnekler üzerinden konu öğrenimi yapmakta, farklı kaynaklara yönelmemekte ve değişik örneklerle karşılaşmamaktadır. Bu duruma yönelik olarak öğrencilerin fen okur yazarlık düzeyleri ve fene karşı tutumları bu çalışma ile birlikte yürütülerek, aralarındaki ilişkiye bakılabilir.

SOME RESULTS ON CYCLİC CODES OVER F2 + uF2 + vF2 + uvF2

Murat GÜZELTEPE

Evren SALKIM

In this paper,we investigate the structure and properties of cyclic codes over the ring F2 + uF2 + vF2 + uvF2 where u2=u, v2=v and uv=vu . We first study the relationship between cyclic codes over and binary cyclic codes. We prove that cyclic codes over the ring are principally generated, and give the generator polynomial of cyclic codes over this ring.

Keywords: Cyclic code, gray map, generator matrix, finite rings.

ÖZET: Bu çalışma, ülkemizde ortaokullarda yeni yürütülmeye başlayan Zeka Oyunları Dersi'nin(ZOD) ortaokullarda öğretmen ve öğrenciler tarafından nasıl karşılandığının belirlenmesi amacıyla yürütülmüştür. Tarama yönteminin kullanıldığı çalışmanın verileri, 2013-2014 Eğitim-Öğretim Yılı Güz Döneminde Bayburt il merkezindeki ortaokullardan elde edilmiştir. ZOD hakkında öğretmen, öğrenci ve idareci görüşlerini belirlemeye yönelik beş açık uçlu sorudan oluşan anket 133 öğrenci ve 15 öğretmen uygulanmıştır. Betimsel olarak analiz edilen anket verilerinde katılımcıların ZOD hakkındaki beklentileri, dersin amaçları, derste karşılaşılan problemler ve dersin daha etkili olmasına yönelik öneriler belirlenmeye çalışılmıştır. Çalışmada, ZOD amaçları tanımlanmış ve bu alanda kazanımların artırılmasına ve problemlerin giderilmesine yönelik öneriler sunulmuştur. Ülkemizin beyin gücünün artmasında çok önemli katkıları olacağına inanılan ZOD ile tanımlanacak davranışların öğrencilere kazandırılmasının, öğrencilerin bilişsel, duyuşsal ve devinişsel yeterliklerinin gelişiminde ve gelişmiş insan gücünün oluşturulmasında çok önemli olduğuna, bu nedenle de ZOD dersine gereken önemin verilmesi gerektiğine inanılmaktadır.

Anahtar sözcükler: zekâ oyunları dersi, katılımcı görüşü.

ABSTRACT: This research has been conducted to investigate the ways how teachers and students perceive Mind Games Courses, which had been recently put into curriculum. Data was collected from Bayburt middle schools in 2013-2014 school year. In order to investigate teachers and students' perspective, five open-ended questions were given to 133 students and 15 teachers. In this descriptive research, it has been aimed to define the problems confronted, the goals of the course perceived, and the suggestions to improve the course content. It has been re-defined the goals of the Mind Games Course, improved the course content, and provided suggestions to overcome the problems. It is our belief that the course has significant importance in improving the work force, the number of well-educated people, and therefore the level of development of our country.

Key words: mind games course, participant perspective

ORTAOKUL ÖĞRENCİLERİNİN PROBLEM ÇÖZME TUTUMLARININ ÇEŞİTLİ DEĞİŞKENLER AÇISINDAN İNCELENMESİ ÜZERİNE BİR ARAŞTIRMA

A RESEARCH ON THE EXAMINING OF SECONDARY STUDENTS' PROBLEM SOLVING ATTITUDES IN TERMS OF DIFFERENT VARIABLES

Dilek SEZGİN MEMNUN
Uludağ Üniversitesi
dsmemnun@uludag.edu.tr

ÖZET: Bu araştırma, ortaokul beşinci ve altıncı sınıf öğrencilerinin problem çözme tutumlarının incelenmesi ve bu tutumların cinsiyet, sınıf düzeyi ve matematik dersi başarısı değişkenlerine göre değişiminin araştırılması amacıyla gerçekleştirilmiştir. Bu amaçla, 2012-2013 eğitim-öğretim bahar döneminde Bursa ilinde bulunan 4 farklı ortaokulda öğrenim görmekte olan beşinci ve altıncı sınıf öğrencileri arasından rasgele seçilen toplam 238 öğrenciye *Matematik Problemi Çözme Tutum Ölçeği* uygulanmıştır. Öğrencilerin ölçeği tamamlamaları yaklaşık 15 dakika sürmüştür. Ulaşılan araştırma verilerinin analizinde, betimsel istatistiklerin yanında bağımsız örneklemler t-testi, korelasyon analizi, Mann-Whitney U ve Ki-Kare testleri kullanılmıştır. Ulaşılan veriler, SPSS 14.0 paket programı aracılığı ile analiz edilmiştir. Araştırmanın sonucunda, ortaokul beşinci ve altıncı sınıf öğrencilerinin büyük çoğunluğunun matematik problemi çözme hakkında pozitif tutuma sahip oldukları anlaşılmıştır. Beşinci ve altıncı sınıf öğrencilerinin matematik problemi çözme tutumu kapsamındaki *hoşlanma* boyutu puanları arasında hem cinsiyet hem de sınıf düzeyleri bakımından anlamlı farklılıklara ulaşılmıştır. Ayrıca, bu öğrencilerin matematik problem çözme tutumu *hoşlanma* boyutu puanları ile matematik dersi başarı notları arasında orta düzeyde, *öğretim* boyutu puanları ile matematik dersi başarı notları arasında düşük düzeyde pozitif ve anlamlı ilişkiler olduğu açıklanmıştır.

Anahtar sözcükler: Matematik problemi, tutum, problem çözme tutumu, beşinci ve altıncı sınıf öğrencisi.

ABSTRACT: The aim of this research is to examine the problem solving attitudes of secondary fifth- and sixth-grade students and investigate the variation of their problem solving attitudes according to gender, grades or mathematics course success. *Problem Solving Attitudes Scale* was administered to a total of 238 fifth- and sixth-grade students who were studying in four different middle schools in Bursa during the 2012-2013 academic year spring semester with this aim. These schools and students were selected randomly. These fifth- and sixth-grade students volunteered to participate in this study and completed this scale within 15 minutes. In addition to descriptive analysis, independent samples t-test, correlation analysis, Mann-Whitney U and Chi-Square tests were used for analyzing the data. Data were analyzed using the SPSS 14.0 program. Research findings indicate that many of these fifth- and sixth-grade students have positive problem solving attitudes. It has been understood that there are significant differences in fifth- and sixth-grade students' *like* dimension scores within the context of problem solving attitudes in terms of both gender and grade level. Additionally, it has been revealed that there is an intermediate positive relationship between *like* dimension scores and mathematics course success, and there is a low positive relationship between *teaching* dimension scores and course success of these students.

Key words: Mathematical problem, attitudes, problem solving attitudes, fifth and sixth grade students.

GİRİŞ

Eğitimde bilişsel değişken ve stratejilerin yanında duyuşsal değişkenler de oldukça önemlidir ve bu duyuşsal değişkenlerden biri de tutum değişkenidir. Bireylerin matematik ile ilgili duygularından ortaya çıkan matematiğe yönelik tutumları da, matematik öğrenme ve öğretmede önem taşımaktadır (Royster, Haris ve Schoeps, 1999). Bununla birlikte, matematik dersi ilköğretimden üniversite eğitimine bireylerin olumsuz tutum geliştirdiği derslerden biridir (Avcı, Coşkuntuncel ve İnandı, 2011). Bireyler matematiği tam olarak anlayamamakta ve bu nedenle de matematik dersine karşı olumsuz tutum sergilemektedirler (Yıldızlar, 2001). Oysaki matematik hakkında olumlu tutuma sahip olan bireyler olumsuz tutuma sahip olan bireylerden daha fazla başarılıdırlar (Reyes, 1984; Ma, 1997). Bu nedenle, öğrencilerin olumlu tutum oluşturmaları, var olan tutumlarını geliştirmeleri, olumlu tutumlarını korumaları ve güçlendirmeleri sürekli olarak önemsenmelidir (Suydam ve Weaver, 1975).

Matematik eğitiminin temel amaçlarından biri, bireylere problem çözme becerisinin kazandırılmasıdır. Çünkü matematiksel bilgileri anlama ve bu bilgiler arasında ilişki kurma problem çözme sürecinde meydana gelmektedir. Matematikte problem çözme, "problemi çözme gayreti sırasındaki süreçlerin tümü"dür (Altun, 2008). National Council of Teachers of Mathematics (2001) tarafından *Okul Matematiğinin Prensipleri ve Standartları*'nda *Okul Matematiği için Standartlar* başlığı altında yer alan üçüncü bölümde de, matematikte problem çözme "çözüm yolunun bilinmediği bir durumla meşgul olmak" olarak tanımlanmıştır. Bu nedenle, matematikte problem çözme bilinmeyen bir durumla meşgul olma isteği ve gayreti gerektirmektedir. Bireylerin problem çözme esnasında bu istek ve gayreti gösterebilmeleri de, matematikte problem çözme konusunda olumlu inanç ve tutuma sahip olmaları ile mümkün olabilir. Bireylerin tutumlarının başarı da oldukça önemli olduğu da bilinmektedir (Aşkar, 1986; Maye ve Kishor, 1997).

Ülkemizde ilköğretim düzeyinde matematiğe yönelik tutumların incelendiği farklı araştırmalar (Köğce, Yıldız, Aydın ve Altındağ, 2009; Şengül ve Öz, 2008; Taşdemir, 2008) bulunmakla birlikte, problem çözme tutumlarının detaylı bir biçimde incelendiği araştırmaya rastlanamamıştır. Bu nedenle, bu araştırmada ortaokul beşinci ve altıncı sınıf öğrencilerinin problem çözme tutumları ve bu tutumlarının cinsiyet, sınıf düzeyleri ve matematik dersi başarılarına göre değişimi incelenmiştir. Bu amaçla, aşağıda yer alan araştırma problemlerine cevap aranmıştır:

1. Ortaokul öğrencilerinin matematik problemi çözme tutumları nasıldır?
2. Ortaokul beşinci ve altıncı sınıf öğrencilerinin matematik problemi çözme tutum puanları (hoşlanma ve öğretim boyut puanları) cinsiyete göre farklılaşmakta mıdır?
3. Ortaokul beşinci ve altıncı sınıf öğrencilerinin matematik problemi çözme tutum puanları (hoşlanma ve öğretim boyut puanları) sınıf düzeylerine göre farklılaşmakta mıdır?
4. Ortaokul öğrencilerinin matematik problemi çözme tutum puanları ile matematik dersi başarıları arasında anlamlı bir ilişki var mıdır?

YÖNTEM

Araştırma Yöntemi

Bu araştırma, tarama modelinde gerçekleştirilmiş olan bir araştırmadır. Bilindiği gibi tarama modelleri, geçmişte ya da var olan bir durumu var olduğu şekliyle betimlemeyi amaçlayan araştırma yaklaşımlarıdır. Evren hakkında genel bir yargıya ulaşmak amacıyla evrenin tümü veya evrenden alınacak bir grup örnek veya örneklem üzerinde yapılan düzenlemelerdir (Karasar, 2003).

Katılımcılar

Araştırmanın evrenini 2012-2013 eğitim-öğretim bahar döneminde Bursa ilinde yer alan ilköğretim okullarında öğrenim görmekte olan beşinci ve altıncı sınıf öğrencileri oluşturmaktadır. Araştırmanın örneklemini ise, 2012-2013 eğitim-öğretim döneminde Bursa ilinde bulunan ortaokullar arasından tesadüfi örnekleme yöntemi ile belirlenen 4 farklı ortaokulda öğrenim görmekte olan beşinci ve altıncı sınıf öğrencileri arasından rasgele seçilen toplam 238 beşinci ve altıncı sınıf öğrencisi oluşturmaktadır. Araştırmaya katılan öğrencilerin 116 (%48.7)'sı beşinci sınıf, 122 (%51.3)'si altıncı sınıf öğrencisidir. Araştırmaya katılan bu öğrencilerin 104'ü kız ve 134'ü ise erkek öğrencidir.

Veri Toplama Aracı

Bu araştırmanın verileri, Çanakçı ve Özdemir (2011) tarafından geliştirilen *Matematik Problemi Çözme Tutum Ölçeği'*nin ortaokul beşinci ve altıncı sınıf öğrencilerine uygulanması ile elde edilmiştir.

Matematik Problemi Çözme Tutum Ölçeği, beşli likert türünde hazırlanmış olan, toplam 19 maddeden oluşan iki boyutlu bir ölçektir. Ölçekten alınabilecek en yüksek puan 95, en düşük puan ise 19'dur. Toplam 10 maddeden oluşan birinci boyutta (hoşlanma boyutu) yer alan maddeler genel olarak öğrencinin problem çözmeyi sevip sevmediği, problem çözerken sıkılıp sıkılmadığı ya da zorlanıp zorlanmadığı ile ilgili tutumlarını yansıtmaktadır. Diğer boyutta (öğretim boyutu) yer alan maddeler ise, öğrencinin problem çözmenin öğretim süreci ile ilgili tutumlarını yansıtmaktadır. Her iki faktör için açıklanan toplam varyans miktarı %42.693 olarak belirlenmiştir. Test-tekrar test tekniği kullanılarak hesaplanan Pearson korelasyon katsayısı 0.89 olarak bulunmuştur. Cronbach alfa iç tutarlılık katsayıları ölçeğin tümü, hoşlanma boyutu ve öğretim boyutu için sırasıyla 0.848, 0.869 ve 0.777 olarak hesaplanmıştır. Aynı zamanda, bu araştırmada *Matematik Problemi Çözme Tutum Ölçeği'*nin ortaokul beşinci ve altıncı sınıf öğrencilerine uygulanması sonucunda elde edilen elde edilen veriler için Cronbach alfa katsayısı 0.87 olarak hesaplanmıştır. Bir test için hesaplanan güvenilirlik katsayısının .70 ve daha yüksek olması test puanlarının güvenilirliği için genel olarak yeterli görülmektedir (Büyüköztürk, 2010). Bu durum, araştırma kapsamına alınan ölçme aracı için ölçme puanlarının yeterli olduğunu göstermektedir.

Verilerin Toplanması ve Analizi

Araştırmaya katılan öğrencilere *Matematik Problemi Çözme Tutum Ölçeği* matematik dersi öğretmenleri eşliğinde uygulanmıştır. Öğrencilerin ölçeği tamamlamaları yaklaşık 15 dakika sürmüştür. Ayrıca, matematik dersi öğretmenleri aracılığı ile araştırmaya katılan ortaokul beşinci ve altıncı sınıf öğrencilerinin matematik dersi notlarına da ulaşılmıştır.

Araştırmaya katılan öğrencilerin ölçeklerde yer alan maddelere verdikleri cevaplardan elde edilen veriler, belirlenen farklı 5 dereceye göre analiz edilmiştir. Bu aşamada, öğrencilerin ölçekte yer alan maddelerden aldıkları toplam puanların madde sayılarına bölünmesi sonucunda ortalama puanlara ulaşılmıştır. Ardından, grup aralık katsayısı değerlerinin "ölçme sonuçları dizisindeki en büyük değer ile en küçük değer arasındaki farkın belirlenen grup sayısına bölünerek (Kan, 2009)" hesaplanmasıyla puan aralık genişlikleri belirlenmiştir. Bu araştırmada, öğrencilerin ölçeklere vermiş oldukları cevapların için değerlendirme aralığı da (5–1)/5=0.80 olarak belirlenmiştir. Buna göre, öğrencilerin *Matematik Problemi Çözme Tutum Ölçeği*'ne vermiş oldukları cevapların yorumlanması için aralıklar; 4.21-5.00 kesinlikle katılıyorum, 3.41-4.20 katılıyorum, 2.61-3.40 kararsızım, 1.81-2.60 katılmıyorum ve 1.00-1.80 kesinlikle katılmıyorum olarak belirlenmiştir.

Ulaşılan veriler, SPSS 14.0 paket programı aracılığı ile analiz edilmiştir. Veri dağılımının normallik varsayımının test edilmesinde Kolmogorov-Smirnov Z testinden, verilerin homojenliğini test etmede ise Levene istatistiğinden faydalanılmıştır. Yapılan inceleme sonucunda, hoşlanma alt boyutu ile ölçeğin tümüne ait veri dağılımının homojen bir dağılım gösterdiği (F_h=0.047, p=.828 ve F_t=2.603, p=.108); ancak öğretim alt boyutu için veri dağılımının heterojen bir dağılım gösterdiği ($F_ö$=5.147, p=.024) belirlenmiştir. Bu nedenle, verilerin analizinde betimsel istatistiklerin yanında *hoşlanma* alt boyutu ile ölçeğin *tümü* için bağımsız örneklemler t-testi ile korelasyon analizi kullanılmıştır. Korelasyon analizinin değerlendirilmesinde Pearson korelasyon katsayısı için 0.00-0.30 aralığı düşük, 0.31-0.70 aralığı orta ve 0.71-1.00 aralığı ise yüksek düzeyde anlamlı bir ilişki biçiminde yorumlanmıştır (Büyüköztürk, 2010). Bununla birlikte, *öğretim* alt boyutu için de Mann-Whitney U testi ile Ki-Kare testi kullanılmıştır.

BULGULAR ve YORUM

Bu bölümde, ortaokul beşinci ve altıncı sınıf öğrencilerinin matematik problemi çözme tutum puanlarının cinsiyet ile sınıf düzeylerine göre değişiminin incelenmesi amacıyla gerçekleştirilen betimsel istatistik sonuçlarına yer verilmiştir. Bununla birlikte, beşinci ve altıncı sınıf öğrencilerinin matematik problemi çözme tutum puanlarının cinsiyet ya da sınıf düzeylerine göre farklılaşmasına ilişkin t-testi sonuçları açıklanmıştır. Ayrıca, beşinci ve altıncı sınıf öğrencilerinin matematik dersi notları ile problem çözme tutum puanları arasındaki ilişkiyi araştıran korelasyon analizi sonuçları da raporlanmıştır.

"Ortaokul beşinci ve altıncı sınıf öğrencilerinin matematik problemi çözme tutumları nasıldır?" biçimindeki birinci araştırma problemine cevap aranırken, ortaokul öğrencilerinin ölçeğe verdikleri cevaplar cinsiyet ve sınıf düzeyleri açısından incelenmiş ve elde edilen bulgular Tablo 1 ve Tablo 2'de sunulmuştur.

Tablo 1. Öğrencilerin Problem Çözme Tutum Puanlarının Cinsiyete Göre Değişimi

	Cinsiyet					
	Kız		Erkek		Toplam	
Puan aralıkları	f	%	f	%	f	%
1.81-2.60 puan	5	2.1	4	1.7	9	3.8
2.61-3.40 puan	18	7.6	22	9.2	40	16.8
3.41-4.20 puan	44	18.5	44	18.5	88	37.0
4.21-5.00 puan	37	15.5	64	26.9	101	42.4
Toplam	104	46.7	134	56.3	238	100.0

Ortaokul beşinci ve altıncı sınıf öğrencilerinin matematik problemi çözme tutum puanlarının cinsiyete göre değişimine ilişkin yüzde ve frekans değerleri incelendiğinde, öğrencilerin 189 (%79.4)'unun problem çözme hakkında pozitif tutuma sahip oldukları görülmüştür. Bununla birlikte, pozitif tutuma sahip olan erkek öğrencilerin sayısının ve yüzde değerlerinin (108- %45.4) kız öğrencilerin sayısı ve yüzde değerlerine (81-%34) kıyasla çok oluşu da dikkat çekicidir.

Tablo 2. Öğrencilerin Matematik Problemi Çözme Tutum Puanlarının Sınıf Düzeylerine Göre Değişimi

	Sınıf Düzeyleri					
	Beşinci sınıf		Altıncı Sınıf		Toplam	
Puan aralıkları	f	%	f	%	f	%
1.81-2.60 puan	5	2.1	4	1.7	9	3.8
2.61-3.40 puan	20	8.4	20	8.4	40	16.8
3.41-4.20 puan	37	15.5	51	21.5	88	37.0
4.21-5.00 puan	54	22.7	47	19.7	101	42.4
Toplam	116	48.7	122	51.3	238	100.0

Araştırmaya katılan ortaokul öğrencilerinin matematik problemi çözme tutum puanlarının sınıf düzeylerine göre değişimine ilişkin yüzde ve frekans değerleri incelendiğinde ise, pozitif tutuma sahip beşinci sınıf öğrencilerinin sayısı ve yüzde değerleri (116-%38.2) ile pozitif tutuma sahip olan altıncı sınıf öğrencilerinin sayısı ve yüzde değerlerinin (122-%41.2) de birbirine oldukça yakın olduğu anlaşılmıştır.

Araştırma kapsamında yer alan "Ortaokul beşinci ve altıncı sınıf öğrencilerinin matematik problemi çözme tutum puanları (hoşlanma ve öğretim boyut puanları) cinsiyete göre farklılaşmakta mıdır?" biçimindeki ikinci araştırma problemine cevap aranırken, öğrencilerin problem çözme tutumları ile cinsiyet arasında anlamlı farklılıklar olup olmadığı bağımsız örneklem t-testi ve Mann-Whitney U testi ile ortaya koyulmaya çalışılmıştır. Ortaokul öğrencilerinin matematik problemi çözme *tutum* puanları ile *hoşlanma* alt boyut puanlarının cinsiyete göre farklılaşıp farklılaşmadığını ortaya koymak amacıyla gerçekleştirilen bağımsız örneklem t-testi sonuçlarına, Tablo 3'te yer verilmiştir.

Tablo 3. Problem Çözme Tutum Puanlarının Cinsiyete Göre Değişimine İlişkin t-Testi Sonuçları

	Cinsiyet	N	$\bar{x}$	ss	t	p
Problem Çözme Tutumu	Kız	104	3.90	0.657	-1.318	0.191
	Erkek	134	4.01	0.684		
Hoşlanma Boyut Puanları	Kız	104	3.50	0.962	-2.027	0.042
	Erkek	134	3.75	0.902		

Araştırmaya katılan kız ve erkek öğrencilerin hem matematik problemi çözme tutumu ortalama puanları arasında anlamlı farklılıklara ulaşılamamıştır ($t_p(236)= -1.318$; $p>.05$). Bununla birlikte, kız ve erkek öğrencilerin problem çözme tutumlarını oluşturan *hoşlanma* boyut puan ortalamaları arasında anlamlı farklılığa ulaşılmıştır ($t_h(236)= -2.027$; $p<.05$). Yapılan incelemelerde, erkek öğrencilerin matematik problemi çözme tutumu ortalama puanları ($\bar{x}$ =4.01) ile kız öğrencilerin problem çözme tutumu ortalama puanlarının ($\bar{x}$ =3.90) birbirine oldukça yakın düzeyde olduğu görülmüştür.

Bu ortaokul öğrencilerinin problem çözme tutumu *öğretim* alt boyut puanlarının cinsiyete göre farklılaşıp farklılaşmadığını ortaya koymak amacıyla gerçekleştirilen Mann-Whitney U testi sonuçlarına ise, Tablo 4'te yer verilmiştir.

Tablo 4. Tutum Puanlarının Cinsiyete Göre Farklılaşmasına İlişkin Mann-Whitney U Testi Sonuçları

Cinsiyet	n	Sıralar Ortalaması	Sıralar Toplamı	U	Z	p
Kız	104	113.67	11822.00	6362.00	-1.153	.249
Erkek	134	124.02	16619.00			

Uygulanan bu parametrik olmayan analiz sonucuna göre, araştırmaya katılan kız ve erkek öğrencilerin problem çözme tutumlarını oluşturan *öğretim* boyut ortalama puanları arasında anlamlı farklılıklara ulaşılamamıştır (U=6362.00; p>.05). Sıra ortalamaları dikkate alındığında, erkek öğrencilerin problem çözme tutumlarının kız öğrencilerin tutumlarına göre daha yüksek olduğu anlaşılmaktadır.

Araştırma kapsamında yer alan "Ortaokul beşinci ve altıncı sınıf öğrencilerinin matematik problemi çözme tutum puanları (hoşlanma ve öğretim boyut puanları) sınıf düzeylerine göre farklılaşmakta mıdır?" biçimindeki üçüncü araştırma problemine cevap aranırken, öğrencilerin problem çözme tutumları ile sınıf düzeyleri arasında anlamlı farklılıklar olup olmadığı bağımsız örneklem t-testi ve Mann-Whitney U testi ile ortaya koyulmaya çalışılmıştır. Ortaokul öğrencilerinin matematik problemi çözme *tutum* puanları ile *hoşlanma* alt boyut puanlarının cinsiyete göre farklılaşıp farklılaşmadığını ortaya koymak amacıyla gerçekleştirilen bağımsız örneklem t-testi sonuçlarına, Tablo 5'te yer verilmiştir.

Tablo 5. Tutum Puanlarının Sınıf Düzeylerine Göre Farklılaşmasına İlişkin t-Testi Sonuçları

	Sınıf Düzeyi	N	$\bar{x}$	ss	t	p
Problem Çözme Tutumu	Beşinci Sınıf	116	4.00	0.716	0.742	0.459
	Altıncı Sınıf	122	3.93	0.632		
Hoşlanma Boyut Puanları	Beşinci Sınıf	116	3.79	0.932	2.441	0.015
	Altıncı Sınıf	122	3.50	0.919		

Araştırmaya katılan kız ve erkek öğrencilerin hem problem çözme tutumu ortalama puanları arasında anlamlı farklılıklara ulaşılamamıştır ($t_p(236)=-0.742$; $p>.05$). Yapılan incelemelerde, beşinci sınıf öğrencilerinin matematik problemi çözme tutumu puan ortalamaları ($\bar{x}$ =4.00) ile altıncı sınıf öğrencilerinin problem çözme tutumu puan ortalamalarının ($\bar{x}$ =3.93) birbirine oldukça yakın düzeyde olduğu anlaşılmıştır. Bununla birlikte, beşinci ve altıncı sınıf öğrencilerinin matematik problemi çözme tutumu kapsamındaki *hoşlanma* boyutu ortalama puanları arasında anlamlı farklılığa ulaşılmıştır ($t_h(236)=2.441$; $p<.05$).

Ortaokul öğrencilerinin matematik problemi çözme tutum *öğretim* alt boyut puanlarının cinsiyete göre farklılaşıp farklılaşmadığını ortaya koymak amacıyla gerçekleştirilen Mann-Whitney U testi sonuçlarına ise, Tablo 6'da yer verilmiştir.

Tablo 6. Tutum Puanlarının Sınıf Düzeylerine Göre Değişimine İlişkin Mann-Whitney U Testi Sonuçları

Sınıflar	n	Sıralar Ortalaması	Sıralar Toplamı	U	Z	p
Beşinci Sınıf	116	120.67	13998.00	6940.00	-0.257	.797
Altıncı Sınıf	122	118.39	14443.00			

Uygulanan bu parametrik olmayan analiz sonucuna göreAraştırmaya katılan beşinci ve altıncı sınıf öğrencilerinin matematik problemi çözme tutumları kapsamındaki *öğretim* boyut ortalama puanları arasında anlamlı farklılıklara ulaşılamamıştır (U=6940.00; p>.05). Sıra ortalamaları dikkate alındığında, beşinci sınıf öğrencilerinin problem çözme tutumlarının altıncı sınıf öğrencilerinin tutumlarına göre daha yüksek olduğu anlaşılmaktadır.

Araştırma kapsamında yer alan "Ortaokul öğrencilerinin matematik problemi çözme tutum puanları ile matematik dersi başarıları arasında anlamlı bir ilişki var mıdır?" biçimindeki dördüncü araştırma problemine cevap aranırken de, öğrencilerin matematik problemi çözme tutum puanları ve hoşlanma boyutu puanları ile matematik dersi başarı puanları arasında anlamlı ilişki olup olmadığı korelasyon analizi ile ortaya koyulmaya çalışılmıştır (Tablo 7).

Tablo 7. Tutum İle Ders Başarı Puanları Arasındaki İlişkiyi Araştıran Korelasyon Analizi Sonuçları

	N	Pearson Korelasyonu	p
Problem Çözme Tutum Puanları Matematik Dersi Başarı Notları	238	0.380*	.00

* p< .05

Araştırmaya katılan beşinci ve altıncı sınıf öğrencilerinin matematik problem çözme tutumu puanları ile matematik dersi başarı notları arasında orta düzeyde, pozitif ve anlamlı bir ilişki bulunmaktadır (r_p=0.380, r_h=0.340, p<.05).

SONUÇLAR

Bu araştırmada elde edilen bulgular, araştırmaya katılan beşinci ve altıncı sınıf öğrencilerinin büyük çoğunluğunun matematik problemi çözme hakkında pozitif tutuma sahip olduklarını göstermektedir.

Araştırmaya katılan beşinci ve altıncı sınıf öğrencilerinin hem matematik problemi çözme tutumu puan ortalamaları hem de problem çözme tutumu kapsamındaki *öğretim* boyutu puan ortalamaları arasında anlamlı farklılıklar bulunamamıştır. Benzer şekilde, kız ve erkek öğrencilerin hem matematik problemi çözme tutumu puan ortalamaları hem de problem çözme tutumu kapsamındaki *öğretim* boyutu puan ortalamaları arasında anlamlı farklılıklar bulunamamıştır. Aksine, öğrencilerin matematik problemi çözme tutumu kapsamındaki *hoşlanma* boyutu ortalama puanları arasında hem cinsiyet hem de sınıf düzeyleri bakımından anlamlı farklılıklara ulaşılmıştır. Bu durum, sınıf düzeyi arttıkça öğrencilerin problem çözmeyi daha fazla sevdiklerini düşündürmektedir. Erkek öğrencilerin hoşlanma alt boyut ortalama puanlarının yüksek olması da, erkek öğrencilerin matematik problemi sevmeyi daha çok sevdiklerine işaret etmektedir.

Öğrencilerin matematik problem çözme tutumu *hoşlanma* boyutu ortalama puanları ile matematik dersi başarı notları arasında orta düzeyde, *öğretim* boyutu ortalama puanları ile matematik dersi başarı notları arasında düşük düzeyde pozitif ve anlamlı bir ilişki bulunmaktadır. Bu durum, öğrencilerin problem çözmeyi sevmeleri (*hoşlanma* boyutu) ya da problem çözmenin öğretim süreci ile ilgili tutumları (*öğretim* boyutu) arttıkça matematik dersi başarı notlarının da arttığını gösterir niteliktedir. Yapılacak olan araştırmalarda, farklı yaş gruplarında matematik problemi çözmeye ilişkin inanç ve tutumlar incelenebilir ve karşılaştırmalar yapılabilir.

Assistant Professor,Department of Elementary Mathematics Education, Dokuz Eylul University, Izmir, Turkey

ABSTRACT: In today's educational approach instead of memorizing individuals who are aware of their own learning and correctly perceives itself is aimed to train individuals. For this reason, it is expected from individuals to be aware of the cognitive processes, to think about thinking and how to stand on rather than what they had learned. In studies, it is showed that students were using awareness of their own thinking in problem solving situations and planned learning processes. For this reason, it is found to be very important for the relationship between mathematics and metacognition to investigate in order to explain the process of problem solving and cognitive activities that people use in this process. The purpose of this study is to examine mathematics problem solving attitudes of middle school students and their metacognitive skills and compare a variety of variables in terms. For this purpose, in the 2013-2014 academic year at a middle school in the province of Denizli with 5th,6th,7th and 8th grades studying a descriptive study was conducted with a total of 204 students. The data were collected using Aydın and Ubuz (2010) by adapted to Turkish on the "Metacognitive Awareness Inventory" and Çanakçı (2008) by developed "Mathematics Problem Solving Attitude Scale". The data obtained in the research process through the program SPSS 15.0 statistical package was analyzed. In the analysis of the survey data independent samples t-test, One-Way Analysis of Variance (ANOVA), Pearson Product Moment Correlation Coefficient was used. At the end of the study, it was found that metacognitive skills of the middle school students differed across grade levels, and math problem- solving attitudes of the students differed across grade levels and gender. Metacognitive skills of students with mathematics problem solving attitude, there is a significant relationship between success in mathematic course was observed. In addition, there was a significant correlation between metacognitive skills and mathematics problem solving attitudes. These results are based on students' mathematics problem solving skills and to develop their problem-solving attitude and will be included in the assessment process, taking responsibility for their own learning and metacognitive skills can develop self regulation , learning environment should be prepared.

Key Words: Metacognitive skills, mathematics problem solving attitudes, middle school students.

ORTAOKUL ÖĞRENCİLERİNİN BİLİMSEL YARATICILIKLARININ FEN LABORATUVARI DENEYİMLERİ İLE GELİŞTİRİLMESİ

IMPROVING MIDDLE SCHOOL STUDENTS' CREATIVITY WITH SCIENCE LOBORATORY EXPERIENCES

ÖZET: Bu araştırmanın amacı 6. ve 8. sınıf öğrencilerinin bilimsel yaratıcılıklarının fen laboratuvarı deneyimleriyle gelişimini incelemektir. Deneysel yöntemin kullanıldığı bu araştırma 2013-2014 Eğitim-Öğretim yılı güz döneminde 18 hafta süreyle devam etmiştir. Çalışmaya 6. ve 8. sınıf olmak üzere 80 ortaokul öğrencisi katılmıştır. Deney gruplarında tüm dersler laboratuarda gerçekleştirilmiş, açık uçlu deney ve etkinlikler uygulanmıştır. Böylece öğrencilerin araştırma ve sorgulama becerileri pekiştirilmiştir. Kontrol gruplarıyla ise yine laboratuar ortamında daha çok kapalı uçlu deneylerin uygulandığı dersler gerçekleştirilmiştir. Veriler, Hu ve Adey (2002) tarafından geliştirilen, Deniş Çeliker ve Balım (2012) tarafından Türkçeye uyarlanan 'Bilimsel Yaratıcılık Ölçeği' ile toplanmıştır. Analizler sonucunda öğrencilerin laboratuvar deneyimlerinin bilimsel yaratıcılık düzeylerini artırdığı tespit edilmiştir. Bu artış 6. sınıflarda 8. sınıflara göre daha fazla olmakla birlikte 8. sınıf öğrencilerinin bilimsel yaratıcılık düzeyinin uygulama öncesi ve sonrasında da 6. sınıflardan daha düşük seviyede olduğu dikkat çekmektedir.

Anahtar sözcükler: Bilimsel Yaratıcılık, Laboratuvar Deneyimleri, Fen Eğitimi.

ABSTRACT: The aim of this study is to investigate the development of sixth and eighth grade students' scientific creativity through science laboratory experiences. The experimental method was used during 18 weeks in the fall semester of 2013-2014 academic year. 80 students participated to the study as half of them attended as control group and half of them experimental group. The experimental group conducted their all lessons in laboratory by using open ended experiments and activities accordance with the scope of the content. In this way, students' inquiry skills were reinforced. On the other hand, closed-ended experiments were utilized to the control group. Data were gathered through "Scientific Creativity Scale" which was developed by Hu and Adey (2002) and was translated into Turkish by Deniş Çeliker and Balım (2012). The results revealed that laboratory experiments increases students' scientific creativity. In other words, sixth grade students' performing laboratory lessons with open-ended experiments exhibited more scientific creativity than eighth grade students. Moreover, it was found that laboratory implications increased scientific creativity of sixth grade students more than eight graders.

Keywords: Scientific Creativity, Laboratory Experiences, Science Education.

GİRİŞ

Fen okuryazarı bireyler, kendilerini toplumsal problemlerin çözümü konusunda sorumlu hisseden, yaratıcı ve analitik düşünme becerileri yardımıyla bireysel ya da işbirliğine dayalı alternatif çözüm önerileri üretebilirler (MEB, 20013). Ancak bu bireylerin bu özelliklerle donatılması ya da bu özelliklerinin daha çok ortaya çıkarılması için eğitim sürecinde uygun ortamlar sağlanmalıdır. Lee ve Erdogan (2007), öğretmenlerin öğretim stratejilerinin ve öğrenme ortamlarının öğrencilerin fene karşı tutumlarında ve yaratıcılıklarında etkili olduğunu belirtmişlerdir. Hu ve Adey (2002), bu konuda yapılacak çalışmaların özellikle toplumun bilime bakış açısını ortaya koyması açısından değerli olduklarını ifade etmişlerdir. Bazı araştırmalar laboratuarda yapılan etkinliklerin öğrencilerin fen kavramlarını öğrenmelerini ve bilimsel düşünmeyi dersten daha etkili bir şekilde kazandırdığını göstermiştir (Noiwong ve Phinyocheep, 2012).

Bu araştırma fen eğitimi için önemli olan bilimsel anlamda yaratıcı düşünme ile fen laboratuvarı deneyimlerinin etkisini araştırmaktadır. Öncü (2003) bilimsel yaratıcılığın eğitimin üst kademelerinde azalma gösterdiğini ifade etmiştir. Aydın Ceran ve arkadaşları da (2014) yapmış oldukları çalışmada benzer bir sonuç elde etmiş özellikle 7. sınıf öğrencilerinin diğer sınıf kademelerinden (8. sınıflar) daha yüksek olduğunu belirlemiştir. Devam niteliğinde olan bu araştırmada ise öğrencilerin 2013 yılında yenilenen fen öğretim programı paralelinde araştırmaya ve sorgulamaya dayalı ortamlar ile pekiştirilen yaratıcılık özelliklerinin aralarında belirli bir yaş farkı bulunan 6. ve 8. sınıf öğrencilerinin bilimsel yaratıcılıklarının ne ölçüde etkilediğinin incelenmesidir.

YÖNTEM

Çalışma Grubu

Bu araştırma tam donanımlı bir laboratuara sahip olan bir ortaokulda 6. ve 8. sınıf öğrencileriyle gerçekleştirilmiştir. Araştırmaya 40 tane 6.sınıf (n=20 deney grubu ve n=20 kontrol grubu) ve 40 tane 8. sınıf (n=20 deney grubu ve n=20 kontrol grubu) öğrencisi katılmıştır. 6. ve 8. sınıflardan birer deney ve kontrol grubu rastgele seçilmiştir. 6. sınıf deney grubu öğrencilerine açık uçlu araştırma sorgulamaya dayalı deney teknikleri ile hazırlanan çalışma yaprakları 'Canlılarda Üreme-Büyüme-Gelişme, Kuvvet ve Hareket, Madde ve Değişim, Yaşamımızdaki Elektrik' ünitelerinde uygulanmıştır. 8. sınıf deney grubu öğrencilerine de yine açık uçlu araştırma sorgulamaya dayalı deney teknikleriyle hazırlanmış çalışma yaprakları 'Hücre Bölünmesi ve Kalıtım, Kuvvet ve Hareket, Maddenin Yapısı ve Özellikleri' ünitelerinde uygulanmıştır. 6.ve 8. sınıf kontrol gruplarıyla dersler laboratuarda kapalı uçlu deneyler ile yürütülmüştür. Araştırma 18 hafta (1 dönem) sürmüştür.

Veri Toplama Araçları

Çalışmada öğrencilerin bilimsel yaratıcılık düzeylerini belirlemek amacıyla Hu ve Adey (2002) tarafından geliştirilen, Deniş Çeliker ve Balım (2012) tarafından Türkçe' ye uyarlanan 'Bilimsel Yaratıcılık Ölçeği (BYÖ) kullanılmıştır. BYÖ açık uçlu 7 sorudan oluşmaktadır ve ölçekteki her bir madde birden çok alt boyutu kapsamaktadır. Ölçekte birinci madde bilimsel bir amaç için nesne kullanımını, ikinci madde bilimsel problem karşısında duyarlılık derecesini, üçüncü madde öğrencinin teknik ürün tasarlamadaki yeteneğini, dördüncü madde öğrencilerin bilimsel hayal gücünü, beşinci madde yaratıcı bilimsel çözme yeteneğini, altıncı madde yaratıcı deneysel yeteneğin saptanması ve yedinci madde yaratıcı bilimsel ürün tasarlama becerisini ölçmek amaçlarıyla tasarlanmıştır.

Verilerin Analizi

Çalışmada kullanılan BYÖ ait öğrenci ifadeleri araştırmacılar tarafından kodlanmış, frekansları belirtilmiş ve puanlanmıştır (Hu ve Adey, 2002). Puanlama analizinin sonucunda öğrencilerin bilimsel yaratıcılık düzeylerinin belirlenmesi, deney ve kontrol gruplarının veri toplama araçlarından aldıkları puanlarının karşılaştırılmasında, aritmetik ortalama, standart sapma, ilişkisiz ve ilişkili örneklemler t testi kullanılmıştır. Verilerin analizinde SPSS 17.00 paket programından yararlanılmıştır.

BULGULAR

Bu bölümde araştırmanın amacına uygun olarak belirlenen hipotezlere yanıt aramak üzere çeşitli istatistiksel teknikler kullanılarak elde edilen bulgulara ilişkin yorumlar yapılmıştır.

6. Sınıf Deney ve Kontrol Gruplarının Deneysel İşlemler Öncesi Bilimsel Yaratıcılık Puanları

Deneysel işlemlerin uygulanmasından önce 6. sınıf deney ve kontrol grubu arasında bilimsel yaratıcılık puanları bakımından bir farklılık olup olmadığına bakılmış, deney ve kontrol grubunun BYÖ'den aldıkları puanlar açısından denkliklerinin kontrolü yapılmıştır. Verilerin analizinde ilişkisiz örneklemler t testi kullanılmıştır. Bulgular Tablo 1'de verilmiştir.

Tablo 1: 6. Sınıf Deney ve Kontrol Gruplarının Ön Test Bilimsel Yaratıcılık Puan Ortalamalarının Karşılaştırılması

BYÖ Puanları	N	$\overline{X}$	S	sd	p
6.Sınıf Deney Grubu Ön Test	*20*	*50,25*	*16,43*	*19*	*,658*
6. Sınıf Kontrol Grubu Ön Test	*20*	*52,50*	*23,54*		

Tablo 1'e göre 6.sınıf deney grubu öğrencilerinin bilimsel yaratıcılık toplam puan ortalaması ($\overline{X}$ = 50,25), 6.sınıf kontrol grubu öğrencilerinin bilimsel yaratıcılık toplam puan ortalamaları ($\overline{X}$ = 52,50) dir. t(19)= -,450 ve p > 0.01 olduğundan 6. sınıf deney ve kontrol gruplarının bilimsel yaratıcılık toplam puanları bakımından deneysel işlem öncesinde denk gruplar olduğu sonucuna ulaşılabilir.

6. Sınıf Deney ve Kontrol Gruplarının Deneysel İşlemler Sonrası Bilimsel Yaratıcılık Puanları

Deneysel işlemler uygulandıktan sonra 6.sınıf deney ve kontrol gruplarında ki öğrencilerin bilimsel yaratıcılık toplam puan ortalamaları arasındaki farka bakılmış ve farkın anlamlılığı test edilmiştir. Bulgular Tablo 2'de özetlenmiştir.

Tablo 2: 6. Sınıf Deney ve Kontrol Gruplarının Son Test Bilimsel Yaratıcılık Toplam Puan Ortalamalarının Karşılaştırılması

BYÖ Puanları	N	$\overline{X}$	S	sd	p
6. Sınıf Deney Grubu Son Test	*20*	*109,30*	*26,88*	*19*	*,000*
6.Sınıf Kontrol Grubu Son Test	*20*	*64,45*	*20,04*		

Tablo 2'ye göre 6. sınıf deney grubu son test bilimsel yaratıcılık toplam puan ortalamaları ($\overline{X}$ =109,30), 6.sınıf kontrol grubu son test bilimsel yaratıcılık toplam puanları ortalamaları ($\overline{X}$ = 64,45) tir. t(19)= 6,225 ve p< 0.01 olduğundan bağımsız t testi sonuçları, bilimsel yaratıcılık toplam puanlarının laboratuar deneyimleri uygulamaları ile oldukça anlamlı bir düzeyde arttığını açıkça göstermektedir. Tablo 1'deki veriler ile kıyaslandığında deney grubu süreç içerisinde bilimsel yaratıcılık toplam puan ortalamalarını 59,05 puan (109,30- 50,25) artırmışken kontrol grubu süreçte bilimsel yaratıcılık toplam puan ortalamasını 11, 95 puan (64,45- 52,50) artırabilmiştir. Bu sonuçta açık uçlu araştırma ve sorgulamaya dayalı laboratuar deneyimlerinin etkililiği hakkında bilgi vermektedir.

8. Sınıf Deney ve Kontrol Gruplarının Deneysel İşlemler Öncesi Bilimsel Yaratıcılık Puanları

Deneysel işlemlerin uygulanmasından önce 8. sınıf deney ve kontrol grubu arasında bilimsel yaratıcılık puanları bakımından bir farklılık olup olmadığına bakılmış, deney ve kontrol grubunun BYÖ'den aldıkları puanlar açısından denkliklerinin kontrolü yapılmıştır. Verilerin analizinde ilişkisiz örneklemler t testi kullanılmıştır. Bulgular Tablo 3'te verilmiştir.

Tablo 3: 8. Sınıf Deney ve Kontrol Gruplarının Ön Test Bilimsel Yaratıcılık Toplam Puan Ortalamalarının Karşılaştırılması

BYÖ Puanları	N	$\overline{X}$	S	sd	p
8.Sınıf Deney Grubu Ön Test	*20*	*38,40*	*14,929*	*19*	*,954*
8. Sınıf Kontrol Grubu Ön Test	*20*	*38,65*	*14,177*		

Tablo 3'e göre 8.sınıf deney grubu öğrencilerinin bilimsel yaratıcılık toplam puan ortalaması ($\overline{X}$ = 38,40), 8.sınıf kontrol grubu öğrencilerinin bilimsel yaratıcılık toplam puan ortalamaları ($\overline{X}$ = 38,65) dir. t(19)= -,058 ve p > 0.01 olduğundan 8. sınıf deney ve kontrol gruplarının bilimsel yaratıcılık toplam puanları bakımından deneysel işlem öncesinde denk gruplar olduğu sonucuna ulaşılabilir.

8. Sınıf Deney ve Kontrol Gruplarının Deneysel İşlemler Sonrası Bilimsel Yaratıcılık Puanları

Deneysel işlemler uygulandıktan sonra 6.sınıf deney ve kontrol gruplarındaki öğrencilerin bilimsel yaratıcılık toplam puan ortalamaları arasındaki farka bakılmış ve farkın anlamlılığı test edilmiştir. Bulgular Tablo 4'de özetlenmiştir

Tablo 4: 8. Sınıf Deney ve Kontrol Gruplarının Ön Test Bilimsel Yaratıcılık Puan Ortalamalarının Karşılaştırılması

BYÖ Puanları	N	X	S	sd	p
8.Sınıf Deney Grubu Son Test	*20*	*82,95*	*16,337*	*19*	*,001*
8.Sınıf Kontrol Grubu Son Test	*20*	*66,45*	*15,826*		

8. sınıf deney grubu son test bilimsel yaratıcılık toplam puan ortalamaları ($\overline{X}$ =82,95), 8.sınıf kontrol grubu son test bilimsel yaratıcılık toplam puanları ortalamaları ($\overline{X}$ =66,45) tir. (Tablo 4). t(19)= 4,040 ve p< 0.01 olduğundan bağımsız t testi sonuçları, bilimsel yaratıcılık toplam puanlarının laboratuar deneyimleri uygulamaları ile oldukça anlamlı bir düzeyde arttığını göstermektedir. Tablo 3 teki veriler ile kıyaslandığında deney grubu süreç içerisinde bilimsel yaratıcılık toplam puan ortalamalarını 44,55 puan (82,95-38,40) artırmışken kontrol grubu süreçte bilimse yaratıcılık toplam puan ortalamasını 25,80 puan (66,45-38,65) artırabilmiştir. Bu sonuçta 8. sınıf öğrencilerinin laboratuvar deneyimlerinin bilimsel yaratıcılıklarını artırmadaki etkinliği hakkında bilgi vermektedir.

6. ve 8. sınıflar Deney Gruplarının Bilimsel Yaratıcılık Ön ve Son Test Toplam Puan Ortalamalarının İncelenmesi

6. ve 8. sınıf öğrencilerin bilimsel yaratıcılık düzeylerini ön ve son testlere göre kıyaslayabilmek amacıyla ilişkili örneklemler t testi kullanılmış ve sonuçlar Tablo 5'te özetlenmiştir.

Tablo 5: 6. ve 8.Sınıf Deney Gruplarının Ön ve Son Test Bilimsel Yaratıcılık Puan Ortalamalarının Karşılaştırılması

BYÖ Puanları	N	$\overline{X}$	S	sd	p	$\overline{X}_1$-$\overline{X}_2$
6.Sınıf Deney Grubu Ön Test	*20*	*50,05*	*16,433*	*19*	*,000*	*-59,25*
6.Sınıf Deney Grubu Son Test	*20*	*109,30*	*26,88*			
8.Sınıf Deney Grubu Ön Test	*20*	*38,40*	*14,929*	*19*	*,000*	*-44,55*
8.Sınıf Deney Grubu Son Test	*20*	*82,95*	*16,337*			

Deneysel işlem başlamadan önce 6. sınıf deney grubunun bilimsel yaratıcılık toplam puan ortalamalarının 8. sınıf deney grubunun bilimsel yaratıcılık toplam puan ortalamasından daha yüksek olduğu yani BYÖ sonuçlarına göre 6. sınıfların bilimsel yaratıcılıklarının daha yüksek olduğu görülmektedir (Tablo 5). Açık uçlu araştırma ve sorgulamaya dayalı laboratuar deneyimleri uygulamasıyla birlikte 6. ve 8. sınıf deney gruplarının ön ve son test toplam puan ortalamaları arasındaki fark incelendiğinde 6. sınıf deney grubunun bilimsel yaratıcılık son test toplam puan ortalamalarının 8. sınıf deney grubunun bilimsel yaratıcılık son test toplam puan ortalamalarından daha yüksek olduğu tespit edilmiştir. Süreçte 6. sınıf deney grubunun bilimsel yaratıcılık toplam puan ortalamalarını 59,25 puan artırmışken, 8. sınıf deney grubunun bilimsel yaratıcılık son test toplam puan ortalamalarını 44, 55 puan artırabildikleri gözlenmiştir.

TARTIŞMA VE SONUÇ

Deney ve kontrol gruplarının bilimsel yaratıcılık ön test puanlarında anlamlı bir fark bulunamazken açık uçlu araştırma sorgulamaya dayalı laboratuar deneyimleri edinen deney grubu öğrencilerinin son test bilimsel yaratıcılık toplam puan ortalamaları kontrol grubu öğrencilerine göre anlamlı derecede farklılık göstermiştir. Çocukların yaratıcılıklarını geliştirmek için onları belirli kalıplara sokmadan özgür kalmalarına izin vermek ve onlara zenginleştirilmiş öğrenme ortamları hazırlamak gerekir. Her birey aslında yaratıcılık potansiyeli ile doğar. Önemli olan bu özelliği geliştirebilmektir (Fisher,1995; Lowenfeld, 1953). Çocukların bilimsel yaratıcılıklarını geliştirmek için açık uçlu araştırma ve sorgulamaya dayanan laboratuar deneylerinin kullanılmasında bu faktörler etkili olmuştur. Yaratıcılığın sadece özel yetenekleri olan bireylere özgü bir özellik olduğu fikrinden uzaklaşarak öğretmenlerin yaratıcılık hakkındaki inanç ve eğitimleri desteklenmelidir. Haigh (2007), yapmış olduğu çalışmada uzun süreli laboratuar etkinliklerinin öğrencilerin yaratıcıklarını gelişiminde daha etkili olduğunu ifade etmiştir. Bu araştırmada Haigh'in çalışmasını destekler nitelikte sonuçlar elde edilmiştir. Ayrıca yaratıcılığın gelişmesi için belirli bir süreye de ihtiyaç vardır. Graham Wallis yaratıcılığın dört aşamalı bir süreç olduğunu tespit ederek(Lytton, 1971), bu süreyi yaratıcığın dört aşamasından biri olan kuluçkaya yatırma aşaması ile açıklamıştır. Öyle ki alan yazındaki bilimsel yaratıcılığın geliştirilmesine yönelik bazı çalışmalarda anlamlı bir farklılık bulunamamıştır (Şahin Pekmez, Aktamış, Can, 2010; Kaptan ve Kuşakçı, 2001).

6. ve 8. sınıf deney gruplarının ön test toplam puanları incelendiğinde 6. sınıf öğrencilerinin bilimsel yaratıcılık düzeylerinin 8. sınıf öğrencilerinin bilimsel yaratıcılık düzeylerinden daha yüksek olduğu ve 6. sınıf deney grubunun bilimsel yaratıcılık toplam puanlarını 8. sınıf deney grubuna göre daha fazla artırdığı gözlemlenmiştir. Torrance (1962) yaratıcılıktaki bu düşüşlerin erinliğin fizyolojik değişimleri sonucu ortaya çıkan çatışmalardan kaynaklandığını ifade etmiştir (Torrance, 1962, s: 94-95; akt Öncü, 2003). Ayrıca 8. sınıf öğrencilerinin merkezi sınava hazırlanmaları sonucu yaşadıkları kaygılarda bu düşüşe sebep olmuş olabilir.

Hem deney hem de kontrol gruplarının süreç sonunda bilimsel yaratıcılık toplam puanlarının arttığı gözlenmiştir ancak deney gruplarındaki pozitif artış dikkat çekmektedir. Wallace Tsoi, Calkin ve Darley (2003)' in yürüttükleri bir araştırmada öğrencilerin açık uçlu deneyleri tercih ettiklerini belirtmişlerdir. Deney gruplarında öğrenciler açık uçlu araştırma ve sorgulamaya dayalı laboratuar deneyimleri edinmiş olmakla birlikte kontrol grupları da derslerde laboratuar kullanmış ancak deneyler kapalı uçlu, öğretmen denetiminde ve genellikle gösteri deneyleri şeklinde yürütülmüştür ve her iki yöntemde de bilimsel yaratıcılığın geliştirilebildiği görülmüştür. Aydın Ceran, Çavuş Güngören ve Boyacıoğlu (2014)'nun yapmış oldukları bir tarama çalışmasında deney ve etkinlik ağırlıklı ders işlediklerini belirten öğrencilerin bilimsel yaratıcılık düzeylerinin daha yüksek olması da bu çalışmanın sonuçlarını destekler niteliktedir.

ÖZET: Bilimsel bilgi kavramına yönelik görüş, bireylerin bilginin ne olduğu, bilme ve öğrenmenin nasıl gerçekleştiği ile ilgili inançları olarak tanımlanmaktadır. Bilimsel süreç becerilerine sahip bir birey problem çözme becerilerine sahip, etrafında gelişen olaylara anlam katabilen akılcı bir bireydir. Bu tür bireylerin yetişmesine fen dersinin katkısı çok büyüktür ve fen öğretmenleri bu konuda çok önemlidir. Çalışmanın amacı, ortaokul 6. sınıf öğrencilerinin "Madde ve Isı" ünitesine yönelik hazırlanan bilimsel süreç becerileri etkinliklerinin bilimsel bilgiye yönelik görüşlerine olan etkisini belirlemektir. Çalışmada öntest-sontest kontrol gruplu deneme modeli kullanılmıştır. Araştırmanın çalışma grubunu, 2013-2014 eğitim öğretim yılında Manisa ili Sarıgöl ilçesi Atatürk Ortaokulu'nda öğrenim görmekte olan elli altıncı sınıf öğrencisi oluşturmaktadır. Araştırmada öğrencilerin bilimsel bilgiye yönelik görüşlerini belirlemek üzere "İlköğretim Öğrencilerinin Bilimsel Bilgiye Yönelik Görüşlerini Belirleme Ölçeği" kullanılacaktır. Bunun yanında hem deney hem de kontrol grubundan 3'er öğrenciyle uygulama öncesi ve sonrasında bilimsel bilgiye yönelik yarı yapılandırılmış görüşme yapılacaktır.

ABSTRACT: Views about concept of scientific knowledge is defined as individuals' beliefs about what knowledge is and about how knowing and learning occur. A person who has scientific process skills has problem solving skills and can give meaning to the events surrounding his/her and is rational. Contributions of science lessons are enormous to growth of these kinds of individuals and science teachers are very important in this regard. The purpose of this study is to determine the effect of scientific process skills that prepared for the unit of "Matter and Heat" on middle school sixth grade students' views about scientific knowledge. In the research, the pre-test post-test experimental model was used. The participants of the research were 50 sixth grade students attending to a state middle school in Manisa/ Sarıgöl Atatürk Middle School during 2013-2014 instructional year. In the research, to determine students' views about scientific knowledge "The Instrument for Determining the Views of Primary School Students about Scientific Knowledge" will be used. Besides that, 3 student from both experimental and control group will be done semi-structured interview before and after the instruction about the scientific knowledge.

Key words: Views About Scientific Knowledge, Scientific Process Skills, Middle School Students, Science Education

ENHANCİNG STUDENT LEARNİNG THROUGH USE OF ONLİNE TECHNOLOGİES

Zeynep YURTSEVEN AVCİ

This study focuses on using communication and collaboration technologies to facilitate and empower student learning of authentic mathematics problems. Two teachers and 35 students at a U.S. public high school participated in this study. A specific curriculum, which is called MINSET (Mathematics INstruction using Decision Science and Engineering Tools), was chosen for this study consists of contextual problems from business as well as from students' lives that employ multi-step mathematical problem-solving techniques to solve and interpret real life situations. Students were introduced two online technologies, Voice Threads and Google Documents, to practice problems, homework, and projects. This research has been designed using qualitative case study method. Data was collected through classroom observations, student and teacher interviews, and teacher reflections. Data was analyzed by open coding applying content analysis method. Results of this research suggest that using online technologies for communication and collaboration purposes might have potential to enhance student learning. Most of the students had positive perceptions about the impacts of using online technologies on their comprehension of the contents of the classes. Some students had also critiques about using online tools in their mathematics class. The reasons of positive perceptions and critiques by students; and teacher perceptions about the impacts of using online tools on student learning were analyzed in detail. It can be concluded that communication and collaboration with peers supported deepening of students' conceptual understanding by providing them access to each other's theories and perspectives on the mathematical problems posed. Students' 21st century skills were strengthened by using contemporary forms of communication and collaboration, participating in discussions, questioning each other's theories, and comparing ideas in the community of practice that they developed in online platforms.

ABSTRACT: The readiness must be enough in order to students can learn a new topic in mathematics and geometry courses and to make sense in the mind. Therefore, one of the most important aspects of readiness students' attitudes towards courses and self-efficacy beliefs should be high. Hence this research is made to determine self-efficacy of the middle school students toward geometry and attitude level for mathematics. The present study aims to reveal if the middle school students' self-efficacy toward geometry and attitude for mathematics differentiates in terms of gender, grade level and their latest math grades. The universe of the current study is composed of the students from secondary schools in Izmir studying in the 2013-2014 academic year. And the sample is consist of 294 randomly selected students including 52 from the 5th grade level, 84 from 6th grade level, 93 from 7th grade, 65 from 8th grade level.The data were collected through the "Geometry Self-Efficacy Scale" improved by Cantürk-Günhan (2006) and the "Scale of Attitudes towards Mathematics" by Nazlıçiçek ve Erktin (2002) demographic information form designed by the researchers. For data analysis, t-test, analysis of variance, correlation ve regression analyzes methods were used. According to the findings; it was determined that there is no significant difference in geometry self- efficacy of students according to gender variable whereas the present study shows significant difference in attitude among gender variable and according to grade level between attitudes and self-efficacy beliefs. According to research findings there is significant relationship between self-efficacy, attitudes and mathematics achievement also self-efficacy and attitudes has been identified as predictors of mathematics achievement. Findings support the importance of students self-efficacy and attitude on their academic achievement thus several suggestions were made according to research findings.

ABSTRACT: The importance of statistics is not limited to statisticians but also impacts on non-statisticians who have to use statistics. One important issue is how statistics is best taught to, and learned by, non-specialist students. The pervasive use of the English language causes additional challenges to learners whose first language is not English, especially when technological resources that use English language, such as statistics software packages, are an integral part of the course. This paper presents research into the current position in Saudi universities, where there has previously been a lack of research into this topic. Mixed methods research has been used: a questionnaire survey of 1,053 students and qualitative interviews with 16 teachers of statistics from all colleges within all six universities where statistics is taught to non-specialist students in Saudi Arabia's Eastern Region. This presentation will discuss differences between the experiences of learners taught in the Arabic and English languages.

Key words: Language in Statistics, Introductory statistics course, Non-specialist students, Statistical software packages; Saudi Arabia.

INTRODUCTION

With the continuing development of statistics as an independent discipline, the number of researchers and those interested in this discipline continues to increase. The need to learn statistics is not limited only to statisticians but also includes non-statisticians in various disciplines who use statistics within their fields, and this has made the teaching of statistics more complex. Therefore, one important issue that requires attention by researchers and those interested in the field of educational statistics is the teaching of statistics to non-specialist students (Garfield and Ben-Zvi 2007, Simpson 1995).

Research and studies related to the teaching and learning of statistics to non-specialist students are only beginning to emerge. Some of the most important topics in this research area which will be discussed in this paper are the impact of English language in learning and teaching statistics to non-specialist students whose first language is not English and how language can affect students' use of technological resources such as statistics software packages in statistics courses.

English Language in Learning and Teaching Statistics

Language plays a crucial role to connect parts of the educational process but sometimes it can be an obstacle for students. Usually, disciplines use specific terminologies which are unknown to junior students or those who are unfamiliar with the discipline. Also, many students who learn subjects in a second language have usually faced some difficulties with the language. Furthermore, printed and online reading resources and software tools which are used in the study of statistics are often not available in languages other than English. Students may face difficulties in their courses in trying to overcome these problems.

The language which is used in teaching statistics is one of most important factors that may help students to understand statistics courses. The use of technical words in teaching statistics to beginner students, particularly students from a non-English Speaking Background (NESB) who have a limited level of language skills, may lead these students to believe statistics courses are more difficult than they really are (Kaplan et al. 2009). Some technical words used in statistics do not exist in all languages and some of them are not fully explained in the dictionaries (Abdelbasit 2010; Hubbard 1990). Moreover, in statistics there is often more than one meaning indicated by one word and in addition, there are several words used to imply one meaning, and this can add to student confusion. For instance, teachers often use "normally" and it does not necessarily relate to "normal distribution" but may relate to another meaning. Also teachers use "average" and sometimes "mean" and both can relate to the same concept. Kaplan et al. (2009) mention that "The use of domain-specific words that are similar to commonly used English words, therefore, may encourage students to make incorrect associations between words they know and words that sound similar but have specific meanings in statistics that are different from the common usage definitions" (p. 2). This can delay or reduce students' understanding of lectures.

Many difficulties that may face students when they use the English language in their studies need to be considered by teachers when designing statistics courses for non-specialists. One of these difficulties is that students need more time in lectures to understand the subject and this may cause the loss of students' attention. Students in many countries also rarely use English outside the classroom, so their level of English language does not improve as much as those students living in English-speaking countries (Abdelbasit 2010).

Technology in Learning and Teaching Statistics

In recent years, technology has become a major influence upon student learning of statistics because of the rapid development of a range of different technologies. At the moment, we cannot imagine that the process of learning and teaching statistics does not include technology because it has become an integral part of teaching. Statistical problems and calculations used to be calculated by hand and by calculator, but technology has changed this and thus approaches to teaching statistics have also needed to change (Chance et al. 2007). In previous years, teachers needed more time to explain new statistical concepts to students in the classroom and some statistical problems and analyses took more time to complete. This situation has changed because technology has provided us with many modern methods and tools to demonstrate these concepts better (Good 2006).

Technology has helped many teachers to teach statistics and it has also helped many students to learn statistics. Chance et al (2007) argue that the use of technology can benefit students through them being able to: collect data on a large-scale and deal with it more accurately; undertake statistical procedures and operations automatically; obtain the results and statistical interpretations more easily and display them with more clarity. These benefits can contribute to building confidence among students during their study of statistics and can encourage and motivate them to learn statistics (Good 2006).

This study examines the role played by English language in teaching statistics to non-specialist students (especially NESB students), and how the language used in teaching affects the use of technology in statistics in Saudi Arabian universities. This paper will discuss differences between the experiences of non-specialist students in Saudi universities taught in the Arabic and English languages.

METHODS

Mixed methods research is used in this study. Quantitative data allows the researcher to gather data from a large number of participants while qualitative data provides in-depth information from a smaller group of participants. Both quantitative and qualitative data complement each other in this study.

The first method of data collection (questionnaire) was used to collect data from non-specialist students who had completed at least one statistics course in different disciplinary colleges of the six universities in the Saudi Arabian Eastern Region. The instrument was designed to identify the current state of learning and teaching statistics for non-specialist students in Saudi universities. The instrument has thirty-one closed questions using yes/no and Likert scale responses, Strongly Disagree (SD), Disagree (D), Neutral (N), Agree (A), Strongly Agree (SA), as well as some open ended questions. The second method of data collection (interview) was used with teachers of statistics who teach statistics courses to non-specialist students in these colleges.

Because of limitations of cost and time affecting the data collection phase of the study, the researcher decided to collect the data from the eastern region of Saudi Arabia as a sample for this study. The eastern region is considered the largest province and covers 33% of the entire area of the country. Also, the population of the region represents 15.6% of the country's total population and, because of its location on the coast of the Arabian Gulf, the people who live in the eastern region represent a mixture of all of the groups in Saudi Arabia. Through the previous justifications, non-specialist students and teachers of statistics courses in the six universities in eastern region, which represent 18.2% of universities in Saudi Arabia and 100% sampling of universities in this region, are the research study population and also provide the researcher with a realistic representation about other universities in Saudi Arabia. The researchers have chosen not to identify the specific institutions at this stage of the analysis.

Sampling

The 16 disciplinary colleges within the six universities in eastern region and 39 academic departments which form most of the academic departments within these colleges where statistics courses are taught to non-specialist students were identified. Then, one suitable class from each academic department was randomly selected and the study aimed to obtain 100% response rate from the study population (students) in these classes for two reasons; first, in order for this study to be more realistic and credible. Second, the last 15 minutes of lectures in these classes were used by the researcher to distribute the questionnaires to students participating in the study, so it was considered unjustified to include some students and not others. Therefore, questionnaires were distributed to every student present in the classes.

When the researcher (AA) entered the classrooms, he introduced himself to the students and briefly explained four important points: students who participated in the study would have to have completed at least one course in statistics, their participation would be voluntary and they were to make sure that they answered the questionnaire as realistically and honestly as possible. Finally, he informed them that all of the information in the questionnaires would be treated confidentially and would be used for research purposes only. He then distributed the questionnaires to every student in each classroom, regardless of the number of students, and so this is the main cause of variation in the number of participants in the various academic departments. The researcher stood at the front of the room until the students had finished filling in the questionnaires, which he then collected from them. The total number of responses from students in this study was 1053 non-specialist students.

To conduct the study of statistics teachers who teach non-specialist students from the six universities being studied, 16 statistics teachers who teach non-specialist students were randomly selected from most of colleges within these universities where statistics is taught to non-specialist. The interviews took 20-35 minutes for the teachers to answer all the questions.

Data analysis methods

The questionnaire contained questions asking respondents to rate their own English language abilities for four skills – reading, writing, listening and speaking – each at one of three levels – Excellent (scored 1), Good (2) or Poor (3). Cross-tabulations and chi-square tests were conducted to identify the level of association between these skills. The associations were very strong and the chi-square tests gave highly significant results, so the mean value of the four scores was calculated and rounded to give an integer-valued overall score for English language skill of 1, 2 or 3 with 3 representing the poorest level of ability.

Several questions had a ‘not applicable’ response option; ‘not applicable’ responses were discounted from the analysis. Seven questions using Likert scales phrased in a negative direction were reverse coded before being analysed.

Because there are many individual questions in the questionnaire, with substantial associations expected among them, factor analysis was conducted for dimension reduction. It was anticipated that the large number of observed items would represent a much smaller number of underlying factors, including the influences of English language and technology use. Cross-tabulations and chi-square tests were then used to explore the relationships between factor scores and background variables, including the main language used for teaching the statistics course (Arabic or English) and the student’s level of English language skill.

RESULTS AND FINDINGS

The-Kaiser-Meyer-Olkin measure verified the sampling adequacy for the factor analysis, KMO=0.82 overall and > 0.6 for individual items, which is well above the acceptable limit of 0.5. Bartlett’s Test of Sphericity, chi square = 4718.69, $\rho<.001$, indicated that correlations between items might be sufficiently large to make factor analysis useful. Five factors were identified with eigenvalues over Kaiser’s criterion of 1, which in combination explained 57.28% of the variance. These factors were interpreted as: (1) Effectiveness of Teachers, (2) English Language, (3) Relevance of Course, (4) Students Engagement and (5) Using Technology. This paper will focus on Factor 2 (English Language) and Factor 5 (Using Technology). Items contained in these factors are listed in

Table 1 and the frequencies of responses for these items after reverse coding (as necessary) are shown in Table 2 below. For each factor, an overall score was obtained by taking the mean value of all the completed items involved in that factor, then rounding the mean to an integer value of 1, 2, 3, 4 or 5 with 5 being the most positive response.

Table 1. Items Contained in Factors 2 and 5

Factor 2 (English Language)	Factor 5 (Using Technology)
Q34. Some statistical technical words which are not translated into my language make it difficult for me to learn statistics. (reverse coded) Q35. Most statistical software programs are in English and this makes it difficult to learn statistics. (reverse coded) Q36. My lack of English language skills is an obstacle to me using statistical software programs. (reverse coded) Q37. My level of English language skills has prevented me from accessing statistics resources and references in the English language. (reverse coded)	Q26. The teacher used technology (e.g. PowerPoint, the internet, statistical packages) effectively to help teach this course. Q27. Using a statistical software program led me to concentrate on the technology and not the statistical concepts being taught. Q28. Using a statistical software program to compute the statistical problems caused me misunderstanding of some steps of statistical procedures. Q29. Enough time was spent in learning and using a statistical software program. Q30. I could have used technology to learn statistics just as effectively without the teacher.

Table 2. Frequencies of Responses for Items in Factors 2 and 5

Factor 2 (English Language)						
	SD	D	N	A	SA	All
Q34	111	218	227	257	163	976
Q35	86	180	203	215	198	882

Q30	169	194	236	248	77	924

Comparison of Universities

In this section we summarize the abilities of students in the English language and describe the overall picture of their responses for Factors 2 and 5, depending on which university they were attending. Within the universities (1, 5 and 6) that used English as the main language for teaching, most students classified themselves in the first and second level (excellent and good) of English language skills. The highest rates were for universities 5, 1 and 6 respectively. After that came universities 2 and 3, where some of the colleges used English and the others used Arabic, then university 4, which used Arabic as the main language and where most students claimed to have poor English skills. Scores for Factor 2 showed that the majority of students in universities 1 and 5 had a positive experience of the way English was used in their statistics courses. After that came students in universities 6, 2 and 3 respectively, but the majority of students in university 4 felt that the use of English impacted negatively on their study of statistics. Furthermore, the scores for Factor 5 reveal that universities 5 and 1 also had the highest rates of satisfaction among students towards the use of technology in studying statistics, then came universities 2 and 3. In universities 6 and 4, the majority of students were dissatisfied with the use of technology. Despite the results for the other universities, it is perhaps surprising that in university 6, although English is the main language of instruction, the majority of students were dissatisfied with the use of technology in studying statistics.

English Language (Factor 2)

Figure 1 compares the distribution of Factor 2 (English Language) scores for students who were taught statistics in Arabic and English. 34% of students who were taught in Arabic had a negative experience of the impact of English on their study of statistics (factor scores of 1 or 2) whereas 32% of them had a positive experience (scores of 4 or 5). However, 58% of students who studied statistics in English had a positive experience and only 18% of them a negative experience. A chi-square test of association between language of instruction and Factor 2 score was significant: $x^2(4, N = 1010) = 78.96, p < .005$. The association was of moderate strength, Cramer's V = 0.28.

Figure 2 compares the distribution of Factor 2 (English Language) scores for students who reported different levels of skill in English. Within level 1 (Excellent) in English language skills, almost 75% of students had a positive experience of the use of English in their study of statistics (scores of 4 or 5), while 18% were neutral and 7% of them had a negative experience. On the other hand, pupils whose English skills are at level 3 (Poor), 49% found that the English language negatively affected their study of statistics. A chi-square test of association between level of English language skill and Factor 2 score was significant: $x^2(8, N = 1010) = 227.57, p < .005$. The association was of moderate strength, Cramer's V = 0.34.

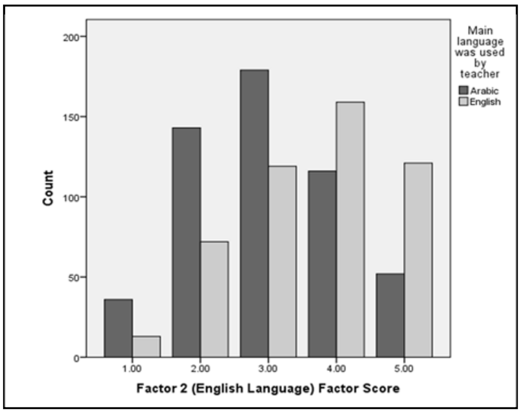

Figure 1. Frequencies of Factor 2 (English Language) Scores for Students Taught in Arabic and English

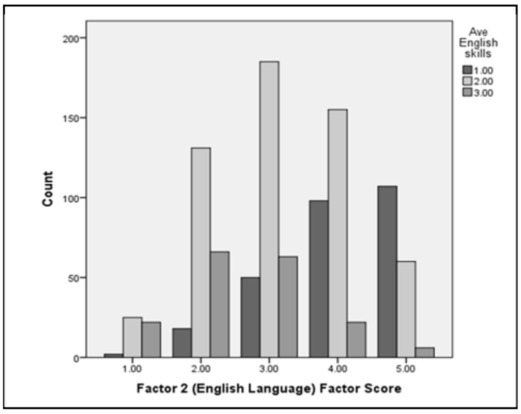

Figure 2. Frequencies of Factor 2 (English Language) Scores for Students with Different Levels of English Language Skills

Using Technology (Factor 5)

Figure 3 compares the distribution of Factor 5 (Using Technology) scores for students who were taught statistics in Arabic and English. When English was the main language of the course, 20% of students were dissatisfied with the use of technology (scores of 1 or 2) and 26% of them had positive satisfaction (scores of 4 or 5). Of students who studied the statistics course in Arabic, 46% were dissatisfied and 18% positively satisfied. A chi-square test of association between language of instruction and Factor 5 score was significant: $x^2(4, N = 1002) = 76.29, p < .005$. The association was of moderate strength: Cramer's V = 0.28.

Figure 4 compares the distribution of Factor 5 (Using Technology) scores for students who reported different levels of skill in English. Among students whose English language skills were excellent (level 1), 21% had negative responses (factor scores of 1 or 2) regarding the use of technology in their statistics course compared to 25% who had a positive response (scores of 4 or 5). On the other hand, 46% of students whose English level was poor (level 3) were not satisfied and just 17% were positively satisfied. A chi-square test of association between level of English language skill and Factor 5 score was significant: $x^2(8, N = 1002) = 33.18, p < .005$. The association was of weak strength, Cramer's V = 0.13.

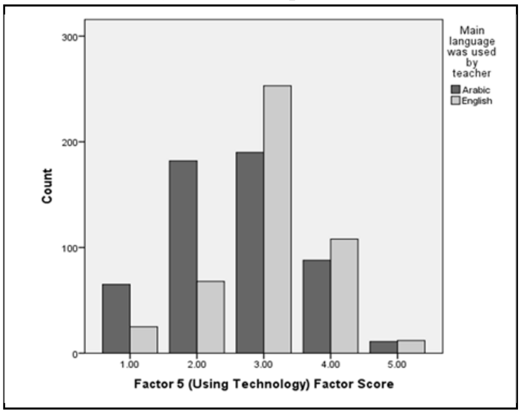

Figure 3. Frequencies of Factor 5 (Using Technology) Scores for Students Taught in Arabic and English

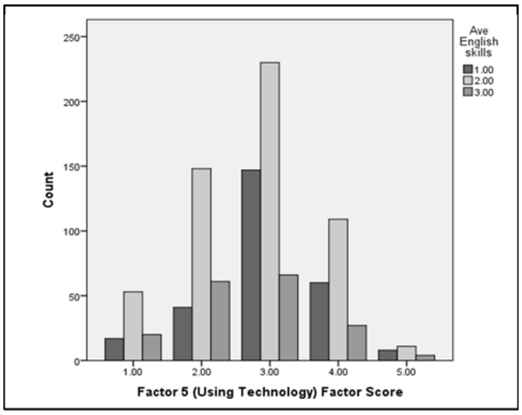

Figure 4. Frequencies of Factor 5 (Using Technology) Scores for Students with Different Levels of English Language Skills

Teachers' Interviews

Analysis of the staff interviews is at an early stage, but some themes related to this paper are already emerging. In using technology, almost all the teachers are using PowerPoint and the Internet for teaching statistics. Most of the interviewees are using statistical software in their teaching (3 are not) and the following packages are mentioned: Excel, SPSS, Matlab, Minitab, Statistica and SAS. Lack of technical facilities and support staff and large class sizes are the main challenges that face teachers who try to use technology in teaching statistics.

Concerning the influence of the students' limited English language skills on their study of statistics, teachers were divided into two groups based on their opinions. Teachers in group one said there are no problems relating to this issue. For example, teachers 1, 2 and 12 find that there is no effect of English in studying statistics; as Interviewee 1 said, "There is no significant effect because Statistics does not require students to have a good command of English language". The student questionnaires on the other hand revealed that the majority of students in the same colleges as these members of staff have negative responses regarding to the influence of English in their study of statistics. The rest of the teachers in this first group explained that the lack of impact of the English language on studying statistics is due to the good English skills of their students; as Interviewee 8 said, "This problem does not affect students' learning of Statistics in this university because the course is 100% taught in English. The fact that the teacher's mother tongue is Arabic may drive him to spontaneously use some Arabic words in the lecture, though the use of Arabic is not encouraged". The second group of teachers argue that the limited English language skills of students, does affect their study of statistics, whether they used Arabic or English as the main language. For instance, Interviewee 15 said, "I often find in exams that the most common errors in the answer sheet result from students' incorrect understanding of the questions, which affects their final results. The students themselves admit that their level in the English language is not good enough to understand the exam questions". Also, Interviewee 16 mentioned that, "Sometimes, I imagine that were the teaching of Statistics in Arabic, students' understanding would be much better. In general, the English language stands as a stumbling block to students' learning."

CONCLUSION

Most statistical software packages and their commands are in English. Text books, websites, lectures on YouTube and other available statistics resources are mainly in the English language and significantly outweigh resources available in Arabic. Consequently, as we can see from the data presented here, many of the non-specialist students in Saudi Arabia's Eastern Region who are taught statistics courses in Arabic have encountered challenges and difficulties in using technology in statistics courses, and most of the students taught in Arabic agree that the English language is an obstacle to their study of statistics. Conversely, the majority of students who are taught a statistics course in English have found that English language was very useful for them and supported them in learning statistics and in dealing with technology. High percentages of students who reported that there were no challenges in using technology were also those students who described their English language ability as excellent. This suggests that English language skills play a key role among non-specialist students in their studying of statistics courses. Our future analysis will include examining whether the type of university is related to the decision about what language is used to teach statistics teaching, and whether student capabilities in particular institutions are related to language skills.

To maximise the benefits of studying statistics for non-specialist students in Saudi Arabia's higher education institutions, the administrators and teachers of statistics in these institutions need to consider several things. First, for institutions that use English language in teaching statistics, they have to be sure that their students' English language skills are sufficient in order for English not to be an obstacle to them. In these institutions as well as in institutions that use Arabic for teaching statistics courses, institutions need to consider teaching some supplementary English language covering relevant statistical terminology to assist students to use more statistics resources that can enhance their use of technology, support student learning through making studying statistics easier. It is also necessary to help students by teaching them the basic skills to use statistical software programmes (Simpson 1995). In designing assessments in English and Arabic, it is important that questions are stated as clearly and unambiguously as possible, and with cognisance of the potential for students to misunderstand statistical terms that are not clearly stated. Where students have good English language skills, teachers should be encouraged to use the good range of statistics resources available in the English language to benefit students. Finally, it is very important for institutions to encourage statistics specialists and researchers to write and translate statistics books into Arabic and create online resources to provide a better range of references for non-specialist students studying in Arabic.

MODERN ICT SOLUTIONS TO BE TAUGHT IN TOURISM AND HOSPITALITY EDUCATION: EVALUATION AND IMPLICATIONS

Edina AJANOVIC
Institute of Social Sciences Akdeniz University
edinaajanovic@akdeniz.edu.tr

ABSTRACT: While there are still short terms courses or one semester teaching on how to use software solutions for property management, technology continues with its rapid development. Introduction of cloud computing had a major impact on almost all sectors that are using ICT services and solutions. In tourism and hospitality industry cloud technology has made a revolution and moved their property management systems online.
It is necessary for tourism educational institutions to include the lessons of ICT usage into their academic curriculum. This is considered as a possibility for students to learn about modern ICT solutions, accept changeable nature of it and get better preparation for the real business world. In this study, current program for teaching desktop solutions and ICT developments in tourism and hospitality were analyzed and compared with new, web-based solutions and teaching methods. Implications on how this topic might be useful for all interested parties in education process were derived.

Key words: Cloud computing, Teaching ICT in tourism and hospitality, ICT practice

INTRODUCTION

According to Cohen (1997) technology-rich classrooms enable more fluid social interaction between teachers and students, making learning a more natural process. Technology enhanced education in classroom is still based on traditional teaching methods in terms of class meetings and faculty lectures. However, technology plays significant role inside and outside the classroom through Power point presentations, online material, computer simulations CD-ROMs, etc. When it comes to topic of teaching and learning usage of modern ICTs (information and communication technologies), it is still not implemented and realized in its full potential. It is based on overview and display of teaching materials and ideas usually involving passive communication with the students. Teaching in a more vivid and interactive environment can significantly increase satisfaction with the learning environment as well as interest in the topic (Nicholson et al. 2008).

To produce quality product and be competitive on the market, companies are recognizing the importance of high talented, knowledgeable, skilful and well motivated working force. Therefore these companies are trying to create environment which will allow employees to implement their knowledge and skills and, if necessary, companies will invest further in their employees' education. One of the reasons why company has to pay attention to the education and development of employees is due to development of information technologies and their application in the company (Krsak et al. 2014).

Researching management education as a category of professional education, Bhaumik (2012) stated that it has been influenced by technology both as a driver and as an enabler. Taking into consideration that in hotel industry Property Management Systems (PMS) software are playing a vital role in overall successful management of a hotel, it is therefore understandable the need and importance of including practical use of ICTs in tourism and hotel industry into faculty courses. In the first part of the paper new ICTs used in the tourism and hospitality industry will be presented. In continuation, example of teaching both desktop and web based systems used in tourism and hotel industry will be presented and analyzed. Important implications for all interested sides in education process will be derived as well. In conclusion, the suggestions for further planning of the academic programs regarding usage of modern ICTs in the sector will be proposed.

MODERN ICTs IN TOURISM SECTOR

Usage of modern ICTs can become a facilitator in successful performance of every-day operations in hotels and also help travel agencies to struggle in the era of increasing usage of Internet in planning travel activities.

Success for some hospitality companies has been achieved, in large part, by taking advantage of information technology (Siguaw and Enz, 1999). While gathering valuable information about guests, PMSs are increasingly incorporating business intelligence tools to help hoteliers organize and make sense of these guest data. PMS helps hotels with keeping a more comprehensive record of its reservations, guest's information and enables better coordination between different departments in the hotel, as the record of important functions in hotel is also kept in this system.

Cloud computing is the contemporary technology that is being recognized by the IT industry as the next (potential) revolution that will change how the internet and information systems operate (Sharif, 2010). Computing is being transformed to a model consisting of services that are commoditized and delivered in a manner similar to traditional utilities such as water, electricity, gas, and telephony. In such model, users access services based on their requirements without regard to where the services are hosted or how they are delivered (Buyya et al., 2009). Cloud computing is being able to deliver this utility computing vision with its specific infrastructure from which businesses and users are able to access applications from anywhere in the world on demand (Buyya et al., 2009). Thus, the computing world is rapidly transforming towards developing software for millions to consume and, in cloud computing, business applications are exposed as sophisticated services that can be accessed over a network.

In the past, company needed at least three requirements in order to install one hotel management system: software, server and data base system. With cloud based PMS there is no need for large investments in software and hardware because "Cloud Servers" are always updated to latest technology. Cloud Servers work at a very low cost (in fact no investment cost) but a reasonable monthly subscription fee is usually charged. Simplicity of the cloud based property management system allows it to be productive. Cloud based PMS can operate on any advice that has a web browser and the companies are putting their efforts to make it even more user-friendly on smaller devices like tablets and smart phones.

Importance of teaching ICTs in tourism sector

Education in tourism should be more functional and offer expertise in a particular area of tourism sector. Considering tourism is a service-oriented field constantly changing towards the needs and requirements of the clients and markets, more specialized skills are required in the area of IT, marketing, planning, promotion activities etc. This should be valid for all enterprises and businesses in tourism sector, including travel agencies and hotels. With this kind of education, as defined by Dale and Robinson (2001), Functional Tourism Degree combined with Generic Tourism Degree and Product/Market Tourism Degree should be incorporated into body of knowledge in tourism.

Important determinant of tourism development on global level is a highly efficient information technology and its use. In the research of Krsak et al. (2014), they were examining the needs for additional training for employees of organization in the field of tourism in order to improve services provided to clients by their fully trained stuff. The results of the research, conducted among the providers of the services such as accommodation, catering and transport companies, information, cultural and social facilities and other tourism organizations, showed the high awareness of the need for the introduction of information technologies in tourism enterprises as a means of increasing the market share and the willingness of employees and their managers to further educate in the field.

In order to develop tourism education that will meet the needs of an expanding and differentiated global industry, there is a need for education program that will allow graduates to demonstrate good management skills and add value to organizations operating in tourism environment (Dale and Robinson, 2001). On classes of usage of ICTs in tourism and any other sector, students are able to meet with the practical terms and working conditions in the real sector. Being able to use the programs and software that are used in the real working environment means that student is able to solve some every-day operation tasks. Knowing the basics of IT sector is always recommendable as this is the fastest growing and changing sector where everything that is newly used is based on the previously learned topics.

EXAMPLE OF TEACHING MODERN ICTs IN TOURISM SECTOR

In this paper, experience of teaching both desktop and cloud versions of the management programs used in tourism and hospitality sector are examined. The research was conducted in the Tourism Faculty at Akdeniz University in Antalya. Being known as Turkish Riviera, Antalya attracts millions of tourists every year. Therefore there are hundreds of hotels and significant number of travel agencies operating in this region. According to TUROFED (Federation of Turkish Hoteliers), in 2013, 51% of 5 star hotels in Turkey are being located in Antalya. Operating in condition of great competitiveness, providing quality, fast, on time service is crucial for hotels in differentiating from the other competitors. Akdeniz University Tourism Faculty is known for its successful cooperation with the tourism sector and as an institution that provides quality, competent and well trained students to work in the tourism sector in Antalya as well. This is partially due to the education program that includes both theoretical and practical teaching of modern ICT technologies used in tourism. After conducting interview with the teaching stuff and observing the education process for a two-semester period, the research was aiming to compare teaching of desktop and cloud based PMS versions.

Following the needs of tourism and hospitality industry in Antalya, Akdeniz University Tourism Faculty has included two programs, "Agency Automation" and "Hotel Automation", in its curriculum. These programs aiming to educate students on how to use hotel and incoming travel agency automation computer programs, are being taught for one year, divided in two semesters. For the hotel automation system, students are taught the basics of using most commonly used programs in hotel industry in Turkey (FIDELIO and ELEKTRA). After the course students will be able to independently work in the program in terms of performing basic front office operations –entering both individual and group reservation, check-in and check-out operations, room management and cashier operations, create all the necessary reports, etc. It is important to mention that both English and Turkish versions of the program are being taught during the course which is very useful for students as they are able to adopt the necessary terminology in both languages and get used to changes in the working programs which may be expected to happen in the real business world. After finishing the two-semester course on incoming travel agency program, students will be able to use new age agency automation program: make basic hotel, agency, flight and similar settings inside the system, enter hotel contracts and daily tour prices, make reservations records and changes of the same in different real time situations, performing flight, rent-a-car, transfer, accounting and other operations necessary for the successful functioning of travel agencies of modern age. Both desktop and web or "cloud" versions of the travel agency program are being taught.

FINDINGS

The main characteristics of two PMS versions and, according to them, derived advantages and disadvantages of the two types of systems are presented in Table 1.

Table 1. Advantages and disadvantages of teaching desktop and web versions of the PMS

Type of system	Advantages	Disadvantages
Desktop Version	• Used in majority of the tourism and hospitality companies • No need for Internet connection • Every user can set the program functions and design templates according to individual needs • In case of error on one computer student can continue with the work on another one	• Harder installation of the system (for every computer individually) • Students can practice only when they have access to computer classrooms • Control of the tasks given lasts longer • Extra equipment needed for server
Cloud Version	• Access from anywhere at any time • Giving homework and doing the same is easier • Easier control of the given tasks by teacher • Longer practicing period • More user friendly interface • No need for installation because program is always ready to use and reach from the web • No need for the additional server equipment	• High Internet speed is mandatory • In case of lost of Internet connection there is no access to the system • In case connection when "server is lost" user does not have access to the system • In case of error in the system, it is present on all computers

Teaching this subject does not have only practical dimension but also theoretical one. Before going directly on the practical part of explaining the use of the management software, there is always a need to theoretically explain vocabulary and operations in the hotel or travel agency business.

IMPLICATIONS

Inclusion of modern ICTs into curriculum and teaching programs and courses will be beneficial for all interested groups in educational process: students, their future employers and educational institutions.

Students will broaden their perspective of overall business operations in tourism and hospitality sector. They will receive theoretical knowledge and gain necessary practical skills in handling property managements systems that are vital for successful performing of everyday business activities.

From the perspective of future employers, teaching modern ICTs allow them to recruit students that posses combination of generic and value-adding specialist skills. They are in constant need and search for well prepared and skilful working force, enhanced with knowledge about modern technologies and, most of all, fresh ideas. Usage of new technologies brought revolutionary and continuous changes in everyday business operations in tourism and hospitality sector. Due to this, companies in this sector became more flexible in offering their services according to needs of their customers. Therefore, they are in need of employees that are flexible and ready to handle changes in needs and requirements of the industry. Teaching and releasing university students with the knowledge about contemporary ICTs used in sector can be one positive step toward creating this kind of working force.

Universities need to encourage practitioners to participate more widely in consultative meetings on the future development of tourism education. This can be done by inviting practitioners to become members of course development committees, ask for their advice and guidance on necessary skills and emerging areas within tourism that require expertise. Through cooperation with the real business sector, universities can obtain valuable information about the trends in the sector and keep their programs up-to-dated for the future benefits of all three parties. Meeting people from the industry, that are doing real job in the manner how they were taught at university, allows students to perceive their course valuable because it enriches their knowledge. Practices will be ensured for the successful students where they will have a chance to work on jobs for which they were educated. With participation of the real sector courses will be tailored according to the needs of both learners and employers.

CONCLUSION

The higher integration of ICTs with the rest of the learning environment, the higher would be its impacts (Bhaumik, 2012). Not only should web based learning systems be included in teaching and learning process in order to increase overall success of the whole course, it is necessary for the students to be taught the use of a new web-based technologies that are already in use in a real time business operations in enterprises.

If following the statements that the three interrelating factors that affect the actual use of ICTs in teaching and learning process in classroom and beyond are institutions, resources and teachers (Mumtaz, 2000), therefore the main effort should be to animate subjects involved in planning the course or provide resources necessary for the successful performing of teaching-learning activities and processes.

Career paths in tourism are so wide and open, but not all students stay in the field. This is partially due to employment possibilities in the field. Therefore the more realistic and structured employment opportunities that are able to sustain students for a career within the tourism industry should be provided. If the path is not clearly defined this can de-motivate the students and discourage them from entering into industry. Clearer career guidance needs to be given before, during and after the completion of the student's tourism degree and opportunities for practical learning of modern ICTs need to be fully integrated into their courses. Institutions should also consider opening new specialized departments or, by following the innovations in the field, update the existing teaching curriculums that will concentrate on providing more effective and practical knowledge.

In this paper the overview of the two different technologies used in real business environment in tourism and hospitality industry is provided. Although web based version of the hotel and agency management program is still not that widely used as the desktop one, the speed with which modern human society accepts and implements modern technology in every day life can allow us to predict that this situation may change in a couple of years. Therefore, tourism educational institutions should create programs that follow the trends in development of modern ICTs and include teaching of "cloud" based management systems already used in the field. In this way, educational institution will be able to act proactively and respond to challenges that tourism sector will face in the future.

ABSTRACT: This study examines pre-service teachers' computer-based learning (CBL) experiences through virtual physics program, Algodoo (phun). We took one specific physic topic for the 10th grade according to the physics curriculum in Turkey. Archimedes` principle is one of the most important basic concepts needed in the study of fluid mechanics. We decided to design a simple virtual simulation in Algodoo (phun) related to Archimedes' principle. Smart board was used in order to make clear demonstration. There were 37 participants in this study who are studying pedagogical proficiency at Kırıkkale University, Faculty of Education in Turkey. Case study method was used and the data was collected by the researchers. The questionnaire consists of 28 items and 2 open-ended questions that had been developed by Akbulut, Akdeniz & Dinçer (2008). The questionnaire was used to find out the teachers` perceptions toward Algodoo for teaching physics. The result of this research recommends that using Algodoo program in physics teaching has positive impact and can improve the students' understanding.

Keywords: physics teaching, virtual environment, Algodoo, Archimedes' principle.

INTRODUCTION

The most emphasized and explored field in analysis of the physics educational research on the computer-based learning is related to the application of simulation (Şengel, Özden & Geban, 2002; Bayrak, Kanlı & İngeç 2007; Bozkurt & Sarıkoç, 2008; Jaakkola & Nurmi, 2008; Çelik, Özbek & Kartal, 2013). In the physics area, there are so many abstract concepts and principles so that it is important to generate some simulations with the kinds of computer program for the physical activities and experiment. Researchers have found that using computer simulations in instructional contexts may afford students with opportunities to promote their understanding of unobservable phenomena in science (De Jong et al., 1999; Khan, 2002; Stratford 1997).

Technology provides some of products that can be used for educational purposes. For example: smart board with related instruments can be used for teaching physics, it also parallel takes part of the continuous development for enhancing the quality of education (Geban& Demircioğlu, 1996).Technology-based teaching environment accommodates simulation so that students can use it for calculating data, sorting data, recording intended layout, testing the hypothesis, changing the variables, observing the results and visualizing the process of information. The simulation accommodates students' initiative so that they can control or operate by their own without teachers. İt also provides tips and access information to the students. Increasing the students' motivation enables them to have the opportunity to learn everything by their own (Edelson, Gordin & Pea, 1999; Tao & Gunstone, 1999; Şen, 2001).

There are some prepared and used software that can be applied for simulation-assisted instruction, such as: Interactive physics, Crocodile physics, Phet and Algodoo. All of the programs have different properties and uniqueness. The specification of Algodoo is that it provides dynamic simulation using water that can't be found in other physics simulation programs. Algodoo provides fluid dynamic simulation in which gravitational acceleration automatically works. So it can be used to explain the phenomena of Archimedes' principle virtually. We decided to use and develop the physics material program with Algodoo in order to prepare an alternative physics course in virtual environment.

The new modified physics program had been prepared to improve students' scientific process skills, develop a framework of students' analytical and critical thinking skills, realize the physics concepts in their daily activity, and build a suitable correlation between science, technology, society and environment. The application of information technology, like smart board, can be used for performing a simulation or practicing an educational activity on virtual laboratory. It becomes an important issue in educational activities (MEB, 2013).

Algodoo is a unique 2D-simulation software from Algoryx Simulation AB. It is designed in a playful, cartoony manner, making it a perfect tool for creating interactive scenes. Explore physics, build amazing inventions, design some cool games or experiment with Algodoo in your science classes. It encourages students and children's own creativity, ability and motivation to construct knowledge while having fun. Making it as entertaining as it is educational game. It is also a perfect aid for children to learn and practice physics at home (www.algodoo.com). As Algodoo is the number one software for creating interactive physics simulations, it is the perfect tool for learning, exploring and experimenting with real physics.

This study tried to develop a physics course program with Algodoo in virtual environment. Researchers focused on designing Archimedes' principles with Algodoo program that provides some useful simulations. This study also explored the pre-service physics teachers' perceptions towards Algodoo for teaching physics.

METHODOLOGY

Research Model

The overall research methodology was comprised of two effective assessments, including quantitative and qualitative research methods. For that reason, case study method was used in this research (Cohen &Manion, 1994). Since few contemporary physics education programs had been effectively implemented in schools in Turkey, the present study focused on pre-service teachers' learning performances to upgrade their competence via integrated simulations in physics teaching. In this research we used Algodoo program as integrated animations of physics instruments. All of the followed-up questionnaires had assessed pre-service physics teachers' performances in the Algodoo-based instruction toward Archimedes' principles. It was believed that physics instruction in Algodoo program would stimulate more interactions between students and instructors and it is suitable for the students' learning competence. We decided to choose the Algodoo program because it was so easy to operate, suitable for physics simulation and provide water simulation that are not available in other simulation programs.

Population and Sampling

Assessments of statistical samples for surveys were taken from 37 pre-service physics teachers in Kırıkkale. The participants take some pedagogical courses and practical teaching in Education Faculty of Kırıkkale University. They were enrolled in a course entitled "the Archimedes' principles with Algodoo simulation". This was a required course for pre-service physics teachers and taught by a bilingual Turkish and English instructor.

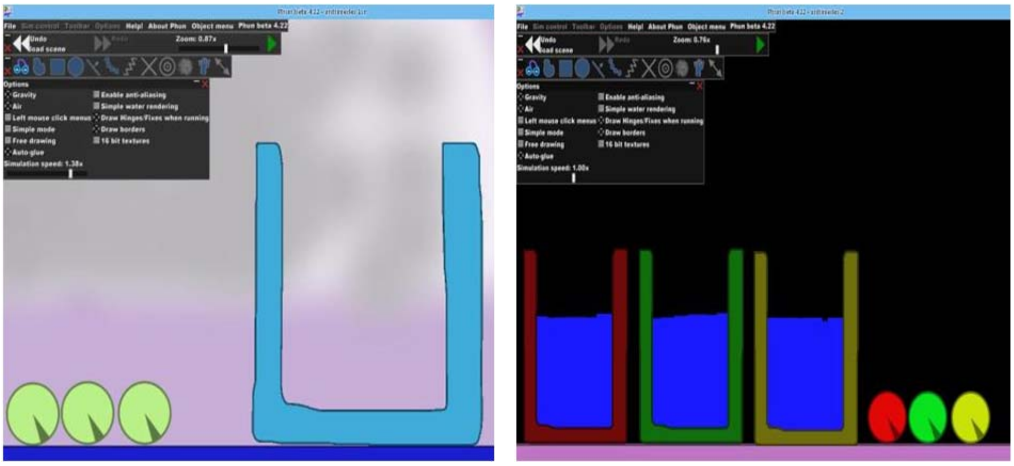
Data collection instrument and procedure

Data's gathered with quantitative and qualitative method was analyzed for this study. Quantitative data sources included a questionnaire that used semantic differentials of a likert scale. Akbulut, Akdeniz & Dinçer, (2008); Yalın, (2001); Öztekin, (2001); Uşun, (2000); Şahin & Yıldırım, (1999) had developed and used it to test teachers' perception on computer-based learning in 5 likert scale. The developed questionnaire consists of 4 major factors with 28 questions. Twenty eight questions were completed and returned by participants. The questionnaire that evaluates computer assisted teaching material was used to collect the pre-service physics teachers' perception on Algodoo-based teaching instruction. The first part which was made up of four factors, such as: instructional relevance, convenience of the program, convenience of instruction & program and formal conformity. The first factor consists of 14 questions, the second factor 4, the third factor 5 and the fourth factor 5. In the second part, two open-ended questions were conducted as qualitative data sources to find out and explore the participants' opinions about virtual physics teaching through Algodoo. The participants could write freely about their opinions toward virtual physics teaching through Algodoo. We used SPSS 17.0 to find out the statistical calculation.

Materials

In this study we developed a physics material through Algodoo in virtual environment. We decided to take one physics course in accordance with the standard curriculum of Turkey. In this point we used the 10^{th} grade course program in accordance with the instruction of the Turkish Ministry of Education. We agreed to take the physics topic of Archimedes' principles. The Archimedes' principle was explained to the pre-service teachers from the basic concept. We tried not to use formula in the beginning of learning. The virtual simulation through Algodoo (phun) was conducted to visualize how the Archimedes' principle works in the fluid without real experiment in laboratory (Fig. 1.). Algodoo program is appropriate to be operated for this topic. Algodoo provides dynamical simulations that help the teachers' performance when they were explaining physical phenomena to the students in the class. Algodoo program also provides a simulation of fluid dynamic so it can be applied to show the Archimedes' principle in virtual environment. Some of the tools in Algodoo can be changed automatically by the users. For example: the material's density can be changed just by controlling a bottom so that we can get any desired value of density.

Figure 1. Example of Algodo program output



RESULTS AND FINDINGS

Table 1 showed some mean values from all factors: instructional relevance ($\bar{x}$ =3.98), convenience of program (3.59), convenience of instruction and program ($\bar{x}$ =3.89) and formal conformity ($\bar{x}$ =3.89). Each factor has mean value more than $\bar{x}$ =3.43. It indicates that Algodoo is good enough as a virtual program for teaching the Archimedes' principles. There are 3 items that have mean value more than $\bar{x}$ =4.23, show specific reason why Algodoo has high influence for teaching physics, such as: remarkable, using appropriate visualization, and encouraging creativity and developing the logical thinking.

From the qualitative analysis, researchers found some of the advantages on using Algodoo for teaching physics, such as: increasing the students' understanding toward physics (29.03%) and providing good visualization (27.42%) (Table 2.). We also found some disadvantages of using Algodoo for teaching physics, such as: problem of foreign language (26.47%), incapability to represent the overall of physical phenomena (17.65%) and preparation time (17.65%).

Table 1. Table pre-service physics teachers' perceptions about Algodoo for teaching physics

Instructional relevance		N	Mean	St. Dev.		
Q1	Accuracy and topicality of information	37	4,00	0,707		
Q2	Compatibility of content and activities	37	4,06	0,674		
Q3	Evident and understandable instructions	37	3,73	0,902		
Q4	Feedback properties	37	3,76	0,796		
Q5	Compliance between individual and collaborative learning	37	4,00	0,745		
Q6	Content of comprehensible level	37	4,05	0,848		
Q7	Active participation and interactive accommodation	37	4,05	1,104	Total $\bar{x}$ = 3,98	Total SD= 0,803
Q8	Encouraging creativity and developing the logical thinking	37	4,41	0,644		
Q9	Appropriate content of partition and logical sequence of presentation	37	3,89	0,699		
Q10	Remarkable	37	4,54	0,650		
Q11	Increasing the motivation	37	3,97	0,866		
Q12	Easy to operate	37	3,65	0,949		
Q13	Understanding the content level	37	3,81	0,811

Q28	Using the screen space	37	4,16	0,866		

Table 2. Table pre-service physics teachers' opinion about Algodoo for teaching physics

Advantages		Frequency	Percentage
1.	Increasing the students' understanding toward physics	18	29,03
2.	Providing good visualization	17	27,42
3.	Easy to operate	7	11,29
4.	Enhance the students' creativity	5	8,06
5	Making physics easier	5	8,06
6.	Represent the physical phenomena in visual program	5	8,06
7.	Entertaining	3	4,84
8	Good for fluid simulation	2	3,23
Disadvantages			
1.	Problem with foreign language	9	26,47
2.	Can't represent the overall of physical phenomena	6	17,65
3.	Preparation time	6	17,65
4.	Lack of properties and tools	5	14,71
5.	The water density can't be changed	4	11,76
6.	Unavailable for mathematical calculation	2	5,88
7.	Lack of computer literacy	1	2,94
8.	Operating program	1	2,94

CONCLUTION

Findings indicated that most pre-service teachers were highly interested in using the Algodoo for teaching physics. According to the participants, the integration of data acquisition experiments with closely associated computer simulations has proved to be particularly effective in the learning process (Kocijancic & Q'sullivan, 2004). In this study, deemed appropriate and supporting meaningful learning of the simulation program is remarkable. So, we believe that there is considerable additional pedagogical advantage to be gained by the integration of the various CBL tools and concepts available, particularly by integrating "teaching cirriculum" and "virtual" laboratory activities (Podolefsky, Perkins & Adams, 2010; Tatlı & Ayas, 2010; Sarı &Güven, 2013).

RECOMMENDATION

The computer program can be used to enhance the students' motivation toward physics (Şen, 2001). Computer program sometimes provides an alternative solution for solving unobserved phenomena. Algodoo is one program that can be operated in various physical phenomena. It provides fluid simulation so it can be utilized for explaining the Archimedes' principle to the students. By giving attractively demonstration and virtual visualization, it can increase the students' motivation and gain a better understanding toward physics. To gain a better educational service, the teachers and students should improve their English language skills because almost the computer program is operated in English instructional language. And Algodoo should develop their program in order to provide a better and more complete physical simulation.

ÖZET: Teknolojik gelişmelerin hızına yetişmenin oldukça zor olduğu bir dönemde teknolojinin kişiler tarafından nasıl algılandığı ve kullanıldığını araştırmak oldukça zor ve bir o kadarda önemli bir süreçtir. Kullanıcıların akademisyen ya da eğitimci olması bu durumun başka bireyleri de etkileyeceği anlamına gelmektedir. Bu çalışma; Türkiye'de araştırma sayısı oldukça az olan tablet bilgisayarların akademik çevrede nasıl benimsendiği ve kullanıldığı; bunun yanında algıları nasıl yönlendirdiğini ortaya koymayı amaçlamaktadır. Çalışmanın teorik çerçevesini Teknoloji Kabul Modeli (TKM) ve İnsan Bilgisayar Etkileşimi (İBE) oluşturmaktadır. Katılımcılar amaçlı ve kartopu örnekleme yöntemleriyle seçilmiştir. Veriler Süleyman Demirel Üniversitesi'ndeki Tablet PC kullanıcısı bir grup akademisyenden yarı yapılandırılmış görüşme yoluyla toplanmış ve içerik analizine tabi tutulmuştur. Bu görüşmeler genel olarak akademisyenlerin Tablet PC kullanımına yönelik tutum, görüş, beklenti ve tecrübelerini ve diğer PC çeşitleri ile kıyaslamalarını içermektedir. İçerik analizi sonucunda bulgular; Tablet PC alma gerekçeleri, kullanım desenleri (sıklık, ortam, deneyim, amaç), kullanımında karşılaşılan kolaylıklar ve zorluklar, mesleki ve öğretimsel kullanımı, kullanımından doğan performans artışı, kullanımı üzerine düşünceler (verimlilik, memnuniyet, ilk tercih, diğer PC'lere ihtiyaçta azalma), diğer PC çeşitleri ile kıyaslanması, Tablet PC'ye yönelik beklentiler temaları altında düzenlenmiştir.

Anahtar sözcükler: Tablet PC, Akademisyenler, Görüşler, Deneyimler

ABSTRACT: It is a difficult and important process to explore how people perceive, adopt and use technology especially in the era of rapid and constant technological developments. When it comes to academicians or educators as being the users of technology, such process also impacts other users such as students. This qualitative study aimed to reveal how Tablet PCs are being adopted and used and how they shape perceptions in academic environments within the context of higher education. The theoretical framework of the study was grounded on Technology Acceptance Model (TAM) and Human Computer Interaction (HCI). Participants were selected through purposeful and snowball sampling strategies from the academicians working at the Suleyman Demirel University in Isparta, Turkey. The main characteristic that made an academician eligible for participation in the study was being a Tablet PC user. Data were collected from 15 academicians through in-depth semi-structural interviews and analyzed by means of content analysis technique. The interviews generally contain academicians' lived experiences, opinions, attitudes, and expectations germane to Tablet PC use as well as their comparisons' of Tablet PC to other PCs including desktop and laptop computers. The findings were organized under these themes: reason for buying Tablet PC, usage patterns (frequency, context, experience, and purpose), ease and difficulty of use, professional and instructional use, perceived performance increase due to its use, opinions and expectations from Tablet PCs, and comparison of Tablet PC to other PCs.

Key words: Tablet PC, Academicians, Opinions, Lived experiences

ÖZET: Bu araştırmada, ortaokul öğrencilerinin matematik öğrenme stilleri ile matematik dersine yönelik tutumları arasındaki ilişkinin veri madenciliği ile belirlenmesi amaçlanmıştır. Araştırmanın kapsamında İzmir, Aydın ve Manisa illerinde öğrenim gören 702 ortaokul öğrencisinin matematik öğrenme stillerini belirlemek amacıyla "Matematik Sınıfta Nasıl Öğrenilir?" ölçeği ve matematik dersine yönelik tutumlarını ölçmek amacıyla tutum ölçeği uygulanmıştır. Veri madenciliği yöntemlerinden karar ağaçları ve birliktelik kuralları kullanılmıştır. Ayrıca ağ grafiği kullanılarak değişkenler arasındaki ilişki görselleştirilmiştir. Oluşturulan C5.0 karar ağacında öğrenme stillerini belirlemede en önemli değişkenin matematik dersine yönelik tutum olduğu görülmüştür. Birliktelik Kurallarından Apriori uygulanarak %76 güvenirlik ile anne ve baba eğitim düzeyleri ortaokul olan kız öğrencilerin açıklayıcı öğrenme stiline sahip oldukları gözlenmiştir. Matematik dersine yönelik tutum ile matematik öğrenme stilleri arasındaki ağ grafiği incelendiğinde ise en kuvvetli ilişkinin açıklayıcı öğrenme stili ile matematik dersine yönelik çok yüksek düzeyde tutuma sahip öğrenciler arasında olduğu görülmektedir.

Anahtar sözcükler: Matematik öğrenme stilleri, matematik dersine yönelik tutum, eğitimsel veri madenciliği

ABSTRACT: The aim of this study is examining the relationship between middle school students' mathematic learning styles and their attitudes towards mathematic lesson with data mining. 'How do I actually learn?' inventory and attitude scale was applied to 702 middle school students studying in İzmir, Aydın and Manisa. Data mining techniques such as decision tree and assosication rules were implemented. Furthermore web graph was used for visualition of relationship between mathematic learning styles and attitude towards mathematic lesson. Constructed decision tree models with C5.0 algorithm revealed that attitude towards mathematic lesson was the most important attribute to identify learning style. Using assosication rules, several rules are constructed with %76 confidence. In network graph, it was found that the strongest relationship was between açıklayıcı learning style and very high level attitude towards mathematic lesson.

Key words: Mathematic learning styles, attitude towards mathematic lesson, educational data mining

GİRİŞ

Öğrenme süreci tüm bireyler için aynı değildir. Öğrenmeyi yönlendiren fiziksel yollar her birey için değişebilen süreçlerin oluşmasına yol açmaktadır. Her öğrenci öğrenirken ya da hatırlamaya çalışırken kendine ait bir yol izler, öğrenme esnasında takip ettiği bu yola öğrenme stili denir. Bilgiyi alma ve işleme sürecinde her öğrenci, farklı yollar kullandığı için, farklı öğrenme stillerine sahip olur. Örneğin, bir kısım öğrenciler, olaylar ve simgelere yoğunlaşırken, bazıları da kuramlar ve matematiksel modellerde daha rahattırlar. Öğrencilerin bazısı resimler, diyagramlar, şemalar gibi görsel uyaranlara daha güçlü tepki gösterirken, diğerleri daha çok yazılı ve sözlü açıklamaları içeren sözel formları tercih eder. Bazı öğrenciler, aktif ve etkileşimli bir şekilde öğrenmeyi tercih ederken, bazıları daha kişisel ve kendi duyguları ışığında öğrenmeyi tercih eder (Felder, 1996) Farklı dersler açısından öğrencilerin öğrenme stilleri hakkında bilgi sahibi olmak öğrencilere öğretim esnasında nasıl yaklaşılacağı açısından önemlidir. Bu çalışmadan da anlaşılacağı gibi matematiği öğrenirken bireyler farklı öğrenme stillerinden yararlanırlar. Bu araştırmada veri toplama aracı olarak kullanılan "Matematik Sınıfta Nasıl Öğrenilir?" ölçeğinde dört farklı öğrenme stili ile ilgili sorular bulunmaktadır. Bu öğrenme stilleri şunlardır: Açıklayıcı öğrenme, sorgulayıcı öğrenme, çabalayıcı öğrenme ve kullanımcı öğrenme.

- **Açıklayıcı öğrenme:** Bu öğrenme stiline sahip bireyler matematiği en iyi; sınıf çalışmalarında sorulara yanıt vererek, arkadaşlarının sorularına yanıt vererek ve arkadaşlarına konuyu anlatarak öğrenirler.
- **Sorgulayıcı öğrenme:** Bu öğrenme stiline sahip bireyler matematiği en iyi; öğretmene kendi düşüncelerine aynen katılıp katılmadığını sorarak, konuların birebir açıklamasını öğretmenden isteyerek, arkadaşlarına düşüncelerine katılıp katılmadığını sorarak ve arkadaşlarından konuların açıklanmasını isteyerek öğrenirler.
- **Çabalayıcı öğrenme:** Bu öğrenme stiline sahip bireyler matematiği en iyi; problemleri derste çözerek, problemleri diğer öğrencilerle çözerek, kendi başına çalışarak ve çözümleri yazarak öğrenirler**.**
- **Kullanımcı öğrenme:** Bu öğrenme stiline sahip bireyler matematiği en iyi; hesap makinesi (bilgisayar vb.) kullanarak, işlemleri hesap makinesinde/bilgisayarda deneyerek ve bütün sınıf çalışmaları boyunca öğretmeni dinleyerek öğrenirler.

Bireylerin kendi öğrenme stillerinin farkında olarak öğrenme-öğretme sürecinde bulunmalarının sağlanması ve akademik başarı, özgüven gibi özelliklerinin geliştirilebilmesi için, küçük yaşlardan başlayarak öğrenme stili özelliklerinin belirlenmesi gerekmektedir. Öğrencilerin bir dersten başarılı olmalarını etkileyen faktörlerden bir diğeri ise öğrencilerin iyi çalışma, tutum ve alışkanlıklarına sahip olmalarıdır (Küçükahmet, 2000). Belirli nesne, durum, kurum, kavram ya da diğer insanlara karşı öğrenilmiş, olumlu ya da olumsuz tepkide bulunma eğilimi (Tezbaşaran, 1996) olarak tanımlanan tutumlar öğrenme süreci sırasında ortaya çıkan duygularla başa çıkma ve kontrol altına alma ile ilgili olup, insan davranışlarına yön vermede önemli bir role sahiptir. Bir değer ve inanç sistemine bağlı olarak oluşan tutumların olumlu ya da olumsuz olması öğrenme sürecini doğrudan etkilemekte ve bireylerin gelecekteki yaşantılarına yön vermektedir (Seferoğlu, 2004; Sünbül ve diğerleri, 2004). İlköğretim basamağından başlayarak gerçekleştirilecek öğrenme stillerini belirleme çalışmaları ile öğrencilerin derslerde daha başarılı olmaları sağlanırken, kimi derslerde öğrenmeye ilişkin olumsuz yaşantılarla karşılaşmalarının önüne geçilebilir.

Araştırmada, ortaokul öğrencilerinin matematik öğrenme stilleri ile matematik dersine yönelik tutumları arasındaki ilişkinin veri madenciliği teknikleri kullanılarak belirlenmesi amaçlanmıştır. Veri madenciliği, veriyi farklı açılardan analiz etmeyi ve bu veriyi kullanışlı bilgiye dönüştürerek özetlemeyi sağlayan veri analizi metodudur. Eğitimsel veri madenciliği ise eğitimsel veri tabanlarından elde edilen veriye, eğitimsel amaçlar doğrultusunda veri madenciliği yöntemlerinin uygulanmasıyla ortaya çıkan bir araştırma alanıdır.

Uygulamaya yönelik bakış açısı ile bakıldığında eğitimsel veri madenciliği, örneğin, eğitimsel sistemleri değerlendirmeye yardımcı olmak için öğrencilerin kullanılabilir verilerine dayalı yeni bilgiler keşfetmeye ve eğitim kalitesini bazı yönlerden potansiyel olarak geliştirmeye ve daha etkili bir öğrenme süreci için altyapı hazırlamaya izin verir. (Romero, Ventura&Bra, 2004).

Ortaokul öğrencilerinin matematik öğrenme stilleri ile matematik dersine yönelik tutumları arasındaki ilişkinin veri madenciliği ile belirlenmesi kapsamında aşağıdaki problem ve alt problemlere yanıt aranmıştır:

Problem cümlesi: Ver madenciliği ile incelendiğinde, ortaokul öğrencilerinin matematik öğrenme stili ile matematik dersine yönelik tutumları arasındaki ilişkiler nasıldır?

Alt problemler:

1. Ortaokul öğrencilerinin matematik öğrenme stillerinin dağılımı nasıldır?
2. Ortaokul öğrencilerinin matematik dersine yönelik tutum düzeyleri nelerdir?
3. Ortaokul öğrencilerinin matematik öğrenme stili ile matematik dersine yönelik tutum düzeyleri arasındaki ilişkiler, veri madenciliğinin karar ağaçları ve birliktelik kuralları yöntemleri ile incelendiğinde nasıl belirlenmekte ve ağ grafiği ile gösterimi nasıl olmaktadır?

YÖNTEM

Araştırmanın modeli

Araştırma betimsel nitelikte olup, ortaokul öğrencilerinin bulundukları matematik öğrenme stili boyutunun matematik dersine yönelik tutumlarının ve bunların bazı değişkenlerle ilişkisinin belirlenmesi amacıyla yapılan

Survey (Tarama) Modeli'nin bir alt yöntemi olan ilişkisel tarama kullanılmıştır. İlişkisel tarama yöntemi, en az iki durum ya da değişken üzerindeki korealasyonu ortaya koymada kullanılan araştırma modelidir. (Karasar,1998)

Evren ve örneklem

Araştırmanın evrenini 2013-2014 eğitim öğretim yılında Aydın ili Köşk ilçesinde bulunan ortaokullarda öğrenim gören 5.,6.,7. ve 8. sınıf öğrencileri, örneklemini ise random yoluyla belirlenen dört ortaokulda öğrenim gören 702 ortaokul öğrencisi oluşturmuştur.

Veri toplama araçları

Çalışmada, verilerin toplanması aşamasında öğrencilerin öğrenme stillerini belirlemek için, Forster (1999) tarafından geliştirilen, dört öğrenme stilini temsil eden toplam 22 maddeden oluşan 5'li likert tipi "Matematik Sınıfta Nasıl Öğrenilir ?" ölçeğinden yararlanılmıştır. Öğrencilerin matematik dersine yönelik tutumlarını ölçmek için ise geçerliliği ve güvenilirliği yapılmış Aşkar (1986) tarafından geliştirilen 5'li likert tipi tutum ölçeği kullanılmıştır. Araştırmaya katılan öğrencilerin demografik özelliklerini belirlemek amacıyla ölçeğin üst kısmına bir bölüm eklenmiş ve bu bölümdeki sorular yardımıyla öğrencilerin cinsiyet, sınıf düzeyi, okul öncesi eğitimi alıp almama, anne ve baba eğitim düzeyleri gibi özelliklerine ulaşılmıştır.

Veri çözümleme teknikleri

Elde edilen veriler SPSS paket programı ve SPSS Clementine programları ile analiz edilecektir. Clementine veri madenciliği uygulamaları için SPSS tarafından geliştirilmiş görsel modelleme aracıdır. Clementine farklı veri kaynaklarına ulaşıma olanak sağlayan, modelleri hızlı bir şekilde oluşturma ve karşılaştırma olanaklarıyla ön plana çıkan yazılımdır (Aydın, 2007).

BULGULAR

Ortaokul öğrencilerinin matematik öğrenme stilleri ve matematik dersine yönelik tutumlarının farklı bağımsız değişkenler de dahil edilerek incelenmesinden elde edilen bulgulara yer verilmiştir. Bu değişkenler cinsiyet, sınıf seviyesi, okul öncesi eğitimi alma durumu, anne ve baba eğitim düzeyleridir. Alt problemlere yönelik araştırma bulguları aşağıda verilmiştir:

1. Alt probleme ilişkin bulgular

Ortaokul öğrencilerinin matematiksel öğrenme stilleri dağılımı incelendiğinde öğrencilerin en çok açıklayıcı öğrenme stiline (41,6%), en az ise kullanımcı öğrenme stiline (6,4 %) sahip oldukları görülmektedir.(Tablo 1)

Tablo 1 Ortaokul Öğrencilerin Matematiksel Öğrenme Stili Dağılımları

	Matematiksel Öğrenme Stili					**Toplam**
	Çift Stil	**Açıklayıcı**	**Kullanımcı**	**Çabalayıcı**	**Sorgulayıcı**	
Öğrenci Sayısı	84	292	45	46	235	**702**
Öğrenci Yüzdeleri	12,0%	41,6%	6,4%	6,6%	33,5%	**100%**

2. Alt Probleme İlişkin Bulgular

Ortaokul öğrencilerinin matematik dersine yönelik tutum dağılımı incelendiğinde öğrencilerin en çok çok yüksek tutuma (39,3%), en az ise çok düşük tutuma (1,1 %) sahip oldukları görülmektedir.(Tablo 2)

Tablo 2 Ortaokul Öğrencilerin Matematik Derine yönelik Tutum Dağılımları

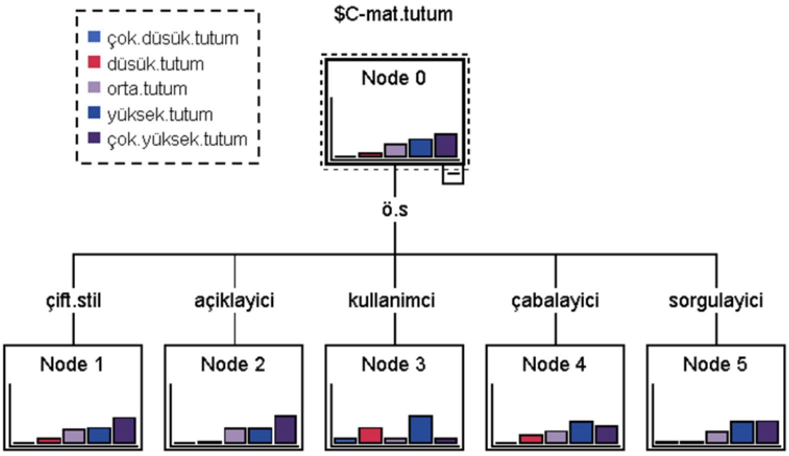
	Matematik Dersine Yönelik Tutum					**Toplam**
	Çok Düşük Tutum	Düşük Tutum	Orta Tutum	Yüksek Tutum	Çok Yüksek Tutum	
Öğrenci Sayısı	**8**	**45**	**153**	**220**	**276**	**702**
Öğrenci Yüzdeleri	1,1%	6,4%	21,8%	31,3%	39,3%	100%

3. Alt probleme ilişkin bulgular

Ortaokul öğrencilerinin matematik öğrenme stilleri ile matematik dersine yönelik tutumları arasındaki ilişkinin incelenmesinde veri madenciliği tekniklerinden karar ağaçları ve birliktelik kuralları kullanılmıştır. Ayrıca web ağı kullanılarak aralarındaki ilişki görselleştirilmiştir.

Karar ağacı

Karar ağacı ağaç yapısına benzer bir akış şemasıdır. Bu şemada her bir düğüm bir bağımsız değişken üzerinde testi, her bir dal test sonucunu ve ağacın yaprakları ise sınıfları gösterir (Garg & Sharma, 2013). Karar ağacı oluşturulurken veri tekrarlı bir biçimde daha küçük alt kümelere bölünür. Her bir bölmede en uygun bağımsız değişkenin seçimi önemli bir konudur. Burada bağımlı değişkene göre en homojen alt kümeyi oluşturan bölme seçilmiş olmalıdır. Bölme süreci daha uygun bir bölme kalmayana kadar devam eder (Güntürkün, 2007).



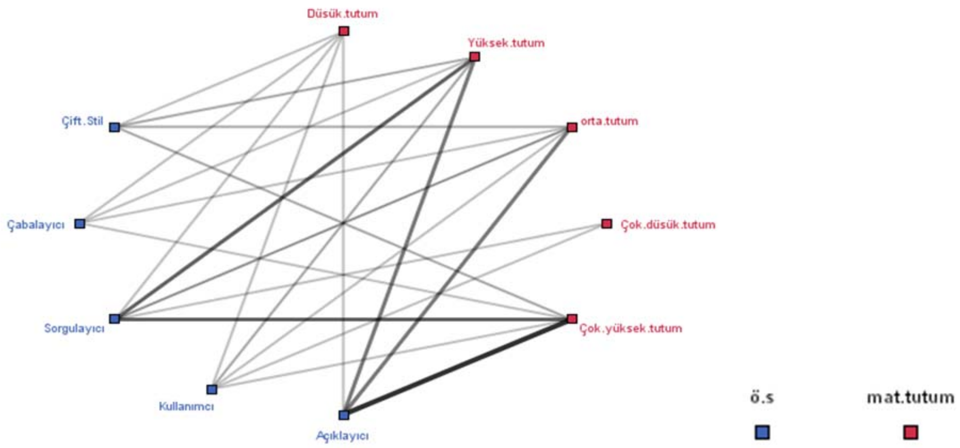
Şekil 1 Matematik Dersine Yönelik Tutum Ve Matematik Öğrenme Stili C5.0 Karar Ağacı

Matematik dersine yönelik tutum bağımlı değişken ve matematik öğrenme stili bağımsız değişken kabul edilerek oluşturulan C5.0 karar ağacında son düğümdeki frekanslar grafiksel olarak gösterildiğinde matematiksel tutumun öğrenme stiline göre farklılaştığı, açıklayıcı ve çift öğrenme stiline sahip öğrencilerin matematik dersine yönelik tutumunun çok yüksek düzeyde olduğu görülmektedir.(Şekil 1)

Cinsiyet, sınıf seviyesi, okul öncesi eğitim alma durumu, anne-baba eğitim düzeyi ve matematik dersine yönelik tutum değişkenleri kullanılarak matematik öğrenme stilinin belirlenmesi için oluşturulan C5.0 karar ağacında ise en etkili değişkeni gösteren ilk dallanmanın matematik dersine yönelik tutum olduğu; matematik dersine yönelik tutumun belirlenmesinde ise en etkili değişkenin sınıf seviyesi olduğu belirlenmiştir.

Ağ grafiği

Ağ grafiği, değişkenler arasındaki ilişkinin gücünü gösteren grafik türüdür. İki değişken arasındaki çizginin kalınlığı o iki değişken arasındaki ilişkinin kuvvetini gösterir. Şekil 2'de matematik öğrenme stilleri ile matematik dersine yönelik tutum düzeyleri arasında oluşturulan ağ grafiği incelendiğinde en kuvvetli ilişkinin açıklayıcı öğrenme stili ve çok yüksek düzeyde matematik dersine yönelik tutuma sahip öğrenciler arasında olduğu görülmektedir. Ağ grafiğinde duyarlılığın azaltılması ile sadece ilişki gücü yüksek olan değişkenler arasındaki ilişkiyi görmek mümkün olmaktadır.



Şekil 2 Matematik Öğrenme Stilleri ve Matematik Dersine Yönelik Tutum Düzeyleri Arasındaki İlişki Ağ Grafiği

Birliktelik kuralları

Birliktelik kuralları verideki güçlü birliktelik özelliklerini tanımlayan örüntüleri keşfetmek için kullanılan bir analiz yöntemidir. Keşfedilmiş örüntüler özel olarak çıkarılan kurallar veya özellik alt grupları şeklinde temsil edilebilir (Aydın, 2007). Sol kısım öncül veya koşul olarak adlandırılırken sağ kısımda bağlı koşul olarak adlandırılır. Buradaki genel form IF-THEN ilişkisi ile ifade edilmektedir. IF<önkoşul> THEN<bağlı koşul> şeklinde gösterilebilir. Birliktelik kuralında değişkenler arasındaki bağıntı destek ve güven kriteri ile hesaplanmaktadır. Destek kriteri, veride öğeler arasındaki ilişkinin ne kadar sık olduğunu, güven kriteri ise A öğesinin hangi olasılıkla B öğesi ile beraber olduğunu ifade etmektedir. İki öğenin birlikteliğinin önemli olması için hem destek hem de güven kriterinin yüksek olması gerekmektedir (Han & Kamber, 2006). Birliktelik kurallarında 1'in üzerindeki lift değeri ise değişkenler arasında kuvvetli ilişkileri gösterir (Pandey & Pal, 2011). Bu çalışma kapsamında birliktelik kuralları için apriori algoritması kullanılmıştır.

Consequent	Antecedent	Support %	Confidence...	Lift
ö.s = açiklayici	sinif = 8,00 mat.tutum = çok.yüksek.tutum cinsiyet = erkek babaegitimdüzeyi = ilkokul anneegitimdüzeyi = ilkokul	5.413	76.316	1.835

Şekil 3 Matematiksel Öğrenme Stili, Matematiksel Tutum ve demografik Değişkenler Arasında Birliktelik Kuralları

Sınıf seviyesi, cinsiyet , anne baba eğitim düzeyi, okul öncesi eğitim alma durumu gibi demografik değişkenleri ile matematik tutumunun ön koşul ve matematik öğrenme stili değişkeninin bağlı koşul olarak alındığı en az %75 güvenirlik seviyesindeki birliktelik kuralları analizi sonuçlarına göre çok yüksek seviyede matematiksel tutuma sahip ve anne-baba eğitim düzeyi ilkokul olan 8. Sınıf erkek öğrencilerin yaklaşık olarak %76 'sının matematiksel öğrenme stilinin açıklayıcı olduğu ve bu öğrencilerin örneklem grubumuzun yaklaşık olarak %5,4'üne karşılık geldiği, görülmektedir. (Şekil 3)

SONUÇ ve ÖNERİLER

Araştırmada ortaokul öğrencilerinin matematik öğrenme stilleri ile matematik dersine yönelik tutumlarının veri madenciliği ile incelenmesi amaçlanmıştır. Bu amaç doğrultusunda öncelikle öğrencilerin matematik öğrenme stilleri ve matematik dersine yönelik tutum düzeyleri dağılımı incelenmiştir. Buna göre ortaokul öğrencilerinin matematik öğrenme stillerinden en çok açıklayıcı, en az ise kullanımcı öğrenme stilini tercih ettikleri görülmüştür. Bu durum öğrencilerin çoğunun bütün sınıf çalışmaları boyunca öğretmeni dinlemek yerine sorulara yanıt vererek ve arkadaşlarına anlatarak öğrenmeyi tercih ettiği şeklinde yorumlanabilir. Ortaokul öğrencilerinin matematik dersine yönelik tutum düzeylerinden ise 'çok yüksek tutum' frekansının en yüksek olduğu bulunmuştur. Bu sonuç ilköğretim 4, 5, 6, 7 ve 8.sınıf öğrencilerinin matematik dersine yönelik tutum puanlarının düşük olduğu yönünde bulgulara rastlayan Akın (2002)'nın sonuçları ile farklılık göstermektedir.

Matematiksel öğrenme stiline bağlı olarak matematik dersine yönelik tutum için oluşturulan karar ağacı matematiksel tutumun öğrenme stiline göre farklılaştığı, açıklayıcı ve çift öğrenme stiline sahip öğrencilerin matematik dersine yönelik tutumunun çok yüksek düzeyde olduğu görülmektedir. Ağ grafiği bu sonucu desteklemekte ve en kuvvetli ilişkiyi gösteren en kalın çizginin açıklayıcı öğrenme stili ile çok yüksek tutum düzeyi olduğu görülmektedir. Sonuç olarak arkadaşlarına konuyu anlatarak ve sorulara yanıt vererek öğrenmeyi tercih eden öğrencilerin matematik dersine yönelik tutum düzeylerin arttığı yorumu yapılabilir. Matematik dersine yönelik tutumun öğrenme stillerine göre değişiklik göstermesi Albayrak(2008)'in farklı öğrenme stiline sahip öğrencilerin en az iki grubunun matematiğe karşı tutum puanı ortalamaları arasında anlamlı fark bulduğu çalışması ile örtüşmektedir.

Ortaokul öğrencilerinin bazı demografik özellikleri ve matematik dersine yönelik tutum değişkenleri kullanılarak matematik öğrenme stilinin belirlenmesi için karar ağacı oluşturulduğunda ise en etkili değişkeni gösteren ilk dallanmanın matematik dersine yönelik tutum olduğu; matematik dersine yönelik tutumun belirlenmesinde ise en etkili değişkenin sınıf seviyesi olduğu belirlenmiştir. Öğrencilerin sınıf düzeyi ilerledikçe ve matematiğe ilişkin yaşantıları arttıkça matematiğe yönelik tutumda düşme olduğunu tespit eden diğer araştırmacıların (Baykul, 1990; Hannula, 2002; Taşdemir, 2009) bulgularıyla örtüşmektedir.

Öğrenme stilleri ile tutum ve demografik değişkenler arasındaki birliktelik kuralları analizi sonuçlarına göre çok yüksek seviyede matematik dersine yönelik tutuma sahip ve anne-baba eğitim düzeyi ilkokul olan 8. Sınıf erkek öğrencilerin yaklaşık olarak %76 'sının matematiksel öğrenme stilinin açıklayıcı olduğu ve bu öğrencilerin örneklem grubumuzun yaklaşık olarak %5,4'üne karşılık geldiği, görülmektedir.

Sonuç olarak, öğrencilerin farklı öğrenme stillerine sahip olabildikleri görülmektedir. Bu nedenle, matematik öğretmenlerinin öğrenme stilinin önemine inanması, temellerini içselleştirmesi gerekir. Bu yolla öğrenme stiline dayalı öğrenme süreci tasarlamaları ve geliştirmeleri gerçekleşebilir. Öğretmenlerin sınıf içerisindeki tüm öğrencilerine ulaşabilmeleri için onların öğrenme stillerinden haberdar olmaları gerekir. Öğrencilerin matematik öğrenme stillerini dikkate alarak düzenlenmiş sınıf ortamlarının, öğrencilerin büyük kısmının önyargılı olarak yaklaştığı matematik dersine yönelik tutumlarını olumlu yönde geliştireceği açıktır. Derse yönelik tutumunda öğrencilerin derslerdeki başarılarını etkileyen bir etmen olduğu unutulmamalıdır.

PROJECT MATHS IN IRELAND: THE EFFECT ON INTERNATIONAL STUDENTS

Mark PRENDERGAST
Dublin Institute of Technology
mark.prendergast@dit.ie

ABSTRACT: Project Maths is an ambitious reform of Irish post-primary education. It involves changes to what students learn in mathematics, how they learn it and how they will be assessed. There is a much greater emphasis placed on student understanding of mathematical concepts, with increased use of contexts and applications that will enable students to relate mathematics to their everyday experiences. The assessment reflects the different emphasis on problem solving and applications in the teaching and learning of mathematics and there is a much greater emphasis on reading and understanding the problems. Hence there is a greater emphasis on student's English language proficiency. This study aims to investigate the effect of Project Maths on International students studying in Ireland who do not speak English as their first language.

Key words: Project Maths, International Students, Language and Mathematics

INTRODUCTION

In Ireland formal education takes place in three stages. After completing eight years of primary education all students progress to the second level system. Second level education is typically of six years and during this time students complete two main State examinations namely the Junior Certificate (JC) and the Leaving Certificate (LC) examinations. These examinations can be taken at three levels with the upper level referred to as Higher, the next level referred to as Ordinary, and the lowest level that can be taken referred to as Foundation. Students can gain entry to Higher Education Institute's (HEI's) depending on how well they perform in the LC examinations. In this system the importance of mathematics is recognised by students, teachers and policy makers alike. Its inclusion as a compulsory subject in schools has widespread support (National Centre for Curriculum and Assessment (NCCA), 2005a) and students who achieve at least a D3 in Higher level LC mathematics examinations are awarded bonus marks (Central Applications office (CAO) - www.cao.ie).

However despite this importance, numerous concerns have been highlighted throughout the literature in recent years regarding mathematics educational strategy in Ireland. These concerns include class time, class and teacher allocation, difficult content, traditional assessment and an out of date curriculum (Prendergast and O'Donohue, 2014). Until recently, changes to this curriculum had not taken place since the 1960's when, even then, a major review of the Irish mathematics syllabuses at second level was undertaken highlighting *"mathematical structures, abstraction and rigorous presentation"* (Oldham, 1993 as cited in Lyons et al., 2003:5). These syllabuses resulted in a highly didactic and procedural approach to mathematics teaching in Ireland (NCCA, 2005b). There was a formal, behaviourist style evident that consisted of whole class teaching and the repetition of skills and procedures demonstrated by the teacher (Morgan and Morris, 1999). This resulted in students learning the 'how' rather than the 'why' of mathematics (Prendergast and O'Donoghue, 2014). There was little or no emphasis on students' understanding the mathematics they were taught or indeed relating it to everyday life (Lyons et al., 2003). These concerns were compounded by the low numbers of students studying Higher level mathematics. For example in 2010, figures show that only 45 per cent of the Junior Cycle cohort took the JC Higher level mathematics' examination (State Examinations Commission (SEC) - www.examinations.ie). More worryingly only 16 per cent opted for the Higher level LC examination (SEC- www.examinations.ie). These figures are also very low in comparison to other subjects. For example, in the same year 68 per cent of students took Higher Level English in the JC examination, while 64 per cent took Higher level English in the LC examination (SEC- www.examinations.ie). To further compound this problem, 10 per cent of students failed Ordinary level mathematics in their LC examination in 2010 (SEC- www.examinations.ie).

As a result of such poor performance in mathematics by second level students, concern is widespread in many Irish HEI's regarding the mathematical under - preparedness of their entrant's. This does not just affect mathematics courses, but also impacts on other courses such as science, technology, engineering, business and finance where mathematics provides an important basis for development. This has serious repercussions for the

Irish economy, particularly in relation to the technology and industrial sectors (Expert Group on Future Skills Needs (EGFSN), 2008).
The Irish Government has been under increased pressure to take action as a result of such concerns. There was a stark realisation that the syllabuses and teaching methods were inadequate in providing students with the skills and knowledge which the twenty first century requires. Mathematics teaching today must emphasise the process of learning, applications of mathematics to the everyday world and problem solving (NCCA, 2005b). In order to achieve this aim and help solve the 'maths problem', the Irish Government have introduced a major new initiative in second level schools called Project Maths.

Project Maths

Project Maths overall aim is to teach mathematics in a way which leads to real understanding (Department of Education and Skills (DES), 2010a). It involves changes to what students learn in mathematics, how they learn it and how they will be assessed (www.projectmaths.ie). The initiative is designed to ensure an appropriate balance between understanding mathematical theory and concepts and developing practical applications skills. There is a much greater emphasis placed on student understanding of mathematical concepts, with increased use of contexts and applications that will enable students to relate mathematics to their everyday experiences. The focus is on students understanding the concepts involved, building from the concrete to the abstract and from the informal to the formal, and learning to apply their knowledge in familiar and unfamiliar contexts (DES, 2010a).

The Junior and Senior Cycle syllabuses are divided into five strands namely, Statistics and Probability; Geometry and Trigonometry; Number; Algebra; and Functions. After an initial pilot phase beginning with 24 schools in 2008, it was rolled out nationally in 2010. Changes are being phased in over a number of years covering all 5 strands of mathematics, with assessment in the examinations being adapted as each strand of mathematics comes on stream. The assessment reflects the different emphasis on problem solving and applications in the teaching and learning of mathematics and there is a much greater emphasis on reading and understanding the problems. It is an objective of Project Maths to increase the uptake of Higher level mathematics at LC to 30 per cent and to 60 per cent at JC (Cosgrove et al., 2012). While Strands 1 and 2 of the revised syllabi were first examined in 2012 at LC level in all schools, the phased implementation means that it will be 2017 before a first cohort of students who have experienced all 5 strands of Project Maths from 1st to 6th year will be examined. Thus it is very early to make any conclusions regarding the successes / failures of the initiative. However, an interim report commissioned by the NCCA and conducted by the National Foundation for Educational Research (NFER, UK) has been published and includes findings on students' attitudes and achievements. Overall this report found that there is emerging evidence of the positive impacts of Project Maths on students' experiences of, and attitudes towards, mathematics (Jeffers et al., 2013). Furthermore, students' are achieving more at individual strand level, and in some instances students appear to be successfully drawing together their knowledge across different mathematics topics (Jeffers et al., 2013). This suggests that students are beginning to acquire a deeper understanding of mathematics and how it can be applied (Jeffers et al., 2013).

However, despite such emerging evidence of the positive impacts on students' experiences of, and attitudes towards, mathematics, many challenges remain for Project Maths. The majority of these challenges centre on the manner of the implementation process and the availability of teaching and learning resources. However concern has also been expressed regarding the perceived literacy demands of the revised mathematics syllabus (Cosgrove et al., 2012; Jeffers et al., 2013). Such concerns highlight the importance of language and literacy in the teaching and learning of mathematics.

Language and Mathematics

Mathematics can be recognised as a language in its own right, a language which has its own vocabulary, grammar, symbols and punctuation (Ellerton and Clarkson, 1996). The teaching of mathematics, however, takes place within a spoken language, such as English (Zevenbergen, 2001). This spoken language is an essential element of the teaching and learning of the subject (Gorgorió & Planas, 2001). It is the vehicle of communication within a mathematics classroom and provides the tool for teacher – student interactions (Smith and Ennis, 1961). Language permits mathematics learners to ask and answer questions, to convey their understanding and to discuss their answers with others. It also plays a significant role in the processing of mathematical text and the interpretation of questions (Hoosain, 1991). This is now particularly relevant in Ireland with the introduction of Project Maths where there is far greater emphasis solving word problems and applications. Students are required to translate every day problems into mathematics, solve them and then clarify their answers in the context of the original problem. Many teachers feel that students with low literacy levels and particularly non – national students for whom English is not a first language are struggling with comprehension of this material and the wordy nature of some of the questions (Cosgrove et al., 2012). '*the language used when phrasing a question poses a major problem for students whose literacy skills would be weak, they can therefore not answer a question they are mathematically capable of doing! This is a major issue!'* (Cosgrove et al., 2012:72). Many students (including those studying at Higher Level) have also expressed difficulties interpreting word based problems and with providing written explanations for their solutions to mathematical problems (Jeffers et al., 2013). Students also appear to lack confidence when asked to draw conclusions from a considerable amount of written information (Jeffers et al., 2013).

THE STUDY

Approximately 1.7 million students, almost half of whom are from non – English speaking developing nations in Asia, cross borders every year to acquire a foreign education (Sawir, 2005). In Ireland, the percentage of international students has increased from 3 per cent in 2002 to 10 per cent in 2012 (Perkins et al., 2013). The Government aims to increase this further as it bids to promote the internationalisation of the Irish Higher Education sector and to significantly increase the proportion of fee paying international students as a means to diversify the income base for HEI's (DES, 2010b). This need to diversify the income base of institutions was further restated in the Hunt Report specifically referencing income generated from the recruitment of fee paying international students (Hunt, 2011). However, the increased arrival of international students has also coincided with the introduction of Project Maths in second level schools and its high emphasis on literacy and the English language. Of the 10 per cent of students in Ireland classified as international, about half speak languages other than Irish or English at home (Perkins et al., 2013). This research aims to investigate the effect (if any) which Project Maths has on International students and to view the initiative from their perspective.

METHODS

The authors decided to use a mixed method approach by combining both qualitative and quantitative methods of research. The use of multiple methods was decided upon in order to get an in-depth understanding of the research. The study evaluates International student's opinions of Project Maths and compares their scores in a traditional style mathematics examination with their scores in a Project Maths style examination.

Participants

The participants for this study comprised of 41 International students who were enrolled in an International Foundation Programme in an Irish HEI. Mathematics is one of six core year-long subjects that all students are required pass, along with two elective choices, in order to complete the programme. Upon successful completion of the programme, students are granted direct entry onto an undergraduate programme of their choice in the HEI. The aim of the programme is to equip them with the skills to meet the minimum entry requirements of such undergraduate programmes. All of the students who participated in the study originated from either Saudi Arabia or Oman and all spoke Arabic as their first language. Thus for many of these students, the main skills required involve improving their English language proficiency. This proficiency is measured using the International English Language Testing Score (IELTS). The IELTS is an internationally standardised 9-band scale. Each band corresponds to a level of English competence. All parts of the test (listening, reading, writing, speaking) and the Overall Band Score can be reported in whole and half bands, for example 6.5, 7.0, 7.5, 8.0.

In order to gain entry onto the Foundation Programme students must have an IELTS of at least level 5.0 or one whole band below the entry requirements of their undergraduate destination. Students with an IELTS of 5 are defined as modest English language users (www.ielts.org). They should have a partial command of the language, and although they are likely to make many mistakes, they should be able to cope with the overall meaning in most situations. Students with an IELTS of 6 are defined as competent English language users (www.ielts.org). They should have a generally effective command of the language despite some inaccuracies and misunderstandings. They should be able to use and understand fairly complex language, particularly in familiar situations. 58.5 per cent of the students who participated in this study had an overall IELTS of 5 and 24.4 per cent had an overall IELTS of 5.5. The remaining students had an overall IELTS of between 6 and 7.5.

The participants were predominately male (80 per cent) and ranged in age from 18 – 24 years old. 61 per cent of the participants were aged between 18 – 19 years old. All of the data was collected by the author in September 2013 in the participants first academic week of the programme.

Quantitative Data

In order to get a quantitative measure on the effect of Project Maths on International students the author decided to compare the scores of students in Project Maths style examination (Exam A) with their scores in a traditional style mathematics examination (Exam B). Each examination comprised of ten questions from the Junior Cycle Number strand and each question was taken from Irish second level textbooks and previous State examination papers. Students had 50 minutes to complete each examination. The questions in Exam A were based on the Project Maths method of assessment and thus reflected the emphasis on understanding, problem solving and applications. The questions in Exam B were technically the same questions from Exam A but were mathematical procedure and skill based only with the removal of any context or language. For example:

Exam A - Question 3
Usain Bolt, the fastest man on earth, has a stride length of $2\frac{4}{5}$m when he is at full stride. In a 100m sprint, how many strides would Usain take to cover the final 30m when he is at full stride?

Exam B - Question 3
Evaluate $30 \div 2\frac{4}{5}$

Students completed Exam A first and then Exam B directly afterwards. Ten marks were awarded per question. Both examinations were corrected by a qualified Irish second level mathematics teacher who has six years experience in correcting State examinations. Each student received a mark out of 100 for each examination.

At the end of Exam B, there were also three closed ended questions which all participants were invited to answer. The questions enquired about which examination the participants preferred; which examination did they find more difficult; and whether their English language skills had negativity affected their ability to answer questions in either of the exams. These questions were further expanded upon more in the focus group.

Qualitative Data

In order to get feedback regarding International student's opinions of Project Maths, a focus group was conducted with eight students who volunteered from the examination participants. This focus group was conducted two days after the students completed the examinations. The quantitative findings from the examinations and closed ended questions were considered. Each student was coded to ensure confidentially (P1 – P8). Their responses were transcribed and analysed using NVivo software and arranged into themes by the author and a mathematics education colleague.

RESULTS AND FINDINGS

Quantitative Data

Descriptive analysis of the data shows that the students performed poorer in Exam A (M: 41.49; SD: 18.06) in comparison to Exam B (M: 63.59; SD: 16.84). A paired– samples t – test found that there was a statistically significant difference in the performance of students in both examinations (t (41) = -9.89, p = .000). Further analysis of the data found that in Exam A, students with an IELTS of 5.5 (M: 52.60; SD: 15.36) performed much better than those with an IELTS of 5.0 (M: 34.08; SD: 16.41). An independent – samples t – test also found that these differences were statistically significant (t (41) = -3.05, p = .005). Such differences were not evident in Exam B where students with an IELTS of 5.5 (M: 67.00; SD: 11.79) and an IELTS of 5.0 (M: 63.45; SD: 14.47) in Exam B performed similarly.

The data collected from the three closed ended questions at the end of Exam B shows that 80.5 per cent of the participants preferred Exam B. 95.1 per cent found Exam A more difficult and 82.9 per cent felt that their English language skills had negatively affected their ability to answer questions in either of the exams.

Quantitative Data

Participants of the focus group gave a number of reasons why the majority of the participants preferred Exam B.
P4: '*because it was straight forward'*.
P6: '*there were no words which I can't understand'*.
P7: *'I didn't have to translate the words; I could understand the method directly by the numbers'*.

However some also gave explanations why they preferred Exam A.
P2: *'it makes you think of the actual situation and it improves our English at the same time. Also, it's more fun than seeing a paper filled with numbers'*.

P3: *'because it helps us improve out language and our reading and it make us understand what we need'.*
P8: *'it gave me the chance to use math in real life'.*

There was a general conclusion amongst participants that Exam A was more difficult. Language and literacy levels were the foremost factors.
P1: *'in Exam A, most of the questions I didn't understand because I didn't know some words. It had hard expressions that an International student who's English is his second language wouldn't be able to understand'.*
P8: '*the questions were written in a different language and that was the hard part. Understanding the question is half if the answer as we say in Arabic'*
P6: *'Sometimes I think I had the solution, but because I did not understand the question, i solved it in the wrong way'.*
P4: *'some of the language was not familiar - the questions were like complicated short stories. Sometimes I could understand the words but found it hard to explain the answer'.*

The allocated time was also consistently mentioned as a factor which made Exam A more difficult.
P3: *'in Exam A there is a lot of reading questions and it takes a long time to solve it especially for non – speaking English student'.*
P8: *'Exam B was just numbers while Exam A was like reading English paragraphs which took more time'.*
P2: *'we need to read the question many times to understand it and that may lose time'.*

Overall their opinion of Project Maths was very positive.
P2: *'I think it is great because you can apply it in your daily use. I would like to see how it turns out because I think it has a bright future and it could change the way of teaching math all over the world'.*
P3: *'I think it is enjoyable and good idea because we will use it in real life or work to solve problems and it helps us to improve our language'.*
P8: *'i think it's a good practice to know how to use math, so the student will be able to solve real life problems using math. It also combines our language skills and our maths skills'.*

However some did express reservations about the difficulty of Project Maths particularly for International students.
P8: *'the questions are more difficult to answer for International students when English is not first language'*
P7: *'it might fail lots of students due to their lack of English'.*
P4: *'it's difficult to understand the language as we are not native speakers. If I have good English I can answer it, if not, I will face some difficult things'.*

Several participants offered suggestions about what could be done to help International students become more accustomed to the changes brought about by Project Maths.
P1: *'Keep the language of the questions basic. Don't use strong language that not everyone can understand'.*
P2: *'I think if there was a class to teach math language and improve our language at the same time. Maybe more projects and discussion to give us more practice in English language in Maths'.*
P7: *'we must improve our language - maybe classes where they just learned math vocab'.*

CONCLUSION

Similar to the findings of the 'Research into the impact of Project Maths on student achievement, learning and motivation' (Jeffers et al., 2013) and 'Teaching and Leaning in Project Maths: Insights from Teachers who Participated in PISA 2012' (Cosgrove et al., 2012) reports, this study highlights concern for non – national students for whom English is not a first language in how they manage the high literacy demands of Project Maths. The heavy emphasis on English language in the problem solving and application questions is difficult for International students. Statistically significant differences were found in the results of student scores in a traditional style mathematics examination with their scores in a Project Maths style examination. There was also statistically significant differences in the scores of students in the Project Maths style examination who had an IELTS of 5.5 compared to those who had an IELTS of 5.0. This shows that student's language levels were a main factor. To support this, 82.9 per cent of participants felt that their English language skills had negatively affected their ability to answer questions in either of the mathematics exams. These findings highlight the importance that language has on the teaching and learning process. A student can have excellent mathematical ability but this is futile unless they can communicate effectively with their teacher and their peers and can competently understand the language in which they are being taught and examined.

RECOMMENDATIONS

This study does not wish to convey negativity towards Project Maths. Indeed, the students of the focus group had very positive opinions of the initiative. However, it does wish to highlight that more needs to be done to cater for non – national students for whom English is not a first language, to ensure that they are not disadvantaged by Project Maths. The number of these students enrolling in Irish HEI's has soared in recent years. It is important that they are given every opportunity to succeed. Further research in this area is needed, but the author feels that Foundation Year Programmes for International students run by Irish HEI's have a major role to play here. These programmes help improve English language skills through traditional classes, tutorials and group work as well as the immersion of students in the day to day life of an Irish HEI. The teaching and assessment of all subjects such as mathematics through English is of great benefit. For mathematical learners, this is twofold. Students gain competence in the language of instruction and also the language of mathematics. Furthermore students enrolled in International Foundation Programmes are introduced to the learning styles which will be expected of them in Irish HEI's. Many students encounter problem solving, applications, discussion and debate for the first time. These are all important components of Project Maths. As mentioned, further research is needed to validate these opinions. The author plans to carry out a longitudinal study to investigate whether international students are better equipped for Project Maths at the end of their year-long Foundation programme and how this helps them make a successful transition to Irish third level education.

ÖZET: Matematiğin temel yapı taşlarından birisi olan ispat, öğrencilerin kavramları daha iyi anlamalarına ve matematiksel düşünce yapılarını geliştirmelerine katkı sağlamaktadır. Matematiksel düşünmede önemli rol oynayan ispat sürecinde, bir önermeyi açıklama, neden doğru veya yanlış olduğunu söyleme ve değişik mantıksal düşünme yollarını ve ispat çeşitlerini seçme ve kullanma gibi eylemler söz konusudur. İspatlar, sadece bir ifadenin doğruluğunu göstermekle kalmaz, aynı zamanda öğrencilerin kavramları daha iyi anlamasına ve matematiksel algı ve anlayışlarının gelişmesine yardımcı olur. Bu bakımdan, ispat süreci matematik öğretim programının ayrılmaz bir parçası olup öğrencilerin bu süreçte, ispat yapma becerilerini kazanmaları gerekmektedir. Bu noktada ise, öğretmenlere önemli bir rol düşmektedir. Öğretmen adaylarının öğrencilerini eleştiren, araştıran, sorgulayan ve muhakeme eden bireyler olarak yetiştirmeleri açısından öğrenim hayatlarında sorgulama ve ispat yapma becerilerini geliştirmeleri önemli görülmektedir. Bu araştırma, öğretmen adaylarının eğitimleri süresince karşılaştıkları ve ileride mesleki yaşamlarında yaygın bir biçimde kullanacakları sayı ve kesirler ile ilişkili bazı temel matematiksel ifadelerin doğruluğu hakkındaki görüşlerini belirlemeyi amaçlamaktadır. Bu amaca yönelik olarak durum çalışması deseni kullanılmış olup, 133 kadın ve 31 erkek olmak üzere toplam 164 öğretmen adayından yapılandırılmış görüşme formlarıyla veri toplanmıştır. Öğretmen adaylarından, görüşme formunda yer alan temel matematiksel ifadelere (Örn: "Her sayının sıfırıncı kuvveti 1'dir; Her sayının sıfıra bölümü tanımsızdır; Üslü sayılarda çarpma işlemi yapılırken üsler toplanır" gibi.) yönelik düşüncelerini gerekçeleri ile birlikte belirtmeleri istenmiştir. Araştırmada elde edilen verilerin analizi sonucunda, öğretmen adaylarının çoğunun temel matematiksel gerçeklikleri sorgulamadıkları ve bu gerçeklikleri ispatlama konusunda da yetersiz oldukları ortaya çıkmıştır. Öğretmen adaylarından bazılarının, ilköğretimden itibaren öğretmenlerinin söylediklerini sorgulamadan ezberlediklerini ifade etmeleri ve bazı ifadelerde sayı kümelerine dikkat etmeden gerekçelendirme sunmaları ilginç bulgular arasındadır. Çalışma sonunda öğretmen adaylarının yorumları incelendiğinde, matematikte temel olan bu tür temel gerçeklikleri sorgulamaları konusunda merak ve farkındalık oluşturulduğu sonucuna ulaşılmıştır.

Anahtar sözcükler: Matematik eğitimi, ispat, sorgulama becerileri

ÖZET: Öğrencilerin fen kavramlarını derinlemesine ve anlamlı öğrenmelerinde labratuvar uygulamalarının etkili bir yol olduğu sıklıkla vurgulanmaktadır. Bu çalışmanın amacı, hizmet öncesi fen öğretmenlerinin lise öğrenimlerindeki laboratuvar yaşantılarını ortaya çıkarmaktır. Çalışmaya 2012-2013 Eğitim-Öğretim yılında Muğla Sıtkı Koçman Üniversitesi, Eğitim Fakültesi, İlköğretim Eğitimi Bölümü, Fen Bilgisi Öğretmenliği Anabilim Dalı 1. sınıfında öğrenim gören 120 öğrenci katılmıştır. Çalışmanın verileri öğrenci kompozisyonlarıyla toplanmıştır. Öğrenciler kompozisyonlarında açık uçlu soruları yanıtlamışlardır. Öğrencilerin kompozisyonlarında yazmış oldukları açıklamaları daha iyi anlamak için rastgele seçilen 10 öğrenciyle yarı yapılandırılmış mülakat yürütülmüştür. Elde edilen nitel verilerin analizinde betimsel analiz ve içerik analizi kullanılmıştır. Okulda laboratuvar bulunmaması, var olan laboratuvarların fiziki koşullarının yetersiz olması, öğretmenlerin laboratuvar kullanımında yetersiz olması gibi nedenlerden ötürü öğrencilerin laboratuvar yaşantılarının çok az olduğu tespit edilmiştir. Elde edilen bulgulara dayalı olarak şunlar önerilebilir: Liselerde görev yapmakta olan fizik, kimya ve biyoloji öğretmenlerinin laboratuvarları daha etkili kullanmalarına yönelik eğitimler tasarlanıp uygulanabilir.

Anahtar sözcükler: fen öğretimi, hizmet öncesi fen öğretmenleri, laboratuvar yaşantıları

ABSTRACT: It is highly emphasized that laboratory experience is an effective way to teach science notions deeply and substantially. The aim of this work is to reveal the laboratory experiences which the science teachers receive in preservıce perıod durıng hıgh school educatıon. 120 First Grade students who study at The Faculty of Education, Primary School Education, Science Teaching Department in Muğla Sıtkı Koçman University attended in this work in 2012-2013 Academic Year. The data of the work was collected from the essays which were written by these students. The students answered some open ended questions in their essays. In order to understand these essays a semi constructed interview was conducted among 10 students that were chosen randomly. Descriptive analysis and content analysis were used while analysing the qualitative data that was gained. It is founded that laboratory experiences of children are very limited due to the reasons such as the lack of labs in schools, the inadequacy of the labs in schools or the inadequacy of the lab teachers. These can be offered according to the findings of this work: some seminars can be given to the high school teachers who give the science, chemistry and biology lessons in order to make them use the labs more efficeintly.

Key words: science education, preservice science teachers, laboratory experiences

GİRİŞ

Labratuvar uygulamalarının yaparak ve yaşayarak öğrenme ortamları sağladığı bu sayede edinilen bilgilerin derin izli ve uzun süre kalıcı olduğu sıklıkla vurgulanmaktadır (Can, 2012; Güneş, Şener, Topal Germi ve Can, 2013; Karaca, Uluçınar ve Cansaran, 2006; Sürücü, Özdemir, Bilen ve Köse, 2013). Özellikle anlamakta zorluk çekilen soyut fen kavramları öğrencilerin bizzat üzerinde çalışması sağlanarak somutlaştırılabilir (Ayas, 1998; Güneş vd., 2013; Kocakülah ve Savaş, 2011).

Fen bilimleri deney ve gözlemi ön planda tutması bakımından diğer bilimlerden ayrılır (Can, 2012). Deneyerek, görerek, araştırarak, inceleyerek, tartışarak öğrenme ortamı sağlanan bireylerin olaylar karşısındaki tutumları, problem çözme becerileri klasik yöntemlerle yetişen bireylerden farklı olacaktır (Güneş vd., 2013; Taşkın Ekici, Ekici ve Taşkın, 2002). Doğru ve etkili bir şekilde yürütülen laboratuvar uygulamaları fene karşı olumlu tutum gelişmesine ve istenilen öğretim hedeflerine daha kolay ulaşılabilmesine katkılar sağlayacaktır (Kaya ve Böyük, 2011; Yeşilyurt, 2006). Bu noktada fen öğretiminde laboratuvarın etkili bir şekilde kullanılmasında öğretmenlere büyük görevler düşmektedir (Feyzioğlu, Demirdağ, Ateş, Çobanoğlu, Altun ve Akyıldız, 2011).

İlgili literatürde sınıf mevcutlarının kalabalık olması, yetersiz malzeme, laboratuvar uygulamalarına ayrılan sürenin yetersiz olması, öğretmenlerin laboratuvar kullanmadaki yetersizlikleri gibi nedenlerle laboratuvar uygulamalarına yeterince yer verilmediği görülmektedir (Feyzioğlu vd., 2011; Güneş vd., 2013).

Bu çalışmanın amacı, hizmet öncesi fen öğretmenlerinin lise öğrenimlerindeki laboratuvar yaşantılarını ortaya çıkarmaktır. Çalışmadan elde edilen bulgular liselerde fen bilimleri, fizik, kimya, biyoloji gibi derslerin nasıl öğretildiği hakkında ipuçları sağlayabilir. Bu çalışma hizmet öncesi fen öğretmenlerinin laboratuvar uygulamalarından neler beklediklerini ortaya çıkarabilir. Eğitim Fakültelerindeki öğretmen eğitimcileri laboratuvar derslerini planlarken öğrencilerin beklentilerini göz önüne alabilirler.

YÖNTEM

Model

Bu çalışmada tarama modeli kullanılmıştır. Tarama modeli, bir konuya ya da olaya ilişkin, katılımcıların görüşlerinin ya da ilgi, beceri, tutum vb. özelliklerinin belirlenmesini sağlar (Büyüköztürk, Kılıç Çakmak, Akgün, Karadeniz ve Demirel, 2008, 177).

Çalışmanın Örneklemi

Çalışmaya 2012-2013 Eğitim-Öğretim yılında Muğla Sıtkı Koçman Üniversitesi, Eğitim Fakültesi, İlköğretim Eğitimi Bölümü, Fen Bilgisi Öğretmenliği Anabilim Dalı 1. sınıfında öğrenim gören 120 öğrenci katılmıştır. Katılımcıların yaklaşık %75' i lise öğrenimlerini düz lisede tamamlamışlardır.

Veri Toplama Araçları

Çalışmanın verileri öğrenci kompozisyonlarıyla toplanmıştır. Öğrenciler kompozisyonlarında açık uçlu soruları yanıtlamışlardır. Bu sorulardan bazıları şunlardır: Okuduğunuz lisede fen laboratuvarı var mıydı? Eğer varsa laboratuvarın fiziki koşulları nasıldı?, Lise öğreniminiz boyunca fen derslerinde laboratuvardan hangi sıklıkta yararlanırdınız?, Fen öğretmeniniz laboratuvarda daha çok hangi yöntem teknikleri kullanırdı?, Fen dersleri haricinde okulunuzdaki fen laboratuvarından hangi sıklıkla, hangi amaçlarla yararlanırdınız?. Öğrencilerin kompozisyonlarında yazmış oldukları açıklamaları daha iyi anlamak için rastgele seçilen 10 öğrenciyle yarı yapılandırılmış mülakat yürütülmüştür.

Verilerin Analizi

Bu çalışmada elde edilen nitel verilerin analizinde betimsel analiz ve içerik analizi kullanılmıştır. "Betimsel analiz, elde edilen verilerin kodlanması, temalar halinde özetlenip yorumlanmasıdır. Bu analizde doğrudan alıntılara sık sık yer verilir. Bu analizin asıl amacı bireylerin görüşlerini çarpıcı bir şekilde yansıtmaktır. Betimsel analizde özetlenen ve yorumlanan veriler, içerik analizinde daha derin bir işleme tabi tutulur" (Yıldırım ve Şimşek, 2005, 224-227).

Öğrenci kompozisyonları tek tek incelenmiştir. Kompozisyonlar bir kaç defa okunmuştur. Bu sırada veriler kodlanmıştır. Elde edilen kodlardan alt temalar oluşturulmuştur. Her bir alt temanın frekans ve yüzde değerleri hesaplanmıştır. Birbiriyle ilişkili olan alt temalar bir araya getirilerek temalar halinde düzenlenmişlerdir. Verilerin analizi iki araştırmacı tarafından bağımsız olarak yapılmıştır. Bir fen eğitimcisinin danışmanlığında bu iki analiz karşılaştırılmıştır. Analizlerin %95 tutarlı olduğu tespit edilmiştir. İki araştırmacının analizleri arasındaki tutarsızlıklar müzakere ile giderilmiştir.

BULGULAR

Bu bölümde verilerin analizinden elde edilen temalar ve alt temalar Tablo 1' de sunulmuştur.

Tablo 1. Katılımcı Kompozisyonlarından Ortaya Çıkan Temalar ve Alt Temalar

Temalar	Alt Temalar	f	%
Okulun laboratuvar durumu	Okulda laboratuvar var	36	30
	Okulda laboratuvar yok	19	16
	Laboratuvarın fiziki koşulları yeterli	7	6
	Laboratuvarın fiziki koşulları yetersiz	25	21
Derslerin işlenişi	Fizik dersinin sunuş yoluyla öğretimi	97	81
	Kimya dersinin sunuş yoluyla öğretimi	82	68
	Biyoloji dersinin sunuş yoluyla öğretimi	69	58
	Fizik dersinin deneylerle öğretimi	12	10
	Kimya dersinin deneylerle öğretimi	13	11
	Biyoloji dersinin deneylerle öğretimi	31	26
Deneylerin yapılışı	Gösteri deneyi	19	16
	Grup deneyi	3	3
	Bireysel deney	4	3
	Deney okuma	13	11
	Deney yazma	3	3
	Ev ödevi verme	4	3
Laboratuvarın kullanımı (Deneyim)	Laboratuvar deneyimi var	21	18
	Laboratuvar deneyimi yok	39	33
	Sadece malzeme tanıtımı yapılmış	3	3
Laboratuvara karşı duygular	Korku	4	3
	Endişe	5	4
	Eğlenceli bulma	13	11
	Merak duyma	14	12
Laboratuvar yaşantılarından zihinde kalanlar	Deneyin adını hatırlama	15	13
	Deneyin yapılışını hatırlama	63	53
	Deney kazalarını hatırlama	5	4
Laboratuvar kullanımına yönelik eleştiriler	Öğretmenlerin laboratuvar kullanmadaki yetersizliği	35	29
	Malzemelere dokunmanın yasak olması	3	3
	Yöneticilerin eleştirilmesi	5	4
	Laboratuvarın amacı dışında kullanımı	3	3

Öğrencilerin %30' unun öğrenim gördükleri lisede laboratuvar bulunmaktadır. Katılımcıların %16' sının mezun olduğu lisede laboratuvar bulunmamaktadır. Katılımcıların yaklaşık olarak %20' sinin öğrenim gördüğü lisede laboratuvar bulunmaktadır fakat laboratuvarın fiziki koşullarının yetersizdir. Katılımcıların sadece %6' sı fiziki koşulları yeterli laboratuvara sahip lisede öğrenim görmüşlerdir.

Öğrencilerin çok büyük bir kısmı fen derslerinin sunuş yoluyla yapıldığını belirtmiştir. 97 kişi fizik derslerinin, 82 kişi kimya derslerinin, 69 kişi biyoloji derslerinin sunuş yoluyla öğretildiğini ifade etmiştir. Hatta öğrencilerden biri yaşantısını "Derste deney kelimesini bile kullanmazdık. (Ö-3)" şeklinde ifade etmiştir. Fizik ve kimya derslerinin deneylerle öğretildiğini söyleyen öğrenciler yaklaşık %10' luk bir dilim oluştururken, biyoloji dersinin deneylerle öğretildiğini söyleyenler %26' lık bir dilim oluşturmaktadır.

Deneylerin yapılışı hakkındaki görüşler incelendiğinde öğrencilerin yalnızca %3' ünün bireysel veya grup deneyi yaptığı görülmektedir. Bu alt tema için öğrenci kompozisyonlarından bir örnek şöyledir: "Son sınıfta organik kimyada laboratuvarı kullandık. Gruplara ayrılırdık. Her grupta olması gereken malzemeler olur ve hep beraber deneyi yapardık (Ö-112)." 19 kişi gösteri deneyleri ile ders işlendiğini söylemiştir. Derste deneyleri yapmayıp, deneylerin yapılışını okuduklarını söyleyen öğrencilerin oranı %11' dir. Öğrencilerin 4' ü deneylerin evde yapılması için ödev verildiğini söylerken, 3 kişi deneylerin uygulamalı olarak yapılmadığını, deneyleri yazarak geçtiklerini belirtmiştir.

Öğrencilerin yalnızca %18' i laboratuvar deneyiminin var olduğunu söylerken %39' u hiç laboratuvar deneyiminin olmadığını söylemiştir. Öğrenci kompozisyonlarındaki "Lise hayatım boyunca laboratuvar yüzü görmedim (Ö-98)." ifadesi bu alt temayı örneklendirmektedir. 3 öğrenci laboratuvar deneyimin olmadığını fakat malzeme tanıtımının yapıldığını söylemiştir.

Öğrencilerin yaklaşık olarak %5' i laboratuvar ortamında fen öğrenmekten korkmaktadır. Yine öğrencilerin yaklaşık olarak %5' i laboratuvar uygulamalarında başarısız olmaktan endişe etmektedir. Öğrencilerden biri korkusunu "Umarım üniversitede bocalamadan laboratuvar derslerinde başarılı olurum. Açıkçası korkularım, güvensizliğim var (Ö-5)." şeklinde ifade etmiştir. Öğrencilerin %11' i laboratuvar uygulamalarını eğlenceli bulmaktadır. Öğrencilerin %12' si laboratuvarı ve laboratuvarda birşeylerle meşgul olmayı merak etmektedirler.

Laboratuvar yaşantılarından zihinde kalanlar temasında baskın olan alt tema deneyin yapılışını hatırlamadır. Katılımcıların yarıdan fazlası lise yaşantılarında yaptıkları deneylerin yapılışını hatırlamaktadır.

Laboratuvar kullanımına yönelik eleştirilerde 4 alt tema tespit edilmiştir. Öğrencilerden yaklaşık olarak %30' u lise öğrenimlerindeki öğretmenlerinin laboratuvarı etkili bir şekilde kullanmada yetersiz olduğunu düşünmektedir. Öğrencilerin yaklaşık olarak %5' i laboratuvar kullanımında yöneticileri eleştirmektedir. Öğrencilerden biri eleştirisini şu şekilde dile getirmiştir: "Bizim okulda laboratuvar milli eğitim müfettişlerine bakın laboratuvarımız var, her şeyimiz tamam demek içindi yani göstermelikti (Ö-21)." Öğrencilerin yaklaşık olarak %5' i laboratuvar malzemelerinin öğrenciler tarafından serbestçe kullanılmamasına izin verilmemesini eleştirmektedir. Bütün bunlara ek olarak laboratuvarın deney yapmak yerine sunuş yoluyla öğretim için kullanılması da eleştirilmektedir.

SONUÇ

Çalışmadan elde edilen bulgulara dayalı olarak liselerde fiziki koşulları yeterli laboratuvarların bulunmadığı söylenebilir. Yapılan bazı çalışmalar da bu sonucu destekler niteliktedir (Çallıca, Erol, Sezgin ve Kavcar 2001; Uzal, Erdem, Önen ve Gürdal, 2010).

Liselerde fen derslerinin çoğunlukla sunuş yoluyla işlendiği, laboratuvar uygulamalarına çok az yer verildiği söylenebilir. Laboratuvar uygulamalarının genellikle gösteri deneyi şeklinde yürütüldüğü söylenebilir. Çallıca vd. (2001) ilköğretim kurumlarındaki laboratuvar kullanımını incelemişlerdir. Bu çalışma sonucunda öğretmenlerin gerektiği şekilde deney yapamadıkları ortaya konmuştur. Deney yapan öğretmenlerin ise çoğunlukla gösteri deneylerine yer verdiklerini belirtilmiştir. Bu durumun sebebi olarak öğretmenlerin laboratuvar kullanımı konusunda yetersiz olması gösterilebilir. Nitekim Şeker, Yalçın ve Yurdanur Altunay (2006) yaptıkları çalışmada öğretmenlerin laboratuvar uygulamaları konusunda kendilerini yetersiz hissettiklerini ve bu nedenle laboratuvar uygulamalarına ya nadiren yer verdiklerini ya da hiç yer vermediklerini belirlemişlerdir.

Hizmet öncesi fen öğretmenlerinin çoğunun lise yaşantıları boyunca laboratuvar deneyimi elde edemedikleri söylenebilir. Bunun nedenleri olarak okulda laboratuvar olmaması, var olan laboratuvarların fiziki koşullarının yetersiz olması, laboratuvarın amacı dışında kullanılması, öğretmenlerin laboratuvar kullanımında yetersiz olması gösterilebilir. Elde edilen bu sonuç literatürde yer alan bazı çalışmalarla benzerlik göstermektedir (Alpaut, 1993; Böyük, Demir ve Erol 2010; Ekici, 1996; Gürdal,1991; Karaca, Uluçınar ve Cansaran, 2006).

Bu çalışmadan elde edilen bulgulara dayalı olarak lise öğreniminde deney yapan öğrencilerin fenden zevk aldıkları ve fene olan meraklarının arttığı söylenebilir. Laboratuvar yaşantısına sahip olmayan öğrencilerin ise laboratuvar uygulamalarında başarısız olma konusunda endişe duydukları ve korktukları söylenebilir. Literatürde yer alan bazı çalışmalar da laboratuvar uygulamalarının fene karşı ilgi ve merakı arttırdığı sonucunu destekler niteliktedir (Güneş vd., 2013; Kaya ve Böyük, 2011). Laboratuvar uygulamalarının öğrencilerin yaparak yaşayarak, birden fazla duyu organına hitap eden, kendi kendilerine keşfetme imkanı buldukları öğrenme ortamları sağlaması buna gerekçe olarak gösterilebilir.

Hizmet öncesi fen öğretmenleri lise öğrenimlerinde yaptıkları deneyleri hatırlamaktadırlar. Buna dayalı olarak laboratuvarların etkili ve kalıcı öğrenmeler sağlayabileceği söylenebilir. Aydoğdu (1999) yaptığı çalışmada laboratuvar uygulamalarının bilgilerin kalıcılığına olumlu katkılar sağladığını belirtmektedir. Bunun sebebi öğrencilerin uygulamaya aktif olarak katılması olabilir. Ayrıca az sayıda yapılan deneyler öğrencilere sıradışı gelmiş bu nedenle de akılda kalmış olabilir.

Hizmet öncesi fen öğretmenlerinin lise öğretmenlerini laboratuvarı kullanma konusunda yetersiz gördükleri söylenebilir. Şeker vd. (2006) yaptıkları çalışmada öğretmenlerin kendilerini laboratuvar uygulamalarında yetersiz gördüklerini belirtmiştir. Öğretmenlerin öğrenimleri boyunca yeterli laboratuvar eğitimi almamaları, hizmet içi eğitimlerin yetersiz olması bunun nedeni olabilir.

ÖNERİLER

Bu çalışmadan elde edilen sonuçlara göre liselerin çoğunda fiziki koşulları yeterli laboratuvarlar bulunmamaktadır. Milli Eğitim Bakanlığı okullarda laboratuvar kurulmasına öncelik vermelidir. Bir semtte laboratuvarı olmayan birden fazla okul bulunuyorsa bu okullar için bulundukları çevreye ortak kullanabilecekleri bir laboratuvar yapılabilir. Laboratuvarı bulunmayan okulların belirli günlerde bu ortak laboratuvardan yararlanması sağlanabilir. Deneye dayalı fen öğretimini uygulamaya koymak için yüksek standartlara sahip laboratuvarlar elzem değildir. Basit ve ucuz malzemelerle sınıf ortamında yapılabilecek birçok deney vardır. Basit malzemeler kullanılarak yapılabilen deneyler Milli Eğitim Bakanlığı tarafından bir kitap haline getirilerek öğretmenlerin kullanımına sunulabilir.

Bu çalışmadan elde edilen sonuçlardan bir diğeri de öğretmenlerin laboratuvar kullanımında yetersiz olduklarıdır. Liselerde fen bilimleri, fizik, kimya, biyoloji derslerini öğretmekte olan öğretmenler için laboratuvarların etkili kullanımı konusunda hizmet içi eğitimler tasarlanıp uygulanabilir. Üniversitelerde sürdürülmekte olan laboratuvar uygulamaları hizmet öncesi öğretmenlerin lise öğrenimlerindeki laboratuvar yaşantılarını tamir edebilecek şekilde yürütülebilir.

INVESTIGATING PRE-SERVICE MATHEMATICS TEACHERS' VIEWS ABOUT VECTOR APPROACH TO GEOMETRY AND INSTRUCTIONAL METHODS DURING GEOMETRY TEACHING

Vildan KATMER-BAYRAKLI

Hatice AKKOÇ

Recently, there have been curriculum changes in geometry in Turkey as well as in other countries. The most obvious change in geometry curriculum in Turkey is the introduction of "vector approach". This study investigates pre-service mathematics teachers' views about vector approach and instructional methods used by them during geometry teaching. Participants of the study are thirty-seven pre-service mathematics teachers who were at the last year of a teacher preparation program in secondary mathematics teaching during 2011-2012 academic years. At the first phase of the study, questionnaires with open-ended questions were administered to thirty-seven pre-service teachers to reveal their views about vector approach to geometry. Data obtained from questionnaires was analysed using content analysis. At the second phase of the study, four participants were selected using purposive sampling. Instructional methods used by these participants were investigated by analysing their lesson plans, micro-teaching lessons and semi-structured interviews. Data obtained from these sources was analysed using descriptive analysis. Findings from the data indicated that thirty-seven pre-service teachers had both positive and negative views about vector approach. In addition, all four participants used teacher-centred instructional methods during their lessons although they were in favour of vector approach since it prevented rote-learning and it could help students discover concepts for themselves.

Keywords: Geometry teaching, vector approach, pre-service mathematics teachers

ORTAOKUL 7.SINIF ÖĞRENCİLERİNİN UZAY ARAŞTIRMALARI KONUSUNDAKİ ALTERNATİF KAVRAMLARININ BELİRLENMESİ

INVESTIGATION OF SECONDARY SCHOOL 7th GRADE STUDENTS' ALTERNATIVE CONCEPTS ABOUT SPACE RESEARCHES

ÖZET: Araştırmanın amacı, ortaokul 7. sınıf öğrencilerinin uzay araştırmaları konusunda sahip oldukları alternatif kavramları kavram karikatürleri ile belirlemektir. Araştırmanın örneklemini 2012-2013 eğitim öğretim yılında güz dönemi, Van'ın bir ilçesinde yatılı bölge ortaokulunda 7.sınıfta öğrenim gören 53 ortaokul öğrencisi oluşturmaktadır. Özel durum metodunun kullanıldığı bu çalışmada, veri toplama aracı olarak "Uzay Araştırmaları" konusu ile ilgili 11 kavram karikatürü hazırlanmış ve kullanılmıştır. Kavram karikatürleri hazırlanırken ortaokul 7. sınıf fen bilimleri dersi öğretim programındaki kazanımlarından ve literatürde belirlenen alternatif kavramlardan yararlanılmıştır. Kavram karikatürlerinin geçerliliği için 5 alan eğitimi uzmanının görüşleri alınmış ve kavram karikatürlerinin pilot uygulaması yapılmıştır. Elde edilen veriler betimsel olarak analiz edilmiştir. Öğrenci cevapları kategorileştirilmiş ve cevapların ifade edilme sıklıkları hesaplanmıştır. Araştırmada, ortaokul 7. sınıf öğrencilerinin "Uzay Araştırmaları" konusunda birçok alternatif kavramlara sahip oldukları tespit edilmiştir.

Anahtar sözcükler: Alternatif kavram, kavram karikatürleri, ortaokul 7. sınıf öğrencileri, uzay araştırmaları.

ABSTRACT: The purpose of this study was to determine the alternative concepts of the secondary school 7th grade students about space researches by concept cartoons. The sample of this study composed of 53 secondary school 7th grade students who study in a town of Van set in 2012-2013 academic years- fall term. At this study which was used case study method, 11 concept cartoons that are related to space researches were prepared and used as data collection tool. While concept cartoons are prepared, were used from acquisitions of secondary school 7th grade science lesson and alternative concepts were examined in the literature. For the validity of concept cartoons, 5 field education experts' views were taken and the pilot implementation of concept cartoons was done. The data obtained were analyzed descriptively. Students' answers were categorized and the sequence of finding voice in answers was calculated. It is determined that secondary school 7th grade students have many alternative concepts about "space researches" in this study.
Key words: Alternative concept, concept cartoons, secondary school 7th grade students, space researches.

GİRİŞ

Fen bilimleri öğretim programının temelini oluşturan yapılandırmacı öğrenme yaklaşımı, öğrenenlerin bilgi edinmeye başlarken boş bir zihinle başlamadığını, yeni öğrendiği konu veya kavramla ilişkili ön bilgilerini harekete geçirdiğini ve öğrendiği yeni bilgiyi etkin olarak zihninde kendisinin yapılandırdığını vurgular. Bu bağlamda öğrenmenin gerçekleşebilmesi ve öğrenme ortamlarındaki yeni bilgilerin sağlam temeller üzerine yapılandırılmasında öğrenenlerin bilişsel yapılarında yer alan mevcut kavramların tespit edilmesi önemlidir. Öğrenciler yeni öğrenecekleri bilgileri eski bilgileriyle ilişkilendirerek anlamlandırırlar ve zihinlerinde yapılandırırlar (Osborne & Wittrock, 1983). Bu nedenle, öğrencilerin öğrendikleri konu hakkındaki önbilgilerinde herhangi bir eksiklik bulunursa bu durum yanlış anlamalara ve bilimsel gerçeklere uymayan bilgilerin ortaya çıkmasına neden olmaktadır (Hewson & Hewson, 1984). Bunun yanında, bazı fen kavramlarının soyut olması, öğrenciler tarafından zor anlaşılmasına ve ezberlenerek bilimsel anlamlarından uzak bir şekilde öğrenilmesine yol açmaktadır. Bilimsel gerçeklerle uyuşmayan fikirler literatürde çoğunlukla alternatif kavram olarak isimlendirilmektedir. Alternatif kavram bir kişinin bir kavramı anladığı şeklin, uluslararası platformda ortaklaşa kabul edilen bilimsel anlamından önemli derecede farklılık göstermesi olarak tanımlanmaktadır (Stepans, 1996). Alternatif kavramlar öğrenmeyi olumsuz olarak etkilemekte ve değişime karşı da oldukça direnç göstermektedirler (Aypay, Erdoğan & Sözer, 2007). Literatürde kuvvet ve hareket (Gamble, 1989), ışık (Heywood, 2005) ve çeşitli astronomi (Emrahoğlu & Öztürk, 2009; Trumper, 2003) konu ve kavramları hakkında yapılan çalışmalarda çeşitli alternatif kavramlar tespit edilmiştir.

Literatürde astronomi hakkında yapılan araştırmalar incelendiğinde, bu araştırmaların daha çok Dünya (İbret & Aydınözü, 2011; İyibil, 2010; Kikas, 2005), Ay ve evreleri (Trundle, Atwood & Christopher, 2007), yıldızlar ve özellikleri (Agan, 2004; Ekiz & Akbaş, 2005; Emrahoğlu & Öztürk , 2009; İyibil, 2010; Kurnaz, 2012), Güneş (İyibil, 2010; Kikas, 2005; Kurnaz & Değirmenci, 2011), uydu (İyibil, 2010; Kurnaz & Değirmenci, 2011), kuyruklu yıldız (Kurnaz, 2012; Taşcan, 2013), takımyıldızı (Kurnaz, 2012), evren (Ekiz & Akbaş, 2005; Emrahoğlu & Öztürk , 2009), Güneş Sistemi (Cin, 2007), gökyüzü (Kikas, 2005), yörünge (Ekiz & Akbaş, 2005) konu ve kavramları ile ilgili olduğu görülmüştür. Ancak literatürde öğrencilerin uzay araştırmaları ile ilgili alternatif kavramlarının belirlenmesine yönelik bir araştırmaya ise rastlanılmamıştır. Öğrencilerin uzay araştırmaları ile ilgili çalışmalara ilgili duymaları ve bu konuyu verimli bir şekilde öğrenebilmeleri için öncelikle öğrencilerin uzay araştırmaları konusundaki ön bilgilerinin ve alternatif kavramlarının tespit edilmesi de oldukça önemlidir.

Öğrencilerin kendi anlamalarını ve ilgili kavram hakkındaki alternatif kavramlarını sorgulamalarında ve düşüncelerinin gerekçelerini rahat bir şekilde ifade edebilmelerinde kavram karikatürleri oldukça etkilidir (Keogh & Naylor, 1999; Stephenson & Warwick, 2002). Çünkü kavram karikatürlerinde karmaşık ve soyut olan fen kavramları basit bir şekilde çizgi karakterlerce ifade edilebilmektedir. Kavram karikatürleri ile öğrencilerin daha önce hiç farkına varmadıkları bir olayla karşı karşıya gelmeleri sağlanarak öğrencilerin ön bilgilerini gözden geçirmelerine imkan sunulabilmektedir (Stephenson & Warwick, 2002).

Bu araştırmanın amacı ortaokul 7. sınıf öğrencilerin uzay araştırmaları konusunda sahip oldukları alternatif kavramları kavram karikatürleri ile belirlemektir.

YÖNTEM

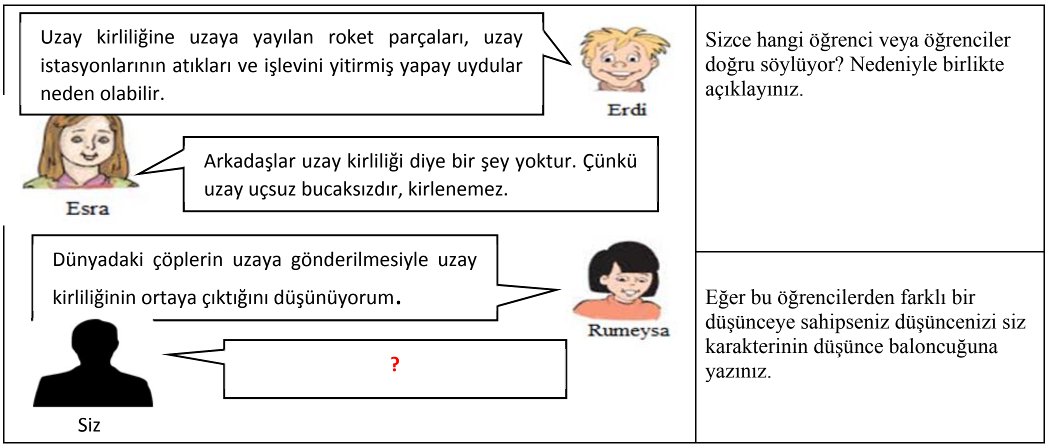
Araştırma ortaokul 7. sınıf öğrencilerinin "Uzay Araştırmaları" konusundaki ön bilgilerini ve alternatif kavramlarını tespit etmek için tasarlandığından özel durum metoduna göre yürütülmüştür. Özel durum çalışmaları bir olayı derinlemesine incelemeye imkân sağlayan bir yöntemdir.

Evren ve Örneklem

Araştırmanın evrenini, 2012–2013 eğitim öğretim yılı güz döneminde Van ilinde öğrenim gören tüm 7. sınıf öğrencileri oluşturmaktadır. Araştırmanın örneklemini, 2012–2013 eğitim öğretim yılı bahar öneminde Van'ın bir ilçesinde yatılı bölge ortaokulunda 7.sınıfta öğrenim gören 53 ortaokul öğrencisi oluşturmaktadır.

Veri Toplama Aracı

Veri toplama aracı olarak, "Uzay Araştırmaları" konusuyla ile ilgili 11 farklı kavram karikatüründen oluşan 'Kavram Karikatürü Testi (KKT)' hazırlanmıştır. KKT hazırlanırken araştırmacılar tarafından ortaokul 7. Sınıf fen bilimleri dersi öğretim programındaki ilgili kazanımlar incelenmiştir. Ayrıca, kavram karikatürleri hazırlanırken literatürde yapılan çalışmalarda tespit edilen alternatif kavramlardan da yararlanılmıştır. KKT'nin yapı geçerliğini sağlamak amacıyla 5 alan eğitimi uzmanın görüşleri alınmıştır. Ayrıca KKT'nin pilot uygulaması da yapılmıştır. Aşağıda KKT'de uzay kirliliği ile ilgili bir kavram karikatürüne Şekil 1'de yer verilmiştir.



Şekil 1. KKT'de yer alan bir kavram karikatürü örneği

Veri Analizi

KKT'den elde edilen veriler, betimsel olarak analiz edilmiştir. Öğrencilerin her bir kavram karikatürüne verdikleri cevaplar kategorileştirilerek "bilimsel açıklamalar" ve "bilimsel olmayan açıklamalar" temaları altında; "gök biliminin amacı, gök bilimci, teleskop, uzay kirliliği astronot ve teknoloji-uzay araştırması ilişkisi" alt temaları oluşturulmuştur. Araştırmacılar temalarla ilgili fikir birliğine vararak verilerin geçerliğini sağlamışlardır. Her bir tema ile ilgili olarak bilimsel açıklamaların ve bilimsel olmayan alternatif kavram içeren açıklamaların ifade edilme sıklıkları ve yüzdelik hesapları yapılmıştır. Ayrıca, verilerin analizinde kavram karikatüründeki ifadelerden farklı alternatif kavramlara sahip olan öğrencilerin "siz" karakterinin düşünce baloncuğunda belirtikleri ifadeleri de ilgili temalar altında sunulmuştur.

BULGULAR

Ortaokul 7. sınıf öğrencilerinin "Uzay Araştırmaları" konusunda sahip oldukları bilimsel olan ve bilimsel olmayan düşünceleri (alternatif kavramları) Tablo 1'de sunulmuştur:

Tablo 1 incelendiğinde öğrencilerin 22 tane alternatif kavrama sahip oldukları görülmektedir. Öğrencilerin seçtikleri karikatür karakterlerin ifadeleri gök bilimi, gök bilimci, teleskop, uzay kirliliği, astronot ve teleskop kavramları ile ilişkilendirilmiş ve kategorileştirilerek ifade edilme sıklığı ve yüzde değerleri hesaplanmıştır.

Elde edilen bulgulara göre ortaokul 7. sınıf öğrencilerinin "Uzay Araştırmaları" konusunda gök bilimi kodunda en fazla sahip oldukları alternatif kavramın "*Eski medeniyetlerde yapılan gökyüzü gözlemleri bilimsel amaçlıydı.*", gök bilimci kodunda en fazla sahip oldukları alternatif kavramın "*Gök bilimcilerinin diğer adı astronottur.*", teleskop kodunda en fazla sahip oldukları alternatif kavramın "*Sanırım teleskopların oküler kısmında kalın kenarlı, objektif kısmında ise ince kenarlı mercek kullanılır.*", uzay kirliliği kodunda en fazla sahip oldukları alternatif kavramın "*Uzay kirliliği diye bir şey yoktur. Çünkü uzay uçsuz bucaksızdır, kirlenemez.*" , astronot kodunda en fazla sahip oldukları alternatif kavramın "*Astronotlar astronomi üzerine uzayda çalışma yapan bilim insanlarıdır.*" ve teknoloji kodunda en fazla sahip oldukları alternatif kavramın ise "*Teflon, tükenmez kalem, alüminyum folyo uzay çalışmalarıyla üretilmiş olamaz. Çünkü uzay çalışmaları için geliştirilen teknolojilerin günlük yaşantımızla bağlantısı yoktur. Örneğin uzay sondalarını günlük hayatımızda kullanmıyoruz.*" şeklinde olduğu belirlenmiştir.

Tablo 1. Öğrencilerin KKT'deki Kavram Karikatürlerine Verdikleri Cevaplardan Elde Edilen Bulgular

Uzay Araşt. ile İlgili Tema	Bilimsel Açıklamalar			Bilimsel Olmayan Açıklamalar		
	Öğrencilerin Seçtikleri Karikatür Karakterlerin İfadeleri	f	%	Öğrencilerin Seçtikleri Karikatür Karakterlerin İfadeleri	f	%
Gök Biliminin Amacı	Eski medeniyetlerde yaşayan insanların gökyüzünü inceleme amaçları zamanı belirlemektir.	15	28	Eski medeniyetlerde yapılan gökyüzü gözlemleri bilimsel amaçlıydı.	22	42
				Sanırım eski medeniyetlerde yaşayan insanların gökyüzünü inceleme amaçları gelir elde etmektir.	16	30
Gök Bilimci	Gök bilimciler, gök cisimlerinin hareketlerini ve yapısını teleskop gibi araçlarla inceleyen kişilerdir.	16	30	Sanırım gök cisimlerinin hareketlerini ve yapısını teleskop yardımıyla inceleyen kişiler kozmonottur.	12	23
	Ünlü Türk gök bilimcilerinden biri de Takiyüddin'dir. Gözlemlerde kullanmak için yıldızların yüksekliğini ve açıklığını ölçen alet gibi birçok alet tasarlamıştır.	14	26	Gök bilimcilerinin diğer adı astronottur.	27	51
				Ünlü Türk gök bilimcilerinden biri Biruni'dir. Biruni Güneş'i gözlemek için teleskop tasarlamıştır.	13	25
				Ali Kuşçu ünlü Türk gök bilimcilerinden biridir ve Güneş'in ilk haritasını çıkaran bilim adamıdır.	25	47
Teleskop	Gökyüzü ve uzaydaki gök cisimlerinin hareketlerini ve yapısını incelemek için kullanılan araçlara teleskop denir.	23	43	Sanırım teleskop ile sadece gökyüzündeki gök cisimlerinin hareketlerini ve yapısın incelenir.	15	28
	Teleskopların oküler ve objektif kısımlarında da ince kenarlı mercek kullanılır. Ayrıca görüntü netliğini sağlamak için iç içe geçmiş kartonlar kullanılmalıdır.	16	30	Bence gökyüzündeki ve uzaydaki gök cisimlerinin hareketlerini ve yapısın incelemede mikroskop adı verilen araç kullanılır.	17	32
				Kalın kenarlı mercekle basit bir teleskop yapılabilir .Oküler kısmında ve objektif kısmında kalın kenarlı mercek kullanılır.	16	30
				Teleskopların oküler kısmında kalın kenarlı, objektif kısmında ise ince kenarlı mercek kullanılır.	18	34
Uzay Kirliliği	Uzay kirliliğine uzaya yayılan roket parçaları, uzay istasyonlarının atıkları ve işlevini yitirmiş yapay uydular neden olabilir.	13	25	Uzay kirliliği diye bir şey yoktur. Çünkü uzay uçsuz bucaksızdır, kirlenemez.	22	42
				Dünyadaki çöplerin uzaya gönderilmesiyle uzay kirliliğinin ortaya çıktığını düşünüyorum.	16	30
Astronot	Astronotlar uzayda fizik, kimya, biyoloji gibi birçok alanda inceleme yapar	9	17	Astronotlar sadece uzayda yaşam olup olmadığı hakkında araştırma yapar. Örneğin Astronotlar Mars'ta yaşam olup olmadığını araştırmışlardır.	18	34
				Astronotlar astronomi üzerine uzayda çalışma yapan bilim insanlarıdır.	22	42
Teknoloji-Uzay Araştırması İlişkisi	Teknolojinin gelişmesiyle birlikte uzay araştırmaları hız kazanmıştır ve yapılan uzay çalışmaları sırasında teflon, tükenmez kalem, alüminyum folyo gibi ürünler üretilmiştir.	12	23	Bence, teknolojinin gelişmesiyle uzay araştırmaları hız kazanmıştır. Örneğin Dünya'ya yakın ve üzerinde yaşam olabileceği düşünülen Mars gezegenine insansız uzay araçları gönderilerek gezegenin yapısı hakkında bilgi elde edinilmektedir. Fakat uzay araştırmalarının teknolojiye katkısı yoktur.	16	30
	1969 yılında Neil Armstong, Adwin Aldrin ve Michel Colins adlı üç astronot Ay'a ayak basarak diğer gezegenlere yapılması düşünülen araştırmaları hızlandırmıştır.	16	30	Teflon, tükenmez kalem, alüminyum folyo uzay çalışmalarıyla üretilmiş olamaz. Çünkü uzay çalışmaları için geliştirilen teknolojilerin günlük yaşantımızla bağlantısı yoktur. Örneğin uzay sondalarını günlük hayatımızda kullanmıyoruz.	25	47
	Uzayda yapılan çalışmalar ile yeni gezegenler, yıldızlar, galaksiler bulunmaktadır. Bu da bize evrenin uçsuz bucaksız olduğunu göstermektedir.	22	42	Ay'a atılan ilk adım sayesinde ulaşılan bilgiler uzay araştırmaları için yeterli olmuştur.	21	40
	Uzay araştırmaları sayesinde gelecekte insanlar Dünya'dan başka gezegenlerde şehirler kurarak buralarda yaşamlarını sürdürebileceklerdir.	19	36	Sanırım Ay'a atılan ilk adımla uzay araştırmaları hızlanmamıştır. Uzay araştırmaları teleskopun icadı ile hızlanmıştır.	11	21
				Gelişen teknoloji sayesinde uzaya, uzay sondaları, uzay mekikleri ve yapay uydular gönderilmektedir. Böylece uzay hakkında sürekli yeni bilgiler elde ediliyor. Örneğin Plüton 2006 yılına kadar gezegen olarak kabul edilirken artık cüce gezegen sınıfına dahil edilmiştir.	10	19
				Sanırım uzay hakkında yapılan çalışmalarda en son noktaya gelinmiştir. Daha fazla bilgiye ulaşılamaz.	18	34
				Uzay araştırmaları sayesinde gelecekte gezegenlerin sıcaklıklarını Güneş'e uzaklılarıyla ilişkilendirmek mümkün olacaktır.	20	38
				Uzay araştırmaları sayesinde gelecekte uzaya yapay uydular gönderilerek haberleşme imkanı sağlanabilecektir.	11	21

TARTIŞMA, SONUÇ VE ÖNERİLER

Son yıllarda yapılandırmacı öğrenme yaklaşımının etkisiyle Fen Bilimleri Dersi Öğretim Programında, öğrencilerin süreç içerisinde izlenmesi, yönlendirilmesi, öğrenme güçlüklerinin belirlenerek giderilmesi, anlamlı ve kalıcı öğrenmenin sağlanmasında geleneksel metotlar yerini bazı alternatif metotlara bırakmıştır (Şenel-Çoruhlu, 2013). Yapılandırmacı öğrenme yaklaşımına paralel olarak; öğrencilerin öğrenme durumunun, belirlenmesine, izlenmesine ve değerlendirilmesine yönelik elde edilen sayısal değerlerin anlam kazanabilmesi, öğrencinin gelişiminin izlenmesi ve bu gelişime bağlı olarak öğrencinin yönlendirilmesi için alternatif ölçme ve değerlendirme yöntem ve tekniklerinin kullanılması da oldukça önemlidir (TTK, 2013). Alternatif ölçme ve değerlendirme araçlarından birisi de kavram karikatürleridir. Bu araştırmada da öğrencilerin uzay araştırmaları konusundaki öğrenme durumları kavram karikatürleri ile ortaya konulmuştur. Araştırmada öğrencilerin;

- Eski medeniyetlerinde gök biliminin amaçları ile ilgili alternatif kavramlara sahip oldukları,
- Gök bilimci ile astronot kavram karmaşası yaşadıkları,
- Uzay araştırmaları ile ilgili araştırma yapan gök bilimcilerinin çalışmalarını karıştırdıkları,
- Teleskopun kullanım amacını bilmedikleri, teleskopu mikroskopla karıştırdıkları ve teleskopun yapısını bilmedikleri,
- Teknoloji ile uzay araştırmaları arasında ilişki kuramadıkları

sonucuna ulaşılmıştır. Benzer şekilde Şenel-Çoruhlu'nun (2013) çalışmasında da ortaokul 7. sınıf öğrencilerinin astronot ve gökbilimci kavramlarını karıştırdıkları belirlenmiştir.

Elde edilen bulgulara göre öğrencilerin bilişsel yapılarında "Uzay Araştırmaları" konusuyla ilgili alternatif kavramların olduğu tespit edilmiştir. Öğrencilerin anlamlı öğrenmeler gerçekleştirebilmeleri için alternatif kavramlarının belirlenmesinin gerekli olduğu düşünülmektedir. Çünkü öğrencilerin sahip oldukları bu ön bilgiler/alternatif kavramlar kabul edilen bilimsel teorilerden uzak ve öğretime karşı dirençlidirler. Nitekim öğrenciler yeni kazandıkları bilgileri sahip oldukları bu ön bilgiler/alternatif kavramlar üzerine inşa etmektedirler. Buna paralel olarak da öğrencilerin sahip oldukları ön bilgiler hatalı ise onlar üzerine inşa edilen bilgilerin de hatalı olması muhtemeldir. Bu nedenle elde edilen sonuçlar ışığında, öğrencilerde "Uzay Araştırmaları" konusunda tespit edilen alternatif kavramların öğrencilere zengin bir öğrenme ortamı sağlanarak giderilmesine yönelik araştırmaların yapılması önerilmektedir.

ABSTRACT: The arrangement of science education program based on the constructivist approach methods and techniques enable students to be active constructers of knowledge. Problem-based learning (PBL) is one of these methods in which students develop a solving method about the problem by using the knowledge they gained from cooperative environments and as a result of their surveys. In this method students participate actively by solving a problem situation given to them during two or three sessions. Supporting PBL with different learning techniques to make PBL sessions and PBL activities more effective might increase students' motivation. Students' active participation is necessary for an effective PBL. It is thought that visual arts activitie depict opinions on an event. It is thought that this method which requires students to be active and responsible for their own learning in the learning process may be more effective on the primary school students when it is used with the visual arts according to interdisciplinary understanding in teaching of science.

In this study the use visual arts activities integrated into problem based learning method are explained and sample activities particulate nature of matter unit given. In this activities, real-life problem situations which can be explained by integrating art with science are discussed through problem-based learning scenarios. Art events in scenarios related to the problem situation are integrated with science subjects.

IS PREZI MORE USEFULLNESS EDUCATION TOOL THAN POWERPOINT?

Andreja ŠPERNJAK
Faculty of Natural Science and Mathematics, University of Maribor, Slovenia
andreja.spernjak@uni-mb.si

ABSTRACT: Using presentation software to support lectures and presentations has become ubiquitous in the whole vertical of education. The most applied presentation in our area is PowerPoint, but Prezi made a free-flowing presentation to give the effect of zooming. The Prezi application is combining creative thinking with facilities of modern technology, which leads to an interactive and highly customised presentation, structured approximately like a mind map. For education purposes, Prezi presentations are available free of charge. However, in our area, only a few students and teachers use Prezi presentation. They do not use it because they are familiar with PowerPoint presentation or they do not know the Prezi presentation.
Some significant differences in learning outcomes, self-efficacy, cognitive load and motivational variables between PowerPoint and Prezi presentation are presented in this paper. This paper also shows advantages and disadvantages of Prezi and PowerPoint presentations.

Key words: Concept map, Education, PowerPoint, Presentations, Prezi

INTRODUCTION

Multimedia materials are frequently used for learning and teaching in 21st century classrooms. With the use of technological tools particularly such as projector, presentation, video and Internet in education in the recent years, visual education has become popular (Vecdi Can et al., 2012). A computer-aided presentation, defined as PowerPoint, is a method of display that supports lecturing (Sugahara & Boland, 2006). PowerPoint presentations were brought to the classroom environment at every stage of education and instruction from the elementary education to graduate education and the lessons gained an interactive structure. A defining attribute of PowerPoint and like different software packages (e.g., Xerte, Apple Keynote, VoiceThread, Libre Office Impress, Google Docs, SlideRocket or Prezi) is the slide show metaphor that undergirds its design and operation. The metaphor of a "virtual slide projector" is clearly visible in the use of today's PowerPoint software. The program allows the user to design and layout content within the boundaries of individual slides, arrange these slides in the desired order, and then display each slide in sequence to an audience during a live presentation. The slide show metaphor that underlies the use of PowerPoint is itself neither good nor bad, but it does have certain characteristics that a knowledgeable information designer should understand. Prezi, on the other hand, is a relative newcomer (it was released to the public in April, 2009) to the presentation software scene and is unique in its rejection of the slide show metaphor in favor of the "infinite canvas" and zooming user interface. Prezi is certainly not the first computer software to employ the infinite canvas or the zooming user interface but it is the first in the category of presentation software to make use of these metaphors. Instead of a series of slides upon which content is laid out, Prezi offers the presentation designer an "infinite canvas," a virtually endless two-dimensional space navigated by a zooming user interface. Visual aids (e.g., words, pictures, YouTube video clips) can be arranged anywhere on the canvas in practically any size, orientation, or spatial arrangement imaginable. The zooming user interface makes use of a simultaneous "pan and zoom" effect along a third dimension (the z axis), creating a sense of movement as the presenter moves across the canvas during his presentation (Bean, 2012). Prezi is an interesting alternative to the PowerPoint presentation with introduces an innovative style.

Advantages and disadvantages of PowerPoint in Prezi presentations

The effectiveness of lectures with presentation may depend on the design of presentations slides as well as tasks and individual differences. Beside individual lecture differences programs also have different possibility of use and their own unique characteristics. There are many useful categories with which these characteristic can be explored. With the Venn´s diagram are represented advantages of PowerPoint and Prezi presentation (Table 1) and in Table 2 are represented disadvantages of PowerPoint and Prezi presentation.

Table 1. Venn's Diagram of Advantages of PowerPoint and Prezi Presentation

PowerPoint	Common characteristics	Prezi
- most well-known presentation making program - allows the fast data transfer to the other Microsoft Office applications - offers the possibility to compress audio and video clips - Microsoft PowerPoint Mobile allows presentations to be viewed on telephone, as well - limitlessly time of auto-play a single animation or slide - elements can be made to appear immediately as if rendered from thin air, or to ″fly in″ using various types of computer animation and different speeds of movement	- user-friendly interface - easy to use - allows introducing various graphical elements by using the drawing bar, images in clipart format, pictures, effects on text and imagines, music files and videos - allows presentations for offline use - user has a series of tutorial movies available and the online manual to learn how to use the application - allows presentations between slides - ability for a presenter to display a slide with ″hidden″ elements	- application is free of charge - it can be made by creating a simple user account (it is accessible) - provides the opportunity to create spectacular presentation - presentation is dynamic and attractive - has an attractive aspect - zooming user interface - able to create mind-map - values the ideas and stimulates the creativity of the one preparing it - helps delivering a more fluent demonstration - able to place the visual elements of the presentation in the most sensible location - presentation designer is free to use position and proximity to visually explain the physical, logical and hierarchical relationships among elements - does not require an external software, since all commands are available in the application interface - there is a total storage space of 100 MB - besides adding text and frames, the creator can draw freely, draw lines or arrows or highlight already pre-existing testes - possibility to use a site paying account, where the offer for making the presentations is diversified and improved - Prezi site has an already made presentation library where we can learn from and choose the most innovative examples

A PowerPoint presentation is a complex mixture of text, graphics, explanations, advanced software and real-time interaction with the audience. Traditional presentation software like PowerPoint is requires preparing a linear story line using a storyboard approach (Figure 1). Prezi allows for both a linear and a free-flowing presentation of a story line (Figure 2).

Figure 1. Linear Sequence of PowerPoint Presentation.

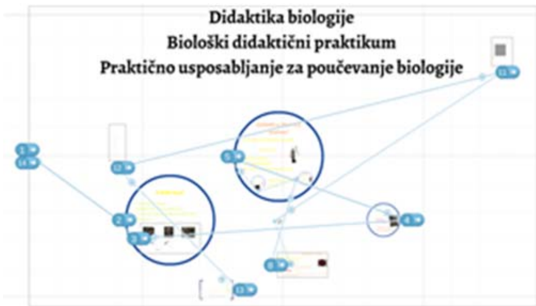

Figure 2. Free-flowing Prezi Presentation

Table 2. Disadvantages of PowerPoint and Prezi Presentation

PowerPoint	Prezi
- slides are static, linear (Fig. 2) - more difficult to visually encode the physical or logical relationship among elements of a presentation when those elements are separated by strong display boundaries - lack of diversity - requires the installation of the entire Microsoft Office Pack - compatibility problems may appear between versions - the fonts must be available and various problems may occur with the video files - it does not offer the possibility of simultaneously having a document edited by several users - it requires resizing the pictures at an optimal resolution or the final presentation size in Mbits will be large - effect combinations are difficult to apply	- many of previously presented strengths are only available in the paid account version - requires the existence of an internet connection and the creation of a user account on the Prezi.com website - at less high-performance computers, the frame movement during the presentation may be fragmented - desktop version has several disadvantages: only available for a fee; PDF files cannot be inserted; the application can be used on 3 computers with one license; the more complicated graphs must be made by using a specialized software; the limit per inserted file is 50 MB; files can be inserted, regardless of their size; - the forms can overload the presentation content - due to the over-mobility, imagines can create visual discomfort - limited and fixed time of auto-play a single animation or slide (just 4, 10 or 20 seconds)

Relationship between presentations and degree of learning outcomes, self-efficacy, cognitive load and motivational variables

Concept mapping technique, as a valuable instrument in science teaching, has been organized as a useful tool in assessing students´ knowledge structure about a certain topic (Zele &Lenaerts, 2004). Concept mapping is an effective teaching and learning strategy for both instructors and students to visually examine what students have learned. Through the mapping process, learners may examine their own existing knowledge and learn how to thing in more critical and complex ways rather than only in a linear manner (Gul & Boman, 2006). The visualizations would affect the shaping of knowledge in a positive way (Kress et al., 2010). Especially science teachers should therefore use graphics organizers in presentations during which they display the explicit structure of the information (Casteleyn & Mottart, 2012). Prezi encourages using graphic organizers (concept maps, mind mapping, Figure 1) and these could be an alternative to the linear sequencing in most presentation, like PowerPoint is.

Prezi is also a window of opportunity to revitalize the interest in graphic organizers, which are not frequently implemented in classrooms (Kinchin, 2001) but those are very effective in teaching and learning process. When concept maps are applied in the design of e-learning materials, it can foster learning performance and computer self-efficacy (Shaw, 2010).

Many studies have examined the effect of PowerPoint on motivation, self-efficacy and the academic successes of students, and many studies have compared PowerPoint with traditional classes but a few studies were compared the same characteristic between PowerPoint and Prezi presentation. Accordingly to Casteleyn & Mottart (2012) research there is no clear indication that graphic organizers (Prezi) as delivered via presentation software (PowerPoint) can positively affect learning outcomes, self-literacy, perceived mental effort and appreciation of the learning material. Johnson & Christensen (2011) retrieved a similar result when they compared simplified, visually rich slides to more traditional presentation slides. On the other hand, evidence-based literature about graphic organizers has demonstrated its positive impact on learning when students are asked to constructed them (Ballentine, 2012).

In this paper are presented characteristics of Prezi and PowerPoint presentations, some significant differences in learning outcomes, self-efficacy, cognitive load and motivational variables between PowerPoint and Prezi presentation. Finally in the paper are represented to survey biology students´ opinions on and attitudes to PowerPoint and Prezi presentation usage.

METHODS

The participants for this study were student biology who volunteered for this study. They were from the 3th and 4th university years at the Faculty of Natural Sciences, University of Maribor in Slovenia. They completed a questionnaire prepared for the purpose of the study. They completed it in electronic form. The questionnaire was prepared with Google Drive. We collected 63 questionnaires from 47 women (74.6 %) and 16 (25.4 %) men.

The questionnaire contained three parts. The first part of the questionnaire solicited demographic data such as gender. The second part concerned students' attitudes about usefulness of different presentations (Prezi and PowerPoint). The answers were measured by a 5-point Likert scale. The scale questionnaire was as follows: 0 = I have no base for answer; 1 = definitely disagree; 2 = disagree; 3 = agree; 4 = definitely agree. Students were to value percent's of their university professors' usage of presentations during lectures. The scale questionnaire was as follows: 1 = 0 – 24 %; 2 = 25 – 54 %; 3 = 55 – 74 %; 4 = more than 75%; 5 = all professors. The third part was an open question about advantages and disadvantages of Prezi and PowerPoint presentation. Similar answers were grouped in to four complexes which describe the same answers.

The reliability of the questionnaire about usefulness of different presentations (Prezi and PowerPoint) was measured by the Cronbach coefficient. The Cronbach reliability coefficient was 0.94 for the 7-item scale, which can be considered satisfactory. Microsoft® Excel 2010 was used for data input. The analyses were performed with the statistical package SPSS 21.0, where we used descriptive statistics; One-way ANOVA was used to examine differences in opinions by student gender why they use presentations. The Chi-Square test (χ^2) was not used for comparison of differences between results from the student opinions about the advantages and disadvantages of PowerPoint and Prezi presentation because we have no results of Prezi usage.

RESULTS AND FINDINGS

One of background question was when and where students learned about e-presentations. In a primary or secondary school 36 students (57.1 %) learned about presentation, 20 students (31.7 %) learned about presentation at university classes and just 6 students (9.5 %) claimed that they learned about presentation by them own across investigation. No one took the special lessons or training to learn about e-presentation.

In Slovenia in most know PowerPoint presentation, so the results are not surprises; the 57 students (90.5 %) use PowerPoint and just 6 students (9.5 %) use PowerPoint and Prezi presentations. We have no students to use just Prezi. Students mostly do not use the Prezi because they do not know it and almost the same results are at professors' usage of Prezi presentation. We asked students who many professors at lectures use presentations and 53 (84.1 %) students claimed that more than 75 % of professors during lectures use the presentations but less than 10 % of them use Prezi presentation. Across my researching I found at that Prezi use just one professor and his field is computer science.

With questioner we asked students about advantages and disadvantages of Prezi and PowerPoint presentations but we could not made s comparison of differences between results because just 6 students know the Prezi presentation and these results cannot be relevant. Students who use Prezi claimed that it is good because it is free of charge and because of zooming in and out it is more interesting than PowerPoint. Why students do not use other presentation than PowerPoint is clear out of those statements:

- ″I saw Prezi presentation. It is very interesting but I do not use it because I do not know how″.
- ″I do not use the Prezi because all lecture room has no Internet connection″.
- ″I use PowerPoint presentation because I am familiar with it, it is accessible and mostly use it″.
- ″I will not use Prezi because it is too trumpery″.
- ″Prezi has no support for different plugins for Chemistry, Physic, Mathematic … but PowerPoint has″.
- "I use PowerPoint because I do not know the other presentation programs.″
- ″PowerPoint meets my all presentations needs and therefore I do not use other applications″.

PowerPoint is a user-friendly package (Uz et al., 2010) and our study also confirms it. 54 (85.7 %) our students said that it is easy to use PowerPoint presentation. There are no significant differences at statement of using PowerPoint presentations by gender. Students mostly use it for the creation of visually clear. Three students (4.8 %) use it because the professors request. Even 6 (9.5. %) students thing just of herself; they use PowerPoint to make their oral presentation easier. These students are not interest in audience and how to effective to represent the contents but just to do it and by easier way. Out of this item these students while preparing PowerPoint presentations do not follow the principles that need to be followed.

Students need more instructions how effective make presentations. At the lectures they see finished presentations but they can to make it effective if they do not kwon how or if they do not follow the principles that need to be followed to make effective presentation.

CONCLUSION

Understanding the metaphors that underline PowerPoint, other tools like it, and differentiated tools such as Prezi give information designers valuable insight to guide their decision when choosing an appropriate presentation tool. The metaphor that underline Prezi afford it unique characteristic (concept-mapping), and the same is true for traditional tools such as PowerPoint. Although Prezi allows created concept-maps there is no clear indication that can positively affect learning outcomes, self-literacy, perceived mental effort and appreciation of the learning material. Familiarity with these characteristics and their inherent strengths allows information designers to choose the tool most appropriate to the content and situation of their specific presentation (Bean, 2012) and it is up to everyone´s IT skills, creativity and innovative inspiration to choose how to make the presentation. Regardless of the used software for creating a presentation and the purpose they are made for (e-lecturing, showing a work report or the conclusions of a research, explain complicated sciences phenomenon…), the presentations are extremely indispensable. The advantages of the presentations, no matter how they are built, are obvious: the conveyed massage is clear, concise, systematized and structured; the message is accompanied by graphics elements; it is attractive, it stimulates curiosity and it holds audience´s interest (Chicioreanu & Oproiu, 2012).

In further research we would like to represent Prezi presentation to our students and make them to use it. After some period of time we would like to find out which one of software presentation; Prezi or PowerPoint; they would like to prefer.

ÖZET: İçerik yönetim sistemleri özellikle programlama tecrübesi olmayan kullanıcıların web içerikleri oluşturmak için kullandıkları platformlardır. Bu amaçla kullanılabilen ve ücretsiz olan pek çok uygulama vardır. Kullanılabilirlik kavramı bu tip uygulamalar için anahtar özellik olarak karşımıza çıkmaktadır. Bu çalışma kapsamında dünya çapında yaygın olarak kullanılan Joomla'nın kullanılabilirlik testi yaklaşımı ile değerlendirilmesi gerçekleştirilmektedir. Teste 12 gönüllü katılmıştır. Katılımcılara 16 ana adım 64 işlemden oluşan bir kullanılabilirlik testi uygulanmış sonrasında da görüşlerini almak amacıyla kullanılabilirlik değerlendirme anketi uygulanmıştır. Görev tamamlama yüzdeleri, tecrübe durumu ve kullanabilirlik faktörleri ile genel memnuniyet ilişkisi değerlendirilmiştir. Genel olarak kullanıcıların sistemi kullanmaktan memnun oldukları, pek az sorunla karşılaştıkları görülmüştür. Bildirilen sorunların başında anlaşılır olmayan sistem mesajları ve kodlama desteğindeki kısıtlar gelmiştir. Bu sorunlara ilişkin bazı çözümler önerilmiştir. Bunun yanı sıra anketten elde edilen genel memnuniyet değerleriyle görev tamamlama yüzdeleri arasında doğru orantılı bir ilişki saptanmıştır.

Anahtar sözcükler: Kullanılabilirlik, içerik yönetim sistemi, Joomla, web yayıncılığı, kullanılabilirlik testi

ABSTRACT: Content management systems are the platforms enabling users who have low programming skills to create web contents. There are many commercial and open source applications for this purpose. Usability is an essential key concept for this kind of applications. In the scope of this study, Joomla which is one of the widely used content management system was evaluated for its usability. A usability test consisting of 16 main steps and 64 procedures was conducted with 12 participants. Afterwards, usability questionnaire was applied. Overall satisfaction relation with task completion percentages, status of experience and usability factors has been evaluated. In general, users were satisfied with the system and encountered few problems. Unclear system messages and lack of coding support are stated main usability problems. Some solutions were provided. In addition, a close relation between overall satisfaction values which were gathered from the questionnaire and task completion percentages was determined.

Keywords: Usability, content management system, Joomla, web publishing, usability test

GİRİŞ

İçerik Yönetim Sistemleri (İYS) insanlar arasında hızlı, güvenilir ve kolay bir şekilde bilgi paylaşımını amaçlayarak ortaya çıkartılan ve son 20 yıl içinde kullanımları oldukça yaygınlaşan uygulamalardır. İçerik yönetim sistemi, müşterek bir ortamda iş akışını yönetecek işlem basamakları sağlar (Paulsen, 2011). Genellikle kodlama becerisi az ya da hiç olmayan kullanıcıların web içerikleri oluşturmalarını sağlamayı hedefleyen bu uygulamalarda kodlamadan kaçınmak amaçlansa da bazı özel durumlarda buna destek de sağlanmaktadır.

İçerik yönetim sistemleri ticari ve açık kaynak şeklinde ikiye ayrılabilir. Ticari bir İYS'nin sorunları üretici firmanın el değiştirmesi veya iflası sonucunda ürün desteğini kesmesi ve belirli bir ücret karşılığında hizmet vermeleri şeklinde sıralanabilir. Buna karşılık açık kaynak İYS'lerinin kaynak kodları ücretsiz olarak temin edilebilir ve ticari İYS'lere göre destek maliyeti çok daha ucuzdur. Kaynak kodların kolay erişimi her türlü ihtiyaca göre değiştirilebilmesi mümkündür. Bütün problemler, geliştirici topluluklarının sağladığı tavsiyelerle çözülebilir. Dolayısıyla zaman ve maliyet tasarrufunun yanı sıra üretkenlik arttırılmış olur.

Açık kaynak İYS'ler de bir takım zayıflıklara da sahiptir. Kullanılabilirlik (Redding, Karreman & der Geest, 2008) ve erişilebilirlik (Rainville-Pitt & D'amour, 2009) açık kaynak İYS'lerdeki en ciddi problemler olarak görülebilir. Her ne kadar topluluk desteği etkin bir şekilde problemlere çözüm getirse de sistemin yanında yeterli bir dokümantasyon mevcut değildir veya sınırlı destek sağlanmaktadır.

Kullanılabilirlik, tüm İYS'ler için anahtar bir unsurdur (Tiggeler, 2012). Kullanılabilirlik sistemin; amaca uygun, kullanımı kolay, etkili ve verimli olması şeklinde tanımlanmaktadır (ISO 9241, aktaran: Abran, Khelifi, Suryn & Seffah, 2003). Bilgisayar sistemlerinin tasarımcılarının işlevselliği kullanılabilirlik ile bir tutma veya kullanılabilirliği işlevselliğin önünde bir sınırlayıcı faktör olarak görme eğilimine karşın bir sistemin işlevlerinin etkili olması aslında onun kullanılabilirliğine bağlıdır (Goodwin, 1987). Günümüzde daha yeni, daha güçlü ve dolayısıyla daha karmaşık yapıdaki İYS'ler, artan işlevsellikleriyle kullanılabilirlikleri arasında bir denge göz önünde tutularak piyasaya sürülmektedir (Tiggeler, 2012)

Genellikle blog, haber veya alışveriş siteleri için kullanılmakta olan açık kaynak kodlu İYS'lerin içerisinde en yaygın kullanılanlar Joomla, Drupal ve Wordpress'tir (w3Techs, 2013). Bu çalışma kapsamında kullanılabilirlik değerlendirmesi gerçekleştirilen Joomla, 2009'da en iyi açık kaynak PHP İYS olarak değerlendirilmiş ve özellikle çoklu fonksiyonelliği intranet ortamlarında en iyi başaran uygulama olarak belirlenmiştir (Patel, Rathod & Parikh, 2011). Tüm dünyada Joomla kullanan web sitesi sayısı ölçülemese de, kendi resmi sitesinde belirtildiği üzere, kurulum paketi bugüne kadar 35 milyon kez indirilmiş ve bugün, ortalama her 2,5 saniyede bir indirilmektedir (Joomla, 2013). Bu kadar yaygın olarak kullanılan bir ürüne ait herhangi bir kullanılabilirlik çalışmasının olmayışı bu araştırmanın temel motivasyonunu oluşturmaktadır. Yapılan kullanıcı deneyimi çalışmalarından yola çıkılarak Joomla için görev tabanlı bir kullanılabilirlik testi yapılmıştır.

YÖNTEM

Çalışmada kullanılabilirlik problemleri deneysel bir yöntem olan kullanılabilirlik testi yaklaşımı ile tespit edilmeye çalışılmaktadır. Kullanılabilirlik testleri hedef kullanıcıların sistemle etkileşimlerinin gerçek görevleri yerine getirirken gözlemlenmesine dayalı bir yöntemdir (Folmer & Bosch, 2004).

Katılımcılar

Kullanılabilirlik çalışmalarına katılacak katılımcı sayısına yönelik farklı yaklaşımlar mevcuttur. Virzi (1992) ve Nielsen (1993) 5 kişi ile kullanılabilirlik problemlerinin büyük bir çoğunluğunun tespit edilebileceğini savunurken Woolrych ve Cockton (2001) ise bu sayının her türlü durumda ideal olmadığını iddia etmektedir. Bu çalışma 12 katılımcı ile gerçekleştirilmiştir. Katılımcılardan altısı web programlama ile ilgilenen fakat herhangi bir Joomla sürümü ile bir web sitesi yönetmemiş kişilerden, diğer altısı ise daha önce en az bir Joomla sürümü kullanarak en az bir web sitesi yönetmiş kişilerden seçilmiştir. Gönüllü katılımcıların yaş, cinsiyet, meslek ve tecrübe süreleri Tablo 1'de verilmiştir.

Tablo 2. Katılımcıların Demografik Bilgileri

Gruplar	Yaş	Cinsiyet	Meslek	Tecrübe (ay)
Grup 1 (Tecrübeli)	21	K	Öğrenci	8
	20	E	Öğrenci	8
	20	K	Öğrenci	6
	33	K	Bilgisayar İşletmeni	36
	32	E	Uzman	32
	32	E	Öğretim Görevlisi	15
Grup 2 (Tecrübesiz)	23	E	Öğrenci	-
	25	E	Bilgisayar İşletmeni	-
	29	E	Bilgisayar İşletmeni	-
	34	E	Uzman	-
	37	E	Öğretim Üyesi	-
	42	E	Teknisyen	-

Veri toplama araçları

Kullanılabilirlik testi 16 ana adım ve 64 işlemden oluşan gerçek görevlerden oluşmaktadır. Görev listesi yer kısıtı nedeniyle burada paylaşılmamıştır ancak genel olarak kurulum gerçekleştirme ve yönetim panelinde kategori oluşturma, yeni menü ya da sayfa gibi bileşen oluşturma, yayınlama veya yayından kaldırma gibi Joomla ile gerçekleştirilebilecek görevleri içermektedir. Kullanıcıların görev tamamlama oranları belirlenmiştir

Kullanılabilirlik testi sonrasında kullanıcılardan görüşlerini almak amacıyla hazırlanan kullanılabilirlik değerlendirme anketini cevaplamaları istenmiştir. Computer System Usability Questionnaire (CSUQ) (Lewis,

1993) anketi Türkçeye çevrilerek adapte edilmiştir. Kontrol edilebilirlik, öğrenilebilirlik, arayüz kalitesi ve genel memnuniyet konularına yönelik yedili Likert ölçeğinde 19 ve 2 adet açık uçlu sorudan oluşmaktadır. Ankete verilen cevaplar ve görev tamamlama oranları göz önünde bulundurularak sistemin kullanılabilirliğine ilişkin çıktılarının yorumlanması yapılmıştır.

BULGULAR

Görevlerin tamamlanma oranları ve genel memnuniyet ortalamaları Tablo 2'de verilmiştir. Tamamlama oranları ortalaması tecrübesiz grup için %83,85, tecrübeli grup için %95,57 olarak hesaplanmıştır. Tamamlanamayan görevlerin başında menü yapılandırması ve modül yerleşimleri gelmektedir.

Tablo 2. Grupların görev tamamlama oranları.

Gruplar	Katılımcı	Tamamlama Yüzdesi (%)	Tamamlama Yüzdesi Grup Ortalaması (%)	Genel Memnuniyet Ortalaması
Grup 1 (Tecrübeli)	K01	90,63	95,57	5,75
	K02	89,06		
	K03	100,00		
	K04	100,00		
	K05	93,75		
	K06	100,00		
Grup 2 (Tecrübesiz)	K07	89,06	83,85	5,45
	K08	81,25		
	K09	89,06		
	K10	87,50		
	K11	93,75		
	K12	62,50		

Joomla'nın kullanılabilirliğine ilişkin kontrol edilebilirlik (KE), öğrenebilirlik (Ö), arayüz kalitesi (AK) ve genel memnuniyetin (GM) yer aldığı istatistiksel değerlendirmeler Tablo 3'te verilmiştir. Her dört faktörde de ortalama puan "iyi" derecesine karşılık gelen 5 puanın üzerindedir. Buna göre bütün faktörler, Joomla'nın kullanılabilirlik açısından başarılı olduğunu göstermiştir.

Tablo 3. Kullanılabilirlik faktörlerin istatistiksel değerlendirilmesi (N = 12)

	Kontrol Edilebilirlik (KE)	Öğrenebilirlik (Ö)	Arayüz Kalitesi (AK)	Genel Memnuniyet (GM)
Ortalama	5,83	5,40	5,39	5,60
Standart Sapma	0,85	0,65	0,90	0,65
Maksimum	7,00	6,14	7,00	6,42
Minimum	4,00	3,86	4,33	4,37
Ortanca	6,00	5,43	5,33	5,71

Çoklu lineer regresyon analizinde, GM bağımlı; KE, Ö ve AK ise bağımsız değişkenler olarak ele alınmıştır. Elde edilen denklem (1)'de verilmiştir. Bu üç bağımsız değişken memnuniyetin varyansını %99,81 oranında açıklamaktadır.

$$GM = -0,055 + 0,179 \times AK + 0,400 \times Ö + 0,433 \times KE \qquad (R^2 = 0,9981) \qquad (1)$$

Tablo 4'teki model için verilen p değerinin 0,05'ten küçük olması, denklemde yer alan üç bağımsız değişken ile GM arasındaki ilişkinin açıklanmasında kullanılan çoklu lineer regresyon analizinin istatistiksel olarak anlamlı olduğunu belirtir.

Tablo 4. Çoklu Lineer Regresyon Analizinin Varyasyon Analiz Tablosu

	Kareler toplamı	Df	F	p
Model	4.6368	3	1474.11	0.0000
Kalan	0.0084	8		
Toplam	4.6452	11		

Kullanılabilirlik faktörleri, memnuniyet faktörü ve katılımcı özelliklerinin arasındaki ilişki ikili korelasyon analizi ile incelenmiştir (Tablo 5). İlk satır, parametreler arasındaki korelasyon katsayısını, parantez içindeki değerler ise olasılık değerini belirtmektedir. Yüzde 95 güven aralığında gerçekleştirilen analize göre p değerinin 0,05'ten büyük olması durumunda, belirtilen iki parametre arasında istatistiksel olarak anlamlı bir ilişkinin olmadığı söylenebilir. Korelasyon sayısı 1'e yaklaştıkça bu, ilişkinin kuvvetlendiğini gösterir. Katsayıdaki işaret ilişki yönünü belirtir. Buna göre AK, GM, Ö ve KE arasındaki ilişkinin kuvvetli olduğu görülmüştür. GM ile Ö ve KE arasında kuvvetli bir ilişki mevcuttur. Katılımcı özelliklerinden sadece cinsiyet (C) ile tecrübe durumu (TD) arasında bir ilişki gözlenmiştir. Bu ilişkinin diğerlerine göre daha düşük çıkmasının sebepleri cinsiyet dağılımının homojen olmayışı (3 kadın, 9 erkek) ve tüm kadın kullanıcıların tecrübeli grupta yer almalarıdır. Son olarak, TD ile ilişkilendirilebilecek parametreler tecrübe süresi (TS) ve tamamlama yüzdesidir (TY).

Tablo 5. Kullanılabilirlik Faktörleri, Katılımcı Özellikleri ve Memnuniyet Arasındaki İkili Korelasyon Tablosu (p < 0,05, N = 12)

	GM	C	Ö	KE	TD	TS	Y	TY
AK	0,909 (0,000)	0,187 (0,561)	0,663 (0,019)	0,700 (0,011)	0,194 (0,546)	0,209 (0,514)	-0,113 (0,728)	0,354 (0,259)
GM		-0,020 (0,950)	0,726 (0,008)	0,853 (0,000)	0,247 (0,440)	0,266 (0,403)	0,013 (0,969)	0,344 (0,274)

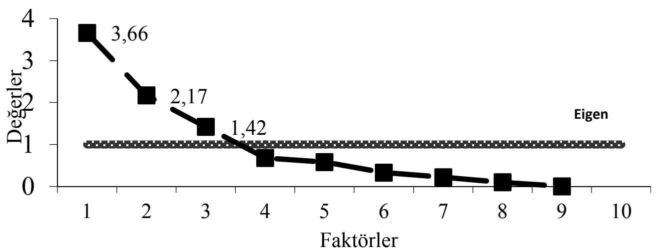
Faktör analizinde girdi olarak kullanılabilirlik faktörleri (KE, Ö, AK), tecrübe bilgileri (TD, TS), TY, katılımcı özellikleri (C, yaş (Y)) ve GM kullanılmıştır. Eigen değeri 1'den büyük olan üç faktör (Şekil 3), toplam varyasyonun yaklaşık %80'inini açıklamaktadır. Her parametrenin yer aldığı faktördeki faktör yükleri Tablo 6'da verilmiştir. Analizde faktör yükü 0,5'ten büyük olan parametreler değerlendirilmiştir.

Tablo 6. Faktör Analizindeki Her Bir Bileşenin Faktör Yükleri

	Faktör 1	Faktör 2	Faktör 3
C	-0,076	0,395	0,689
Y	-0,092	0,075	-0,885
AK	0,915	0,188	0,087
GM	0,965	0,231	-0,086
KE	0,726	0,413	-0,363
TD	0,111	0,733	0,544
TS	0,086	0,844	-0,065
TY	0,198	0,815	0,132
Ö	0,827	-0,164	0,248
Varyans (%)	40,7	23,6	15,7

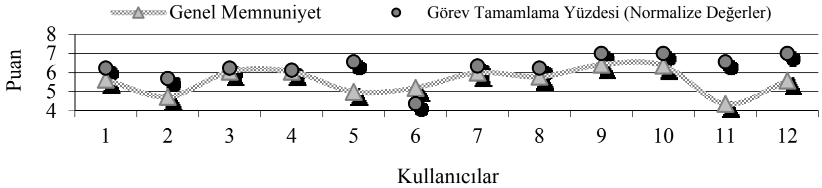


Şekil 3. Eigen değeri 1'den büyük olan faktörler.

Toplam varyansın %40,7'sini açıklayan Faktör 1 içerisinde AK, GM, KE ve Ö yer almaktadır. Tecrübe durumu (TD), TS ve TY'nin yer aldığı Faktör 2 toplam varyansın %23,6'sını açıklamaktadır. Faktör 3'te yer alan C, TD ve Y ise toplam varyansın %15,7'sini açıklamaktadır. Y parametresinin Faktör 3'te negatif çıkması diğer parametrelerle ters yönde bir ilişkiye sahip olduğunun göstergesidir. Diğer bir ifade ile kullanıcının yaşı ilerledikçe kullanım memnuniyeti düşmektedir.

Ankette alınan kullanıcı yorumları, anketin üç alt ölçeğine göre gruplandırıldığında elde edilen bulgular anket sonuçlarıyla örtüşmektedir. Joomla'nın işlemleri hızlandırdığı dolayısıyla verim sağladığı, kullanımının kolay olduğu yönünde yorumlar yapılmıştır. Joomla'nın öğrenmesi kolay, zengin dokümantasyon ve bilgi kaynağına sahip olduğu belirtilmiş ancak hata mesajlarının, özellikle tecrübesiz kullanıcılar tarafından, tam olarak anlaşılamadığı vurgulanmıştır. Arayüz kalitesine ilişkin olarak kodlama yetersizlikleri, sınırlı metin editörü seçenekleri ve içeriklerde tablo düzenlemelerinde sorunlar olduğu belirtilmiştir. Genel anlamda Joomla; basit, kullanışlı ve verimli olarak hemen hemen tüm kullanıcılardan olumlu yorumlar almıştır. Yaşanan en büyük problemlerin, modül oluşturma ve oluşturulan modülün sayfa atamalarında yaşandığı hazırlanan web siteleri incelendiğinde görülmüştür.

Kişi bazında GM ortalaması ile GTY'nin normalizasyon değerlerinin eğilimlerinde bir benzerlik tespit edilmiştir (Şekil 4). Ankete verilen cevap ortalamasını GTY'nin etkilediği söylenebilir. Diğer bir ifade ile kullanıcıların görevlerini tamamladıkça sistemi kullanmaktan daha memnun oldukları söylenebilir.



Şekil 4. GTY'nin Kullanıcı Memnuniyetiyle İlişkisi

SONUÇ

Bu çalışma kapsamında yaygın kullanılan İYS'lerden biri olan Joomla'nın en güncel sürümünün kullanılabilirlik testi yaklaşımı ile değerlendirmesi gerçekleştirilmiştir. Genel olarak tamamlanmayan görevlerdeki eksiklikler, modül konumlandırma ve sayfa seçimi ayarlarının yapılamayışından kaynaklanmaktadır. İkinci olarak menü ayarlamaları konusunda zorluklar yaşandığı ve hata mesajlarının çok anlaşılır olmadığı öne çıkmaktadır. Hatalı işlem durumunda, hatanın ne olduğu, neden kaynaklandığı ve çözüm önerilerini içeren kısa mesajlar gösterilmesi, kullanıcıların sistemi daha rahat kullanmalarını sağlayabilir. Joomla geliştiricilerinden ihtiyaç durumunda kullanıcının kodlama yapmaya imkân sağlayan kolaylıkların olmadığı kullanıcılar tarafından bildirilmiştir. Ancak sistem içinde kod yazmak için ortam sağlayan üçüncü parti eklentiler ile bu sorun ortadan kaldırılabilir. Senaryoda verilen görevleri tamamlama yüzdesi ile anketten elde edilen genel memnuniyet (GM) arasında bir ilişkinin olduğu gözlenmiştir. Anket ortalamasının "iyi" derecede çıkması ve tecrübe durumlarının bu ortalamayı etkilememesi Joomla'nın sunduğu arayüzün sezgisel olduğunu ve kullanılabilirlik açısından kullanıcılar üzerinde olumlu bir kanı oluşturduğunu göstermektedir.

Çalışma kapsamında tespit edilen problemler ve bunlara yönelik olarak geliştirilen önerilerin dikkate alınmasının sistemin iyileştirilmesi açısından uygulama geliştiricilere ve bu uygulamayı kullanmak üzere seçeceklere yardımcı olacağı düşünülmektedir. Daha fazla sayıda kullanıcının katılacağı ve farklı değerlendirme yöntemlerinin kullanılacağı araştırmaların gerçekleştirilmesi uygun olacaktır.

ABSTRACT: The aim of this research was to develop LMS as an effort in increasing learning effectiveness and learning activities of students in Sriwijaya University. The method used in this research was development research method by applying a model proposed by Hanafin and Peck, with specific phases as analysis of necessities, design, development, and implementation. The subjects of this research were students in Physics Education Study Program in Sriwijaya University, Indonesia. Data collection techniques used in this research were questionaire technique and observation. Validation result frommedia experts showed that mean of total validation score was of 4.41 indicating that our LMS used was absolutely valid. The effectiveness which was analyzed from students responses showed mean of total responses of 71.5% in one-to-one experiment phase, 82.32% in limited experiment phase, and 79.88% in class experiment; indicating that all of students responses was positive. Analysis of observational forms in term of active students learning showed that the total scores of observational forms was of 83.51%, which indicated that students were active in learning activities. We succeeded in developing LMS in Sriwijaya University.

Keywords: *e*-learning, LMS, development research, students activities, effectiveness.

INTRODUCTION

There are two facts about Informations and Communications Technology (ICT) in scientific literature. First, it is important to integrate ICT in science education. Research literature has shown that the use of ICT has a promising positive results in education. ICT supports students collaboration and knowledge building. In the context of science education, it also offers possibilities for interaction with the nature and tools for real-time data logging (Juuti, et. al., 2009). According to Twigg (2001), ICT creates transformative learning environment which provides individual approach and is suitable for students need. It aslo helps students to acquire and even use knowledge, skills, and attitude which are necessary for professional activity (Dwyer, 1999). Second, ICT has low levels of use in classrooms. A case study conducted by Istance and Kools (2013) in "OECD's New Millenium Learners Project" showed that since 2007, the gap between the current use of technologies for teaching and learning in schools and the daily experiences students have with technologies outside schools has been increasing. ICT can be used as an integral tool of laboratory-based practical activities to enhance students learning process, virtual alternative to real practical work, or a pedagogical tool for the teachers but classroom use remains scarce (Beaufils, 2005; Alev, 2003).

E-learning is a new form of learning organizations in the 21st century (Seok, 2008). E-learning is the use of ICT (e.g. internet, computer, mobile phone, Learning Management System (LMS), televisions, radios, and others) to enhance teaching and learning activities (Oye, et. al., 2012). In 1960s and 1970s, schools and universities started to use printed learning materials, television, radio, overhead projector (OHP) and movies in learning process (Nguyen, et. al., 2012). However, the rapid growth of computer (personal computer and notebook) and even smart phone in recent days has increased the use of ICT in classrooms. Thus, the use of ICT will adress e-learning activities.

Based on our own informal observations, we found that what is stated on OECD's Project was right. All of our students have their own gadgets (e.g. notebook, personal computer, mobile phone, smart phone, ipad, etc.) brought to the class. These gadgets will allow them to get information from world-wide sources so the focus of courses will not only be on textbooks anymore. Besides, Sriwijaya University (UNSRI) campus offers a free internet access (free wi-fi) for students and lecturers. Thus, both students and lecturers can acces internet for teaching and learning purposes. These all factors enabled us to conduct research about e-learning as an effort to increase effectiveness in learning activities.

Introduction to Solid State Physics is one of the courses offered in our study program. According to our students, this course is relative hard to understand as the tree-dimensional structure of solids including lattice and atoms, atomic binding, band gap, boundaries, and other abstract concepts are not easy to visualize. By this difficulties, the learning effectiveness was low and lecturers needed more time to explain the materials. Thus, we assume that we need to make a Learning Management System to help our students learn this course effectively.

As we know, LMS are software systems designed to support students learning activities (Ellis & Calvo, 2007). Usually, they contain a number of presentations, assessment, communication, and management tools. There are many kinds of LMS, such as Blackboard (Blackboard Inc.), Moodle, and Desire2Learn. The focuses of our research were the development of Learning Management System (LMS) by using Moodle (https://elearning.unsri.ac.id) and use of this LMS to increase effectiveness of our students learning activities.

METHODS AND PROCEDURES

Method used in this research was Development Research method. Our participants were 46 third year students who enrolled Introduction to Solid State Physics course. In this research, we developed LMS by using Moodle. In developing our LMS, we used Hannafin and Peck design model. The model (Suryana, et al., 2014) has three phases including Needs Assessment Phase (Phase I), Design Phase (Phase II), and Development/Implementation Phase (Phase III). Evaluation and revision were carried out throughout all three phases of this model. In Phase I we identified the objectives and learning materials to produce some learning units and to collect data which are related to the developed LMS which is used and another research publications which support our research. In Phase II we designed the LMS. In this phase, we produced story board documents of the LMS as an illustration for designing the LMS which would be developed. In Phase III we developed the story board documents so it became a complete LMS, and we implemented it on the one-to-one of the students, small group and classrooms.

During the three phases, we also had carried out the evaluation and revision processes. Before we implemented it on the one-to-one of the students, we had some expert validations process, including 2 media validators and 2 content validators. The media validators validated the e-learning media in terms of its simplicity, integration, emphasis, balance, and colors. The content validators validated the e-learning media in terms of its content fidelity and language.

The criteria of media and content validity were based on Kiswanto (2012). Mean score for each term criteria from four validators was gained from this formula:

$$Ki = \frac{\sum_{j=i}^{n} V_{ji}}{n}$$

where K_i was the mean score for i-th criteria, V_{ij} was the score of i-th criteria from j-th validator, and n is the number of validators. After we got the mean score for each criteria, we calculated the mean score for i-th aspect with this formula:

$$Ai = \frac{\sum_{j=i}^{n} K_{ij}}{n}$$

Where $A_i$was the mean score for i-th aspect, K_i was the mean score for the j-th criteria in i-th aspect, and n was the number of criteria in i-th aspect. Then, the mean of total validity scores was calculated with formula:

$$V_{amedia} = \frac{\sum_{i=1}^{n} A_i}{n}$$

Where V_{aMedia} was the mean of total validity scores and n was the number of criteria in i-th aspect. Based on Khabibah (Kiswanto, 2012), validity criteria was fitted by the following range: if $1 < V_{a\ Media} \leq 2$the e-learning is not valid, if $2 < V_{a\ Media} \leq 3$ the e-learning is less valid, if $3 < V_{a\ Media} \leq 4$ the e-learning is valid, and if $4 < V_{a\ Media} \leq 5$ the e-learning is strongly valid.

After the implementation on one-to-one of the students, we had three students who had differences in term of cognitive level to complete the questionnaires in which they gave some suggestion for improving the e-learning media. After the small group implementation, we also had evaluation and revision process by choosing six students who had differences in term of cognitive level to complete questionnaires for improving the LMS. The revision of LMS based on the questionnaires was then used in classrooms.

The analysis of questionnaires was done by rating the statement expressed by students. If students “strongly agreed” with the statement in questionnaires, the score would be 5; if students “agreed” with the statement in questionnaires, the score would be 4; if students “were in doubt” with the statement in questionnaires, the score would be 3; if students “didn’t agree” with the statement in questionnaires, the score would be 2; and if the students “strongly didn’t agree” with the statement in questionnaires, the score would be 1.

Our developed LMS is considered as an effective e-learning if data collected from students responses were positive. Data from students responses were analyzed by calculating the mean of the number of student response for each statement with this formula:

$$\mathrm{R_{smedia}} = \frac{\sum \text{score for each statement}}{\mathrm{n}}$$

where $R_{smedia}$was the mean of all students responses scores for each statement and n is the number of students. The percentage of the number of student response for each statement were calculated with this formula:

$$\%\mathrm{R_{smedia}} = \frac{\sum \mathrm{R_{smedia}} \text{ for each statement}}{5} \times 100\%$$

According to Kiswanto (2012), there are 4 criteria of students responses: if the percentage of R_{smedia} is more than 85%, it means that the responses is strongly positive; if the percentage of R_{smedia} is more than 70% but less than 85%, it means that the responses is positive; percentage of R_{smedia} is more than 50% but less than 70%, it means that the responses is less positive; and if percentage of R_{smedia} is less than 50%, it means that the responses is not positive.

Beside giving the questionnaires to the students in classroom implementation, we also observed students learning activities to measure the learning effectiveness with using e-learning media. The observation was performed with using checklist and indicators. Students activities were scored by using rating scale with three criteria: if the student “completed 3 criteria”, the score would be 3; if the student “completed 2 criteria”, the score would be 2; and if the student “completed 1 criteria”, the score would be 1. In this research, we first calculated maximum score for each aspect according to the following formula proposed by Riduwan (2007):

$$\text{Total of maximum score for each aspect} = \text{maximum score for each aspect} \times \text{students}$$

Then we calculated score of all students for each aspect and students activeness percentage in learning process by using the following formula:

$$\%K_s = \frac{N_{smaks}}{N_{si}} \times 100\%$$

Where $\%K_s$ was the percentage of students activeness, N_{smax} was the maximum score for each aspect, and N_{si} was the total score for all students in each aspect. After finding the percentage of students activeness, we fitted it with these criteria:

0 20% 40% 60% 80% 100%

Very Weak WeakEnough StrongVery Strong

RESULT AND DISCUSSION

1. Needs Assessment Phase

In this phase, we identified the objectives and learning matters. Learning units were produced. Data which were related to the developed LMS, including publications of another research were collected to support our research. The analysis of needs assessment produced a prior concept of LMS which would be developed.

Firstly, we examined what courses are too difficult for students to understand. We found that Introduction to Solid State Physics was the most difficult course according to our students. It was quite reasonable as many concepts of this course (crystal structures, atomic binding, band gap, energy levels, lattice, etc.) were not easy to visualize. It needed more time for lecturers to explain the concepts more detail. Some lecturers had difficulties in drawing the crystal structures and explain the electron transfer. Students also needed more time to understand the explanations because the visualization was not good enough. They also needed some flash animations to recognize some learning materials.

In choosing the software for our LMS, we found that there are many industries offered software for LMS development. Some of these softwares were Blackboard, Desire2Learn, and Moodle. By some considerations, we finally chose Moodle as the software for our LMS. We found that many universities in and outside our country also used this software for developing LMS.

2. Design Phase

In this phase, we designed the LMS based on story board documents which had been developed before. In designing the LMS, we used Moddle application. Thus, our LMS have to be used in online. After the LMS created, we validated it to the validators, so there were improvements in terms of content and media features. Validation mean scores in term of media features from two media validators were of 4.41. It revealed that our developed LMS was valid in term of media features according to Kiswanto (2012). We also validated the LMS to the content validators. Validation mean scores in term of content fidelity and language from two content validators were of 3.14. It revealed that our developed e-learning was also valid in terms of content fidelity and language (Kiswanto, 2012).

3. Development/Implementation Phase

The designed LMS were then implemented on one-to-one students. Here we have chosen three students who were cognitively different to try our LMS out. After trying out, these three students were asked to complete questionnaires. The questionnaires were then used to measure students responses in e-learning process. Based on the analysis of completed questionnaires, we had mean score of students responses of 3.5 or 70%. It showed that the students had positive responses to the e-learning process. Because of this positive responses, our LMS were then continued to be implemented on small group. In small group implementation, we had choosen six students who were cognitively different to try our LMS out. After trying out, these students were asked to complete questionnaires. The questionnaires were then used to measure students responses in e-learning process. According to the analysis of completed questionnaires, we had mean score of students responses of 4.01 or 78%. It showed that the students had positive responses to the e-learning process. This positive responses showed that our LMS was effective and valid. This phase were also the final revision before the LMS was implemented to classroom.

In classroom implementation, we used the LMS for students learning activities in classroom. In this implementation stage, we used blended learning, which was a systematic mix of e-learning and learning in face-to-face context. However, using LMS in classrooms is not about teaching students only how to use the LMS or only teach students in traditional way. It is the combination of them. Thus, we used Technology Pedagogoy Content Knowledge (TPCK) Model (Mishra & Koehler, 2006), which describes the inter-relationships between content, pedagogy, and technology. This model is a valuable theoretical conceptual framework as there is a balance between content, pedagogy, and technology. Thus, lecturers should not only be a passive facilitators, but also play an important role in engaging students in classroom activities.

To observe student activeness, we used such a checklist observation form. An accompanying teacher (observer) was asked to observe students and completed the checklist observation form. Data collected from observation forms showed that the mean percentages of students activeness was of 83.52%. It showed that the students were strongly active in e-learning. Thus, our developed e-learning had increased learning effectiveness and students activities in Physics Education study program in UNSRI.

CONCLUSION

We developed LMS for Introduction to Solid State Physics course. The design followed the research development method proposed by Hannafin & Peck. In Phase I, we identified the objectives and learning materials to produce some learning units and to collect data which are related to the developed LMS which is used and another research publications which support our research. In Phase II we designed the LMS. In this phase, we produced story board documents of the LMS as an illustration for designing the LMS which would be developed. In Phase III we developed the story board documents so it became a complete LMS, and we implemented it on the one-to-one of the students, small group and classrooms. During the three phases, we also had carried out the evaluation and revision processes. Validation mean scores in term of media features from two media validators were of 4.41. It revealed that our developed LMS was valid in term of media features. Based on the analysis of completed questionnaires, we had mean score of students responses of 3.5 or 70%. It showed that the students had positive responses to the e-learning process.Validation mean scores in term of content fidelity and language from two content validators were of 3.14.Data collected from observation forms showed that the mean percentages of students activeness was of 83.52%. It showed that the students were strongly active in e-learning. Thus, our developed e-learning had increased learning effectiveness and students activities in Physics Education study program in UNSRI.

ÖZET: Bu çalışma kapsamında Türkiye'de çoğunlukla akademisyenler ve araştırmacılar tarafından sıklıkla kullanılan TÜBİTAK Web sitesinin kullanılabilirlik analizi gerçekleştirilmektedir. Çalışmanın birinci aşamasında akademisyenlerden oluşan 30 kişiye TÜBİTAK Web sitesininin kullanım amaçlarını belirlemeye yönelik bir anket uygulanmıştır. Anket sonuçları doğrultusunda bir sonraki aşamada uygulanan kullanılabilirlik testi için görev listesi oluşturulmuştur. Kullanılabilirlik testine katılan 7 katılımcının görevlerin yapımı sırasında karşılaştıkları zorluklar, yaptıkları hatalar, sesli düşünceleri not edilmiştir. Görevler tamamlandıktan sonra kullanıcılara kullanılabilirlik anketi uygulanmıştır. Çalışmanın son aşamasında 4 kullanılabilirlik uzmanı sitenin sezgisel değerlendirmesini gerçekleştirmiştir. Kullanıcı testi ile sezgisel değerlendirmede bulunan kullanılabilirlik sorunlarının çoğu benzerdir. Ancak birinin bulup diğerinin bulamadığı sorunlar olmuştur. Kullanıcı testinde kullanılabilirlik problemi olarak menü isimlendirmelerinde ve yapısındaki karmaşıklık, sistem durumunun görünür olmaması ve sistemin geleneklerle tutarsızlığı listelenmiştir. Sezgisel değerlendirmede ise yine sistemin görünürlüğünün az olması ve kullanıcı kontrolü problemleri ağır kullanılabilir sorunları olarak tespit edilmiştir.

Anahtar sözcükler: Kullanılabilirlik, kullanılabilirlik testi, sezgisel değerlendirme**,** TÜBİTAK web sitesi

ABSTRACT: In this study usability evaluation of TÜBİTAK website has been conducted. In the first phase of the study, a questionnaire was applied to 30 users to determine the intended use. Task list for the usability test was formulated based on its results. 7 participants were observed while performing these tasks. In the final phase, 4 usability experts conducted heuristic evaluation of the web site. The problems revealed by heuristic evaluation and usability testing were similar. However, there are some problems that one has found while the other cannot. Complexity in the structure and naming of the menu items, invisibility of system status and inconsistencies with conventions are listed as usability problems in usability testing. On the other hand, invisibility of system status and user control are stated as severe usability problems based on the heuristic evaluation.

Key words: Usability, usability test, heuristic evaluation, TÜBİTAK website

GİRİŞ

Kullanılabilirlik kavramı günümüzde herhangi bir yazılım ürünü için olmazsa olmaz kalite kriterlerinden biri haline gelmiştir. ISO standartlarında kullanılabilirlik kavramına yönelik kullanım kalitesi (ISO 9241) ve yazılım kalitesi (ISO/IEC 9126) olarak iki tanım yer almaktadır. Kullanım kalitesi sistemin ne derece etkin, verimli ve tatmin edici kullanılabildiğini, yazılım kalitesi ise kullanılabilirliğin belirlenen şartlar altında anlaşılacak, öğrenilecek, kullanılacak ve beğenilecek yazılım olma becerisini ifade etmektedir (Abran, Khelifi, Suryn & Seffah, 2003). Kullanılabilirlik birçok yönü ile özellikle ara yüz değerlendirmede birincil öneme sahiptir. Kullanılabilirlik ara yüz için öğrenilebilirlik, kullanım etkinliği, hatırlanabilirlik, yapılan hatalar, memnuniyet gibi olguları da içerisinde barındırır (Nielsen, 1993).

Son yıllarda organizasyonların dışarıya bakan yüzlerini oluşturan web siteleri için kullanılabilirlik olmazsa olmaz bir niteliktir. Yapılan çalışmalar web sitesinin kullanılabilirliği arttıkça siteye olan güven artmakta ve bu da siteye olan sadakati artırmaktadır (Flavi'An, Guinal'Iu, & Gurrea, 2006; Robins & Holmes, 2007). Kullanılabilir olmayan bir web sitesinin alternatifleri tercih edilirken, bu durum kamu kurumlarına ait sitelerde alternatifinin olmaması nedeniyle olumsuz sonuçar doğurmaktadır. Bu nedenle kamu kurum web sitelerinin kullanılabilirliğinin değerlendirilmesi oldukça önem kazanmaktadır. Türkiye'de kamu kurum web sitelerinde kritik kullanılabilirlik sorunlarının olduğu ortalama bir vatandaşın bilgisayar kullanım becerisiyle ciddi sorunlar yaşadığı ortaya konulmuştur (Akıncı & Çağıltay, 2004).

Kullanılabilirlik değerlendirmeleri, kullanıcı memenuniyetini arttırdığı, geliştirme maliyetlerini düşürdüğü ve sisteme olan olumsuz algıları azalttığı için oldukça önemlidir (Çağıltay, 2011). Kullanılabilirliğin değerlendirilmesine yönelik çeşitli yöntemler vardır. Zhang (2001, aktaran: Folmer & Bosch, 2004) kullanılabilirlik yöntemlerini test tabanlı, denetim tabanlı ve sorgulama tabanlı olacak şekilde üç başlık altında sınıflandırmıştır. Blanford ve arkadaşları ise (2004) çalışmalarında yöntemleri deneysel ve analitik olarak iki genel başlık altında gruplandırmışlardır.

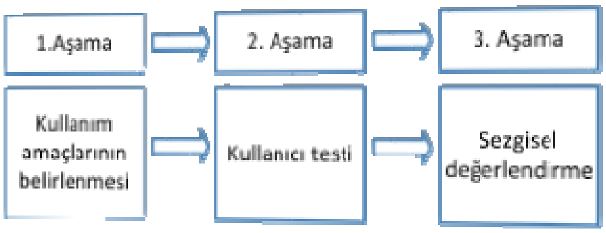
Farklı kullanılabilirlik değerlendirme yöntemleri, farklı kullanılabilirlik problemlerinin tespitinde farklı derecelerde etkili olmaktadırlar. Sezgisel (Jeffries, Miller, Wharton & Uyeda 1991) değerlendirme az maliyet ve çaba ile en çok problem bulmayı sağlarken; deneysel kullanılabilirlik testi daha fazla ara yüz problemi bulmaktadır (Karat, Campbell & Fiegel, 1992). Sezgisel değerlendirme (Nielsen 2001), Nielsen'in 10 maddeden oluşan sezgisellerine dayalı olarak gerçekleştirilen analitik bir değerlendirme yöntemidir. Bu yaklaşımda değerlendiriciler bu 10 maddeyle sistemi değerlendirirler, bulunan problemleri listelerler ve bunlara ciddiyet derecesi vererek çözüm önerilerini belirlerler. Birden fazla uzman tarafında değerlendirme gerçekleştirildikten sonra herbirinin bulguları bir araya getirilerek değerlendirme tamamlanır. Kullanılabilirlik testi ise gerçek kullanıcıları ile gerçekleştirilir. Kullanıcılar görevleri gerçekleştirirken gözlemlenir ve karşılaştıkları problemler belirlenir.

Bu çalışma kapsamında Türkiye'de çoğunlukla akademisyenler ve araştırmacılar tarafından kullanılan TÜBİTAK Web sitesinin kullanılabilirlik analizi gerçekleştirilmektedir. Kullanılabilirlik problemlerinin tespitinde kullanılabilirlik değerlendirme yöntemlerinden sezgisel değerlendirme ve kullanılabilirlik testi yaklaşımları bir arada kullanılarak mümkün olduğunca çok problemin tespiti sağlanmaya çalışılmaktadır. Bu problemlerin tespiti ile sitenin daha kullanılabilir olmasını sağlayacak çözüm önerileri sunulabilecektir.

YÖNTEM

Süreç

Çalışma üç aşamada gerçekleştirilmiştir. Birinci aşamada sitenin kullanım amacı belirlenmiştir. İkinci aşamada kullanılabilirlik testleri yapılmış ve kullanılabilirlik değerlendirme anketi uygulanmıştır. Son aşamada sitenin sezgisel değerlendirmesi yapılmıştır. Çalışmanın akışı Şekil 1'de görülmektedir.



Şekil 1. Araştırma Akış Şeması

Katılımcılar

Üç aşamada farklı kullanıcılar yer almıştır. Birinci aşamada sitenin kullanım amacını belirlemeye yönelik 30 kişilik akademisyen grubuna bir anket uygulanmıştır. Bu grup 22 erkek ve 8 kadından oluşmaktadır. Katılımcıların yaş ortalaması 32'dir. Bilgisayar ve Internet kullanım tecrübeleri iyi düzeydedir. Katılımcıların demografik bilgileri Tablo 1'de özetlenmektedir.

Tablo 3 TÜBİTAK Web Sitesi Kullanım Amacı Katılımcıları Demografik Bilgileri

Cinsiyet		Yaş		Enstitü		Fakülte		
Erkek	Kadın	25-35 yaş	35-45 yaş	Fen Bilimleri	Sosyal Bilimler	Mühendislik	İktisadi ve İdari Bilimler	Diğer
22	8	25	5	17	13	8	14	8

Bilgisayar kullanımı		Günlük bilgisayar kullanımı		Günlük internet kullanımı	
1-10 yıl	11-20 yıl	1-5 saat	6-10 saat	1-5 saat	6-10 saat

9	21	11	19	17	13

Çalışmanın kullanılabilirlik testi aşamasında 7 erkek katılımcı yer almaktadır. Yaş ortalaması 35'dir. Bilgisayar kullanım tecrübeleri iyi düzeydedir. Katılımcıların demografik bilgileri Tablo 2'de özetlenmektedir.

Tablo 4 Kullanım Testi Katılımcıları Demografik Bilgileri

Cinsiyet		Yaş		Enstitü		Fakülte		
Erkek	Kadın	25-35 yaş	35-45 yaş	Fen Bilimleri	Sosyal Bilimler	Mühendislik	İktisadi ve İdari Bilimler	Diğer
7	0	4	3	4	3	3	3	1

Bilgisayar kullanımı		Günlük bilgisayar kullanımı		Günlük internet kullanımı	
1-10 yıl	11-20 yıl	1-5 saat	6-10 saat	1-5 saat	6-10 saat
3	4	3	4	6	1

Son aşamada yer alan sezgisel değerlendirmeyi gerçekleştiren kullanılabilirlik uzmanlarının hepsinin bilgisayar kullanım tecrübeleri çok iyidir. Uzmanlardan üçü bilgisayar mühendisiliği alanında yüksek lisans (1) ya da doktora (2) yapmaktadır. Dördüncü uzman ise endüstri mühendisliği doktora öğrencisidir.

Veri Toplama Araçları

Birinci aşamada web sitesinin kullanım amaçlarını ortaya çıkarmak ve kullanıcı testinde yer alacak görevleri oluşturmak için anket yoluyla veri toplanmıştır. Anket 14 ifadeden ve bir açık uçlu sorudan oluşmaktadır. İkinci aşamada kullanıcı testi kapsamında, katılımcılar 8 görev gerçekleştirmişlerdir. Görevler gerçekleştirilirken ekran ve ses kayıtları alınmıştır. Bu kayıtlar daha sonra incelenmiştir. Görevler sırasında katılımcılardan sesli düşünmeleri istenmiştir. Yapılan hatalar, karşılaşılan zorluklar not edilmiştir. Görevlerin listesi Tablo 3'te yer almaktadır. Kullanıcı testi sonrasında katılımcılardan kullanılabilirlik değerlendirme anketi doldurmaları istenmiştir. 19 sorudan oluşan anketin birinci bölümünde demografik sorular, ikinci bölümünde ise 14 maddeden oluşan 5'li Likert ölçeğine dayalı "Website Analysis and Measurement Inventory" (WAMMI) anketinden Türkçe'ye çevrilerek adapte edilen kullanılabilirlik değerlendirmesi soruları yer almaktadır (Claridge & Kirakowski, 2013). Son aşama olan sezgisel değerlendirme, Nielsen'in (2001) 10 sezgiseline göre bir kontrol listesi hazırlanarak gerçekleştirilmiştir. Kullanılabilirlik konusunda eğitim almış uzmanlar siteyi değerlendirmiş ilgili sezgisele ait sorunları derecelendirmişlerdir.

BULGULAR

Kullanım Amacı Bulguları

TÜBİTAK web sitesinin kullanım amacı anketinde katılımcılar %100 oranda akademik destek programlarının hakkında bilgi olması gerektiğini belirtmişlerdir. Bilgi sunulması istenen konular arasında sanayi destekleri (%77), kamu destekleri (%77), girişimcilik destekleri (%73), bilimsel etkinlik destekleri (%76), bilim ve toplum destekleri (%71), AR-GE merkezleri (%80), ürün ve projeler (%84), bilmsel yarışmalar (%93), bilimsel olimpiyatlar (%79) ve bilimsel yayınlar (%79) başlıkları listelenmiştir.

Kullanıcı Testi Bulguları

Kullanılabilirlik testinde katılımcılar görev listesindeki görevleri gerçekleştiriken gözlemlenmişler; eğer görevi kısa sürede takılmadan gerçekleştirebildilerse "başarılı", eğer uzun sürede ya da yardım alarak gerçekleştirebildilerse "zorlandı", veya tamamlayamadılarsa "başarısız" şeklinde değerlendirilmişlerdir. Görev performans tablosuna (Tablo 3) göre katılımcıların 4, 6, 7 ve 8 numaralı görevleri kolaylıkla başardıkları görülmektedir. Ancak diğer görevlerde başarısız oldukları ya da zorlandıkları da olmuştur.

Birinci görevi katılımcılardan sadece K_1 tamamlayabilirken; K_2 belli bir süre uğraştıktan sonra hangi menü altında olabileceği konusunda yönlendirme aldıktan sonra gerçekleştirebilmiş, diğerleri ise gerçekleştirememiştir. K_2, burslar adlandırmasının proje destekleri için olabileceğini düşünmediğini ve proje için aklına ilk gelen menünün Ar-Ge menüsü olduğunu belirtmiştir. K_3, istenilen yardım programını Hakkımızda menüsü altında aramış ve sonuçta görevi gerçekleştirememiştir. Bu görevde istenen yardım programı burslar menüsü altındadır. Ancak katılımcıların projeyle direk ilişkilendirdikleri isimler destek veya Ar-Ge olmuş ve bu nedenle Destek veya Ar-Ge Faaliyetleri menüsü altında aramıştır. Burs kelimesi genelde öğrencilerin eğitim yaşamlarında verilen yardım olarak algılanmıştır. İkinci sırada yer alan görevi yardım almadan sadece K_4 gerçekleştirebilmiştir. K_2 ise yardım aldıktan sonra yapabilmiştir. Yardımlar ana sayfaya gidip oradan bakmak veya diğer menüler altında olabileceğini hatırlatmak tarzında olmuştur. Görevi yaparken üst menülerde kriptoloji ile alakalı alt menüler aranmış ancak fare ile üzerinden geçilmesine rağmen istenen birimin ismi fark edilememiştir. Katılımcıların hemen hepsi bu sorunu yaşamıştır. Katılımcılar görevi yapmaya çalışırken doğru üst menüye gitmişler ancak alt menülerin (yaklaşık 30 tane) çok olması nedeniyle bulamamışlardır. Üçüncü görevi K_1 yaparken, K_2 yardım alarak yapabilmiştir. Diğer katılımcılar ise yapamamışlardır. Katılımcılar görevin bağlantısını üst menülerde aramışlardır. Görevin bağlantısı ana sayfadadır ancak haberlerin altında olduğu için fark edilememiştir. Fark edenlerin bağlantıda kullanılan resmin dikkat çekici özelliğinden yararlandıkları söylenebilir. Çünkü sağ tarafta menü kullanımı alışık olunmayan bir durumdur. Beşinci görevde yardım programının numarası da verilmiş ve bu arama özelliğini kullananlar için bir kolaylık olmuştur. Görevi tüm katılımcılar yapmıştır. 2 katılımcı yardım ve arama özelliğini kullanmadan yapmışlardır. Diğerleri arama özelliğini kullanmışlar veya yardım almışlardır.

Tablo 5. Görev Listesi ve Katılımcıların Görev Performansları

#	Görev Tanımı	Başarılı	Zorlandı	Başarısız
1	Öğrencilerle beraber geliştirdiğiniz bir projeye yardım almak için TÜBİTAK'ın verdiği desteklerden faydalana bileceğinizi öğrendiniz. Size uygun bir yardım programını bulunuz.	1	1	5
2	Kriptoloji alanında araştırma yapan iki tane birimin veya merkezin iletişim bilgilerine ulaşınız	1	1	5
3	Fizik alanında yayın yapan bir dergi bulunuz ve son sayısını indiriniz	2	1	4
4	Yazılım alanında düzenlenen yarışmaları bulunuz	6	1	0
5	Bilimsel çalışmalarınızda faydalanabileceğiniz 1505 nolu destek programı olduğunu öğrendiniz. İlgili duyuru ve başvuru şatlarını bulunuz	2	5	0
6	Parlak fikirleri olan ve girişimci birisine faydalanabileceği bir yardım programı arıyorsunuz size uygun programları bulunuz	7	0	0
7	Özel sektörün faydalanabileceği yardım programlarına nereden ulaşabilirsiniz?	7	0	0
8	Ulusal bilimsel olimpiyatlara katılma şatlarını bulunuz	7	0	0

Görev Sonrası Kullanılabilirlik Değerlendirmesi Anketi Bulguları

Katılımcılara uygulanan görev sonrası kullanılabilirlik değerlendirmesi anketinin sonuçlarına göre katılımcılar sistemde gezinirken zorluklar yaşamalarına karşılık bu durumu anket cevaplarına yansıtmamışlardır. Katılımcıların sistemin kullanılabilirliğine yönelik olumlu tutumlarının olduğu Tablo 4'den görülmektedir.

Tablo 6 Görev Sonrası Kullanılabilirlik Değerlendirmesi Anketi Sonuçları

Sezgisel Değerlendirme Bulguları

Sezgisel değerlendirmede kullanılabilirlik uzmanları toplamda Tablo 5'de özetlendiği gibi 49 kullanılabilirlik sorunu bulmuştur. Bulunan sorunların 20 tanesi yüzeysel, 10 tanesi hafif, 13 tanesi ağır, 6 tanesi ciddi kullanılabilirlik sorunlarıdır. Toplamda farklı kullanılabilirlik sorunu 22 tanedir. Ciddi kullanılabilirlik problemleri özellikle sistem görünürlüğü ve kullanım kontrolü başlıkları altında yer almaktadır.

Tablo 7 Kullanılabilirlik uzmanlarının bulduğu kullanılabilirlik sorunları

	Bulunan kullanılabilirlik sorunları				
	1.uzman	2.uzman	3.uzman	4.uzman	Toplam
1)Sistem durumunun görünürlüğü	3	2	2	3	10

SONUÇLAR

Bu çalışma kapsamında TÜBİTAK web sitesinin kullanılabilirlik testi ve sezgisel değerlendirme yaklaşımları ile kullanılabilirlik analizi yapılmıştır. İki farklı değerlendirme yaklaşımı kullanılarak bulunan problemlerin kapsamı ve geçerliliğinin artırılması hedeflenmiştir (Fenech Adami & Kiger, 2005).

Kullanıcı testinde katılımcılar ana menülerin altındaki sayfaları tahmin etmekte zorlanmışlardır. Katılımcıların çoğu ilk olarak yanlış bağlantıyı tıklamışlardır. Üst menülere verilen isimler ciddi kullanıcı sorunlarına sebep olmaktadır. Üst menüde sadece 4 başlık olması isimlendirmeyi daha önemli hale getirmektedir. İsimlendirme çok iyi yönlendirme yapmıyorsa bunun yerine üst menü sayısını artmak kullanım kolaylığı sağlayacaktır. Üst menü altındaki menülerin çok fazla olması ve menü isimlerinin bir satırdan fazla yer alması ciddi kullanıcı sorunlarına sebep olmaktadır. Kullanıcı testinde ve sezgisel değerlendirmede bulunan sorunlar birbirleriyle örtüşmektedir. Kullanıcı testindeki katılımcıların görevleri yapmak için ana sayfaya dönmeleri, sitenin neresinden olduklarını bilememeleri ve uzmanların sistem görünürlüğünün zayıf olduklarını belirtmeleri aynı soruna işaret etmektedir. Katılımcılar üst menünün değişmesinin gezintiyi zorlaştığını belirtmişlerdir. Aynı şekilde uzmanlar üst menünün değişmesinin kritik kullanıcı sorunu olduğunda hem fikirdirler. Uzmanlar sağ tarafta ve altta menü olmaması gerektiğini belirtmişlerdir. Bağlantı menülerinin hepsinin yukarıda olması gerektiği ve sabit durmasını önermişlerdir. Ana sayfanın menülerde olmaması dikkat çekilen diğer bir husustur. Ana sayfa bağlantısı her zaman görünür bir yerde olmalıdır.

Çalışma kapsamında tespit edilen problemler ve bunlara yönelik olarak geliştirilen önerilerin dikkate alınmasının sistemin iyileştirilmesi yönünde katkı sağlayacağı düşünülmektedir. Daha fazla sayıda kullanıcının katılacağı ve farklı değerlendirme yöntemlerinin kullanılacağı araştırmaların gerçekleştirilmesi uygun olacaktır.

DEVELOPING GEOMETRICAL THINKING THROUGH MATHEMATIZATION

Zekeriya KARADAG
Bayburt University
zekeriya@bilelim.net

ABSTRACT: This paper summarizes a research done at a graduate course. The researcher investigates the mathematization experience of three graduate students while solving a geometry problem. The participants were expected to go through a vertical mathematization derived from a real life example. However, only one of the participants was successful on exploration whereas the other two failed going further. Data exploring the possible reasons puts forward that their learning habits hindered them from exploring the problem although they agreed on their current knowledge was sufficient to solve the problem.

Key words: Geometrical thinking, Mathematization, Qualitative research

INTRODUCTION

Realistic Mathematics Education (RME) is one of the leading theories getting more appreciation in recent years. The Realistic Mathematics Education (Freduenthal, 1991) framework suggests taking realistic examples from daily life and connecting it to mathematics. That is, mathematics in daily life should be observed and explored through horizontal mathematization and be extended up to higher levels through vertical mathematization (Treffers, 1987).

For examples, the following picture taken from an ordinary carpet illustrates a square like figure having some extensions at the corner (Figure 1). One can take this specific example by assuming the figure is a regular square with side a. Then, it would be great to extend each side by a certain amount such that he could construct an octagon through the end points of these extensions. Now the question would be how much should one extend sides? Maybe $a/\sqrt{2}$, maybe not!

Figure 1: A Carpet Illustrating A Square Like Figure

By assuming the figure on the square is a perfect square, one transforming this example on paper-and-pencil or any Dynamic and Interactive Mathematics Learning Environment (DIMLE) (Martinovic and Karadag, 2012) completes a horizontal mathematization process. However, elaborating the example little more and looking for answer for the question, “what about constructing a polygon with 16-sided from an octagon through a similar method?” and even going furthermore and asking a generalization demonstrates a vertical mathematization.

Vertical mathematization

In order to initiate a vertical mathematization process, one should start with a square with a side a in length and construct an octagon. Now the best question at this moment would how much should we extend the sides to obtain an octagon. After a period of exploration at the paper-and-pencil environment, one may find the answer, ${}^{a}/_{\sqrt{2}}$, and then, in order to verify the answer start drawing a circle with radius, $= {}^{a}/_{\sqrt{2}}$, located its center at the one of the corners, say at B, of the square (Figure 2).

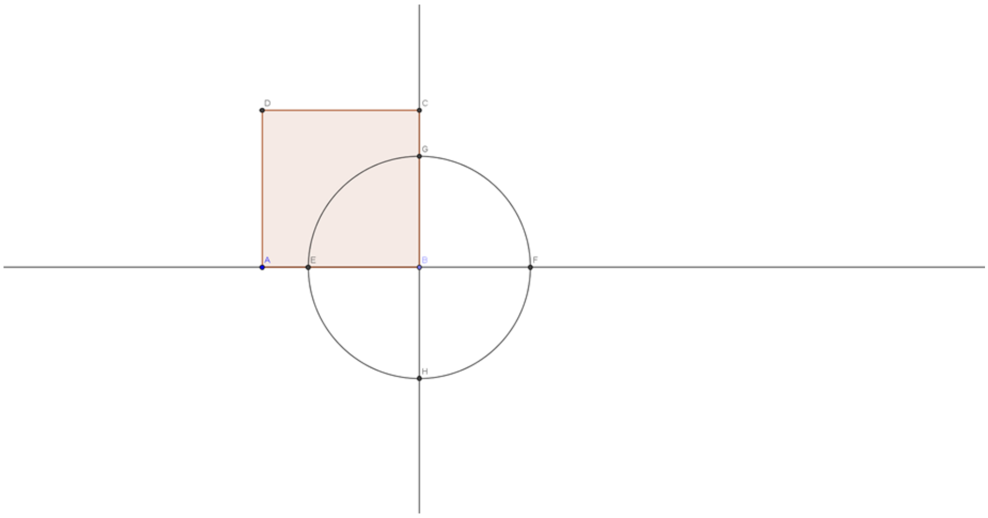

Figure 2: A Circle Created At The Corner B

Since the intersection points of the lines extending the sides and circle located its center B would be the two cornes of the octagon we have been looking for, the rest of the construction would be easier. GeoGebra allows using a tool, helping to construct a polygon if two consecutive corners and the number of sides are known (Figure 3).

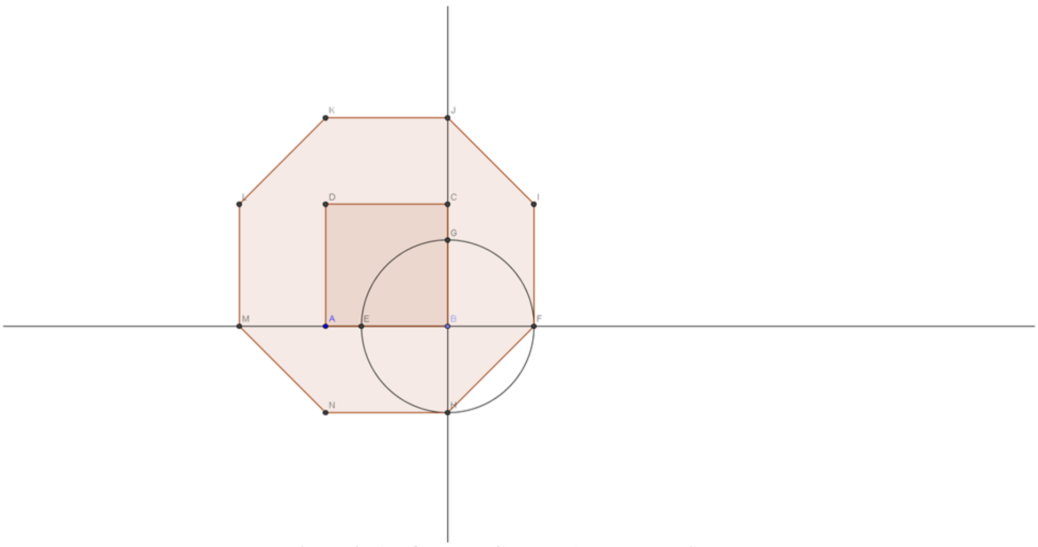

Figure 3: An Octagon Created Around The Square

One could follow similar procedures to construct polygons with 16-sided by drawing a circle at one of the corner with a radius of $R = {}^{a}/_{\sqrt{2-\sqrt{2}}}$, 32-sided etc. However, a mathematician point of view seeks a generalization to accomplish this task if it is possible. Even it is impossible, mathematician needs to convince herself that the generalization problem has no solution. Fortunately, we have a solution for generalization.

Generalization

One having some experience with geometry in general, polygons in particular may assume that we need a formula consisting some angles, and therefore, may attempt to transform the relationships she developed into more trigonometric forms. For example, the following table summarizes these relationships in more tabular form (Table 1).

Table 2: A Summary Of Relationships Between The Sides And The Radii Of Circles

To construct	Start with	Draw a circle with radius
A octagon	a	$R = \dfrac{a}{\sqrt{2\left(1 - \cos\frac{\pi}{2}\right)}}$
A polygon with 16-sided	a	$R = \dfrac{a}{\sqrt{2\left(1 - \cos\frac{\pi}{4}\right)}}$
A polygon with 32-sided	a	$R = \dfrac{a}{\sqrt{2\left(1 - \cos\frac{\pi}{8}\right)}}$
A polygon with 2n-sided	a	$R = \dfrac{a}{\sqrt{2\left(1 - \cos\frac{2\pi}{n}\right)}}$

This table summarizes the findings of free exploration of the aforementioned vertical mathematization process. The following sections describe how participants could perform in following this anticipated mathematization path.

THE STUDY

This qualitative study explores the graduate students' experience while going through mathematization. The resarch problem for the study has been described as, "how could graduate students experience a non-routine geometry problem through vertical mathematization?"

In order to have them better understand mathematization processes, they were instructed on mathematization, including horizontal and vertical mathematization dimensions. Following the instruction, the carpet picture was shown, and how an octagon could be drawn starting from a square was demonstrated. Then, they were asked to elaborate the problem and to construct (1) a polygon with 16-sided by starting from a octagon and (2) a polygon with 32-sided by starting a polygon with 16-sided. Finally, they were asked if it would be possible to generalize the problem and to generate a formula holds true for all cases.

Participants were three graduate students studying mathematics education and taking a course named, "Teaching Geometry: Yesterday, Today, and the Future." Their teaching experience were at Grades 5-8 at various experience levels. Following the problem was exposed, they were given a week to work on the problem. After exploration time was completed, their results were asked to discuss the mathematization they needed to solve the problem and the challenge they had experienced.

Data included their work on paper-and-pencil and GeoGebra environments and informal interviews including their own reflections. In order to understand their experience the data was analyzed qualitatively. As Charmaz (2006) suggests seeking the truth in qualitative data analysis rather than looking for validity and reliability the data was triangulated with each other to make sure that the research results illustrates the truth.

FINDINGS

Interestingly, one out of three graduate was really succesful in this mathematization process whereas one of them had never done anything. One had declared an unsuccesful attempt. The one who had performed succesfully moved even further and developed a formula for another context.

She declared that once she completed the task she had asked herself “what if I start with triangle rather than a square.” Many mathematicians and mathematics educators suggest encouraging themselves to ask a similar question led them to pose new problems and deepen their understandings.

In contrast, asking the other two what holded them to go further or why they could not solve the problem revealed that their learning habit of mathematics throughout their schooling years was the barrier for them to think further. They put forward that their learning habits of learning geometry led them absorbing some geometrical facts rather than exploring geometry by themselves.

RESULTS AND DISCUSSION

This qualitative study reflected on the graduate students’ experience while going through a mathematization process. The data suggests that schooling they had to go through developed a rote learning habit rather than a explorative way of learning. This claim was put forward by one of the participants, and the others also confirmed the claim. They argued that they were supposed to find some certain answers for the test questions on the standardized tests because of the education system they had to follow.

Despite the fact that they appreciated the mathematization they went through they still were unsure about the ways of implementing more problem solving and mathematization sections in their current courses. They claimed that it should be done through Ministry of Education.

Assoc. Prof. Dr. N.İzzet KURBANOGLU
Sakarya University Faculty of Education
kurbanoglu@sakarya.edu.tr

ABSTRACT: In this study; it has been investigated that the science laboratory self-efficacy and science laboratory attitudes points of science teacher candidates and the relationship between the anxiety points of physics, chemistry and biology laboratory and whether these variables make a difference according to gender and class levels. Sample of the study has been consisted of 685 science teacher candidate including 235 male and 450 female that studying in three different Faculty of Education. As data collection tool, Physics, Chemistry, and Biology Laboratory Anxiety and Science Laboratory Attitude and Self-efficacy Belief Scales have been applied at the second semester of the 2012-2013 academic years. Questions of the study have been analyzed with "Pearson Moment Correlation", ANOVA and "t-test". Results showed that between the science laboratory self-efficacy belief and science laboratory attitude points of students' have a positive and meaningful relationship and the science laboratory self-efficacy and science laboratory attitude and physics, chemistry and biology laboratory anxiety points have a negative and meaningful relationship. Students' science laboratory attitude and physics laboratory anxiety points showed meaningful differentness according to the gender. Moreover, students' science laboratory attitude points have showed a meaningful differentness according to the class level. Accordingly 2th grade students' attitude points have been seen more higher than 3th and 4th grade students'.

Key words: Self-efficacy, attitude, anxiety, gender and class level.

ASSESSING AND UPGRADING THE REALITY OF E-LEARNING AT TIKRIT UNIVERSITY

Qasim Mohammed HUSSEIN

e-mail: essaibrahimessa@yahoo.com

ABSTRACT: At this time e-learning still need more experiments in Iraqi universities, including the Tikrit university, needs to be a major effort and intensive process of development towards scientific progress growing in all the Arab countries and the world, for the purpose in this paper we will try to assessing the level of e-learning at Tikrit university, and know that reality and ways to promote it. The teachers do not ask students delivery duties on CDs, and do not use e-learning facilities. Through a questionnaire was distributed to members of the sample of teachers and students totaling 150. The statistical analysis showed that the percentage of responses is (agree, strongly agree, agree somewhat, don't agree, strongly disagree). In front of computer among the most important requirements necessary to build a system of e-learning at the Tikrit university, must be provide financial allocations, training courses, and the adoption of the computer literacy project.

Key words: E-learning, communication, interactive, multimedia, intranet, and availability.

INTRODUCTION

The progress growing and growing information and communication technology in this day and age and the environment interactive with these techniques help to overcome a lot of problems in the field of teaching by linking universities and educational institutions , and research and development centers informational using these techniques , and providing freedom of access to information and education resources , and this leads to an increase in the productivity of the educational process through the independence of time and place (Ahmed S. (2004) & Ali R. (1993)).

And the transformation of traditional learning environment to the environment depends on the knowledge of electronic networks could become a student and teacher of which store and retrieve data through various means, including the Internet. Depending on the ability of the beneficiary to obtain information and develop and employ them and make them available for others to take advantage of them , and so distasteful regimes teaching and learning of new and influential impact "positive " and those aspiring e-learning systems (Horton W. & Horton K. (2003) & Jacob H. (1997)).

PROBLEM OF THE STUDY

Still e-learning in the stages first a need to further testing and research and study and e-learning in Iraqi universities , including the Tikrit University requires great effort and intensive process of development towards scientific progress growing in all the Arab countries and the world , and for the purpose of assessing the reality of the level of e-learning at the Tikrit university, and the ways we will try to promote it in this research to find out the reality and ways to improve it in line to achieve international quality assurance standards.

THE MOST IMPORTANT FOUNDATION OF LEARNING TECHNIQUES

At the end of the last decade of the last century and early this century, and after the two world wars (first and second) appeared to use new types of communication media audio and video in education (such as photos, slides, movies, mobile recording devices, optical film, camera and video) , and the emergence of television and computer automation. We include below some of the most important foundations that underpin learning techniques at the present time:

i. Contact the educational (the process of interaction between the two parties by the idea or opinion, or skill or a joint letter between them).

ii. Educational technologies (set of educational materials and services to increase efficiency within the classroom).

iii. Interactive (the existence of the computer, interactive video, multimedia and the Internet).

Collaborative (rendering software and teaching materials from colleges to individuals one at a time using the internet). .iv

Asynchronization in space and time (progress subjects regardless of time and place for the teacher and the student and access to information in any time he pleases). .v

Instructional design (the use of theory, practice in the design of processes, resources development, and management for education) (Frances D. (2007) & Taleb A. & Wolfgang H. (2008) & Brad M. et. al. (2009)). **.vi**

THE CONCEPT OF E-LERNING

With the use of modern technologies in teaching different subjects within the classroom and designed in an integrated manner based on the use and employ these techniques to be called education-mail (e-learning) is education , which employs an environment rich interactive applications on multiple computer technology and the World Wide Web (WWW) for information and availability of the teacher and the student in which access to resources at any time and from anywhere via the Internet and intranet, extranet (FAO Report (2011) & Debra P. & Zane L. (2006)). The e-learning contributes to the delivery of information and services, training and educational media provided directly to the homes of students and their places of work and therefore, the universities will benefit from the input of these technical studies to prepare and get results quickly (mSysTech (2009)).

THE OBJECTIVES OF THE E-LEARNING

The e-learning has a set of goals, including create an interactive learning environment provide a strengthen the relationship between the university and the community support the process of interaction between students and teachers through the exchange of experiences. On the other hand, its gives teachers and students technical skills up to date, modeling education and presented in the form of a standard, develop the role of the teacher in the teaching process, expand the circle of communication student through the WWW, create networks to organize and manage the work of academic institutions, and finally it provide education that fits different age groups , taking into account individual differences among them (Debra P. & Zane L. (2006) & mSysTech (2009)).

PROCEDURE

The procedures that have been followed in this study through a questionnaire on the study population academic and students to view a range of questions of (25) question included many themes (such as the axis of the use of e-learning at the university and the focus of interest of the e-learning) and through paragraphs questionnaire has been giving each response a certain degree to be processed accurately on the following pattern : strongly agree (5) grades, agree (4) grades, agree somewhat (3) grades, agree (2) grades, and strongly disagree (1) grades. As we see in Table 1 show the responses to the sample's (150) phrases resolution.

Table 1: The Responses To The Sample's (150) Phrases Resolution.

Seq.	**Phrases**	**Degree Acceptance**						**Mean**	**Rank**
			Strongly Agree	**Agree**	**Agree Somewhat**	**Don't Agree**	**Strongly Disagree**

RESULTS

To get to know the reality of e-learning at the Tikrit university was calculated frequencies, percentages, and mean of the responses of the sample, as in Table 1. The study points out that there are phrases statistically significant through the arithmetic average grade as paragraph (17) retained the level first through grades approvals first three any exclusion of non-approval of the response of the sample agreed gain of (60%) of them on the existence of laboratories in the college in paragraph (1) did not agree with the gain of (10%) of them considered gain of (32.6 %) of them that way a successful e-learning in paragraph (19) in paragraph (2) gain of strongly agreed (59.4%) of them did not agree strongly with paragraph (4) gain of (32%) of them agreed strongly gain of (40%) of them with paragraph (13), while strongly disagree gain of (34%) of them with paragraph (7), while strongly disagree them gain of (36%) with paragraph (15) , and so on with the rest of the paragraphs in the Table 1. In the foregoing, the reality of e-learning at the Tikrit university needs to be more effort with the teacher and with the student, and the needs of infrastructure, provision of multimedia and technical support, and provide the Internet.

CONCLUSION AND SUGGESTIONS FOR FURTHER WORKS

The provision of infrastructure linking the home university qualify with other universities through a reliable network of contacts, providing staff trained and qualified to solve problems and support at any time require him to do so, training of teachers through (local, international training courses, and workshops), and increase the financial allocations as much as possible to e-learning projects at the university. The upgrading e-learning project needs to provide software packages that will support it and get to know the work of multimedia.

ORTAOKUL KADEMLERİNE YÖNELİK FEN VE MATEMATİK PROJE YARIŞMALARININ DEĞERLENDİRİLMESİ: TRABZON ÖRNEĞİ

Nilgün MİSİR

Mehmet YEREKAPAN

Erol ŞAHİN

Araştırmada 2005-2006 eğitim-öğretim yılı itibariyle fen ve matematik alanında uygulanan, ortaokul düzeyine yönelik "Bu Benim Eserim" proje yarışmasına katılan projelerin eksik yönlerinin belirlenmesi ve bu eksikliklerin giderilmesine yönelik öneriler sunulması amaçlanmıştır. Araştırmanın verileri 2013-2014 eğitim-öğretim yılı Trabzon ilinden yarışmaya katılan 209 fen ve matematik projesinin, tarama modeline göre incelenmesinden elde edilmiştir. Projelerin incelenmesinde, projenin il ve bölge düzeyindeki değerlendirme kriterlerine göre hazırlanan anket kullanılmıştır. Anketten verilerine göre;projelerin çoğunlukla daha önce benzer yöntemlerle çalışılmış olduğu, proje süreçlerinde bilimsel basamakların yeterince uygulanmadığı, projenin yazılmasında ifadelerin istenilen düzeyde bilimsel açıklanamadığı sonuçları elde edilmiştir. Araştırmada tespit edilen eksikliklerin giderilmesine yönelik önlemlerin belirlenmesi amacıyla, fen ve matematik branşından 10 uzmana yönelik yarı-yapılandırılmış mülakat hazırlanarak veriler betimsel olarak analiz edilmiştir. Yapılan mülakatlar sonucunda, alan öğretmenleriyle işbirliğine girilerek proje konusunun belirlenmesi, bilimsel basamakların uygulanması ve proje raporu yazılmasıyla ilgili öğrencilerin geliştirilmesi, bununla birlikte fen ve matematik ders etkinliklerine proje sürecine ait bilimsel beceri ve tutumların entegre edilmesi gerektiği belirlenmiştir.

ANALYSIS OF MATHEMATICAL PROBLEM SOLVING PROCESSES OF 6TH GRADE STUDENTS USING THE THINK-ALOUD PROTOCOL

Zeynep Çiğdem ÖZCAN

Vildan KATMER-BAYRAKLI

Yeşim İMAMOĞLU

Problem solving is highlighted in many mathematics curricula and has recently become one of the most investigated topics in the field of mathematics education. There is an extensive amount of studies reporting that developing students' problem solving skills enhances their understanding of mathematics. Therefore, investigating problem solving processes of students is very important. One of the measurement techniques used in analyzing the problem solving process is the "think-aloud process".

This study investigates sixth grade students' think aloud processes while solving a mathematical problem verbally. The study group consists of 24 students (8 low, 8 moderate and 8 high achievers) selected from 69 sixth grade students according to the results of a problem solving test developed by the researchers. Think aloud process of each student was videotaped and transcribed. The collected data were first categorized as type (paraphrasing, elaborating, monitoring and identifying a problem) and then each type were coded as either facilitating or non-facilitating. The frequency of these categories were determined and compared according to students' success at solving the problem. Further analysis of students' problem solving process is continuing.

FEN VE ETKNOLOJİ DERSİNDE BİLGİSAYAR DESTEKLİ PROJE TABANLI ÖĞRENME MODELİ UYGULAMALARI

NİlgÜn MİSİR

Mehmet YEREKAPAN

Muhammet TÜRKMEN

Araştırmada fen ve teknoloji dersinde bilgisayar destekli proje tabanlı öğrenme modeli uygulamalarının öğrencilerin akademik başarılarına olan etkisinin belirlenmesi amaçlanmıştır. Araştırma Trabzon İl MEM'nin Comenius Bölge Projesi kapsamında, 2012-2013 eğitim öğretim yılı güz döneminde, Aalittin Akçay Ortaokulunda öğrenim gören 30 kontrol, 30 deney grubu olmak üzere toplam 60 8. sınıf öğrencisi ile yarı-deneysel yönteme dayalı olarak yürütülmüştür. Deney grubuna BIT destekli PTÖ modeline göre, kontrol grubuna ise klasik yönteme göre performans ödevleri verildi. Araştırmanın verileri öğrencilerin performans ödevleri ve ortak sınavlardaki başarılarının karşılaştırılması ile elde edilmiştir. Ortak sınavlardan elde edilen verilerin analizi SPSS.16 programında bağımlı t testi kullanılarak, performans ödevleri ise doküman analiziyle analiz edilmiştir. Yapılan analizler sonucunda deney ve kontrol grubu arasında, deney grubu lehine anlamlı fark olduğu tespit edilmiştir. Ayrıca yapılan doküman analizinde, deney grubunun bilimsel süreç becerilerini kullanma, rapor yazma, bilgisayar teknolojilerinden etkili ve bilinçli olarak yararlanarak bu yönde beceri geliştirme, öğretmenle işbirliği içinde öğrencilerin aktif olduğu ders ortamının oluşturulmasına katkı sağlama sonuçları elde edilmiştir. Araştırmada BIT destekli PTÖ modelinin farklı derslerde de kullanılması önerilmektedir.

EXAMİNATİON OF SCİENCE TEACHER'S PEDAGOGİCAL CONTENT KNOWLEDGE İN THE TOPİCS RELATED TO ACİDS AND BASES

Munise SEÇKİN KAPUCU

Since 1986, following the introduction of content knowledge concept by Shulman, many researchers tried to understand the nature of pedagogical content knowledge. In this study, it has been planned to examine pedagogical content knowledge of two science teachers who have different teaching experiences, using qualitative research method. One of the teachers is female and has 2 years teaching experience, and the second teacher is male and has 31 years teaching experience. Both teachers are working in a public school in Eskişehir, during 2013-2014 academic year. Case study technique, which is thought to fulfill the aims of the research, has been selected as the research tool. Purposive and appropriate sampling technique will be used for the selection of teacher. Research data will be collected using a combination of observation, interview and document review techniques. Semi-structured interviews will be conducted with the science teachers at the beginning and at the end of the study. Moreover, teachers will be observed for 4 weeks, during the instruction of acids and bases topic. Descriptive analysis, content analysis and continuous comparison techniques will be used together to analyze semi-structured interviews conducted with teachers and documents. Following the completion of all analysis and interpretations, the results will be shared with the teachers and they'll be asked if these interpretations can be derived from his words (respondent's approval). Thus, the reliability of the analysis and interpretations will be increased. The data obtained from the study will be resolved in accordance with pedagogical components of the teachers. According to the findings, the recommendations which are thought to contribute to the pedagogical content knowledge of science and technology teachers will be given.

ÖZET: Bir kültür çalışanı olarak değerlendirilen öğretmenlerin niteliklerini arttırmak için günümüzde diğer alanlarda olduğu gibi eğitim alanında da gereklilik gibi görülen lisans üstü eğitim, geçmiş dönemlere nazaran daha önemli hale gelmiştir. Öğretmen adayların lisansüstü eğitime dair tutumları bu bağlamda oldukça önemlidir. Lisansüstü eğitime girişte Lisans mezuniyet ortalaması ve ALES puanı ağırlıklı olarak dikkate alınmaktadır. Araştırmamızda bu verilerin yanında öğretmen adaylarının tutumlarını da dikkate alarak, lisansüstü eğitime girişte bütün bu bileşenlerin bulanık mantık tabanlı bir değerlendirme ile yorumlanmasına yer verilmektedir. Bu çalışmada; öğrencilerin lisansüstü eğitime yönelik tutumlarının belirlenmesinde Ünal ve İlter'in (2010) yılında 5'likert tipinde hazırladıkları "lisansüstü tutum ölçeği" ile elde edilmiş sonuçların yanı sıra öğretmen adaylarının lisans mezuniyet ortalamaları ve ALES puanları da dikkate alınarak lisansüstü eğitime uygun öğrencilerin değerlendirmesi, bulanık mantık kurallarıyla gerçekleştirilmiştir. Çalışma 155 İlköğretim matematik öğretmenliği öğrencisi ile yürütülmüştür. Eldeki verilerin değerlendirmesi bulanık mantık yöntemi ile yapılmış ve bu yaklaşımla daha etkin ve doğru sonuçlara ulaşılabileceği gösterilmiştir.

Anahtar sözcükler: lisansüstü eğitim, bulanık mantık, tutum

ABSTRACT: To improve the quality of teachers who evaluated as an employee of a culture today as it was in other areas such as training requirements seen in the area of graduate education, has become more important than in the past period. The entrance to postgraduate education graduate degree and ALES are mainly taken into account. In our study, these data alongside the attitudes of teachers, taking into account all these components at the entrance to graduate education with an evaluation of the fuzzy logic-based interpretation is given.The analysis which was made with different components. In our study, we used the graduate attitude scale. The scale's findings with the baccalaureate and ALES are determined graduate education in consideration of eligible students by fuzzy logic 155 students applied to teaching elementary school mathematics scale assessment made by fuzzy logic method and results achieved with this approach was shown to be more effective and accurate.

Key words: graduate education, fuzzy logic, attitude

LİSELERDEKİ PERFORMANS GÖREVLERİ HAKKINDA ÖĞRETMEN GÖRÜŞLERİ

ÖZET: Bu çalışma, ortaöğretim kurumlarında görev yapan öğretmenlerin performans görevleri hakkındaki görüşlerini belirlemek amacıyla yürütülmüştür. Araştırmanın verileri 2013-2014 Eğitim-Öğretim yılı Güz döneminde Bayburt il merkezindeki liselerde görev yapan öğretmenlerden elde edilmiştir. Bu amaçla hazırlanan sekiz açık uçlu sorudan oluşan anket 37 lise öğretmenine uygulanmıştır. Anket sorularıyla öğretmenlerin performans görevlerinin amaçları, öğrencilere katkıları, performans görevlerinin değerlendirilmesi, süreçte karşılaşılan güçlükler hakkındaki düşünceleri ve önerileri belirlenmeye çalışılmıştır.

Öğretmenlerin ifadelerinden performans görevlerinin hem öğrenci hem de öğretmen için sorumluluk isteyen uygulamalar olduğu; öğrencilerin araştırmaya nerden başlayacağını bilmesi için öğretmenlerin öğrencileri yönlendirmesi, araştırma tekniklerini göstermesi, mevcut kaynakların en etkin şekilde kullanılması ve velilerden doğrudan yardım almak yerine onların yol gösterici olması gerektiği yönünde durumlar belirlenmiştir. Öğretmenler, performans görevlerinin doğasına uygun olarak öğrencilerin araştırma yapmalarının önemini, aksi durumda bunun hiçbir katkısının olmayacağını vurgulamışlardır. Performans görevlerinin değerlendirilmesi konusunda sorunlar yaşadıklarını belirten öğretmenler, öncelikle yaşadıkları bölgede öğrencilerin imkânlarını dikkate aldıklarını, bu aşamada değerlendirme ölçeklerinden de faydalandıklarını söylemişlerdir.

Çalışmanın sonunda, performans görevlerinin öğrencilere daha yararlı olması konusunda öğretmenlerin görüşlerine ve bu alandaki çalışmalara dayalı bazı somut öneriler sunulmuştur.

Anahtar sözcükler: performans görevi, öğretmen, lise, görüş.

ABSTRACT: The aim of this study is to determine the teachers' opinions in high school about the performance tasks used newly. The study was conducted in the fall term of 2013-2014 academic year with the high school teachers from different branches such as physics, chemistry, mathematic etc. For this aim open-ended questions were applied to 37 teachers. By the open-ended questionnaire the teachers' preceptions about the aims of performans tasks, their contrubitions to students, evaluation of the tasks, problems during the task and suggestions about performans tasks were determined.

Research results showed that most of the teachers' have largely positive attitudes towards the performance tasks. They think that teacher and student have a great responsibility to perform the tasks successfully. The teachers believe the contribution of the performans tasks when it is performed with the aims of them.

The study was ended by the suggestions to realize the aims of the performans task in high schools.

Key words: performance task, teacher, high schools, opinion.

LİSE ÖĞRENCİLERİNİN FEN BİLİMLERİNDE KULLANILAN ÖLÇÜ BİRİMLERİYLE İLGİLİ BİLGİ DÜZEYLERİ VE DÜŞÜNCELERİ

THE LEVEL OF KNOWLEDGE AND OPINIONS OF HIGH SCHOOL STUDENTS WITH REGARD TO UNIT OF MEASURE USED IN SCIENCE AND TECHNOLOGY

Burcu ANILAN
Eskişehir Osmangazi Üniversitesi, Eğitim Fakültesi
burcud@ogu.edu.tr

ÖZET: Öğrenmede kalıcılığı sağlamanın en temel yollarından biri neden-sonuç ilişkisi kurmak, fen bilimleri için hem bir kolaylık hem de bir gerekliliktir. Bu nedenle öğrencilere fen bilimlerinde geçen kavramlar öğretilirken sabitler ve birimler kullanılarak formüllere ulaşılmanın yolu ve mantığı kavratılmalıdır. Bu çalışmada orta öğretim öğrencilerinin söz konusu birim ve sembolleri bilip bilmediklerinin belirlenmesi ve bu birimlerin kullanılmasına yönelik görüşlerinin bazı değişkenler açısından farklılık gösterip göstermediğinin belirlenmesi amaçlanmıştır. Araştırmaya 2010-2011 eğitim-öğretim yılında Eskişehir il merkezindeki ortaöğretim kurumlarında öğrenim gören 354 öğrenci katılmıştır. Genel olarak bakıldığında ortaöğretim öğrencilerinin ölçü birimleriyle ilgili bilgi düzeyleri yeterli seviyede değildir. Öğrenciler sınavlarda birimlerden puan kırılmaması gerektiğini, birimleri doğru yazmaya çalışmanın soru çözümünde zaman kaybı yarattığını düşünmektedirler. Ancak bununla birlikte birimlerin belirtilmesinin önemli olduğunu vurgulamaktadırlar.

Anahtar sözcükler: ölçü birimi, birim, sembol, ortaöğretim

ABSTRACT: One of the most basic ways of ensuring persistence in learning establishes cause-effect relationships, as well as an ease for the sciences and is a requirement. Therefore, you should use the constants and units of ways and means of achieving the formulas while teaching the concepts to students in science. In this study, high school students if they know what these units and symbols identifying and opinions on the use of these units in terms of some variables was to determine whether there is a difference. 354 students who study in the field of science education in high schools in Eskisehir in the 2010-2011 academic years participated to this research. Overall, the level of knowledge about the unit of measure of secondary school students is not sufficient. Students believe that should not be break points in the examinations, trying to write the units correct is to cause loss of time in solution to the question. But it is important to emphasize specifying the units.

Key words: measurement unit, unit, symbol, high school

GİRİŞ

İnsanoğlunun varoluşu ile kıyaslama ihtiyacı başlamıştır. İnsanoğlu bir şeyin uzunluğunu, büyüklüğünü ve ağırlığını kıyaslamak için öncelikle çevresinde gözlemlediği ve kolayca ulaşabildiği nesneleri ve vücudundaki bazı uzuvları kullanma yoluna gitmiştir. Ölçü birimlerinin ortaya çıkışı ve ölçü birimlerine duyulan ihtiyaç da bu şekilde başlamıştır. Öte yandan aynı büyüklüğün farklı yerlerde değişik bir birimle ölçülmesi günlük yaşamda, ticarette, sanayide, sağlıkta ve özellikle bilim dünyasında büyük karışıklıklara yol açmıştır. Bu karışıklığa son vermek amacıyla 1960'ta Birleşmiş Milletler örgütünün öncülüğünde uluslararası bir ölçü sistemi oluşturulmuştur. Fransızca adı *Systeme Internationale d'Unites* (Uluslararası Birimler Sistemi) olan ve tüm dünyada SI kısaltmasıyla bilinen yedi niceliği simgeleyen yedi temel birim ve sembolden oluşan bu birim sistemi, bilim dünyasında da büyük ölçüde benimsenerek öğretilmeye ve kullanılmaya başlanmıştır (Yalçıner, 2001).

Fen bilimleri derslerinde birçok kavram, sabit ve sembol öğretilmektedir. Ancak sadece kavramların bilinmesi yeterli değildir, bu kavramlara ilişkin formüllerde geçen sabitlerin tanınması ve formülün biriminin de bilinmesi önemlidir. Bununla birlikte çoğu zaman, birimlerden yola çıkarak formüllere ulaşılması ise ezberlemeye gerek duymadan konunun daha iyi anlaşılmasını sağlar. Ancak sembol ve birimlerin çoğu öğrenciler tarafından önemsenmemekte ve kullanılmamaktadır. Birim ve sembolleri kullanmadan sadece formülleri ezberleyerek yapılan işlemler sadece o anı kurtaran ve kısa süreli başarıyı getiren geçici çözümlerdir. Oysa öğrenmede kalıcılığı sağlamanın en temel yollarından biri de neden-sonuç ilişkisi kurmaktır. Bu fen bilimleri için hem bir kolaylık hem de bir gerekliliktir. Bu nedenle öğrencilere fen bilimlerinde geçen kavramlar öğretilirken sabitlerin ve birimlerin kullanılarak formüllere ulaşılmasının yolu ve mantığı kavratılmalıdır.

Bu çalışmada orta öğretim öğrencilerinin söz konusu birim ve sembolleri bilip bilmediklerinin belirlenmesi ve bu birimlerin kullanılmasına yönelik görüşlerinin bazı değişkenler açısından farklılık gösterip göstermediğinin belirlenmesi amaçlanmıştır. Bu temel amaç doğrultusunda aşağıdaki sorulara yanıt aranmıştır.

1. Ortaöğretim öğrencilerinin, fen bilimleri derslerinde kullanılan uluslararası birimler ve sembollerle ilgili bilgi düzeyleri nedir?
2. Ortaöğretim öğrencilerinin, fen bilimleri derslerinde kullanılan birim ve sembollerin kullanılmasına yönelik görüşleri nelerdir?
3. Ortaöğretim öğrencilerinin, fen bilimleri derslerinde kullanılan birim ve sembollerin kullanılmasına yönelik görüşleri cinsiyet, sınıf düzeyi ve okul türüne göre farklılaşmakta mıdır?

YÖNTEM

Araştırma Modeli

Ortaöğretim öğrencilerinin fen bilimlerinde kullanılan birim ve sembolleri bilip bilmediklerini ve bu birimlerin kullanılmasına yönelik görüşlerinin bazı değişkenler açısından farklılık gösterip göstermediğinin belirlenmesini amaçlayan bu çalışma, betimsel tarama türünde bir araştırmadır. Bilindiği üzere tarama çalışmaları geçmişte ya da halen var olan bir durumu var olduğu biçimiyle betimlemeyi amaçlayan çalışmalardır (Cohen, Manion ve Morrison, 2000; Karasar, 2013).

Örneklem

Araştırmanın örneklemini 2010-2011 eğitim-öğretim yılında Eskişehir'de dört farklı ortaöğretim kurumunun 10. ve 11. sınıfta öğrenim gören, 109'u kadın ve 245'i erkek, 354 ortaöğretim öğrencisi oluşturmaktadır. Araştırmaya katılan öğrencilere ait bireysel özellikler Tablo 1'de verilmiştir.

Tablo 1. Araştırmaya Katılan Öğrencilerin Bireysel Özellikleri

Bireysel Özellikler		**f**	**%**
Cinsiyet	Kadın	109	30,8
	Erkek	245	69,2
Sınıf düzeyi	10	92	26,0
	11	262	74,0
Okul türü	Anadolu lisesi	47	13,3
	Meslek lisesi	181	51,1
	Fen lisesi	45	12,7
	Genel lise	81	22,9
TOPLAM		354	100,0

Veri Toplama Aracı

Araştırmada veri toplama aracı olarak anket formu kullanılmıştır. Anket, üç bölümden oluşmuştur. Anketin birinci bölümünde araştırmaya katılan ortaöğretim öğrencilerinin bireysel özelliklerini (cinsiyet, sınıf düzeyi, okul türü) belirlemeyi amaçlayan maddeler yer alırken; ikinci bölümde fen bilimleri derslerinde kullanılan uluslararası kabul görmüş birimler ve sembolleri bilip bilmediklerini ölçen 25 madde yer almaktadır. Üçüncü bölüm ise, birimlerin kullanılmasına yönelik görüşleri belirlemeyi amaçlayan maddeleri içermektedir (Yıldırım ve İlhan, 2007). Veri toplama aracının geçerlik ve güvenirliği için bazı işlemler yapılmıştır. Buna göre veri toplama aracının kapsam geçerliliği için iki alan uzmanın görüşüne başvurulmuştur. Güvenirlik için ise Likert tipi ölçekler için en uygun yol olan Cronbach Alpha katsayısı (Tezbaşaran, 1997) hesaplanmıştır. Anketin Cronbach Alpha iç tutarlılık katsayısı 0.79 bulunmuştur. Bu işlemlere dayalı olarak veri toplama aracının geçerli ve güvenilir olduğu kabul edilmiştir.

Verilerin Analizi

Araştırmanın verileri SPSS programında çözümlenmiştir. Veri toplama aracına verilen yanıtların frekans, yüzde ve aritmetik ortalama ($\overline{X}$) değerleri hesaplanmıştır. Ortaöğretim öğrencilerinin fen bilimlerinde kullanılan birim ve sembolleri bilip bilmediklerini ve bu birimlerin kullanılmasına yönelik görüşlerinin bazı değişkenler açısından farklılık gösterip göstermediğinin incelenmesinde ise her bir anket maddesine verilen yanıtların analizi için parametrik ya da nonparametrik testlerden hangilerinin kullanılacağına karar vermek için verilerin normal dağılıp dağılmadığına bakılmıştır. Bunun için Kolmogorov-Smirnov testi uygulanmış ve verilerin normal dağılmadığı görülmüştür ($p<.05$). Bu nedenle verilerin çözümlenmesinde nonparametrik testler kullanılmıştır. Buna göre verilerin çözümlenmesinde iki değişkenli karşılaştırmalarda Mann-Whitney U Testi, üç ve daha çok değişkenli karşılaştırmalarda da Kruskal-Wallis Testi uygulanmıştır. Anlamlılık düzeyi .05 olarak alınmıştır. Veri toplama aracında ikinci bölüm yer alan ifadeler için "doğru" ve "yanlış", üçüncü bölümde yer alan ifadeler için "Hiç Katılmıyorum" (1), "Katılmıyorum (2), "Kararsızım (3)", "Katılıyorum (4)" ve "Tamamen Katılıyorum (5)" dereceleri kullanılmıştır. Aritmetik ortalamalar yorumlanırken 1.00-1.80 arasındaki değerlerin "Hiç Katılmıyorum", 1.81-2.60 arasındaki değerlerin "Katılmıyorum", 2.61-3.40 arasındaki değerlerin "Kararsızım", 3.41-4.20 arasındaki değerlerin "Katılıyorum" ve 4.21-5.00 arasındaki değerlerin "Tamamen Katılıyorum" derecesinde gerçekleştiği kabul edilmiştir. Düzeylerin yer aldığı bu aralıklar, seçeneklere verilen en düşük değer olan 1 ile en yüksek değer olan 5 arasındaki seri genişliğinin seçenek (düzey) sayısına bölünmesi ile elde edilmiştir.

BULGULAR

Bu bölümde ortaöğretim öğrencilerinin fen bilimlerinde kullanılan birim ve sembolleri bilip bilmediklerini ve bu birimlerin kullanılmasına yönelik görüşlerinin bazı değişkenler açısından farklılık gösterip göstermediğini ortaya koyan bulgulara yer verilmiştir.

Ortaöğretim Öğrencilerinin Fen Bilimlerinde Kullanılan Birim ve Semboller ile İlgili Bilgi Düzeyleri

Ortaöğretim öğrencilerinin fen bilimlerinde kullanılan birim ve semboller ile ilgili bilgi düzeyleri Tablo 2'de verilmiştir.

Tablo 2. Ortaöğretim Öğrencilerinin Fen Bilimlerinde Kullanılan Birim ve Semboller ile İlgili Bilgi Düzeyleri

Madde		Doğru		Yanlış	
		f	%	f	%
1	İnç, bir uzunluk birimidir.	257	72,6	97	27,4
2	Ons, bir kütle birimidir.	137	38,7	217	61,3
3	Bir kara mili 1,609km'dir.	256	72,3	98	27,7
4	Kilogram, tonun 1/10000'idir.	91	25,7	263	74,3
5	1 Saat, 6000 saniyedir.	71	20,1	283	79,9
6	Newton'un birimi $kg.m/s^2$ dir.	196	55,4	158	44,6
7	SI birimlerinde basınç, Pascal ile tanımlanmıştır ve birimi N/m^2 dir.	244	68,9	110	31,1
8	1bar, $1x10^6$ Pascal'a eşittir.	212	59,9	142	40,1
9	$1L = 1x10^3 m^3$ 'tür.	186	52,5	168	47,5
10	SI birim sisteminde hız, m/s^2 ile ifade edilir.	172	48,6	182	51,4
11	Hızın birim zamandaki değişim miktarı olan ivmenin birimi, m/s^2 dir.	256	72,3	98	27,7
12	SI birim sisteminde yoğunluğun birimi, kg/m^2 dir.	143	40,4	211	59,6
13	Sıvıların akmaya karşı gösterdikleri direnç olarak bilinen viskozitenin birimi Pa/s dir.	177	50,0	177	50,0
14	Joule, bir enerji birimidir.	295	83,3	59	16,7
15	Bir kalori (cal) ortalama 4,1868joule'dür.	243	68,6	111	31,4
16	SI birim sisteminde gücün birimi watt'tır.	234	66,1	120	33,9
17	Watt'ın birimi joule/saat 'tir.	213	60,2	141	39,8
18	Ohm, bir direnç birimidir.	276	78,0	78	22,0
19	SI birim sisteminde m^2/kg ifadesi, özgül hacim birimidir.	145	41,0	209	59,0
20	Avogadro sayısı kadar atom veya molekül içeren maddeye 1mol denir.	264	74,6	90	25,4
21	273,15 K sıcaklık, 0°C'ye eşdeğerdir.	212	59,9	142	40,1
22	Sıcaklık ölçüsü olarak mutlak sıfır sıcaklığı 0 Kelvin'e karşılık gelmektedir.	184	52,0	170	48,0
23	0°C sıcaklık, 32°F'a eşdeğerdir.	223	63,0	131	37,0
24	Özısı, 'c ' ile ifade edilir ve birimi cal/g°C dir.	276	78,0	78	22,0
25	Elektrik akımı birimi amperdir ve 'A' ile gösterilir.	279	78,8	75	21,2

Tablo 2'de görüldüğü üzere ortaöğretim öğrencilerinin fen bilimlerinde kullanılan birim ve sembolleri bilme durumları toplam frekans ve yüzde değerlerine göre değerlendirilmiştir. Buna göre genel olarak öğrencilerin sorulan birim ve sembolleri bildikleri söylenebilir. Lise ve üniversite öğrencileri ile ilgili olarak yapılan çalışmalarda da kimya derslerinde kullanılan birimlerin öğrenciler tarafından yeterince öğrenilmediğini göstermektedir (Yücel vd. 2001; Seçken vd. 2002; Yıldırım ve İlhan, 2007). Çalışmada elde edilen sonuçlarla çelişmektedir. Tablo 2'de görüldüğü üzere ortaöğretim öğrencilerinin 5 maddeye (2, 8, 9, 10, 17) vermeleri gereken yanıtı vermedikleri görülmektedir. Bir madde de (13) öğrencilerin yarısı doğru yarısı yanlış yanıt vermişlerdir. 25 maddeden 19 madde de öğrencilerin belirttiği yanıtlar gerçek yanıtlardır. Buradan yola çıkarak, genel olarak ortaöğretim öğrencilerinin birim ve sembolleri bildiklerini söyleyebiliriz.

Ortaöğretim Öğrencilerinin Fen Bilimlerinde Kullanılan Birimlerin Kullanılmasına Yönelik Görüşleri

Ortaöğretim öğrencilerinin fen bilimlerinde kullanılan birimlerin kullanılmasına yönelik görüşleri Tablo3'te verilmiştir.

Tablo 3. Ortaöğretim Öğrencilerinin Fen Bilimlerinde Kullanılan Birimlerin Kullanılmasına Yönelik Görüşleri

Madde	Hiç Katılmıyorum		Katılmıyorum		Kararsızım		Katılıyorum		Tamamen Katılıyorum		$\overline{X}$
	f	%	f	%	f	%	f	%	f	%	
1	39	11,0	35	9,9	51	14,4	107	30,2	122	34,5	3,67
2	88	24,9	76	21,5	56	15,8	71	20,1	63	17,8	2,84
3	45	12,7	57	16,1	99	28,0	102	28,8	51	14,4	3,16
4	157	44,4	67	18,9	59	16,7	40	11,3	31	8,8	2,21
5	57	16,1	55	15,5	93	26,3	88	24,9	61	17,2	3,12
6	43	12,1	48	13,6	124	35,0	97	27,4	42	11,9	3,13
7	34	9,6	47	13,3	103	29,1	122	34,5	48	13,6	3,29
8	37	10,5	54	15,3	77	21,8	110	31,1	76	21,5	3,38
9	44	12,4	60	16,9	85	24,0	97	27,4	68	19,2	3,24
10	29	8,2	59	16,7	77	21,8	102	28,8	87	24,6	3,45
11	46	13,0	65	18,4	108	30,5	72	20,3	63	17,8	3,12

Tablo 3'te ortaöğretim öğrencilerinin fen bilimlerinde kullanılan birimlerinin kullanılmasına yönelik görüşlerini belirlemeye yönelik maddelere verdikleri yanıtların ortalama değerleri yer almaktadır. Buna göre öğrencilerin hiç katılmadıkları ve tamamen katıldıkları hiçbir madde olmamıştır. Öğrencilerin sadece 1 maddeye (4) katılmadıkları; 8 maddede (2, 3, 5, 6, 7, 8, 9, 11) kararsız oldukları ve 2 maddeye de (1, 10) katıldıkları görülmektedir. Yani öğrenciler sınavlarda birimlerden puan kesilmemesi gerektiğini (Yıldırım ve İlhan, 2007) ve birimleri doğru yazmaya çalışmanın soru çözümünde zaman kaybı yarattığını düşünmektedirler. Ancak yine de birimlerin belirtilmesinin önemli olduğunu vurgulamaktadırlar. Bu sonuç, öğrencilerin sürekli olarak süre ile yarıştıkları sınav sistemiyle ilişkilendirilebilir.

Ortaöğretim Öğrencilerinin, Fen Bilimleri Derslerinde Kullanılan Birim ve Sembollerin Kullanımına İlişkin Görüşlerinin Cinsiyet, Sınıf Düzeyi ve Okul Türüne Göre Farklılaşma Durumu

Ortaöğretim öğrencilerinin, fen bilimleri derslerinde kullanılan birim ve sembollerin kullanımına ilişkin görüşlerinin cinsiyet, sınıf düzeyi ve okul türüne göre farklılaşma durumu Tablo 4 ve Tablo 5'te verilmiştir.

Tablo 4. Araştırmaya Katılan Öğrencilerin Fen Bilimlerinde Kullanılan Birimlerinin Kullanılmasına Yönelik Görüşlerinin Cinsiyet Değişkenine Göre Farklılaşma Durumu (Mann-Whitney U Testi)

Madde	Kadın		Erkek		U (10^4)	Z	p
	Sıra ort	Sıra top.	Sıra ort.	Sıra top.			
1	156,84	17095,50	186,69	45739,50	1,110	-2,633	,008
9	205,97	22450,50	164,83	40384,50	1,025	-3,579	,000

Tablo 4'de de görüldüğü üzere orta öğrencilerinin fen bilimlerinde kullanılan birimlere ilişkin görüşlerinin cinsiyete göre farklılaşma durumu verilmiştir. Buna göre iki maddede farklılaşma vardır. Ankette yer alan 1. maddeye "Birimlerin belirtilmesi önemlidir", erkeklerin daha fazla katıldıkları, 9. madde ise "Birimleri birbiriyle karıştırıyorum" kadınların daha fazla katıldıkları anlaşılmaktadır.

Araştırmaya katılan öğrencilerin fen bilimlerinde kullanılan birimlere yönelik görüşlerinin sınıf düzeyi değişkenine göre hiçbir maddede farklılaşmadığı görülmüştür. Herhangi bir maddede farklılaşma olmadığı için istatistiksel çözümlemeye yer verilmemiştir.

Tablo 5. Araştırmaya Katılan Öğrencilerin Fen Bilimlerinde Kullanılan Birimlerinin Kullanılmasına Yönelik Görüşlerinin Okul Türü Değişkenine Göre Farklılaşma Durumu (Kruskal-Wallis Testi)

Madde	Anadolu lisesi	Meslek lisesi	Fen lisesi	Genel lise	df	X^2	p	Anl.Fark
	Sıra ortalamaları							
3	231,21	155,17	196,20	185,85	3	24,986	,000	M.Lise-*A.Lise
4	164,62	190,62	177,57	155,63	3	8,249	,041	G.Lise-*M.Lise
8	219,56	170,95	171,58	171,02	3	9,690	,021	G.Lise-*A.Lise

Tablo 5'te araştırmaya katılan öğrencilerin fen bilimlerinde kullanılan birimlere yönelik görüşlerinin okul türüne göre farklılaşma durumuna yer verilmiştir. Buna göre öğrenci görüşlerinin 3 maddede farklılaştığı görülmektedir. 3. maddede "Birimini bilmediğim kavramları formüllerinden çıkarabiliyorum" maddesinde Anadolu lisesi ile meslek lisesi öğrencileri arasında Anadolu lisesi öğrencileri lehine anlamlı bir fark vardır. Bu sonu Anadolu lisesi öğrencilerinin daha iyi çıkarsama yapabildikleri biçiminde yorumlanabilir. 4. madde olan "Sınavlarda birimlerden puan kırılması gerektiğini düşünüyorum" maddesine ise genel lisedeki öğrencilerin meslek lisesindeki öğrencilerine oranla daha az katıldıkları görülmektedir. Bu da genel lise öğrencilerinin daha çok çözüme odaklandığı, çözüme giden yola pek önem vermedikleri biçiminde yorumlanabilir. "Birimleri bilmesem de doğru sonuca ulaşabilirim" (8. madde) maddesinde ise her iki lise türünün ortalama puanlarının birbirine çok yakın olmasına rağmen farkın Anadolu lisesi öğrencileri lehine olduğu görülmektedir.

SONUÇ

Ortaöğretim öğrencilerinin fen bilimlerinde kullanılan söz konusu birim ve sembolleri bilip bilmediklerinin belirlenmesi ve bu birimlerin kullanılmasına yönelik görüşlerinin bazı değişkenler açısından farklılık gösterip göstermediğinin belirlenmesi amaçlanan araştırmanın bulguları genel olarak değerlendirildiğinde aşağıdaki sonuçlar elde edilmiştir:

- Genel olarak öğrencilerin fen bilimleri derslerinde kullanılan birim ve sembolleri bildikleri görülmektedir.
- Ortaöğretim öğrencileri birim ve sembollerin kullanımının önemli olduğunu bildiklerini fakat soru çözümlerinde birim yazmanın zaman kaybına neden olduğunu ve buna bağlı olarak birim yazmadıkları için puan kırılmaması gerektiğini belirtmektedir.
- Erkek öğrenciler, birimlerin belirtilmesini kadın öğrencilere göre daha fazla önemsemektedirler.
- Kadın öğrenciler erkek öğrencilere göre birimleri daha fazla karıştırmaktadır.
- Öğrencilerin fen bilimlerinde kullanılan birimlere yönelik görüşleri sınıf değişkenine göre farklılaşmamaktadır.
- Anadolu lisesinde öğrenim gören öğrenciler, birimini bilmedikleri kavramları formüllerinden çıkartabilmektedirler.
- Genel lise öğrencileri birimlerden puan kesilmemesi gerektiğini düşünmektedirler.
- Anadolu Lisesi öğrencileri birimleri bilmeden de doğru sonuca ulaşabileceklerini belirtmektedirler.

ABSTRACT: The aim of this study is to investigate the pre-service science teachers' images of physicist and physics course. A total of 69 students, who were studying in primary science teaching at the Education Faculty of Muğla Sıtkı Koçman University in Turkey. The data were collected using Word Association Test. Response words with the same meaning were classified under the most frequently repeated words. Words less than two times and those words that could not be associated were considered as irrelevant and were excluded. After contents have been analyzed, the frequency of the response words has been calculated and categorized. Participants' associations of the term physicist were arranged into four categories. Participants' associations of the term physics course were arranged into six categories. According to results, most of the participants related to personal character of physicist. More than half of the participants' images are that physics course is difficult and most of them have negative attitudes towards physics course.

Key words: physicist, physics course, image, word association test

INTRODUCTION

Physics help us to understand most of the facts/phenomenon/events in real life. Additionally, individuals can gain scientific thinking abilities through physics education. This is mainly based on the interactions and communications which take place between physicist and students. On the other hand, instructor's qualifications for physics course are so important that learning physics is accepted difficult by some of the researcher (Lederman, 1993). Physicist's characteristics, including the actions and behaviors from the beginning till the end of the lesson can affect the students' perspectives about physicist and physics course. Therefore it is essential to understand how students' perceive physicist and physics course. Students' images of physicist and physics course can inform us how students see them and what they sense about them. The aim of this study is to investigate the pre-service science teachers' images of physicist and physics course.

METHODS

Participants

A total of 69 students, who were studying in primary science teaching at the Education Faculty of Muğla Sıtkı Koçman University in Turkey, participated in this study. They were in first year in their teacher training program. The majority of the participants were female (%89.8). This study was conducted during September 2013.

Data Collection

Participants were asked to complete a word association test (WAT). The word association test is a data collection technique which is reported in the literature to be used to investigate a person's or a group's conceptual field or image on a particular subject. In it's simplest form one or a series of stimulus words projected orally or written to the participants who must respond with the first word(s) that come(s) to their mind (response words) (Daskolia, Flogaitis, & Papageorgiou, 2006). In the test, the terms "physicist" and "physics course" were presented as a stimulus in the following format:

Physicist:
Physicist:
Physicist:
Physicist:
Physicist:
Related Sentence:…………………………………………………………….

The reason for writing the term stimulus five times, one under the other, is to prevent the risk of chain responses. If the teacher does not return to the stimulus term after writing one response, he or she will tend to write words associated with the previous response word that he or she wrote instead of the stimulus word. This situation could be detrimental to the purpose of the test. Teachers were asked to write the first five words that came to then-mind when hearing or reading terms "physicist" and "physics course." The technique is based on the assumption that providing a stimulus word and asking respondents to freely associate the ideas which come to mind gives relatively unrestricted access to mental representations of the stimulus term (Bahar, Johnstone, & Sutcliffe, 1999; Sato & James, 1999). During the implementation, the participants were provided with necessary explanation. In the first stage, they were given 40 seconds for writing responses (Gussarsky & Gorodetsky, 1990) In the second stage, participants were also expected to write down a sentence related to the key concepts in 20 seconds.

Data Analysis

Data collected from word association test were analyzed by authors. Response words with the same meaning were classified under the most often repeated words. Words less than two times and those words that could not be associated were considered as irrelevant and were excluded. After contents have been analyzed, the frequency of the response words has been calculated and categorized. Related sentences were individually examined during the data analysis to determine participants' images of physicist and physics course. Many studies have shown this type of data analysis technique provides reliable results (Daskolia et al., 2006; Torkar & Bajd, 2006).

RESULTS AND FINDINGS

The data collected from responses regarding the word association test are submitted in two separate sections. They are pre-service science teachers' images of physicist and physics course.

Pre-Service Science Teachers' Images of Physicist

Participants' associations of the term physicist were a total of 315. A total of 17 (5%) of these associations could not be categorized. These words appeared once and could not be categorized with the other words. Inferentially, they were excluded from the results in Table 1. The remaining 34 different associations were divided into four categories. These categories, response words and their frequency are listed in Table 1.

According to the results, the associations related to personal character of physicist create the dominant category (f= 234). In this category some of the participants produced positive associations, such as *intelligent*, *industrious, disciplined, successful* and *patient* related to physicist. However, some of the participants produced negative associations, such as *nervous*, *boring, compelling* and *scary*. When participants' sentences are examined about physicist, it is seen that the sentences were in parallel with findings of stimulus term. For example: "Physicists are very intelligent people." (Student 1), "Physicists are always industrious." (Student 2).

In the second category, participants produced associations related to activities of physicist (f= 50). In this category, most of the participants focused on *experiment, researcher, calculation* and *comment*. For example related sentence about this category: "Physicist is a person who likes to experiment and research" (Student 3).

In the third category, participants focused on the physical character of the physicist (f= 10). Accordingly, the participants consider the physicist as a person with *bespectacled, female* and *fat*.

In the fourth category, the participants produced associations related to careers of the physicist (f= 9), such as *teacher* and *professor*.

Table 1. Associations With The Term Physicist

Categories	Associations Included in Categories and Their Frequencies	Total Frequency of Associations in This Category	%

Pre-Service Science Teachers' Images of Physics Course

Participants' associations of the term physics course were a total of 345. A total of 58 (17%) of these associations could not be categorized. These words appeared once and could not be aggregated with other words. Finally, they were excluded from the results. The remaining 29 different associations were divided into six categories. These categories, response words and their frequency are listed in Table 2.

According to the results, the associations related to qualifications of the physics course create the dominant category, (f= 180). In this category, it is observed that many of the participants focused on the *difficult, boring, enjoyable* and *tiring*. When participants' related sentences are examined about physics course, it is seen that the sentences were in parallel with findings of stimulus term. For example: "Physics course is the most difficult course among science courses" (Student 4), "Generally physics course is a theoretical course, so it is boring" (Student 5).

In the second category, the participants produced associations related to requires to be successful in the physics course (f= 34). In this category, many of the participants believed to need *decided, thinking, patient* and *attentive*. For example related sentence about this category: "Physics course is difficult and complicated. If you are patient during the lesson, you can be successful" (Student 6).

In the third category, the participants focused, in general, on activities in physics course, such as *using formula, calculate* and *experiment* (f= 34).

The fourth category reflects the associations of participants' attitudes towards physics course (f= 29). In this category most of the participants produced negative associations, such *dislike, unnecessary* and *belief for unsuccessful*. However some of the participants produced positive associations *necessary* and *excitement*. For example related sentences about this category: "I'm afraid that if I can not pass the physics course" (Student 7), "Actually I like physics course. It is interesting. But this situation can be change according to the teacher" (Student 8).

In the fifth category, the participants associated with environments of physics course, such as *laboratory* and *classroom* (f= 6). For example related sentence about this category: "We wear white laboratory coat in the laboratory" (Student 9).

In the six category, the participants have produced associations related to content of physics course (f= 13). Most of the participants in this category focused on *force and motion*.

Table 2. Associations With The Term Physics Course

	Excitement (3)		
	Necessary (3)		
Environments of Physics Course	Classroom (4)	6	2
	Laboratory (2)		
Content of Physics Course	Force and Motion (4)	4	1

CONCLUSION

A general feature of pre-service science teachers' images for physicist is about personal character of him/her. Dikmenli (2010) investigated undergraduate biology students' images of science and scientist. His study revealed that participants focused on personal character of scientist. Physicist is thought intelligent or interesting person by some of the participants. However, some of the participants have negative associations for physicist like boring, nervous and scary. Such kinds of negative images for scientist have been revealed in previous studies (Finson, 2002; Bovina & Dragul'skaia, 2008). Also, some of the participants focused on activities of the physicist, such as experiment, responsive to the needs and researcher.

Participants’ dominant category for physics course is qualifications of physics course. Negative associations for this category are difficult, boring, tiring, not understandable, complex and easily forgotten. A widespread opinion in the literature is that physics is a difficult course for most of the students; furthermore physics is a course which students have prejudgement and fears to be unsuccessful (Angell, Guttersrud, Henriksen, & Isnes, 2004; Carlone, 2003; Korur & Eryılmaz, 2009; Osborne & Collins, 2001). Positive associations for this category are enjoyable, curious, easy, interesting, fastmoving, understandable and detailed. Another conclusion of this study, participants generally have negative attitudes toward physics course.

RECOMMENDATIONS

In this study, it was revealed that pre-service science teachers produce both negative and positive associations, regarding physicist and physics course. However, negative associations are more than positive associations. Because of these negative images are products of secondary school physics course, physics teaching can be revised in these schools. In the teacher training program, physics instructors should be aware of pre-service science teachers’ negative images of physics course and physicist. Because of these negative associations can affect participants’ physics success and their science teaching in the future. Physics and physics laboratory courses should support pre-service science teachers’ improving positive images.

ÖZET: Matematik öğretmen adaylarının lisans eğitimi süresince alan bilgilerinin şekillenmesinde önemli rolü olan derslerden birisi de Sayılar Teorisi dersidir. Bu çalışmada, matematik öğretmen adaylarının, Sayılar Teorisi dersinde verilen Çin kalan teoremi ile ilgili algılayışları, Hazzan'ın (1999) geliştirdiği *soyutlamanın indirgenmesi* teorisi çerçevesinde incelenmiştir. *Soyutlamanın indirgenmesi* düşüncesi, öğrencilerin bir derste karşılaştıkları kavramlardaki soyutlamadan veya uzmanların (matematikçiler, öğretmenler vb.) kendilerinden beklediğinden daha düşük seviyedeki bir soyutlamayla çalışma eğilimlerine dayanmaktadır. Araştırmamızda, ilköğretim ve ortaöğretim matematik eğitimi bölümlerinde okuyan öğretmen adaylarından oluşan bir çalışma grubuyla yapılan geniş kapsamlı bir araştırma kapsamında sorulan Çin kalan teoreminin uygulamasına yönelik bir probleme verilen cevaplar, betimsel analiz ve içerik analizi yöntemleri ile incelenmiştir. Elde edilen bulgulardan, öğretmen adaylarının birçoğunun, problemin çözümünde ortaokul veya lisede öğrendikleri yöntemi kullandıkları veya teoremi hipotezlerini kontrol etmeden bir formül gibi kullandıkları görülmüştür. Öğretmen adaylarının bu şekildeki yaklaşımları soyutlama seviyesinin indirgendiğinin bir göstergesidir.

Anahtar sözcükler: Soyutlamanın indirgenmesi, Çin kalan teoremi.

ABSTRACT: Number Theory is one of the courses that plays an important role in forming the content knowledge of the pre-service mathematics teachers during their undergraduate education. In this research, the conception of the pre-service mathematics teachers about the Chinese remainder theorem which is given in the Number Theory course is examined through the lens of the theoretical framework of *reducing abstraction* (Hazzan, 1999). The answers of a study group to a question related with the Chinese remainder theorem which is in the scope of a wider research are analyzed with the methods of content and descriptive analysis. From the obtained findings, it was observed that many of the pre-service teachers used the method that they had learned at high school to solve the question or they used the theorem like a formula without checking the hyphothesis of the theorem. This situation is an indication that the level of abstraction is reduced.

Key words: Reducing abstraction, Chinese remainder theorem.

GİRİŞ

Bireylerin matematiği iyi öğrenmesini etkileyen en önemli faktörlerden birisi de öğretmenlerdir. Öğretmenlerin bilgi ve yeterlikleri, matematik eğitiminin kalitesiyle doğrudan alakalıdır. Shulman'ın (1987) bir öğretmenin sahip olması gereken bilgi ve yeterlikler kapsamında tanımladığı alan bilgisi, öğretmenin alanındaki kavram ve olgular bilgisi ve alanın yapısı hakkındaki bilgisini kapsar. Sayılar teorisi de matematik öğretmen adaylarının lisans eğitimi süresince alan bilgilerini şekillendiren en önemli derslerden birisidir. Sayılar teorisi, formel ve bilişsel doğası, aritmetik ve cebirle ilişkisi, kriptoloji ve bilgisayar bilimleri gibi birçok uygulama alanı ile matematik eğitiminde üzerinde özellikle durulması gereken bir alandır. Matematik tarihi ve felsefesindeki rolü ve öğretmenlerin alan bilgisindeki önemine rağmen sayılar teorisine yakın zamana kadar matematik eğitimi araştırmalarında kısıtlı yer verilmiştir (Zaskis ve Campbell, 2011). Bununla birlikte araştırmamızın teorik çerçevesini oluşturan s*oyutlamanın indirgenmesi teorisi* de öğrencilerin lisans matematiğindeki kavramalarını açıklamak ve soyutlama seviyelerini incelemek için geliştirilmiş olmasına rağmen sayılar teorisi alanında derinlemesine kullanılmamıştır.

Soyutlamanın İndirgenmesi

Soyutlama seviyesinin indirgenmesi (kısaca, *soyutlamanın indirgenmesi*) teorisi, ilk olarak Hazzan (1999) tarafından, lisans öğrencilerinin soyut cebir kavramlarını algılayışlarını açıklamak için geliştirilerek kullanılmış ve genellikle de ileri matematiksel düşünceyle ilgili alanlar (bilgisayar bilimleri gibi) ve lisans matematiğindeki konularla ilişkilendirilmiş (Hazzan, 2001, 2003a, 2003b) bir teoridir. Hazzan ve Zaskis (2005) ise bu teorinin okul (ilk ve orta öğretim) matematiği seviyesinde de kullanılabileceğini göstermişlerdir. *Soyutlama seviyesinin indirgenmesi* düşüncesi esasen öğrencilerin, derste karşılaştıkları kavramlardaki soyutlamadan veya uzmanların (matematikçiler, öğretmenler vb.) kendilerinden beklediğinden daha düşük seviyedeki bir soyutlamayla çalışma eğilimlerine dayandırılabilir. "Soyutlamanın indirgenmesi" terimi mutlaka yanılgıyla veya matematiksel hatayla sonuçlanan bir zihinsel süreç olarak anlaşılmamalıdır. Soyutlama seviyesini indirgeme süreci, öğrencinin öğrendiği yeni kavramlarla baş edebilmek için yollar bulmasının göstergesidir. Öğrenciler bu şekilde, kavramları zihinsel olarak erişilebilir hale getirir böylece onlarla düşünebilir ve bilişsel olarak ele alabilirler. Soyutlamanın indirgenmesi teorisi, literatürdeki *soyutlama seviyeleri* ile ilgili üç farklı yorumdan hareketle oluşturulmuştur. Bununla birlikte, soyutlama seviyelerinin bu farklı yorumlarının birbirlerini karşılıklı olarak ne tamamen dışladıklarını ne de tamamen kapsadıklarını da ayrıca belirtmeliyiz (Hazzan, 1999, 2001). Aşağıda, soyutlama seviyelerinin bu üç farklı yorumu ile ilgili bilgi verilecektir.

a) Düşünülen nesne ve düşünen insan arasındaki ilişkinin kalitesi bakımından soyutlama seviyesi
Soyutlama seviyesi ile ilgili bu yorum, Wilensky' nin (1991), "herhangi bir şeyin soyut ya da somut olması, o şeyin doğal bir özelliği değildir aksine kişi ile nesne arasındaki ilişkinin özelliğinden kaynaklanır" iddiasına dayanır. Başka bir deyişle, her kavram ve her kişi için ikisi arasındaki önceki ilişkiyi yansıtan farklı bir seviyedeki soyutlamayı gözleyebiliriz. Bir kişi bir nesneye ne kadar yakın olursa ve ne kadar çok bağ kurmuşsa bu nesneyi o kadar daha somut (ve daha az soyut) hisseder. Bu bakış açısının temelinde, bazı öğrencilerin zihinsel süreçlerindeki, tanıdık olmayan bir düşünceyi daha tanıdık yapma veya soyutu somut yapma eğilimleri yatmaktadır (Hazzan, 1999).

b) Süreç-nesne ikililiğinin (*process-object duality*) yansıması bakımından soyutlama seviyesi
Soyutlama seviyesi ile ilgili bu yorum, matematik eğitiminde kavram geliştirme teorilerinde önerilen süreç-nesne ikililiğine dayanır. Bu ikililiğe dayanan teoriler (*APOS* teorisi gibi), matematiksel düşüncelerin, süreç olarak kavranışı ile nesne olarak kavranışını birbirinden ayırırlar ve farklılıklarına rağmen matematiksel bir kavram öğrenildiğinde, onun bir süreç (ardışık işlemler) olarak kavranmasının nesne olarak kavranmasından önce ve daha az soyut olduğu üzerinde birleşirler. Bundan dolayı matematiksel bir kavramın süreç olarak kavranışı bir nesne olarak kavranışından daha düşük bir seviyede soyutlama (yani *soyutlamanın indirgenmesi*) olarak yorumlanabilir (Hazzan, 1999).

c) Düşünülen matematiksel kavramın karmaşıklığının derecesi bakımından soyutlama seviyesi
Soyutlama seviyesinin bu yorumunu bir örnekle açıklamak gerekirse; elemanların bir kümesi, kümedeki herhangi bir özel elemandan daha karmaşık bir matematiksel yapıdır. Bu gerçek tabi ki de karmaşık nesnelerle düşünmenin daha zor olacağını gerektirmez. Buradaki varsayımımız, bir yapı ne kadar karmaşıksa o kadar da soyuttur çünkü bir yapı bütün olarak analiz edildiğinde daha fazla detay göz ardı edilmelidir. Bu bakımdan soyutlamanın bu yorumu, öğrencilerin, bir kümenin yerine onun bir elemanını koyarak dolayısıyla da daha az karmaşık bir nesneyle çalışarak soyutlama seviyesini nasıl indirgediklerine odaklanmaktadır.

Çin Kalan Teoremi

Kalanlarla ilgili en eski problemin, M.S. üçüncü yüzyılda yazıldığı kabul edilen *Sun Zi Suanjing* adlı bir matematik eserinde olduğu keşfedilmiştir. Bundan dolayı kalan problemi günümüzde Çin kalan teoremi olarak bilinmektedir. *Sun Zi Suanjing*'deki problem şu şekildedir: " Bir sayı 3'e bölündüğünde 2 kalıyor, 5'e bölündüğünde 3 kalıyor, 7'ye bölündüğünde de 2 kalıyor. Bu sayı kaçtır?". Eski çağlardan günümüze kadar kalan problemi ile ilgili birçok çalışmalar yapılmış ve teorem geliştirilerek günümüzdeki halini almıştır (Ing, 2003). Çin kalan teoremi özellikle bilgisayar bilimleri ve kriptolojide yaygın olarak kullanılmaktadır.

Çin Kalan Teoremi: $m_1, m_2, \ldots, m_r$ sayıları karşılıklı aralarında asal olan r tane pozitif tamsayı, $a_1, a_2, \ldots, a_r \in Z$ olsun. Bu durumda,

$$\begin{gathered} x \equiv a_1 (\operatorname{mod} m_1) \\ x \equiv a_2 (\operatorname{mod} m_2) \\ \ldots\ldots\ldots\ldots\ldots\ldots \\ x \equiv a_r (\operatorname{mod} m_r) \end{gathered}$$

sisteminin ortak çözümleri vardır. Ayrıca $m_1.m_2.....m_r$ modülüne göre bu sistemin bir tek çözümü vardır (Şenay, 2007, s.151).

Araştırmamızın amacı, öğretmen adaylarının Sayılar Teorisi dersinde gördükleri ve ispatı kongrüans sistemlerinin çözümleri için bir metot oluşturan Çin kalan teoremi ile ilgili soyutlamayı indirgeme seviye ve eğilimlerini belirlemektir. Bu amaç doğrultusunda problem cümlesi, “ Matematik öğretmen adaylarının Çin kalan teoremi ile ilgili soyutlamayı indirgeme eğilimleri nelerdir?” şeklinde belirlenmiştir.

YÖNTEM

Bu bölümde, araştırmanın modeli, çalışma grubu, veri toplama aracı, verilerin toplanması ve verilerin analizi ile ilgili açıklamalar yapılacaktır.

Araştırmanın Modeli

Araştırmamızın odağını, elde edilen verilerin belirli bir teorik çerçevede yorumlanması oluşturduğu için çalışmamızda yorumlayıcı örnek olay incelemesi modeli kullanılmıştır. Yorumlayıcı örnek olay incelemeleri, toplanan verilerle, özellikle bir kuram geliştirilmesine veya bir kuramın test edilmesine uygun bir modeldir (Akar Vural ve Cenkseven, 2005).

Çalışma Grubu

Bu araştırma, 2012-2013 güz döneminde, N. Erbakan Üniversitesi A. K. Eğitim Fakültesinin İlköğretim Matematik Öğretmenliği ve Ortaöğretim Matematik Öğretmenliği Bölümlerinde okuyan 136 öğretmen adayı üzerinde yürütülmüştür. Araştırmamızda, matematik öğretmen adaylarının Sayılar Teorisi dersi kapsamındaki Çin kalan teoremi ile ilgili soyutlamayı indirgeme eğilimleri inceleneceği için çalışma grubu, Sayılar Teorisi dersini almış veya almakta olan öğretmen adaylarından oluşturulmuştur.

Verilerin Toplanması ve Analizi

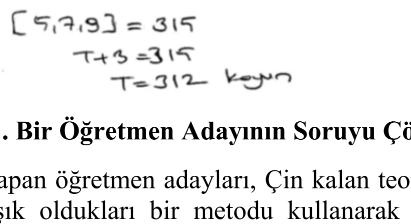
Çalışma grubundaki öğretmen adaylarına Çin kalan teoreminin uygulamasına yönelik aşağıdaki problem sorulmuştur.

Soru. Bir çoban koyunlarını 5 er saydığında 2, 7 şer saydığında 4, 9 ar saydığında 6 koyun artmaktadır. Buna göre çobanın en az kaç koyunu vardır?

Soruya verilen yazılı cevaplar, teorik çerçeveye uygun olarak betimsel analiz ve içerik analizi yöntemleri ile incelenmiştir.

BULGULAR ve YORUMLAR

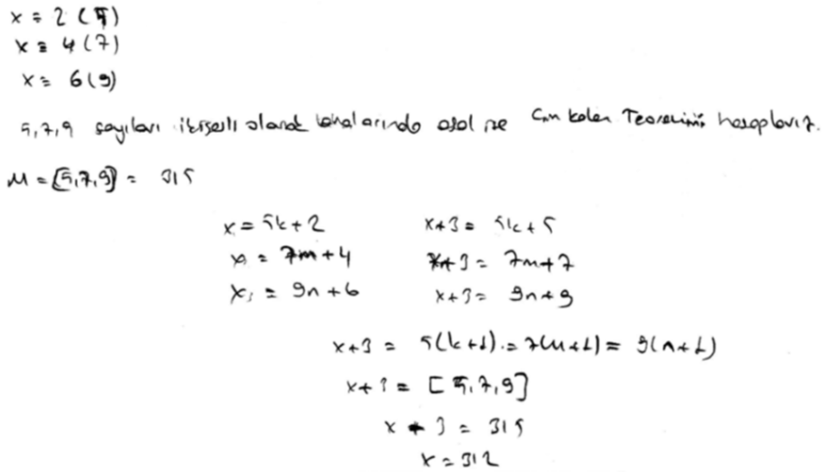
Öğretmen adaylarından 33’ü (% 24.3), Çin kalan teoremini tam ve doğru bir şekilde kullanarak problemin çözümünü yapmıştır. 101 (% 74.3) öğretmen adayı soyutlama seviyesini indirgemiş, bunlardan 79’u (%58.1) ise soyutlamayı indirgeyerek doğru cevaba ulaşmıştır. Öğretmen adaylarından 66’sı (% 48.5) sorunun çözümünde ortaokul veya lisede öğrendikleri yöntemi kullanmışlardır. Şekil 1.’ de bir öğretmen adayının bu yöntemle yaptığı çözüm örnek olarak verilmiştir.



Şekil 1. Bir Öğretmen Adayının Soruyu Çözümü

Şekil 1.’ deki ve benzer çözümleri yapan öğretmen adayları, Çin kalan teoremini kullanmak yerine kendilerine daha tanıdık gelen ve önceden alışık oldukları bir metodu kullanarak soyutu daha somut yapma eğilimi göstermişler ve *düşünülen nesne ve düşünen insan arasındaki ilişkinin kalitesi bakımından* soyutlama seviyesini indirgemişlerdir. Bu öğretmen adaylarının, soruda istenenin, aslında bir kongrüans sisteminin çözümü olduğunu analiz etmeden yani kavramı *nesne* olarak göz önüne almadan, soruyla otomatik olarak tetiklenen *yönteme* (*süreç*) yönelerek aynı zamanda *süreç-nesne ikililiğinin yansıması bakımından* da soyutlama seviyesini indirgediklerini söyleyebiliriz. Hazzan (1999) bu yaklaşımı, matematiksel bir kavramın süreç olarak kavranışının, öğrencinin doğal yöntemlere (*canonical procedure*) eğiliminin bir yansıması olarak açıklamaktadır. Doğal yöntemle aslında az veya çok sorulan soruyla otomatik olarak tetiklenen yöntem kastedilmektedir. Bu eğilim, problemin doğasının gereği oluşabildiği gibi, öğrencinin daha önce karşılaştığı benzer bir probleme uygulanan yöntemle ilişki kurmasının bir sonucu olarak da oluşabilir. Doğal yöntemler, matematiksel kavramların özelliklerinin analizi yapılmadan yani kavram nesne (*object*) olarak göz önüne alınmadan problemin çözülmesine fırsat verdiğinden öğrenciler tarafından daha çok tercih edilmektedir.

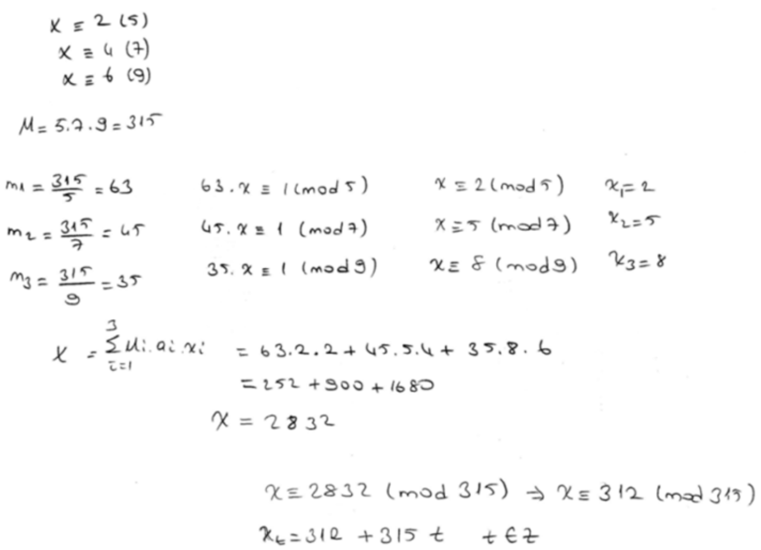
Öğretmen adaylarından 15'i (% 11), sorunun çözümünde Çin kalan teoremini kullandıklarını belirtmelerine rağmen teoremin teknik gösterimleri yerine kendilerinin alışık olduğu veya kendilerine daha tanıdık gelen gösterimleri kullanmışlardır. Şekil 2.' de bir öğretmen adayının kendi gösterimlerini kullanarak yaptığı çözüm örnek olarak verilmiştir.



Şekil 2. Bir Öğretmen Adayının Soruyu Çözümü

Şekil 2.' deki ve benzer gösterimleri kullanan öğretmen adayları, tanıdık olmayanı tanıdık yapma eğilimi göstererek soyutlama seviyesini *düşünülen nesne ve düşünen insan arasındaki ilişkinin kalitesi bakımından* indirgemişlerdir. Bu öğretmen adaylarının aynı zamanda, formel ifadeleri kişiselleştirerek yani *birinci şahıs dilini* kullanarak, soyutlama seviyesini *süreç-nesne ikililiğinin yansıması bakımından* da indirgediklerini söyleyebiliriz.

Birinci dereceden bir kongrüans sisteminin çözümünde Çin kalan teoreminin kullanılabilmesi için sistemdeki modüllerin karşılıklı olarak aralarında asal olması gereklidir. Fakat öğretmen adaylarından 16'sı (% 11.8) bu durumu göz ardı ederek teoremi kullanmışlardır. Şekil 3.' de bir öğretmen adayının bu şekilde yaptığı çözüm örnek olarak verilmiştir.



Şekil 3. Bir Öğretmen Adayının Soruyu Çözümü

Şekil 3.' deki ve benzer çözümleri yapan öğretmen adayları, bir teoremin geçerli olabilmesi için hipotez(ler)inin sağlanması gerektiğini düşünmemiş ve hipotez(ler)in doğruluğunu kontrol etmeden teoremi kullanmışlardır. Bu öğretmen adaylarının, teoremi hipotezi ile birlikte bir bütün (*nesne*) olarak değil de sadece verilen problemi çözmek için kullanılan bir yöntem (*süreç*) olarak gördüklerini ve soyutlama seviyesini *süreç-nesne ikililiğinin yansıması bakımından* indirgediklerini söyleyebiliriz.

Öğretmen adaylarından 4'ü (% 2.9) ise sorunun çözümünde Çin kalan teoremini kullanmalarına rağmen buldukları 2832 sayısını sorunun cevabı olarak kabul etmişlerdir. Bu öğretmen adayları, sorudaki "çobanın en az kaç koyunu vardır?" ifadesine dikkat etmemiş veya teoremi bütünüyle matematiksel bir *nesne* olarak kavrayamamış ve teoremin ispatında kullanılan yöntemi sadece verilen problemi çözmek için kullanılan bir *süreç* olarak görmüşlerdir. Teoremi bir *süreç* olarak algılayan öğretmen adayları, teoreme göre, soruya uygun kongrüans sisteminin, aynı zamanda $m_1.m_2.m_3 = 315$ modülüne göre tek bir çözümü olduğunu ve bu çözümün, $x \equiv 312 (\mathrm{mod}\, 315)$ kongrüansını veya $x = 312 + 315k$, $k \in Z$, eşitliğini sağlayan x tamsayıları olacağını ve $k = 0$ için sorunun cevabının 312 olması gerektiğini düşünmemişlerdir. Bu öğretmen adaylarının, soyutlama seviyesini *süreç-nesne ikililiğinin yansıması bakımından* indirgediklerini söyleyebiliriz.

SONUÇ ve ÖNERİLER

Matematik öğretmen adaylarının Çin kalan teoremi ile ilgili soyutlamayı indirgeme eğilimlerini incelediğimiz bu çalışmada, öğretmen adaylarının sorulan problemle ilgili matematiksel kavramları nasıl anladıkları veya anlaşılabilir hale getirdikleri yani soyutlamayı hangi seviyede indirgedikleri örneklerle gösterilmiştir. Bu çalışmayla, Hazzan'ın (1999, 2001), belirttiği gibi teorik çerçeve olarak *soyutlamanın indirgenmesi* teorisinin, öğrencilerin matematiksel yapıları ve kavramları algılayışlarını açıklama ve yorumlamada kuvvetli bir araç olduğu bir kere daha gösterilmiştir. Problemin çözümünde, öğretmen adaylarının çoğunlukla ortaokul veya lisede pratik çözüm adı altında öğretilen yöntemi veya sorulan soruyla otomatik olarak tetiklenen yöntemi (doğal yöntem) kullanmayı tercih ettikleri görülmüştür. Bu eğilimi gösteren öğretmen adaylarının kendilerinden beklenen soyutlamayı yapmaktan çok ezberledikleri veya kendilerine daha kolay gelen yöntemlere yöneldiklerini söyleyebiliriz. Bu durum, teoremin matematiksel bir nesne olarak kavranamadığının ve içselleştirilemediğinin bir göstergesidir. Bir kısım öğretmen adayının da hipotezini doğrulamadan veya tam olarak uygulamadan teoremi kullanmaları ise matematiksel bir yapı olan teoremin bir bütün olarak değil de sadece belirli bir soru tipinin çözümünde kullanılan bir formül veya yöntem olarak algılandığını göstermektedir. Sayılar teorisi ve soyut cebir gibi teorik derslerin içerdiği kavramların soyutluk seviyeleri, bu derslerin işleniş şekli ve öğrencilerin bu kavramları içselleştirmelerini sağlayacak etkinliklerin düzenlenmesi için yeterli zamanın olmayışı öğrencilerin karşılaştıkları yeni matematiksel yapıları önceki bilgileriyle birlikte özümsemelerini engellemektedir. Bunun için öğretmen adaylarına verilen derslerin içeriğinin ve kapsamının daha çok uygulama ve günlük yaşamla ilişkilendirilmesi yönünde planlanması faydalı olacaktır.

ÖZET: Bu çalışmanın amacı seçmeli matematik uygulamaları dersini alan ve almayan 5. sınıf öğrencilerinin matematiğe yönelik tutumlarını incelemektir. Bu amaçla 165 öğrenciye matematiğe yönelik tutum ölçeği uygulanmıştır. Veriler t testi kullanılarak analiz edilmiştir. Sonuçlara göre seçmeli matematik uygulamaları dersini alan öğrencilerin tutumları bu dersi almayan öğrencilere göre daha yüksek bulunmuştur. Ayrıca matematiğe yönelik tutumlarda cinsiyete bağlı bir farklılık görülmemiştir.

Anahtar Sözcükler: matematik eğitimi, tutum, matematik uygulamaları, seçmeli ders

ABSTRACT: Aim of this study is to compare of 5th class primary students' attitudes towards mathematics. Two groups of students' attitudes have been comparied. The experimental group has taken an elective "application of mathematics" course. The other group has not selected the elective course. Attitude scales towards mathematics have been used to conduct the study. A total of 165 students involved in the study experiment group. Data were analyzed by independent samples t-test to compare the groups attitudes. The results shows that, the attitude levels of the experiment group who have taken elective applications of mathematics course are quite positive when compared with the normal group. In addition attitude levels do not differ by gender.

Key words: mathematics education, attitude, applications of mathematics, elective mathematics course.

GİRİŞ

Öğrenme sürecinde; bireyin öğrenmesini etkileyen birçok etken bulunmaktadır. Bu sürece etki eden önemli etkenlerden biri de tutumlardır (Çaydaş ve Balcıoğulları, 2004). Literatürde tutum ile ilgili birçok tanım bulunmaktadır. Umay (1997) bir dersle ilgili duyuşsal özellikler ve o dersle ilgili öğrenmelere karşı ilgi/ilgisizlik durumunu tutum olarak adlandırılmaktadır. Smith (1968) ise bir bireye atfedilen ve onun bir psikolojik obje ile ilgili düşünce, duygu ve davranışlarını düzenli bir biçimde oluşturan bir eğilim olarak tanımlamaktadır. Smith'e (1968) göre tutumların temelinde iki önemli özellik yatar: 1- uzun sürelidirler. 2- bilişsel, duygusal ve davranışsal biçimleri içerirler.

Bir objeye yönelik tutum ile o objeye yönelik davranışlar arasında büyük bir ilişki bulunmaktadır. Birey olumsuz tutum geliştirdiği objeye karşı ilgisiz kalır, onu sevmez, takdir etmez ve onunla uğraşmaz, hatta kendisine göre bir iş olmadığını bile düşünür (Baykul ,2006).

Matematiğe yönelik tutum ile matematik başarısı arasında büyük bir ilişki olduğu düşünülmektedir. Nitekim Arun (1998) matematiğe yönelik tutum ile matematik başarısı arasında yüksek bir kolerasyon bulunduğu sonucuna ulaşmıştır. Yapılan birçok çalışmada ise matematik dersindeki başarısızlıkların temelinde matematiğe yönelik olumsuz tutumların olduğu görülmektedir (Cain, 1986; Kulm, 1998).

Gelişmiş ülkeler doğa ve sosyal yapılardaki değişimleri önceden görüp vatandaşlarının yararına çevirebilmek için bilim ve teknoloji alanında birçok araştırma/geliştirme çalışmaları yapmaktadırlar. Bu kapsamda Milli Eğitim Bakanlığı (MEB) çeşitli araştırma geliştirme çalışmaları yapmış ve yapmaktadır. Bu çalışmalardan bir tanesi de 2012-2013 Eğitim Öğretim yılı ile birlikte 5. sınıftan itibaren kademeli olarak bütün ortaokulda matematik uygulamaları seçmeli dersine başlamak olmuştur.

Milli Eğitim Bakanlığı Matematik uygulamaları dersinin içeriğini şu şekilde açıklamaktadır (MEB, 2013):

> "Günlük hayattan matematiğin uygulanacağı gerçek ve kurmaca problemler, diğer bilim alanlarından matematiksel problemler veya soyut matematiksel oyunlar ve problemlerden oluşacaktır. Program öğrencilerin sınıftaki yaşantılarında ağırlıklı olarak bireysel çalışma yerine grup çalışması ve sınıf tartışmasını ve sunumlarını öngörmektedir. Öğrenciler bu süreçte mantıklı olan ve akla yatkın yaklaşım ve çözümleri ortaya çıkaracaktır. Öğretmen bu derste doğru çözüme yönlendirmekten çok, öğrencilerin çözüm yollarını kendilerinin bulmalarına yardımcı olacaktır. Bu yaklaşımla derste hem öğrencilerin matematiksel bilgi ve becerileri derinleşecek, hem de sosyal becerileri ve iletişim becerileri desteklenecektir."

Bu içerik incelendiğinde matematik uygulamaları dersinde probleme dayalı öğrenme modelinden faydalanıldığı görülmektedir. Bu kapsamda probleme dayalı öğrenmenin temel prensipleri aşağıdaki gibi özetlenebilir;

- Öğretime bir problem ile başlanır.
- Problem ile öğrencinin dünyası arasında bağlantı kurulur.
- Problem disiplinler üzerinde değil yalnızca konu üzerinde organize edilir.
- Öğrencilere probleme şekil vermeleri ve çözümü baştan sona yönetmeleri için tam yetki verilir.
- Etkili, tam ve bağlamında öğrenme için küçük gruplar oluşturulur.
- Öğrencilere performansları ve çözümleri hakkında sürekli olarak açıklamalarda bulunulur (Kılınç, 2007).

Matematik uygulamaları dersinin öğretim programında bu dersin genel amacı öğrencilere düzeylerine uygun matematiksel uygulamalar yapma fırsatı vererek matematik bilgi ve becerilerini geliştirirken matematiği sevdirmek ve matematiğe karşı olumlu tutum geliştirmektir. Bu genel amacın üç bileşeni bulunmaktadır:

1. Öğrencilerin aldığı zorunlu matematik dersinin genel amaçlarını desteklemek ve matematiksel deneyimlerini problem çözerek zenginleştirmek ve bu yolla matematiksel bilgilerini derinleştirmektir.
2. Öğrencilerin problem çözme ve kurma, akıl yürütme, iletişim, matematiksel kavramlar arasında, matematik ve diğer disiplinler arasında ve matematik ve günlük hayat arasında ilişkilendirme ve matematiksel düşüncelerini çoklu gösterimlerle ifade etme becerilerini geliştirmektir.
3. Öğrencilere matematiği sevdirmek, matematik hakkında doğru değerleri ve problem çözümünde gereken sabrı ve çabayı gösterecek tutumları kazandırmaktır (MEB, 2013).

Matematik uygulamaları dersinin amaçları incelendiğinde tutumların oldukça önemli olduğu görülmektedir. Bu nedenle matematik uygulamaları alan ve bu dersi almayan ortaokul 5. sınıf öğrencilerinin matematiğe yönelik tutumlarının ortaya çıkarılması önemli görülmektedir.

Problem ve alt Problemler

Bu çalışmanın amacı matematik uygulamaları dersini alan ve bu dersi almayan ortaokul 5. Sınıf öğrencilerinin matematiğe yönelik tutumları arasındaki farkı ortaya çıkarmaktır. Bu bağlamda araştırmanın problemi; "Ortaokulda matematik uygulamaları dersini alan ve bu dersi almayan öğrencilerin matematiğe yönelik tutumları arasında bir fark var mıdır?" Alt Problemler:

1. Seçmeli matematik uygulamaları dersi alan ve almayan öğrencilerin matematiğe yönelik tutumları arasında anlamlı bir fark var mıdır?
2. Seçmeli matematik dersi alan öğrencilerin matematiğe yönelik tutumları arasında cinsiyete yönelik ilişki var mıdır?
3. Seçmeli matematik dersi almayan öğrencilerin matematiğe yönelik tutumları arasında cinsiyete yönelik bir ilişki var mıdır?

YÖNTEM

Bu çalışma ortaokullardaki matematik uygulamaları dersini alan ve almayan öğrencilerin tutumları arasındaki fark veya benzerlikleri ortaya çıkarmayı amaçladığından tarama modelinde bir çalışmadır. Tarama modellerinde durumu veya olguları herhangi bir şekilde değiştirme, etkileme çabası yoktur (Karasar, 1999: 77). Var olan durumu ortaya çıkarma amacı taşımaktadır.

Veri Toplama Araçları

Çalışmada öğrencilerin matematiğe yönelik tutumlarını belirlemek amacı ile Eğitimi Araştırma ve Geliştirme Dairesi (EARGED) tarafından geliştirilen matematiğe yönelik tutum ölçeği kullanılmıştır.

Çalışmada kullanılan matematiğe yönelik tutum ölçeğinin güvenirliği hesaplanmış ve Cronbach Alfa katsayısı ,905 olarak bulunmuştur.

Çalışma Gurubu

Araştırmanın çalışma gurubunu 2013/2014 eğitim öğretim yılında Antalya'daki bir Ortaokul'da öğrenim gören 5. sınıf öğrencileri oluşturmaktadır. Çalışmaya toplam 165 öğrenci katılmış ve öğrencilerle ilgili bilgiler Tablo 1'de gösterilmiştir.

Tablo 1. Çalışma Gurubu İle İlgili Bilgiler

	MATEMATİK UYGULAMALARI			
	ALIYOR		**ALMIYOR**	
	Kız	Erkek	Kız	Erkek
	46	38	26	55
	84		81	
TOPLAM	**165**			

BULGULAR

Bu bölümde, araştırmanın amacına uygun elde edilen verilerin analizleri sonucunda, araştırmanın alt problemleri ile ilgili bulgulara yer verilmiştir.

1. Seçmeli matematik uygulamaları dersi alan ve almayan öğrencilerin matematiğe yönelik tutumları arasında anlamlı bir fark var mıdır?

Matematik uygulamaları dersi alan ve almayan öğrencilerin matematik tutum ölçeğinden aldıkları puanlar arasında anlamlı bir fark olup olmadığına bağımsız örneklemler için t testi yapılarak bakılmış ve sonuçlar tablo 2 ve tablo 3 de gösterilmiştir.

Tablo 2. Matematiğe Yönelik Tutum Puanlarının Matematik Uygulamaları Dersi Değişkenine Göre Dağılımı

Gurup	N	Ortalama	Standart Sapma	Standart Hata
Matematik uygulamaları alıyor	84	72,7024	13,72341	1,49735
Matematik uygulamaları almıyor	81	65,6667	16,01640	1,77960

Tablo 3. Öğrencilerin Matematiğe Yönelik Tutum Puanlarının Matematik Uygulamaları Dersi Değişkenine Göre Bağımsız Örneklemler t Testi Sonuçları

		Ortalamaların Eşitliği için t testi			
		t	Sd	P	Ortalama fark
Matematik Uygulamaları	Varyans eşitliği	3,034	163	,003	7,03571
	Varyans eşitsizliği	3,025	157,353	,003*	7,03571

P<0,05*

Tablo2 incelendiğinde matematik uygulamaları dersini alan öğrencilerin matematik uygulamaları dersini almayan öğrencilere göre tutum puanları daha yüksek bulunmuştur. Bu farkın anlamlılığını incelemek amacı ile bağımsız örneklemler t testi yapılmış ve tablo 3 de gösterilmiştir. Tablo 3'e göre t=3,03 ve p<0,05 çıktığından matematik uygulamaları dersi alan ve almayan öğrenciler arasında matematik uygulamaları dersi alan öğrenciler lehine anlamlı bir farkın olduğu görülmektedir.

2. Seçmeli matematik dersi alan öğrencilerin matematiğe yönelik tutumları arasında cinsiyete yönelik ilişki var mıdır?

Matematik uygulamaları dersi alan öğrencilerin matematik tutum ölçeğinden aldıkları puanlar arasında cinsiyet değişkenine göre anlamlı bir fark olup olmadığına bağımsız örneklemler için t testi yapılarak bakılmış ve sonuçlar ve sonuçlar tablo 3 ve tablo 4 de gösterilmiştir.

Tablo 4. Matematik Uygulamaları Dersini Alan Öğrencilerin Cinsiyet Değişkenine Göre Dağılımı

Gurup	N	Ortalama	Standart Sapma	Standart Hata
Kız	46	72,0652	14,43053	2,12767
Erkek	38	73,4737	12,96510	2,10322

Tablo 5. Matematik Uygulamaları Alan Öğrencilerin Cinsiyete Göre Bağımsız Örneklemler t Testi Sonuçları

		Ortalamaların Eşitliği için t testi			
		t	Sd	P	Ortalama fark
Cinsiyet	Varyans eşitliği	-,466	82	,642	-1,40847
	Varyans eşitsizliği	-,471	81,392	,639	-1,40847

Tablo 4 incelendiğinde matematik uygulamaları dersi alan erkek öğrencilerin tutum puanları toplamı kız öğrencilerin tutum puanları toplamına göre daha yüksek bulunmuştur. Bu farkın anlamlılığını incelemek amacı ile bağımsız örneklemler t testi yapılmış ve tablo 4 de gösterilmiştir. Tablo 4 göre t=-,471 ve p>0,05 çıktığından kız ve erkek öğrencilerin matematiğe yönelik tutumları arasında anlamlı bir fark bulunmamıştır. Yapılan birçok çalışmada matematiğe yönelik tutumun cinsiyet değişkenine göre anlamlı bir fark oluşturmadığı bilinmektedir

3. Seçmeli matematik dersi almayan öğrencilerin matematiğe yönelik tutumları arasında cinsiyete yönelik bir ilişki var mıdır?

Matematik uygulamaları dersi almayan öğrencilerin matematik tutum ölçeğinden aldıkları puanlar arasında cinsiyet değişkenine göre anlamlı bir fark olup olmadığına bağımsız örneklemler için t testi yapılarak bakılmış ve sonuçlar ve sonuçlar tablo 6 ve tablo 7 de gösterilmiştir.

Tablo 6. Matematik Uygulamaları dersini almayan öğrencilerin cinsiyet değişkenine göre dağılımı

Gurup	N	Ortalama	Standart Sapma	Standart Hata
Kız	31	68,6774	15,22145	2,73385
Erkek	50	63,8000	16,36073	2,31376

Tablo 6. Matematik Uygulamaları Almayan Öğrencileri Cinsiyete Göre Bağımsız Örneklemler t Testi Sonuçları

		Ortalamaların Eşitliği için t testi			
		t	Sd	P	Ortalama fark
Cinsiyet	Varyans eşitliği	1,339	79	,185	4,87742
	Varyans eşitsizliği	1,362	67,246	,178	4,87742

Tablo 6 incelendiğinde matematik uygulamaları almayan kız öğrencilerin tutum puanları toplamı erkek öğrencilerin tutum puanları toplamına göre daha yüksek bulunmuştur. Bu farkın anlamlılığını incelemek amacı ile bağımsız örneklemler t testi yapılmış ve tablo 7 de gösterilmiştir. Tablo 7'ye göre t=1,362 ve p>0,05 çıktığından matematik uygulamaları dersi almayan kız ve erkek öğrencilerin matematiğe yönelik tutumları arasında anlamlı bir fark bulunmamıştır.

SONUÇ VE ÖNERİLER

Seçmeli matematik dersi alan ve almayan öğrencilerin matematiğe yönelik tutumları arasında bu dersi alan öğrencilerin lehine anlamlı bir fark tespit edilmiştir. Seçmeli matematik uygulamaları dersinin amaçları incelendiğinde öğrencilere düzeylerine uygun matematiksel uygulamalar yapma fırsatı vererek matematik bilgi ve becerilerini geliştirirken matematiği sevdirmek ve matematiğe yönelik olumlu tutum geliştirmelerini sağlamak olduğu görülmektedir. Seçmeli matematik uygulamaları dersi alan ve almayan öğrencilerin matematiğe yönelik tutumları arasındaki bu anlamlı fark seçmeli matematik dersinin en az bir amacına ulaştığını göstermektedir.

Matematik uygulamaları dersinin içeriği problem çözme temelli matematik öğretimi olduğundan bu yönde bir alan yazın incelemesi yapılmıştır. Alan yazın incelemesi problem çözmeye yönelik çalışmaların matematiğe yönelik tutumda olumlu bir etkisi olduğunu göstermektedir (Ku ve Sullivan, 2002; Cantürk Günhan, 2006; Sarıtaş, 2002; Yavuz, 2006).

Seçmeli matematik uygulamaları dersini alan öğrencilerin matematiğe yönelik tutumları arasında cinsiyet değişkenine göre anlamlı bir fark bulunmamıştır. Bu bulgu seçmeli matematik uygulamaları dersinin cinsiyet faktöründen bağımsız olduğunu göstermektedir. Yapılan bazı çalışmalar bu çalışmanın sonucunu desteklemektedir (Özdoğan, Bulut ve Kula, 2005; Arslantürk, 2013; Çelik ve Ceylan, 2009). Ancak bazı çalışmalarda ise matematiğe yönelik tutumun cinsiyet değişkenine göre farklılaştığı tespit edilmiştir (Uysal, 2007; Reçber, 2011; Swetman, 1995; Gavin ve Reis, 2003).

Seçmeli matematik uygulamaları almayan öğrencilerin de matematiğe yönelik tutumları arasında cinsiyet değişkenine göre anlamlı bir fark bulunamamıştır. Bu bulgular matematik uygulamaları dersi almanın veya almamanın matematiğe yönelik tutum üzerinde cinsiyete bağlı herhangi bir etkiye sahip olmadığını göstermektedir.

Bu çalışmanın uluslararası alanda düşük başarı gösterilen; okuduğunu anlama (seçmeli okuma becerileri), fen bilimleri (seçmeli bilim uygulamaları) ve sportif faaliyetler (seçmeli spor ve fiziki etkinlikler) alanlarda da yapılması faydalı olacaktır.

Bu çalışma bütün bir yıla genişletilerek seçmeli matematik uygulamaları dersini alan ve almayan öğrencilerin eğitim öğretim yılı başında ve sonunda matematiğe yönelik tutum puanları karşılaştırılarak yıl içerisindeki değişim de incelenmelidir.

Öğrencilerin 4. sınıf sonundaki matematiğe yönelik tutumları ile 5. sınıf sonundaki matematiğe yönelik tutum puanları incelenerek; seçmeli matematik uygulamaları dersini alan ve almayan öğrencilerin 5. sınıf sonunda matematiğe yönelik tutumları arasındaki farklılaşma durumu incelenmelidir.

A PRELIMINARY STUDY FOR DYSCALCULIA IN SABAH, MALAYSIA.

Chin Kin Eng, Vincent Pang, Wong Ken Keong, Tan Choon Keong, Lee Kean Wah, Lay Yoon Fah

Universiti Malaysia Sabah,
Jalan UMS, 88400 Kota Kinabalu,
Sabah, MALAYSIA

ABSTRACT: In Malaysia, it is reported that the number of registered students with learning disabilities increased from 7,919 in year 2000 to 20,814 in year 2006 (Teoh & Lim, 2007). It is estimated that the prevalence of Dyscalculia in the general population is 5-8% (Adler, 2008). This research intends to develop an instrument for measuring dyscalculia and identify the prevalence of Dyscalculia among primary school students in Sabah, Malaysia. The Dyscalculia instrument developed in this study is a computer-based assessment for children that aims to identify the characteristics of Dyscalculia by measuring response accuracy and response time to test items. The purpose of this paper is to report the results of a preliminary study for Dyscalculia which involved 91 students in three primary schools in Sabah, Malaysia. The results show that 5.5% of the primary school students in Sabah suffer from Dyscalculia.

Key words: Prevalence, Dyscalculia.

INTRODUCTION

In England, 'Dyscalculia' has been defined as 'the condition that affects the ability to acquire mathematical skills. Dyscalculia is a term most commonly used for those having disability in learning mathematics. Dyscalculia means severe or complete inability to count (Hallahan *et al.*, 2005). According to Newman (1998), Dyscalculia means "specific learning disability in mathematics". People with Dyscalculia generally have normal intellectual ability but having troubles in certain thought processes in particular cognitive process (Adler, 2008).

The research of Adler (2008) had supported the long-term study of Shalev and Von Aster (2008) which indicated that many children with Dyscalculia outgrow their diagnosis after a few years. If a child is getting the right treatment and support, the possibility for the development of mathematical ability will increase. There are still some difficulties remain in a milder form such as the problem of recalling numerical facts. It is common that students will continue to have such difficulties in a milder form throughout their lives. The ability to concentrate might be improved greatly and this will help in the understanding of mathematical concepts and symbols.

This study involves the identification of pupils who suffer from Dyscalculia. The instruments used in this study was developed based on the theory of making sense of mathematic as proposed by Chin and Tall (2012) and the concept of numerosity as suggested by Butterworth (2002). Additionally the work by several researchers such as Geary (2006), Murphy (2006), Gersten *et al.* (2008), and Shalev and Von Aster (2007) also contributed to the development of this instrument. Prevalence of Dyscalculia among primary school students in Sabah is obtained by analyzing the data obtained through this instrument.

METHODS AND PROCEDURES

This study focuses on 7-9 year old children who experience difficulties in learning mathematics. The main objective of this project is to design and develop a Malaysian Dyscalculia instrument that can be used to screen and measure the extent of Dyscalculia among primary school students. The identification of learning disabled students involves screening and diagnosis. Screening is used to examine large groups of children to identify those performing above or below the norm. Diagnosis is used to investigate selected children to determine the precise nature of their difficulties (Mohd Sharani Ahmad, 2004).

There are three main constructs in this framework which involves seven tests namely simple reaction time, short term memory, number sense, matching items, dot enumeration, number comparison and arithmetic (see Table 1). In order to ensure that the instrument is fit to be used and measures what it is suppose to measure, the reliability and the validity of the instrument are seriously taken into account (Creswell, 2005). Reliability of the research instrument is based on its consistency to measure what is being measured. While, validity plays a role of judgement of how well an instrument measures what it purports to measure in a particular context (Cohen & Swedlik, 2005). Table 1 below shows the constructs for Malaysian Dyscalculia instrument developed by the researchers and Table 2 shows the results of analysis of reliability based on Cronbach's index of internal consistency and item fit based on the in-fit square values.

Table 1: Constructs for Malaysian Dyscalculia Instrument

No.	Construct	Description of items	Capacity/Test	Researchers
1	Simple Reaction Time	10 items for left, 10 items for right.	Response Time	Butterworth (2003), Murphy (2006)
2	Short Term Memory	10 items	Short term memory	Gersten et. al (2008)
3	Numerosity			
	(a) Number Sense	10 items	Sense of Numerosity	Buterworth (1999), Geary (2006), Gersten et. al (2008), Shalev & Von Aster (2007)
	(b) Matching Items	10 items	Numerosity as a property of sets	Butterworth (2002), Geary (2006)
	(c) Dot Enumeration	10 items	Enumeration (counting)	Butterworth (2002)
	(d) Number Comparison	10 items	Sense of ordered numerosities	Butterworth (2002)
4	Arithmetic Test	10 items	Arithmetic	Butterworth (2003), Geary (2006)

Table 2: Reliability and Items fit for Malaysian Dyscalculia Instrument

No.	Construct	Cronbach Alpha, α	No of Fit Items
1	Simple Reaction Time	0.800	19/20
2	Short Term Memory	0.720	10/10
3	Matching Item	0.827	10/10
4	Number Sense	0.769	10/10
5	Dot Enumeration	0.845	10/10
6	Numerical Stroop	0.872	10/10
7	Arithmetic Test	0.768	9/10
OVERALL (SCREENER)		0.896	79/80

1. ***Simple Reaction Time*** is a test to measure the psychomotor response time. Recorded response time is taken into account in order to identify the actual cognitive processing time (Butterworth, 2003). Figure 1 shows the chronology of the items in simple reaction time. This process will be repeated for ten times for left and right hands respectively. The response times on the following six tests are adjusted to take this measure into account.

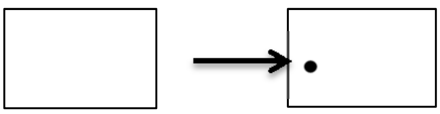

Figure 1: Simple Reaction Time

2. In general, students with learning disabilities have a very limited working memory (Gersten *et al.*, 2008). Siegal and Ryan (1989) found that children with Dyscalculia did less well than control on a working memory task involving counting and remembering digits. Working memory is **Short Term Memory** (Baddeley, 2002) and the concept of working memory evolved from earlier concepts of **Short Term Memory** (Lervag & Hulme, 2013). Pupils are asked to make a short memory on the picture (see Figure 2) and have to give an answer whether the number of black dots that appear on the left or right of the screen is more.

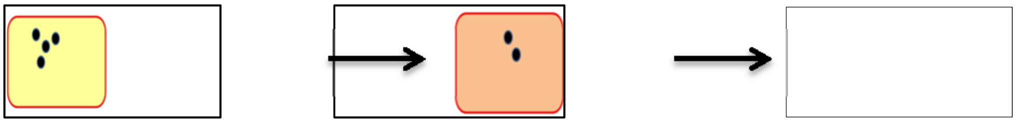

Figure 2: Short Term Memory

3. The idea of numerosity (Butterworth, 1999) involves familiar consequences such as two sets of things might have the same numerosity as the other, or a larger or smaller numerosity. This innate ability is called **Number Sense** (Butterworth, 2002). Figure 3 shows a sample item of number sense which is used to evaluate whether a pupil possesses the concept of quantity and the scientists called this concept as numerosity (Santos-Sousa, 2007). Pupils must provide their answers by identifying which diagram has more black dots.

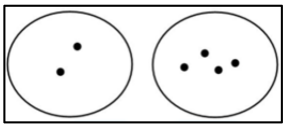

Figure 3: Number Sense

4. Butterworth (2002) proposes that two sets have the same numerosity if and only if the members of each set can be put in a form of one-to-one correspondence with none left over. This involves the principle of matching every item of one set to the items of other set. Hence, the researchers have included **Matching Items** (see Figure 4) in order to test whether a student understands the one-to-one correspondence principle.

Figure 4: Matching Items

5. **Dot Enumeration** is a test (see Figure 5) that requires better skills in counting numerals and using symbols (Butterworth, 2002). Learning the basic counting sequence, "one, two, three and four ..." is not difficult and almost all the children including Dyscalculic students can learn this (Geary 2006). However, it is not only about the sequence but also involved the ability to assign to each counted object and represents the quantity of items in the counted set.

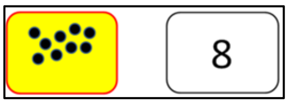

Figure 5: Dot Enumeration

6. According to Geary (2006), Dyscalculia students usually do not know basic number names such as "7" = "Seven". They have difficulty in discriminating large numbers and small numbers. This difficulty can be identified by using items which are about number comparison such as "Which is bigger, 6 or 8?". Hence, the **Number Comparison** (see Figure 6) construct is crucial to test the brain area which is specialised for quantity comprehension. According to Butterworth (2002), this is also known as the sense of ordered numerosities.

Figure 6: Number Comparison

7. Many children with Dyscalculia have difficulty in remembering basic arithmetic facts. They have great difficulties in memorising simple addition, subtraction and multiplication facts. The **Arithmetic** test (see Figure

7) is a test which consists of addition and subtraction of two numbers and the children need to choose whether each of the given mathematical statements is true or false.

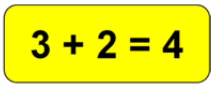

Figure 7: Arithmetic Test

Classification of Dyscalculia

The model for Dyscalculia Classification (see Figure 8) employed in this research was developed by our research team based on the model of numerical cognition (Von Aster & Shalev, 2007), concept of Numerosity (Butterworth, 1995 & 2002) and the Theory of Cognitive Development in Mathematical Thinking (Tall, 1995 & 2007).

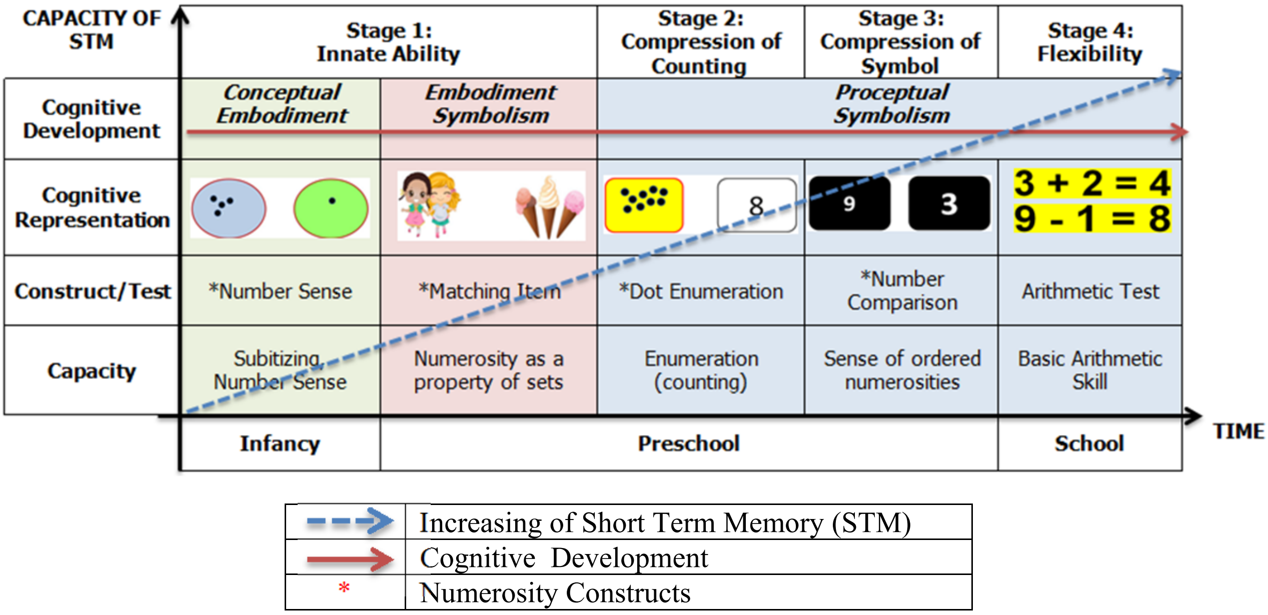

Figure 8: The Model of Dyscalculia Classification

According to this model, a normal pupil (6 and above) should have the ability to perform appropriately from stage 1 to 4 and this involves the ability to compress knowledge into thinkable concepts (Tall, 2006). Based on Feikes and Schwingendorf (2008), complex mathematical thinking will occur if a person is able to compress previous ideas into a compact and precise mathematical object.

In Stage 1, Butterworth's (2003) research outcomes had showed that the infants noticed the constancy of objects and detected differences in their numerical quantities. An infant seems to be able to discriminate visual arrays on the basis of numerosity even in the first week of life. Tall (2008) proposed the notion of 'set befores' to denote a mental structure that all humans born with which may take a little time to mature as our brains make connections in early life. *Recognition* of similarities and differences, *repetition* of complex actions that becomes automatic and the use of *language* to name, describe and refine meanings are the three abilities (set befores) that form the foundation for the development of mathematical thinking. In other words, these innate abilities help pupils to perform appropriately at this stage. A deficit in these abilities could contribute to Dyscalculia.

Stage 2 and stage 3 have been instrumental to get strong evidence for Dyscalculia (Butterworth, 2003). The ability to compress knowledge into a useable form will give an edge to master the tasks in these stages. In Stage 2, the ability to compress the actions of counting into a number will enable a pupil to answer the items of Dot Enumeration construct correctly. Meanwhile in stage 3, a pupil should be able to compare the numbers displayed on a screen without performing the counting actions because he/she had already compressed the counting actions into a number in stage 2.

In Stage 4, a pupil will achieve the flexibility to see mathematics symbol as process and concept. Tall (2004) used the notion of '*procept*' to indicate this flexibility. It is an idea generated by looking at a symbol such as 3+2 both as a process (of addition) and a concept (of sum). It was extended by Gray and Tall (2001) to include different symbols and different processes that give rise to the same mental object in the mind of a particular individual. Thus 3+2, 4+1, 5, 7-2 can all represent the same *procept*, involved in composing and decomposing arithmetic processes that give 5. The task in this stage involves two basic operations (addition and subtraction) of arithmetic as a test of basic arithmetic skill. A deficit of this task could not contribute to Dyscalculia. We can only claim a pupil who is either good in arithmetic or poor in arithmetic based on the results of this task.

Generally, if a pupil can perform appropriately in these four stages, he/she is unlikely to have dyscalculia. Meanwhile, it is possible that the pupil will guess because of an inability to answer the question, but other causes cannot be excluded. To identify such cases, further analysis of data is required for identifying pupils who were guessing the answers to most of the questions in the test.

Table 3: Summary of Dyscalculia Classification

No.	Type	Classification
1	Poor in 4 Numerosity constructs	Evidence of Dyscalculia
2	Poor in Number Sense OR/AND Matching Item Poor in ANY 3 Numerosity constructs	High Risk of Dyscalculia
3	Poor in ANY 2 Numerosity constructs	Moderate Risk of Dyscalculia
4	Poor in ANY 1 Numerosity construct	Low Risk of Dyscalculia
5	Poor in Arithmetic	Poor Arithmetic without dyscalculia
	Normal	Normal Performance
6	Guessing	Guessing

The description of Dyscalculia Classification below is based on Table 3.

***Type 1*: Poor in 4 Numerosity constructs**

The pupil has low performance in all the four capacity tests of numerosity constructs. This pattern of results is evidence of Dyscalculia.

***Type 2*: Poor in Number Sense OR/AND Poor in Matching Item OR Poor in ANY 3 Numerosity constructs**

***Sub-type 2.1*: Poor in Number Sense OR/AND Matching Item**

The pupil has low performance in the Number Sense or/and Matching Item constructs. This pattern of results suggests that the pupil has high risk to have Dyscalculia.

***Sub-type 2.2*: Poor in ANY 3 Numerosity Construts**

The pupil has low performance in three out of the four numerosity constructs. This pattern of results suggests that the pupil has high risk to have Dyscalculia.

***Type 3*: Poor in ANY 2 Numerosity constructs**

The pupil has low performance in two out of the four numerosity constructs. This pattern of results suggests that the pupil has moderate risk to have Dyscalculia.

***Type 4*: Poor in ANY 1 Numerosity construct**

The pupil has low performance in the one of the four numerosity constructs. This pattern of results suggests that the pupil has low risk to have Dyscalculia.

***Type 5*: Normal Performance in Numerosity Constructs**

***Sub-type 5.1*: Poor in Arithmetic**

The pupil performs appropriately in all the numerosity constructs but poor in Arithmetics Test. This pattern of results suggests that the pupil is not failing in arithmetic because of Dyscalculia.

Sub-type 5.2: **Normal**
The pupil performs appropriately in all the numerosity constructs and Arithmetics Test therefore he/she is unlikely to have Dyscalculia.

Type 6: Guessing
The pupil appears to have been guessing the answers on some or all of the tests. It is not possible to give a diagnosis since there may be various reasons for this behavior, including not trying. It is possible that he/she is Dyscalculic and cannot answer any of the questions satisfactorily.

It is suggested that the test should be repeated on another occasion. If he/she still guesses rather than tries to answer the questions, then he should be provisionally classified as Dyscalculic until further investigation can be carried out.

RESULTS

The preliminary study involved a sample of 91 primary school students aged between 7-9 years old who were selected randomly from three different schools in the state of Sabah, Malaysia. Each student took 10-12 minutes for the screening process. Table 4 shows the result of the preliminary study.

Table 4: Analysis of Preliminary Study

No.	Result/Category	Total	Prevalence (%)
1	Evidence of Dyscalculia	5	5.5
2	High Risk to have Dyscalculia	23	25.3
3	Moderate Risk to have Dyscalculia	1	1.1
4	Low Risk to have Dyscalculia	9	9.9
5	Poor Arithmetic without dyscalculia	9	9.9
6	Normal Performance	44	48.3
	Total	91	100

In this study, 5 out of 91 students were under the category of "Evidence of Dyscalculia" and this is equivalent to a prevalence of 5.5%. Generally, if a pupil can perform appropriately, he/she is unlikely to have Dyscalculia. Meanwhile, a pupil who is incapable of answering a particular question can simply select a random answer and still have chance of receiving score for it. In order to identify such cases, a further analysis of the data is required for identifying pupils who were guessing the answers for most of the items in the test. The result of this study had supported the research of Butterworth *et al.* (2011) which stated that the development Dyscalculia is a mathematics disorder with an estimated prevalence of about 5-7%.

Geary (2004) found that between 5% and 8% of children in school have some forms of disabilities in mathematics. As we can see in Table 5, these figures were confirmed by a number of researchers in different countries. The research study performed by Voutsina and Ismail (2007) in South England showed that the prevalence of Dyscalculia was 5%. Based on Fuchs (2006), the prevalence of Dyscalculia ranges from 4-7%. Meanwhile Belgium researchers found that the prevalence of Dyscalculia ranges from 3-8% (Desoete *et al.*, 2004). Flanagan & Alfonso (2011) conducted a survey of recent work of authors and found that the prevalence was 7%. Reigosa-Crespo *et al.* (2011) discovered that the basic numerical deficits had affected 4.54% of school-age population.

Shalev and Von Aster (2008) reported the prevalence rate of Dyscalculia as 6% and they claimed that the estimation of prevalence was only depends on the accuracy of the diagnosis which could be based on a valid instruments test and representing the whole population. Although there were differences in the use of criteria and test instruments in different research studies however the prevalence rate obtained was around 6% thus this estimate is reliable.

Table 5: Prevalence Rate of Dyscalculia by Several Researchers

Author	Prevalence	Methodology	Location
Voutsina. C. & Qaimah Ismail. (2007)	5 %	Dyscalculia Screener (Butterworth, 2003)	South England

Geary D. C. (2004)	5 – 8%	survey of recent work of authors	Columbia
Desoete, A., Roeyers, H. & De Clercq, A. (2004).	3 – 8%	TEDI-MATH a Belgian dyscalculia battery	Belgium
Teresa Guillemot	3 – 6%	survey of recent work of authors	Sweden
Butterworth et.al (2011)	5 – 7%	Dyscalculia Screener (Butterworth, 2003)	UK
Fuchs, L. S. (2006)	4 – 7%	intervention approach: conceptual instruction and drill and practice	United State
Reigosa-Crespo et. al (2011)	4.54%	Dyscalculia Screener (Butterworth, 2003)	Havana, Cuba.
Shalev, R. S., & von Aster, M. G. (2008)	6%	survey of recent work of authors	few different countries
Flanagan & Alfonso (2011)	7%	survey of recent work of authors	-

CONCLUSION

The prevalence of learning disabilities among school children varies from country to country. This is largely dependent on the definition used to classify learning disabled children in each country. This involved about 5.5% of the students in school (aged 6 to 17) for special education due to learning disabilities (Teoh, Cheong & Woo, 2007). In a study conducted by Komoula *et al.* (2004) which involved 240 Greek students aged between of 7 - 11 years old from rural and urban areas, they had found that the prevalence of developmental Dyscalculia among rural students was higher than in urban schools. Therefore, specific learning disability might be more common among rural students.

In 1991, the National Statistical Office of Thailand reported a prevalence rate of 1.9% for visual impairment, 5.4% for speech impairment, 13.2% for hearing impairment and 10% for intellectual disability. In 2002, the Malaysia Department of Special Education reported 14,535 children with learning disabilities in 700 schools across the country. These statistics included children who had learning disabilities, hearing impairment and visually impaired in special schools or integrated schools (Teoh, Cheong & Woo, 2008). Although the prevalence of mathematics disability is high, the research in this domain is limited (Desoete, Roeyers & De Clercq, 2004). Nowadays, more studies on this issue have evolved (Butterworth, Varma & Laurillard, 2011).

Recently, more attention is focused on students who demonstrated challenges in learning mathematics skills and concepts taught in schools at all levels. Starting as early as pre-school, parents, educators, and researchers are aware that some students seem easily to be confused with the simple mathematical learning skills. For example, some young children have difficulties in learning numbers, recognizing, and counting items in a group. Some of these children continue to show these mathematical learning difficulties as they attend the mathematics lessons. All these difficulties might be related to Dyscalculia therefore by realizing that 5% to 8% of school-age children are identified as having a mathematics disability (Braynt, 2005), we will be in a better position in helping the children to cope with this learning disability.

A THEORETİCAL FRAMEWORK FOR DYSCALCULİA

Kin Eng CHİ

Vincent PANG

Ken Keong WONG

Choon Keong TAN

Kean Wah LEE

Dr. Lay Yoon FAH

The purpose of this paper is to introduce a new theoretical framework which was formulated in a study of Dyscalculia. This framework is formulated based on the theory of making sense of mathematics through perception, operation and reason as proposed by Chin & Tall (2012). Additionally this framework evolves from the theory of cognitive development in mathematical thinking as suggested by Tall (1995 & 2004). There are three main constructs in this framework which involved seven tests namely simple reaction time, short term memory, number sense, matching Items, dot enumeration, number comparison and arithmetic. In general, this study is concerned with the development of an instrument for diagnosing Dyscalculia and the proposed framework has guided us to the development of the mathematical items for diagnosing Dyscalculia. The core idea of Dyscalculia in this study is based on the concept of numerosity as suggested by Butterworth (2002). The work of Murphy (2006), Geary (2006), Gersten et. Al (2008) and Shalev & Von Aster (2007) have contributed to the understanding of symptoms and causes of Dyscalculia in this study.

ÖZET: Öğretmen adaylarının hizmet öncesinde edindikleri davranış ve tutumların, biriktirdikleri bilgi zenginliğinin hizmet sırasında öğrencilere verecekleri çevre eğitimini etkileyeceği düşünülmektedir. Bu araştırmanın amacı uluslararası bir çevre eğitimi programı olan "Yeşil Kutu" Projesinin fen ve teknoloji öğretmen adaylarının çevreye yönelik yararlı davranışları üzerindeki etkisini araştırmaktır. Bu çalışma, 2012-2013 Eğitim-Öğretim Yılında bir üniversitede öğrenim gören Fen Bilgisi Öğretmenliği üçüncü sınıf öğrencileri ile yapılmıştır. İlgili bölüme kayıtlı üçüncü sınıf fen ve teknoloji öğretmen adaylarının bir şubesi (N=30) deney grubuna, diğer bir şubesi (N=30) kontrol grubuna atanmıştır. Araştırmada deneysel yöntemin ön test- son test deney ve kontrol gruplu deseni kullanılmıştır. Erten (2000) tarafından geliştirilen "Çevre Bilinci Ölçeği" (ÇBÖ) ile veri toplanmıştır. Elde edilen bulgulara göre, bu eğitimin sonucunda deney grubundaki adayların çevreye yönelik davranışları lehine anlamlı bir artış olduğu görülmüştür. Yani, özetle, araştırma kapsamında verilen çevre eğitimi öğretmen adaylarının çevreye yönelik davranışlarını geliştirmiştir.

Anahtar Kelimeler: fen ve teknoloji öğretmen adayı**,** çevre eğitimi, çevreye yönelik davranışlar

ABSTRACT: It is thought that environmental awareness; knowledge, behaviors and attitudes that has been gained by prospective teachers, will influence environmental education that they would transfer to the students during their service process. The purpose of the education is to search about the effect of an international environmental education project "Green Pack" on the prospective science and technology teachers' environmental behaviors. This study is conducted on students who study at science and technology education department of a university on 3rd grade at 2012-2013 academic years. One section of 3rd grade science and technology education is accredited to (N=30) whereas the other section is accredited to (N=30) control class. In this study, a model of experimental research design consisting pretest and posttest of experimental and control groups are being used. Data has been collected by Environmental Awareness Scale (EAS) formed by Erten (2000). The instrument contains different tests that measure indicated dimensions. According to research, an expressive increase in favor of environmental behaviors was obtained. As a result of the study, the environmental education which has been given during the study does not affect prospective teachers. In addition to that, in terms of behavior test scores of environmental awareness scale (EAS), there has been no improvement in control group whereas the prospective science and technology teachers who are in the experimental group have shown significant increase. The most important externalized indicator that should be shown by individuals will be the environment friendly behaviors. According to both the data gained by research, it is obviously presented that the behaviors of prospective teachers have been significantly changed.

Keywords: prospective science and technology teacher**,** environmental education, environmental behaviours

GİRİŞ

İnsanın tarihsel gelişimi doğadan uzaklaşmasını da beraberinde getirmiştir. Yüzyıllar boyunca doğa, toprak ve diğer tüm canlılarla birebir etkileşim halinde olan insanoğlu zamanla, her geçen yüzyıl ile birlikte, onlardan uzaklaşmış ve kendini tanıma sürecini yaşarken diğer canlılara olan saygısını yitirmeye başlamıştır. Ortaya çıkan teknolojik gelişmeler, kentleşme, nüfus artışı gibi faktörler insanın toprakla arasını açmış, endüstrileşme ve sanayileşme tarımsal yaşam koşullarını dahi olumsuz etkilemiştir. Elbette ki insanın çok eskiden doğayla dost bir hayat sürmesi yine çıkar ve istekleriyle alakalıdır (Pooley ve O'Connor, 2000). Çünkü eski tarihlerden beri insanın temel ihtiyaçları buradan karşılanmaktadır. Barınma, yeme-içme, avlanma, hayvan yetiştirme gibi durumların tamamı insanın temel ihtiyaçları sebebiyle sürdürdüğü faaliyetlerdir (Reiss ve Chapman, 1998) . Bununla birlikte, insanın doğayı ve çevresini koruması açısından diğer canlılara sevgi duyması da tabii ki insanın doğasında var olan ikincil planda kalan bir koruma faktörü olduğu söylenebilir. Günümüz koşullarında ise işler değişmiştir. Sanayi devrimi ile birlikte başlayan süreç her ne kadar insanı bilimde gelişmeye, "***bilgiye***" götürse de onu var olan biyolojik koşullarından ve ekolojik ortamından soyutlamıştır (Öztürk, 2013).

19. yy ile birlikte hızlı bir teknolojik değişim sürecine giren insanoğlu, bu sırada çevreye ve doğal yaşama verdiği zararı fark etmiş ve önlemler almaya başlamıştır (Palmer, 1995). Bu; durumun ciddiyetini anlamaya başlanmasından kaynaklanmaktadır. Çevreyi ve doğayı koruma önlemleri ister ben merkezli ve çıkarcı eğilimlerinden (antroposentrik düşünce) olsun, ister gerçekten içinde yatan doğa ve yaşam sevgisinden (ekosentrik düşünce) olsun, şu anki koşullarda dünyanın her yerinde uygulanması gereken yaptırımları içermelidir. Ekosentrik düşüncelere sahip bireyler doğayı gerçekten değer verilmeye layık bulduğu, bitkileri ve hayvanları; daha doğrusu tüm canlıları değerli gördüğü için çevreye duyarlı davranır. Antroposentrik kişiler ise çevreyi insanların yaşam kalitesinin yükseltilmesinde ve insanın yaşamını devam ettirmesinde vazgeçilmez olduğu için korumak isterler (Erten, 2011). Bu faydacı bir görüştür. Dolayısıyla, bir bireyin çevresiyle, bitkilerle ve hayvanlarla ilgilenmesinin hangi düşünce yapısından kaynaklandığının bilinmesi onun davranışlarına zemin hazırlayan önemli bir anlayıştır.

Çevre problemleri yalnızca ortaya çıktığı yerlerde kalmamakta ve dünyanın çok farklı bölgelerini de etkilemektedir. Elbette etrafında olan çevresel sorunları fark eden insan, bu problemlerin çözümüne odaklanabilir. Ancak, insanda bulunan bu içsel dürtüler, saf çıkarcı düşünce anlayışlarından kaynaklansa bile daha kapsamlı bir eğitimle, sürekli davranışlara dönüşmelidir. Çevreye karşı olumlu tutumlara sahip, dost ve yaralı davranışlar sergileyen, hatta bunları bir yaşam tarzı haline getiren, kendinden sonraki nesilleri de bu anlayışla büyüten bireyler yetiştirilmelidir. Bu da ancak bilinçli bir çevre eğitimi ile olabilir.

Çevre eğitimi: Yeni bir insan tipini, ahlak anlayışını ve tüketim bilincini topluma kazandırmayı, ihtiyacı kadar tüketen, gelecek nesillere karşı sorumluluk hisseden, çevre sorunlarına karşı duyarlı ve çevre dostu davranış gösterebilen çevre bilincine sahip insan modeli yetiştirmeyi amaçlayan öğrenme alanı

Davranış: Organizmanın doğrudan ya da dolaylı olarak gözlenebilen her türlü hareketi

Çevreye yararlı davranışlar (ÇD): Çevrenin korunması için gösterilen gerçek çevre dostu davranışlar ve öğretmen adaylarının çevrenin korunması için kendi çıkarlarından taviz vermesi ve gerektiğinde çevre sorunlarını azaltma veya bu sorunların ortadan kaldırılması için maddi katkılarda bulunmaları

Yukarıda belirtilen tanımından da anlaşılacağı gibi çevrenin korunması, mevcut sorunların ve tehditlerin azaltılması ve geleceğe yönelik kalıcı önlemlerin alınması ancak bireylerin çevreye bilgi ve olumlu tutumlarının davranışlara dönüşmesiyle gerçekleşebilir. Çevre eğitimine yönelik diğer ülkelerde yapılan araştırmalarda çevre dostu davranışlar ve bunları etkileyen faktörlere daha fazla yer verildiği görülürken ülkemizde bu örneklerin az olduğu söylenebilir. Bu çalışma ile çevre eğitimi alanında, ülkemizde özellikle çevreye yararlı davranışlar hususunda, diğer araştırmacılara öncü niteliğinde bir yol açacağı düşünülmüştür. Yukarıda da belirtildiği gibi öğretmen adaylarına çevre bilincini bütün boyutlarını göz önüne alarak tam ve doğru kazandırılması gerekmektedir. Etkili bir lisans dersiyle bunun gerçekleştirilebileceği düşünülmektedir. Bunun için birçok ülkede yürütülen uluslararası bir çevre eğitimi programı (Yeşil Kutu) incelenmiş ve ülkemizde "çevre bilimi" lisans dersiyle bütünleştirilmesinin, öğretmen adaylarına iyi düzeyde bir çevre bilgisi, olumlu tutumlar ve çevre dostu davranışlar içeren etkin bir çevre bilinci kazandıracağı öngörülmüştür. Aynı zamanda, bu araştırma ışığında elde edilen sonuçlar ve getirilen önerilerin çevre eğitimi alanındaki araştırmacılara ve eğitimcilere yol göstermesi hedeflenmiştir.

Uluslararası Bir Çevre Eğitimi Projesi: Yeşil Kutu

Yeşil Kutu Projesi MEB ortaklığı, üniversiteler ve alanda uzman akademisyenlerin işbirliği ile birlikte çalışmalar yapıldıktan sonra, çevre eğitiminin tüm bu alt konularını birleştirmeyi hedeflemiş bir projedir. Diğer program ve projeleri göz önüne alarak çevre eğitiminin temel unsurlarını (çevrenin öğeleri, tehditler ve baskılar, insan etkinlikleri ve etkileri, küresel sorunlar ve değerler) konu edinmiş bir eğitim programıdır (Tüysüzoğlu, 2005). Hedef kitleye bilgi vermeyi, çevreye yönelik kalıcı ve olumlu tutum ve değerler oluşturmayı amaçlamaktadır. Bu nedenle kapsamlı ve günümüz koşullarında oldukça ihtiyaç duyulan bir proje olduğu düşünülmektedir.

Projenin ilköğretim okullarında uygulanabilmesi için öncelikle öğretmenlerin bu eğitimi almış olmaları gerekmektedir. Bu nedenle bu araştırmada gelecekte öğretmenlik yapacak öğretmen adaylarına hizmet öncesinde Yeşil Kutu Projesi kapsamında eğitim vermenin, adayların çevreye yönelik tutumlarında, davranışlarında ve çevreye yönelik bilgilerinde etkili olacağı öngörülmektedir.

YÖNTEM

Bu araştırmada deneysel yöntemin ön test- son test deney ve kontrol gruplu deseni kullanılmıştır. Bu desen şöyle gösterilebilir:

GRUP	ÖN TEST	ÖĞRETİM SÜRECİ	SON TEST
Kontrol Grubu (G1)	Çevre Bilinci Ölçeği (ÇBÖ)	Mevcut Program	Çevre Bilinci Ölçeği (ÇBÖ)
Deney Grubu (G2)	Çevre Bilinci Ölçeği (ÇBÖ)	Yeşil Kutu Proje Uygulamalarına göre Program	Çevre Bilinci Ölçeği (ÇBÖ)

Çalışmada deneysel yöntem kullanıldığından evren ve örneklem tayinine gidilmemiştir. Bu çalışma, 2012-2013 Eğitim-Öğretim Yılında bir üniversitenin Fen Bilgisi Öğretmenliği üçüncü sınıf öğrencileri ile yapılmıştır. İlgili bölüme kayıtlı üçüncü sınıf düzeyinde öğrenim gören fen ve teknoloji öğretmen adaylarının bir şubesi (N=30) deney grubuna, diğer bir şubesi (N=30) kontrol grubuna atanmıştır.

Veri toplama aracı olarak Erten (2000) tarafından geliştirilen "Çevre Bilinci Ölçeği" (ÇBÖ) kullanılmıştır. Bu ölçek çevreye yönelik farklı boyutları ölçen üç ayrı test içermektedir. Ölçekte, öğrencilerin çevre hakkındaki bilgilerini, çevreye yönelik tutumlarını ve çevreyi korumaya yönelik davranışlarını içeren 20 tutum, 20 davranış ve 20 çevre bilgisine ait olmak üzere toplam 60 madde vardır. Erten'e (2005) göre davranış testinde çevrenin korunması için gösterilen gerçek davranışlar yer almaktadır. Dolayısıyla, ölçekteki maddeler bu çalışmada kazanılması hedeflenen davranışları içermektedir. Çalışma sonunda, Yeşil Kutu Projesi uygulamalarına göre işlenen dersin çevreye yönelik olumlu davranış geliştirmede anlamlı bir fark oluşturup oluşturmadığının incelenmesi hedeflenmiştir. Ölçeğin Erten tarafından yapılan önceki çalışmalarda Cronbach güvenirligi .97'dir. Bu çalışmada ise ölçeğin güvenirlik değeri .82'dir.

Süreç öncesinde, ÇBÖ ön test olarak uygulanmış ve elde edilen veriler üzerinde betimsel analizler yapılarak çevreye yönelik davranışların ne derece açıklandığı incelenmiştir. Yeşil Kutu Projesi ile ilgili etkinlikler ve uygulamalar, ilgili sınıf düzeyinde dönem boyunca uygulandıktan sonra, aynı ölçekler gruba son test olarak uygulanmış ve arada anlamlı bir farkın olup olmadığına bakılmıştır.

BULGULAR

Bu araştırmada; verilen eğitimin öğretmen adaylarının çevre dostu davranışlarına etkisi incelenmiştir. Bunun için, *"Yeşil Kutu" Projesi ve uygulamaları fen ve teknoloji öğretmen adaylarının çevreye yönelik davranışları üzerinde etkili midir? (Bireylerde istendik davranış değişikliği oluşturmuş mudur?)* sorusuna yanıt aranmıştır. Bu amaçla, fen ve teknoloji öğretmen adaylarının, kontrol ve deney grubu ön test ve son test davranış boyutu puanları arasında t testi uygulanmıştır. Buna göre, aşağıdaki tabloda deney ve kontrol grubunun ÇBÖ davranış boyutuna ait betimsel istatistikler ve t testi sonuçları sunulmuştur.

Tablo 1. Deney ve Kontrol Grubunun ÇBÖ Davranış Boyutuna ait Betimsel İstatistikler ve t Testi Sonuçları

	Test Çeşidi	N	Ortalama	s.s	s.d	t	p
Kontrol Grubu	Ön Test	30	60.1000	9.10153	29	-3.138	0.074
	Son Test	30	64.4333	9.42094			
Deney Grubu	Ön Test	30	64.1667	7.15871	29	4.294	*0.000
	Son Test	30	73.2333	8.57295			

Fen ve teknoloji öğretmen adaylarının çevreye yönelik davranışları incelendiğinde, Tablo 1.de görüldüğü gibi kontrol grubuna uygulanan ilk testin ortalaması 60.10, standart sapması 9.10 olarak belirlenmiştir. Son testin ortalaması 64.43 iken standart sapma 9.42 dür. Kontrol grubunda uygulanmış bu iki testin ortalaması arasında artış olsa bile ($p=0.074<0.05$) çevreye yönelik davranış boyutundaki bu artış istatistiksel olarak anlamlı farklılık göstermemektedir.

Deney grubuna uygulanan ön test puanlarının ortalaması 64.16, standart sapması 7.15 iken ders sonrası uygulanan testin ortalaması 73,23, standart sapması 8.57'dir. Bu durumda, çevreye yönelik davranış boyutu bakımından deney grubunda uygulanan testlerin ortalamaları istatistiksel olarak **anlamlı** bir farklılık ($p=0.000<0.05$) gösterdiği görülmektedir.

SONUÇ

Kaiser ve diğerleri (1996), "Çevreye yönelik tutum ve çevreye dair davranış" isimli çalışmada, çevreye karşı olumlu tutum oluşturularak, çevresel davranışın habercisi olan çevre psikolojisi yapılandırılmıştır. Ajzen'in planlı davranış teorisine dayanan bu çalışmada tutum kavramı ve olabilirlik ölçüm yaklaşımı birleştirilmiştir. Çalışmada faktör analizi şeklinde üç ölçümün ortagonal boyutları doğrulanmıştır:

1. Çevre bilgisi

2. Çevre değerleri (tutum) ve

3. Çevreye yararlı davranışlar

Bu yaklaşım, bu çalışmadaki çevre bilinci yaklaşımıyla aynı anlayıştadır. Çevre bilincini, bilgi tutum ve davranışlar örüntüsü olarak görürken, çevreye yönelik davranışın önemi vurgulanmıştır. Diğer bir ölçümde, genel çevre davranışları ile kişilerin gerçek davranışlarının arkasındaki etkiler incelenerek değerlendirilmiştir. Çevre bilgisi ve çevresel tutumların, çevreye yönelik davranışların 40 %'ını değiştirdiği görülmüştür. Dolayısıyla, bireylerin herhangi bir eğitim almadan da çevreye yönelik bazı davranışlarının, etkili bir eğitimle gelişmesi beklenmektedir. Bu çalışma ile çevre bilincinin önemli bir ayağı olan davranış boyutunun önemi vurgulanmıştır.

Sonuç olarak, her iki grubun da davranış boyutu test puanlarında artış belirlenmiştir. Ancak bu artış deney grubu davranış boyutu puan ortalamalarında daha yüksektir. Yapılan t-testi sonuçlarına göre, bu durumda, "Yeşil Kutu" Projesi uygulamalarıyla işlenen derslerin öğretmen adaylarında **anlamlı düzeyde** davranış değişikliği oluşturduğu söylenebilir. Bu sonuç araştırmanın hedefleriyle örtüşmektedir. Çünkü etkili ve sürekli bir çevre bilincinin oluşmasında karşılaşılan en önemli problem öğrenilenlerin davranışa dönüşememesidir. Her ne kadar bireylere verilen çevre eğitimleri sonrasında, bilgi düzeylerinde veya tutumlarında artış gözlense de, bu bilgilerin maalesef hayata geçirilmediği görülmektedir. Dolayısıyla verilen eğitimler yalnızca bilişsel ve duyuşsal boyutta kalmakta, psikomotor becerilerin gelişimine destek olmamaktadır. Erten (2005) okulöncesi öğretmen adaylarıyla yaptığı çalışmasında çevreye yönelik olumlu tutumlar ile sergilenen davranışlar arasındaki tutarsızlıkları ortaya koymuştur. Buradan hareketle, iyi bir çevre bilinci kazandırmada yalnızca *bilgiyi öğrenmeye* odaklanmadan davranış kazandırmanın önemi anlaşılmalıdır. Bu araştırmanın en önemli hedeflerinden biri çevreye yönelik davranışların verilen çevre eğitimiyle kazandırılması göz önüne alınırsa, bu sonuçla birlikte çevre dostu davranışların geliştiği görülmektedir.

Önceki araştırmalarda belirtilen sonuçlara göre (Erten, 2003; Erten, 2012; Keleş ve diğ. , 2010) çevre eğitiminde öğrenilen bilgilerin gerçek yaşamda davranışlara dönüştürülemediği göz önüne alınırsa, bu sonuçlar dikkate alınarak tüm üniversitelerin çevre bilimi lisans dersinde uygulanacak eğitim programı güncelleştirilmesi gerektiği söylenebilir. Bu çalışmada çevre dostu davranışları artıran faktörler, çevre eğitiminde öne çıkarılmalıdır. Bu faktörlerin; çevre bilimi derslerinin dönem boyunca yaparak yaşayarak öğrenme prensibine göre öğrencilerin aktif katımını sağlayacak şekilde gerçekleştirilmiş olması, uygulamalardaki bazı etkinliklerin yerleşke dışında yerinde görerek saha çalışmalarına yer verilmesi, tüm derslerde konuların "peki biz neler yapabiliriz?" yaklaşımıyla sonuçlandırılması böylece öğrenilenlerin günlük yaşantılarına transfer edilmesi olduğu düşünülmektedir. Özetle, iyi bir çevre eğitimiyle öncelikle etkili bir çevre bilincinin kazandırılması hedeflendiğine göre böyle bir eğitim programı ilerde çocuklarımızı eğitecek öğretmenlerimizin hizmet öncesinde bu alanda iyi yetişmelerini sağlayacaktır.

ÖNERİLER

Araştırmadan elde edilen sonuçlar ışığında öğretmenlere ve eğitimcilere aşağıdaki önerilerde bulunulabilir;

Çevre eğitimine yönelik öğretim etkinlikleri planlanırken çevreye yönelik davranışları geliştiren ve kalıcılığını sağlayan uygulamalara yer verilmelidir. Bu kapsamda öğrenci merkezli etkinlikler düzenlenmeli ve grup etkinliklerine önem verilmelidir.

Yeşil Kutu Projesi gibi uygulamaların çevre dostu davranışları geliştirdiği görüldüğü için öğretmen adaylarına benzer kapsamlı ve içerikli eğitimler verilmesi önerilmektedir.

Bu araştırmada çevreye yönelik davranışları artırdığı görülen faktörler eğitimde öne çıkarılmalıdır. Çevre dostu davranışları artıran faktörler açısından bakıldığında bu çalışmadaki öğretim sürecini bir bütün olarak görmek gerekir. Ancak özellikle; çevre bilimi derslerinin dönem boyunca yaparak yaşayarak öğrenme prensibine göre öğrencilerin aktif katımını sağlayacak şekilde gerçekleştirilmiş olması, uygulamalardaki bazı etkinliklerin kampus dışında yerinde görerek saha çalışmalarına yer verilmesi, tüm derslerde konuların "peki biz neler yapabiliriz?" yaklaşımıyla sonuçlandırılması; böylece öğrenilenlerin günlük yaşantılarına transfer edilmesinin etkili olduğu düşünülmektedir. Bu sebeple, fakültelerde çevre bilimi lisans derslerinde bu faktörler göz önüne alınarak planlama yapılabilir.

Sürdürülebilir bir yaşama yönelik çevre eğitimi aracı olarak da görülen "yeşil kutu" projesinin uygulanması ve değerlendirilmesinin nasıl yapılacağı konusunda öğretmenler ve öğretmen adayları bilgilendirilmelidir.

Öğretmen adaylarının çevre bilinçlerinin arttırılması için okulöncesinden başlayan çevre eğitimine ihtiyaç vardır. Özellikle çevre dostu davranışların geliştirilmesi için öğretilmek istenen bilgilerin, daha sonra hangi ortamlarda kullanılacağının öğretilmesi ile mümkün olabilir. Yaparak yaşayarak öğrenmenin önemi burada ortaya çıkmaktadır. Çünkü yapay ortamlarda öğrenilen bilgilerin gerçek ve karmaşık bir yaşamda kullanılması mümkün olmaz (Gräsel, 1997). Bunun için çevre eğitiminde öğrencilerin duyuşsal alanda, bilişsel alanda ve psikomotor alanında öğrenmeleri sağlanmalı, okul dışında ve doğal ortamda yapılacak etkinliklerle dersler işlenmeli ve çevre sorunları ele alınmalıdır.

Öğretmen adaylarında %26'lık çevre dostu davranışların açıklanmasının gerisinde yatan neden kolay olan davranışlar olduğu düşünülmektedir. Çevre bilincine sahip bireylerin oluşması için öncelikle öğrencilerin çevre merkezli (ekosentrik) tutumlarının güçlendirilmesi için eğitime ağırlık verilmelidir.

Genel olarak çevre bilincine sahip toplumun oluşması için öncelikle kreşlerden başlayarak ilk ve ortaöğretim kurumlarında ve lisans eğitimlerinde çevre dostu davranışlar geliştirecek bir biçimde disiplinler üstü ve tüm öğretmenlerin görev bilinciyle bir çevre eğitimi verilmelidir (De Haan, 1989).

EXTENDED ABSTRACT

Purpose of the Study: The main purpose of environmental education is to create environmental awareness. By the way, it is thought that environmental awareness; knowledge, behaviors and attitudes that has been gained by prospective teachers, will influence environmental education that they would transfer to the students during their service process. The purpose of the education is to search about the effect of an international environmental education project "Green Pack" on the prospective science and technology teachers' environmental behaviors.

Methodology: This study is conducted on students who study at science and technology education department of a university on 3rd grade at 2012-2013 academic years. A graduate course "Environmental Science" of Elementary Science Education Department is used during research process. One section of 3rd grade science and technology education students is accredited to (N=30) whereas the other section is accredited to (N=30) control class. In this study, a model of experimental research design consisting pretest and posttest of experimental and control groups are being used. Data has been collected by Environmental Awareness Scale (EAS) formed by Erten (2000). The instrument contains different tests that measure indicated dimensions as environmental knowledge, behaviors and attitudes. The Cronbach Alpha reliability of the instrument in this research is .82.

Results: According to research, by the end of this education programme environmental behaviors of teacher candidates has been increased by either control or environmental groups, nevertheless the increase in control group is not significant. So, as a result, the environmental education which has been given during the study does not affect prospective teachers in control group. In addition to that, in terms of overall scores of environmental awareness (EAS), there has been no improvement in control group whereas the prospective science and technology teachers who are in the experimental group have shown significant increase. The most important externalized indicator that should be shown by individuals will be the environment friendly behaviors. According to both the data gained during the study, it is obviously presented that the behaviors of prospective teachers have been significantly changed.

THE EFFECT OF COMPUTER ASSISTED LABORATORY APLLICATIONS ON PRESERVICE TEACHERS' ATTITUDES TOWARDS SCIENCE TEACHING

Şeyma ULUKÖK

Uğur SARI

The aim of this study is to find out the effects of computer assisted laboratory applications on preservice science teachers' attitudes towards science teaching. The opinions of the preservice teachers about the conducted activities are also aimed to be determined. The sample of the study consists of 46 students studying Science Education at Kırıkkale University's Faculty of Education. These students are junior students who have enrolled for the course "Laboratory Applications for Science Teaching II". The data of the study are obtained after an application that lasts for eight weeks in the second semester of 2012-13 academic year. One sample pretest-posttest design which is one of the experimental methods is used in the study. A semi-structured interview form and the 'Science Attitude Scale' developed by Thompson and Shringley (1986) and adapted to Turkish by Özkan, Tekkaya and Çakıroğlu (2002) are used as data collection tools in this study. The statistical analysis of the obtained data reveals that the computer assisted laboratory applications have significant effects on preservice teachers' attitudes towards science teaching. The analysis result of the qualitative data shows that the preservice teachers generally give positive opinions about the applications.

RETHİNKİNG THE MEANİNG OF İNTERNATİONAL LARGE-SCALE ASSESSMENT

Tsung-Hau JEN

Kuan-Ming CHEN

The results of large-scale survey of education, for example, PISA and TIMSS, help in inspiring the revolution in education. By using a secondary analysis, the 15-year-olds' performances on mathematics literacy were examined according to their grade levels for ten participant countries of PISA 2012. By treating the confounding variables of mathematics literacy including the SES status, school repetition and the birthday month, as moderators, we argued that the 15-year-old students in a certain grade level and participated in PISA 2012 can be seen as a sample of all the students in the same grade level in the same country. Therefore, the slop coefficient of the grade variable can be seen as the learning progression per year. The results indicates that the learning progression from grade 9 to grade 10 is significant for all the analyzed countries except for Taiwan. The implications of this study will be presented in the conference.

ABSTRACT: The aim of this study is to develop a measuring tool for measuring the anxiety levels of university students for Chemistry Laboratory course. According to this purpose, the validity and reliability study of anxiety scale for Chemistry Laboratory course was carried out. Chemistry Laboratory Anxiety Scale includes 12 items that supporting anxiety. In anxiety scale items were prepared as 5-point Likert type and graded as “Never”, “Rarely”, “Often”, “Usually” and “Always”. Sample of the study has been consisted of 685 science teacher candidate including 235 male and 450 female that studying in three different Faculty of Education, enrolling chemistry and chemistry laboratory courses. Content validity was done by taking decisions of different experts. Explanatory Factor Analyses (EFA) was executed for structural validity of the scale. The results of the EFA showed that scale consisted of one factor. The total variance explained was 45% and factor loadings ranged from .52 to .77. It is found that for all the items in the scale Cronbach alpha is .88 and split half test correlation is .84.

Key words: Chemistry laboratory, anxiety, reliability and validity.

DEVELOPMENT AND VALIDATION OF A SCALE TO MEASURE BIOLOGY LABORATORY ANXIETY LEVEL OF UNIVERSITY STUDENTS

ABSTRACT: The aim of this study is to develop a measuring tool for measuring the anxiety levels of university students for Biology Laboratory course. According to this purpose, the validity and reliability study of anxiety scale for Biology Laboratory course was carried out. Biology Laboratory Anxiety Scale includes 15 positive items that supporting anxiety. In anxiety scale items were prepared as 5-point Likert type and graded as "Never", "Rarely", "Often", "Usually" and "Always". Sample of the study has been consisted of 685 science teacher candidate including 235 male and 450 female that studying in three different Faculty of Education, enrolling biology and biology laboratory courses. Content validity was done by taking decisions of different experts. Explanatory Factor Analyses (EFA) was executed for structural validity of the scale. The results of the EFA showed that scale consisted of one factor. The total variance explained was 53% and factor loadings ranged from .61 to .80. It is found that for all the items in the scale Cronbach alpha is .93 and split half test correlation is .85.

Key words: Biology laboratory, anxiety, reliability and validity.

KNOWLEDGES FOR EFFECTIVE INTEGRATION OF MATHEMATICS AND SCIENCE

Dr Páraic Treacy

paraic.treacy@ul.ie

Prof. John O'Donoghue,
NCE-MSTL, University of Limerick, Ireland.
john.odonoghue@ul.ie

The level and complexity of knowledge held by a teacher affects what is done in classrooms and, as a consequence, also influences what students learn (Fennema and Franke 1992). Integrating mathematics and science requires the teacher in question to have a certain level of both content knowledge and pedagogical knowledge to educate students in both disciplines successfully (Frykholm and Glasson 2005). Consequently, the knowledges required to effectively instruct students in an integrated setting is a vital element of the successful implementation of such lessons. Research indicates that a teacher's content knowledge in the subjects he/she teaches is of utmost importance, this translates to an integrative setting – content knowledge and pedagogical content knowledge within both mathematics and science must be of a high standard to implement these lessons successfully. This can be achieved through provision of the relevant resources, a working support structure, and teacher training.

Keywords: integration, mathematics, science, knowledges, pedagogy.

INTRODUCTION

The level and complexity of knowledge held by a teacher affects what is done in classrooms and, as a consequence, also influences what students learn (Fennema & Franke, 1992). Integrating mathematics and science requires the teacher in question to have a certain level of both content knowledge and pedagogical knowledge to educate students in both disciplines successfully (Frykholm & Glasson, 2005). Consequently, the knowledges required to effectively instruct students in an integrated setting is a vital element of the successful implementation of such lessons. This piece of writing will investigate the knowledges required to teach effectively during lessons which integrate mathematics and science by considering research conducted in this field and applying it to the preparation required of teachers prior to implementing lessons which integrate mathematics and science in classroom.

Such an understanding of the knowledges required to integrate mathematics and science was developed by the author in order to successfully implement a new teaching model for integrating mathematics and science in second level classrooms. This new model, entitled 'Authentic Integration', caters for the specific needs of integration of mathematics and science as it requires that each lesson be based around a rich task which relates to the real world, explores concepts from both subjects, and ensures that hands-on group work, inquiry and discussion are central to the lesson (Treacy, 2012). This model was applied in four post-primary schools in Ireland. Understanding the knowledges required to effectively integrate mathematics and science in the classroom proved to be vital in the overall success of the intervention. The development and implementation of this understanding is discussed in this article as well as its contribution to the efficient execution of the lessons.

KNOWLEDGES FOR EFFECTIVE TEACHING

Shulman's (1986) work was the first foray into the area of knowledges for effective teaching and provided a base for the work which was to follow from the likes of Ernest (1989), Fennema and Franke (1992), and Rowland et al. (2005). Shulman (1986) identified three domains when constructing his model:

- Subject Matter Content Knowledge
- Pedagogical Content Knowledge
- Curricular Knowledge.

He believed that 'Subject Matter Content Knowledge' was the most important of the three, claiming that teachers must have a deep understanding of the content in order to teach it effectively (Shulman 1986). This is an important issue when considering integration of mathematics and science as, depending on the approach taken, it may require one teacher to educate pupils in mathematics and science simultaneously (Jacobs, 1989). If this occurs then the teacher must, according to Shulman (1986), possess a decent depth of knowledge within both subjects.

'Pedagogical Content Knowledge' refers to the repertoire of representations of the content that a teacher draws on to aid pupils in comprehending the subject matter. These could be demonstrations, examples, analogies or illustrations which help pupils form a greater understanding of what is being examined (Shulman 1986). In other words, it is the ability of a teacher to draw on various exemplifications of the given content to enhance the quality of their instruction so as to ensure a greater depth of understanding amongst the pupils. An example of this could be the use of a balance scales to explain procedures adopted when solving mathematical equations. With a balance scales, if a weight is added to one side then a weight of the same magnitude must be added to the other side to maintain balance. It is the same with equations: if a number is added to one side of the equation then the same number must be added to the other side of the equation to 'maintain balance'. This offers a concrete example which pupils can recognise and refer to, thus improving understanding of the concept.

'Curricular Knowledge' refers to knowledge and competency in relation to the range of programmes and materials available to the teacher with regards to a particular subject or topic. It refers to the knowledge of the various ways an educator can teach elements of the curriculum to their pupils and the educator's recognition of which way is best in given situations (Shulman 1986). In other words, this element refers to the notion that there is more than one way to teach a topic or subject and a teacher should have a certain level of expertise in the various approaches which could be deployed as well as knowing when best to deploy them.

Schulman's (1986) work was not subject specific hence it was aimed at encompassing all teaching. It formed the key reference for subsequent attempts at modelling subject specific and non-subject specific knowledges for effective teaching. As the issue of knowledges for effective teaching began to develop, more authors offered theories in relation to its make-up. Two of these authors, Ernest (1989) and Fennema & Franke (1992) lead the way in defining the knowledge make-up of effective mathematics teachers, leading onto Rowland et al. (2005) and their work on the 'Knowledge Quartet'.

KNOWLEDGES FOR EFFECTIVE MATHEMATICS TEACHING

Following Shulman's (1986) ground-breaking work, academics began to apply his theory to specific subjects with Ernest (1989) developing one of the first models of teacher knowledges for effective mathematics teaching. This model was quite detailed, outlining the knowledges, beliefs and attitudes vital for effective mathematics teaching. Similar to Shulman (1986), Ernest (1989) highlighted subject content knowledge, i.e. knowledge of mathematics, as the most important element. When Fennema and Franke (1992) published their model of knowledges for effective mathematics teaching, content knowledge was also identified as the most vital characteristic. This aspect continues to be regarded as being of the utmost importance in present day models of this nature.

Surprisingly, content knowledge has been shown to be negatively related to the use of inquiry-based classroom instruction and to beliefs in the effectiveness of such instruction (Wilkins, 2008). Many teachers with strong content knowledge tend to rely on 'traditional' methods i.e. focus on rules and procedures (Mewborn, 2001). It is, rather, positive attitudes towards the subject that facilitate the adoption of inquiry-based instruction in the classroom (Karp, 1991; Wilkins, 2008). These findings show that content knowledge is of great importance for effective mathematics instruction but must be supplemented with positive beliefs in relation to inquiry-based instruction if such an approach is to be adopted.

Returning to the aforementioned models: interestingly, the knowledge characteristic which Ernest (1989) terms as the next most important, 'Knowledge of Other Subject Matter', is an endorsement of the assimilation of mathematics with other subjects. Ernest (1989, p.17) claims that knowledge of other subject matter "provides a stock of knowledge of uses and applications of mathematics" which he believes forms an important contribution to the teaching of mathematics. Similarly, Rowland et al. (2005) cited such a characteristic in his 'Knowledge Quartet' model – 'Connection Knowledge'. This aspect deals with the knowledge required to make connections within mathematics i.e. between concepts and/or procedures; and between mathematics and other subjects or disciplines (Rowland et al., 2005). As such, the 'Knowledge Quartet' may lend itself to underpinning the knowleges required to effectively integrate mathematics and science in the classroom.

The Knowledge Quartet

The ‘Knowledge Quartet’ provides the most recent widely endorsed version of what knowledges it takes to be an effective mathematics teacher. Again, Mathematical knowledge tops the list of most important characteristics; within the quartet it is referred to as ‘Foundation Knowledge’. But there is one important difference in the definition of this aspect compared to previously mentioned models – it not only includes knowledge of mathematics itself but also the beliefs which the teacher holds in relation to mathematics, and it is upon this foundation that the other characteristics of the model are built (Rowland et al. 2005). This is significant due to the observation, discussed earlier, that although content knowledge is vital for effective teaching, beliefs determine whether innovative practices such as active and experiential learning are adopted (Wilkins 2008, Karp 1991). Thus, if an innovation like the integration of mathematics and science is to be adopted, ‘Foundation Knowledge’ within teachers, which encompasses the desirable beliefs and levels of mathematical knowledge, would be a cornerstone of its implementation. The significance of this to the author is the realisation that an effective implementation of an integrative framework would require training for teachers to ensure they have the required content knowledge but also, possibly more importantly, it would require teachers to ‘buy into’ the approach being used i.e. hold the belief that experiential and active learning is a worthwhile endeavour.

Next in the Knowledge Quartet is ‘Transformation Knowledge’ which is very similar to Shulman’s (1986) ‘Pedagogical Content Knowledge’ described earlier. In essence this characteristic separates those who know mathematics from those who know how to teach mathematics. This leads into the third element of the ‘Knowledge Quartet’ – ‘Connection Knowledge’ which, as discussed earlier, is the knowledge required to make connections within mathematics i.e. between concepts and/or procedures; and between mathematics and other subjects or disciplines (Rowland et al. 2005). The ability to make connections to areas within and outside mathematics is of course an essential element of integration of mathematics with other subjects thus it is imperative that teachers pursuing an integrative approach have this characteristic.

Finally, within Rowland et al.’s (2005) ‘Knowledge Quartet’, ‘Contingency Knowledge’ which describes a teachers ability to adjust to unexpected situations such as an unforeseen circumstance, or a question which had not been anticipated. It also alludes to a teacher’s recognition of when and how a lesson needs to be adjusted from the original lesson plan if required (Rowland et al., 2005). Once again, this is quite relevant to issues relating to integration of mathematics and science, as a teacher’s ability to think on their feet is essential in an active or experiential lesson as there is a great element of discovery learning involved which can go down various paths thus calling on the teacher to be able to adjust and react to various scenarios and questions, some of which could (and probably will) be unanticipated.

KNOWLEDGES FOR EFFECTIVE SCIENCE TEACHING

Research into the knowledges required to effectively teach science produced similar findings to those outlined previously i.e. a teacher’s content knowledge plays a pivotal role in the depth of learning achieved by their students as well as the manner in which they learn in the classroom. Science teachers with well-developed levels of content knowledge ask more questions while there is a greater probability that their students will consider alternative explanations, propose more investigations, and embark on unanticipated inquiries compared to teachers with weaker content knowledge (Alonzo, 2002; Sanders, Borko, & Lockard, 1993). Teachers with poor content knowledge tend to teach in a more direct manner, telling the students the content rather than allowing them to develop their own understanding through inquiry (Alonzo, 2002; Sanders et al., 1993). Consequently, it is clear that the greater content knowledge a teacher has, the more they are open to holistic approaches to tuition in which students explore topics and concepts, by which they develop their own meaning and understanding.

Pedagogical content knowledge (PCK) has previously been flagged as an important part of the range of knowledges a teacher possesses in both typical tuition (Shulman, 1986) and in a setting which integrates mathematics and science (Frykholm & Glasson, 2005). Greater focus has been placed on PCK recently by those researching knowledges for effective science teaching with Loughran et al. (2012) exploring the PCK of science teachers held in high-regard to gain a greater insight into how this translates into their teaching. This research clearly indicated the importance of in-depth understanding of PCK as Loughran et al. (2012) regularly observed that the knowledge of practice which science teachers relied upon and the manner in which they conceptualised science content in the classroom was a clear indicator of whether or not a teacher could be termed as being expert in their field.

BUILDING TEACHERS' KNOWLEDGES FOR EFFECTIVE INTEGRATION OF MATHEMATICS AND SCIENCE

Analysis of the knowledges required for effective instruction indicates that content knowledge is a vital characteristic of successful educators. Content knowledge, characterised in one way or another, was labelled the most important aspect of all the models outlined (Ernest, 1989; Fennema & Franke, 1992; Rowland et al., 2005). It is of great importance to find ways to counteract any gaps in knowledge within mathematics and/or science amongst teachers prior to attempting an integrative approach. One solution to this would be for teachers of each subject to work in tandem i.e. team teach a lesson. This would probably be an unrealistic aim for schools that typically follow a set timetable as both teachers would need to be free to work at the same time with one class.

Another solution would be to conduct the mathematics aspect of the intended problem or project during the mathematics lesson and the science aspect during the science lesson. Such an approach may be possible for certain problems or projects but for most lessons it would most likely negatively affect the learning that takes place in the lesson and could greatly reduce the integrative element of the lesson and any positives that come with that.

A third solution, and probably the most practical one, would be to up-skill the teachers in relation to the knowledge gaps they have i.e. improve the mathematics teachers' science content knowledge and pedagogical content knowledge in relation to the material which would come up in each lesson they are to teach, and vice versa. In other words, give them the knowledges they require to deal with any questions from the pupils and to successfully use various representations and exemplifications of concepts in both disciplines to effectively aid student understanding.

In summation, with this close look at knowledges for effective teaching, it is clear that work must be done with teachers prior to an implementation of an integrative framework. Work must be carried out on the level of content knowledge they possess in both mathematics and science, while also developing their pedagogic content knowledge within both subjects to enhance the manner in which they guide the pupils' learning. Such an approach was taken to provide a basis for integration of mathematics and science during the author's intervention.

APPLYING IMPROVED TEACHER KNOWLEDGES FOR INTEGRATION OF MATHEMATICS AND SCIENCE

The requirement for teachers to have a working knowledge of both mathematics and science can obstruct the implementation of integrative lessons as teachers may be aware of how the subjects connect but may not have the expertise or the confidence to carry through these connections into their teaching:

> "[O]bviously I'd be aware of the link [between the subjects], but it took someone to point it out for me to actually explain it perfectly to the students."

Jennifer Collins (mathematics teacher)
(Treacy, 2012)

Later in the interview she confirmed this anxiety:

> "At the start I was a bit apprehensive about how I'd incorporate it into my teaching, how I'd put the whole lesson across and would I be able achieve what I was hoping to. But as I got into it, and the resources were brilliant that I was provided with, and it was laid out so well that it was easy to follow and deliver the lesson to the students. I really enjoyed it. It also gave me an awakening; it showed me how you can teach a topic in different ways and integrate it with something else."

Jennifer Collins (mathematics teacher)
(Treacy, 2012)

The author, due to the careful consideration of the nature of knowledges for effective teaching outlined previously, anticipated that this would be an important element within this research and thus ensured that each teacher would have the requisite level of knowledge within both mathematics and science prior to implementing the lessons by providing plenty of resources as well as teacher training. Focus was placed on content knowledge and pedagogical content knowledge in both mathematics and science.

This support system – which included electronic presentations on all the topics, teacher training, availability of the lead researcher for assistance – evidently proved to be quite important in ensuring that teachers were comfortable in implementing the lessons. Collins (mathematics teacher) had some anxiety in relation to her ability to teach lessons which incorporated both mathematics and science, as stated above, but made use of the resources and training available which gave her the confidence to conduct the integrative lessons.

It proved not to be a stumbling block for the other teachers involved in this project as each of them found the content to be very manageable and none voiced any problems grasping elements that they weren't previously overly familiar with. In fact, the participants gained great benefit from combining the subjects:

> "I think it worked very, very well. From my own point of view, there's a lot I didn't know – some of the definitions in science… there's a lot I didn't know myself and they're very maths related. So I think there's so many areas in science that are related to maths and I think it'll come through with the project maths type of questions that are coming in".
>
> Martina O'Reilly (mathematics teacher)
> (Treacy, 2012)

O'Reilly gained a greater insight into elements of science that mathematics could be related to and envisions the benefits that this will provide for her when adapting to the new 'Project Maths' syllabus which was being introduced in Ireland at the time of the intervention.

CONCLUSION

Students learn more from teachers who are skilled, experienced, and know what and how to teach (Darling-Hammond, 2000; Goldhaber, 2002; Rice, 2003). A teacher may tick all these boxes when it comes to his/her specialised subject but the adoption of an additional subject within their classroom setting provides a further challenge. This is because their content knowledge, which is the best indicator of an effective teacher (Shulman 1986), and/or pedagogical content knowledge within that auxiliary subject might not be of the required standard.

At the commencement of the aforementioned intervention, some of the teachers, i.e. those not specialised in both mathematics and science, displayed some anxiety and indicated their trepidation regarding their lack of content knowledge within their non-specialist subject. The allocation of teacher training and the support structure put in place for this investigation allowed them to develop their content knowledge and pedagogical content knowledge within the topics they studied with the pupils through the lessons. It became clear as the study progressed, and through interviews with the teachers, that such development of knowledges was a vital element in the success of the lessons.

As such, research indicates that a teacher's content knowledge and pedagogical content knowledge in the subjects he/she teaches is of upmost importance. This also translates to an integrative setting – content knowledge and pedagogical content knowledge within both mathematics and science must be of a high standard to implement these lessons successfully. As shown in this study, this can be achieved through provision of the relevant resources, a working support structure, and teacher training.

ABSTRACT: The automated scoring or evaluation for written student responses have been, and are still a highly interesting topic for both education and natural language processing, NLP, researchers alike. With the obvious motivation of the difficulties teachers face when marking or correcting open essay questions; the development of automatic scoring methods have recently received much attention. In this paper, we developed and compared number of NLP techniques that accomplish this task. The baseline for this study is based on a vector space model, VSM. Where after normalisation, the baseline-system represents each essay by a vector, and subsequently calculates its score using the cosine similarity between it and the vector of the model answer. This baseline is then compared with the improved model, which takes the document structure into account. To evaluate our system, we used real essays that submitted for computer science course. Each essay was independently scored by two teachers, which we used as our gold standard. The systems' scoring was then compared to both teachers. A high emphasis was added to the evaluation when the two human assessors are in agreement. The systems' results show a high and promising performance.

Keywords: Automated Essay Scoring, Project Essay Grade, E-Pedagogy and E-Assessment.

INTRODUCTION

The essays examinations are basically considered as an indispensable key in the educational processes. It helps instructors to know students achievements and their situations during the learning journey. Even more, they are considered as a measurement of the learner's ability to memorise, organise, analyse, and write thoughts focusing on specific desirable goals. In perspective aspects, the essay examination advantageously suits the small number of candidates as this gradually decreases when the number becomes larger. Furthermore, it eliminates the candidate's guessing, since it relies on his free answer rather than selecting the good answer such as in multiple choices tests.

However, when there is a vast number of examinations that need to be assessed at once, the instructor finds himself overwhelmed to provide high quality feedback to educators within as short a period of time as is reasonable. Furthermore, different instructors of such a module can have various feedback scores for one candidate, which is one of the essays examinations drawbacks commonly known as subjectivity (Nitko, 1996). As a result, the advancement in technological systems, especially natural language processing (NLP), is increasingly flourishing into to reduce effort, time, and cost of institution resources, for example the Intelligent Essay Assessor (IEA) (Landauer, 2003), which uses Latent Semantic Analysis (LSA) to extract semantic similarity of words and passages from text. However, this kind of system, based on (LSA) tends more towards the frequency of terms rather than understanding the meaning of human knowledge (language).

To address this issue, an automated scoring system based on vector space models (VSMs) is applied in this paper. Using this model we address the issues of the aforementioned approaches and attempt to exploit the different NLP techniques to come up with an optimal solution.

In the remainder of this paper we demonstrate our system development, in five parts. The first part describes related work. In the second section, a methodology is described. The results and findings are presented in the third section. Section four has been dedicated to drawing conclusion following some recommendations for the future work.

LITERATURE REVIEW

Automated Essay Scoring (AES) is defined as the computer technology that enables us to evaluate and score the written prose (Shermis & Barrera, 2002; Shermis & Burstein, 2003; Shermis, Raymat, & Barrera, 2003). The aim of using AES is to tackle the issues related in writing assessments, such as: time, cost, generalisability and reliability (Burstein, 2003; Chung & O'Neil, 1997; Hamp-Lyons, 2001; Ellis Batten Page, 2003; Rudner & Gagne, 2001; Rudner & Liang, 2002; Sireci & Rizavi, 2000). The advantages of using AES have been attracting public schools, universities and researchers (Burstein et al., 1998; Shermis & Burstein, 2003; Sireci & Rizavi, 2000). Some of these advantages are: relieve the grading burden from the educators and adding a consistent level that unachievable sometimes by educators (Shermis & Barrera, 2002).

Nowadays, there are more than 12 programs in the Project Essay Grade (PEG) and Automated Essay Scoring field. These projects have been influenced by Page work(1966) (Williamson, 2009). In addition, they focus as much on assessing the essays' semantic relevance to a given prompt as on assessing the quality of the essay itself. Some of the popular programs are; the Educational Testing Services (ETS) e-Rater (Attali & Burstein, 2006), PearsonKTs KAT Engine, Intelligent Essay Assessor (IEA) (Landauer, Laham, & Foltz, 2003) and Vantage Learnings Intellimetric (Elliot, 2003).
The e-Rater engine marks writing essays by extracting a set of features representing important aspects of writing quality from each essay. It is based on a regression-based methodology, which is a number of properties derived from natural language processing (NLP). When the regression weights are determined for those properties, they can be employed to more essays to turn a predicted score out based on the calibrated feature weights. The on-going version of e-Rater system uses 10 such regression properties, with eight representing factors of writing quality and two representing content. A set of such sub-features computed from NLP techniques composes of primary scoring features (Attali & Burstein, 2006; Burstein, 2003).

PearsonKT's KAT Engine is a similar application which uses a Latent Semantic Analysis technique (Landauer, Foltz, & Laham, 1998). This technique uses a dimensionality-reduction method based on singular-value decomposition. This method represents the content of each essay as a vector. They use direction and length as two aspects of the computed vector which define the location of the essay in this multi-dimensional space. Then, the content score is calculated as a weighted sum, after normalisation and regression. The essay victor is compared to pre-scored essays by the angle separating. They select the closest pre-scored essays in angle, then take their average human scores, and then the cosine distance from the candidate essay is calculated to produce the direction value. The content score is the combination of the weighted sum with a vector length value of the essay. Finally, they combined this content score with other linguistic measures such as style and mechanics (e.g. spelling) features to produce the resultant essay score (Landauer et al., 2003).

Vantage Learning's IntelliMetric is used to evaluate students' essays as part of intelligent tutoring system (Kukich, 2000). As a consequence of a wide range of applications that are used for automated assessment to essays, these systems concentrate on assessing the semantic relevance or topicality of essays. The IntelliMetric is a scoring engine that assesses the skills of student's essays. The aim of this system is to mark the students writing based on the state achievement examinations. This approach, as other systems, uses a substantial number of computer-produced features, which are designed to represent different aspects of writing quality. Moreover, they use five main classes to aggregate these features. The classes are as follows: Focus/Coherence, Organisation, Elaboration/Development, Sentence Structure, and Mechanics/Conventions. Finally, the multiple concurrent statistical methods are used for aggregating the features in order to give the final score (Elliot, 2003; Learning, 2003; Rudner, Garcia, & Welch, 2006).

Similarity within the text is a fundamental and essential research topic within the processing of the natural language as well as the similarity measure of the variation of physical units. Many researchers have conducted the evaluation of the students' essays upon the matching between the model's and optimal answer and the candidate's answer. It is essential to emphasise the simplicity of the vector space model (VSM), yet effective techniques are needed to determine the similarities between documents or utterances. Such method has been widely used within the educational testing field .VSM technique has been applied by Attali & Burstein (2006) for the purpose of measuring English writers that are non-native in terms of the choice of vocabularies. This technique, which is used during the students' essay, are scored through determining the relationship between the words that exist within a student's answer with the words that are contained within sample essays originating from individual scoring categories. A theory of this method is that outstanding essays would have higher similarity in the choice of words being used. This is especially true when two VSM-derived characteristics were utilised that includes the maximum cosine similarity as well as the cosine similarity related to the top scoring category. Furthermore, this technique has been used by Higgins et al. (2006) in order to discover the off-topic essays by students, though comparing the word based IV originating from an essay to an RV built from a series of essays that are on-topic. The essay is considered to be off-topic if the difference is more significant compared with a pre-defined threshold. Zechner and Xi (2008) also used VSM to assess whether content was relevant or not when marking work by non-native English speakers, while Xie et al. (2012) examined the viability of VSM methods for automated speech grading. They used a more advanced ASR than Zechner and Xi, and determined that the VSM results correlated quite highly with human scores. This study aims to expand on the scope of existing studies by employing the cosine similarity

METHODS

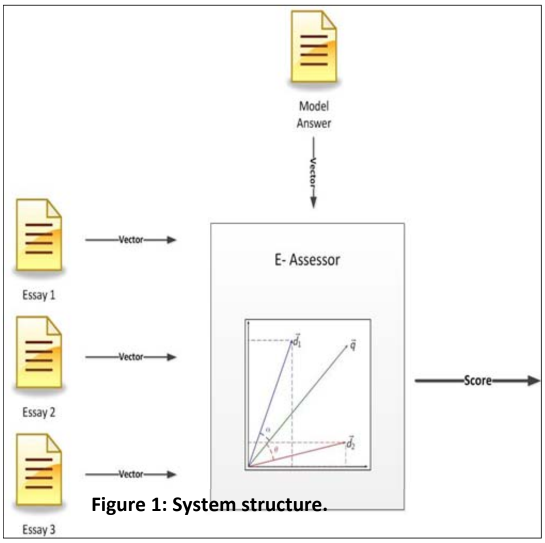

Figure 1: System structure.

Firstly, we defined the language based on the model answer and created a vector for each subject area. Subsequently these vectors are compared with each student submission to get the automated result (Figure 1).

Before creating the model answer vector we run the standard NLP normalisation techniques including removing stop-word (Figure 2).

a	an	and	are	as	at	be	by	for	from
has	he	in	is	it	its	of	on	that	the
to	was	were	will	with					

Figure 2: An example of 25 semantically non-selective stop words. Manning et al. (2009)

Removing such words before processing reduced the noise from the collection and helped to increase the accuracy of the system. Moreover, it helps in the computational process, as we will be dealing with much smaller vectors.

We expand the result text by electing the most relevant synonyms for each word to be including in the composed vector. This step is crucial to capture a higher level of semantic. Therefore, if the same concept is formulated using different words, it still is considered toward the correct answer. The WordNet[1] lexical database is used within the normalisation engine to extract the synonyms.

Finally, we normalise result texts by converting each word to its base form. Thus words like *organise*, *organizes*, and *organising* would be mapped to the same element in our vector. This will help in comparing the students' work to the model answer as they may use different forms of the same word to express the same idea. To accomplish this task we apply Porter's algorithm. We found that the aforementioned steps would greatly increase the accuracy of the results.

We emphasise on this where we examine the similarity of each part of the document separately, before calculating the full document similarity. This approach helps the problem faced when marking the documents organisation, not only the document content. At this stage we consider only three parts of the document, the abstract, document body, and the conclusion. We use these parts as they are clearly mentioned in the question description. We used a linear function for combining these similarities with weighting factors for each part.

EXPERIMENT AND RESULTS

To test our approach, we selected eight essays from two different knowledgeable areas. Each essay was assigned to two independent human assessors to mark it. The human marks are then compared with the marks generated by our systems.

	Knowledge area 1				Knowledge area 2			
Essay number	1	2	3	4	5	6	7	8
hVec	56	57	38	62	63	57	66	54
mVec	73	79	69	72	80	77	88	82
humanAvg	86	88	62	65	82	80.5	73.5	84.5

Table 1: Results summary.

[1] http://wordnet.princeton.edu

Two automated runs are computed: 1) *hVec*, where we use one vector to represent the model document and the students essays. 2) *mVec*, where we represent each document with multi vectors, one vector for each part of the document.
We compared both automated runs with the average of the two human marks, *humanAvg* (Table 1). As can be seen in (Figure 3) the multi vector model, *mVec*, is much closer to human judgment, which gives a more reliable and accurate indication.

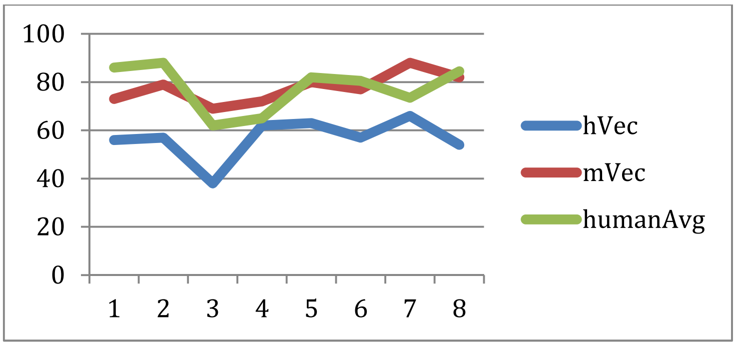

Figure 3: System results.

CONCLUSION

This paper has given an account of, and the view for the widespread use of automated scores techniques. In this investigation, the aim was to assess the methods used in the automated scoring systems. Our system showed that normalisation and taking document structure into account gave a noticeable improvement in the results. The normalisation process was an important factor, which reduced noise in our data. Using document structure to compare with model answers instead of evaluating the whole document at once resulted in an increasing accuracy. For future work, we plan to improve our approach by investigating more ways to represent the document structure. We also plan to apply our methodology in different languages (e.g. Arabic).

ÖZET: Enerji kavramı ve enerji kaynaklarının sürdürülebilirliği geçmişten bugüne dünyanın en önemli konularından ve sorunlarından biri olmuştur. Dünya enerji üretiminde öncelikli kaynaklar; petrol, doğalgaz ve kömür gibi yenilenemeyen enerji kaynaklarıdır. Farklı dönemlerde bu enerji kaynaklarından bazıları daha ön plana çıkmıştır. Günümüzde ise enerji ihtiyacı gün geçtikçe artmakta ve mevcut enerji kaynakları bu gereksinimi karşılamakta yetersiz kalmaktadır. Bu bağlamda enerji kaynakları içerisinde nükleer enerji, enerji sorununun çözümünde alternatif bir kaynak olarak görülmektedir. Nükleer enerji gerekli güvenlik önlemleri alındığında çevreye en az zarar veren enerji türlerinden birisi olarak kabul edilmektedir. Buna bağlı olarak yeni yetişen neslin bu konudaki bilgi düzeylerinin belirlenmesi önem taşıdığından lise öğrencilerinin nükleer enerji hakkındaki görüşleri belirlenmeye çalışılmıştır. Bu araştırma betimsel tarama türünde bir araştırmadır. Araştırmaya Eskişehir il merkezinde üç farklı lisede öğrenim gören 409 öğrenci katılmıştır. Araştırmanın verileri anket formu ile toplanmıştır. Elde edilen veriler SPSS paket programı yardımıyla bilgisayarda çözümlenerek yorumlanmış ve bu doğrultuda öneriler geliştirilmiştir.

Anahtar sözcükler: nükleer enerji, lise öğrencileri, bilgi düzeyleri

ABSTRACT: The concept of energy and sustainability of energy resources has been one of the most important issues and problems of the world from the past to present. The primary source of world energy production; oil, gas and coal are non-renewable energy sources. Some of these energy sources in different periods than has been in the forefront. Today, energy needs are increasing day by day and the current energy sources are insufficient to meet this requirement. In this context, nuclear energy in the energy sources is seen as an alternative source for in the solution of the energy problem. Nuclear energy is considered one of the least environmentally damaging forms of energy taking the necessary safety precautions. Accordingly, growing a new generation of knowledge levels on this subject is important to determine the levels of high school students were studied to determine their views on nuclear energy. This research is a study in the descriptive type. Research in three different schools in the city of Eskisehir studying 409 students participated. Research data were collected through a questionnaire. The data obtained with the help of SPSS software program on the computer and interpreted by analyzing proposals have been developed in this direction.

Key words: nuclear energy, high school students, knowledge levels

GİRİŞ

Enerji, çağımızın en önemli tüketim ihtiyaçlarından biri ve vazgeçilmez bir uygarlık aracıdır. Gelişmişlik düzeyi yüksek ülkelerin en önemli ihtiyaçlarının başında gelen enerji tüketimi, sürekli artmakta ve bu artış gelecekte de devam etmektedir(Uyar 2001). Yaşamımızı sürdürürken hayatımızı kolaylaştıran, günlük yaşantımızda kullandığımız cihazlar sürekli enerjiye ihtiyaç duyarlar. Gerekli olan bu enerjinin elde edilmesi için çeşitli kaynaklar kullanılmaktadır. Bu enerji kaynakları, yenilenebilir ve yenilenemeyen enerji kaynaklarıdır. Yenilenebilir enerji, doğada var olan ve sürekli kendini yenileyen enerji kaynağı demektir. Hidroelektrik enerji, rüzgâr enerjisi, güneş enerjisi, jeotermal enerji, biokütle enerjisi, gel -git enerjisi vb. gibi kaynaklar yenilenebilir ve bunları kullanmakla eksilmeyen enerji kaynaklarıdır. Yenilenebilir enerji kaynaklarının, temiz olması, hava kirliliğini, su kirliliğini ve sera etkisini azaltmaları, tükenmez olmaları vb. gibi birçok olumlu yönleri olmasına rağmen şu andaki kullanımları kısıtlıdır. Yenilenemeyen Enerji Kaynakları ise kömür, petrol, doğalgaz ve nükleer enerji gibi kaynaklar olup zamanla tükenmektedir. Yenilenemeyen enerji kaynaklarının çevreye birçok olumsuz etkileri de mevcuttur. Bu enerji kaynaklarından nükleer enerji, fisyon (çekirdek bölünmesi) veya füzyon (çekirdek birleşmesi) sonucu açığa çıkan enerjidir. Ancak, füzyon, yıllar süren çabalara rağmen pratikte ümit vaad eden bir noktaya getirilememiştir. Nükleer enerji, sağlık sektöründe tanı ve tedavi amacıyla; sanayide, tarım ve hayvancılıkta önemli pek çok izotopun üretimi için; kalp pillerinden, uyduların ve uzay araçlarının enerji üreteçlerine kadar geniş bir yelpazede kullanılır(Zabunoğlu 2012). Dünyanın birçok yerinde değişik amaçlar için çok sayıda reaktörler yapılmıştır. Nükleer reaktörler, denizaltılarda, uçak gemilerinde, araştırma gemilerinde özellikle tercih edilir. Nükleer reaktör, bir nükleer reaksiyonun (fisyon) kontrollü bir şekilde gerçekleştirilmesini ve bu sırada açığa çıkan ısının sürekli ve düzenli olarak üretimini; güvenli, çevreci ve güvenilir bir şekilde sağlamak üzere tasarımlanmış bir makinedir. Ancak, nükleer reaktörlerde doğal afetler ya da insan kaynaklı hatalar yüzünden tehlikeli durumlar ortaya çıkabilmektedir(TEGR, 2012). Nükleer reaktörün en önemli olumsuz yönü radyoaktivite yüzündendir. Radyoaktivite doğal bir olgudur ve her yerde vardır; ancak nükleer enerji üretimi sırasında reaktör kalbinde oluşan parçalanma (fisyon) ürünlerinin radyoaktivitesi çok yüksek düzeydedir. Normal çalışma koşullarında reaktör kalbinde tutulan bu radyoaktivite, bir kaza sırasında en önemli sorunu oluşturur(Ertürk vd. 2006).Genel olarak nükleer enerji konusunda yapılan çalışmalar incelendiğinde (Ateş, 2013; Ateş ve Saraçoğlu, 2013; Karagöz, 2007; Özdemir ve Çobanoğlu, 2008); nükleer enerji ile ilgili çalışma sonuçları farklılık göstermektedir. Buradan yola çıkarak genel olarak toplumun nükleer enerji konusunda bilgi eksikliklerinin ve yanlış bilgilere sahip oldukları söylenebilir. Nükleer enerji ve çevre ile ilgili toplumun genelini ilgilendiren konular her bireyin geleceğini yakından ilgilendirmekle birlikte, bu sorunların farkına varma ve bilinç kazanma daha çok ortaöğretim ve yükseköğretim döneminde mümkün olmaktadır. Bütün öğrencilerin üniversite eğitimini sürdürüp sürdüremeyeceği düşünüldüğünde farkındalığı yüksek öğrencilerin yetiştirilmesi orta öğretim seviyesinde daha da önem kazanmaktadır. Bu yüzden toplumun bilinçlendirilmesinde lise öğrencilerinin bilinçlendirilmesi ve bilgi düzeylerinin belirlenmesi önemlidir. Bu nedenle, çalışmamızda lise öğrencilerinin nükleer enerji hakkındaki bilgi düzeyleri ve bilgi düzeylerinin bazı değişkenler açısından farklılık gösterip göstermediğinin belirlenmesi amaçlanmıştır. Bu temel amaç doğrultusunda aşağıdaki sorulara yanıt aranmıştır.

4. Lise öğrencilerinin, nükleer enerji hakkındaki bilgi düzeyleri nedir?
5. Lise öğrencilerinin, nükleer enerji hakkındaki bilgi düzeyleri cinsiyete göre farklılaşmakta mıdır?
6. Lise öğrencilerinin, nükleer enerji hakkındaki bilgi düzeyleri lise türüne göre farklılaşmakta mıdır?
7. Lise öğrencilerinin, nükleer enerji hakkındaki bilgi düzeyleri sınıf değişkenine göre farklılaşmakta mıdır?

YÖNTEM

Araştırma Modeli

Lise öğrencilerinin nükleer enerji hakkında bilgi düzeylerini belirlemeyi amaçlayan bu araştırmada, amaca uygun olarak nicel araştırma yöntemlerinden betimsel tarama modeli kullanılmıştır. Bilindiği üzere tarama modelleri, geçmişte ya da halen var olan bir durumu var olduğu şekliyle betimlemeyi amaçlayan araştırma yaklaşımlarıdır ve araştırmaya konu olan olay, birey ya da nesne, kendi koşulları içinde ve olduğu gibi tanımlanmaya çalışılır(Karasar, 2009). Araştırmaya katılan lise öğrenci sayısı 409' dur. Ölçme aracı (Karagöz, 2007) tarafından geliştirilen anket soruları üzerinde düzenlemeler yapılarak uzman görüşleri alınarak veri toplama aracı oluşturulmuştur. Veri toplama aracının Crombach alpha değeri 0.80 olarak bulunmuştur.

Evren Örneklem

Araştırmanın evrenini 2010-2011 eğitim-öğretim yılı Eskişehir il merkezinde üç farklı lisede öğrenim gören 409 lise öğrencisi oluşturmaktadır. Araştırmaya katılan öğrencilerin 121'ü (%29,6) kadın iken 288'i ise (%70,4) erkektir. Araştırmaya katılan lise öğrenciler hakkında genel bilgiler Tablo 1'de ayrıntılı olarak verilmiştir.

Tablo 1. Araştırmaya Katılan Öğrencilerin Genel Özellikleri

Bireysel Özellikler		f	%
Cinsiyet	Kadın	121	29,6
	Erkek	288	70,4
Sınıf Düzeyi	9. Sınıf	173	42,3
	10. Sınıf	140	34,2
	11. Sınıf	46	11,2
	12. Sınıf	50	12,2
Lise Türü	Genel lise	55	13,4
	Fen lisesi	209	51,1
	Meslek lisesi	145	35,5
Toplam		409	100

Araştırmaya katılan öğrencilerin yarısından fazlasını fen lisesi öğrencileri (%51,1) oluşturmaktadır. Daha sonra sırasıyla meslek lisesi (%35,5) ve genel lise (%13,4) öğrencileri gelmektedir.

Tablo 2. Araştırmaya Katılan Lise Öğrencilerinin Nükleer Enerji Hakkındaki Bilgi Düzeylerine Ait Tanımlayıcı İstatistikler

Madde		$\overline{X}$

11	Radyasyon nükleer santrallerin diğer adıdır.	3,5648
12	Radyasyon enerjinin bir noktadan diğerine parçacıklar veya elektromanyetik dalgalar seklinde aktarılmasıdır.	3,6479
13	Radyasyon madencilikte kullanılan ölçü birimidir.	3,9951
14	Radyasyon bir kanser türüdür.	3,7531
15	Nükleer teknolojinin kullanımı ülkelerin kendi inisiyatifinde değildir, denetleme ve takip uluslar arası bir kurum olan IAEA (Uluslar Arası Atom Enerji Ajansı) tarafından yapılır.	3,2983
16	Sağlık Bakanlığı Türkiye'de nükleer güvenlik ve radyasyon güvenliğinden sorumlu kurum/kuruluştur.	3,3545
17	Türkiye Atom Enerji Kurumu Türkiye'de nükleer güvenlik ve radyasyon güvenliğinden sorumlu kurum/kuruluştur.	3,4156
18	Çevre Bakanlığı Türkiye'de nükleer güvenlik ve radyasyon güvenliğinden sorumlu kurum/kuruluştur.	3,1980
19	Enerji Bakanlığı Türkiye'de nükleer güvenlik ve radyasyon güvenliğinden sorumlu kurum/kuruluştur.	3,4377
20	Çernobil nükleer santral kazasından sonra biri ABD'de diğeri Japonya'da olmak üzere iki kaza daha olmuştur.	3,0440
21	Bir ülkenin enerji programı, o ülkenin gelişmişlik düzeyiyle ilgilidir.	3,8337
22	Nükleer teknoloji konusunda halkımızın bilinç düzeyi yeterlidir.	3,7824
23	Nükleer teknolojinin ülkemiz için gerekliliğini halkımıza anlatmak için yapılacak bir çalışmada görev almak isterim.	2,9707
24	Nükleer teknolojinin en önemli uygulama alanı enerji konusunda da bir an önce üretime geçilmelidir.	3,3961
25	Enerji sorununun aşılmasında sadece bir teknoloji üzerinde durulmamalı, alternatif enerji üretim yolları geliştirilmelidir.	3,8998
26	Bir ülkenin alternatif enerji üretim yolları konusunda etkili çalışmalar yapabilmesi ancak nükleer teknolojiye sahip olmasıyla mümkündür.	3,0318
27	Enerji konusundaki sorunlarını çözememiş bir ülke ekonomik ve teknolojik konularda dışa bağımlı yaşamak zorundadır.	3,9267
28	Nükleer enerji ülkemizin enerji ihtiyacının giderilmesinde ideal bir çözüm yoludur.	3,3570
29	Nükleer teknolojiyi geliştirmek için yapılan çalışmalarda en fazla üzerinde durulan konu güvenlik konusudur. Böylece nükleer enerji günümüzde oldukça güvenli enerji üretim yollarından biri olmuştur.	2,7848
30	Nükleer teknolojinin beraberinde getirdiği risklerin yanında avantajları göz ardı edilemez.	3,7042

Tablo 2'de görüldüğü gibi lise öğrencilerinin nükleer enerji hakkındaki bilgi düzeylerini belirlemeyi amaçlayan 30 maddenin 3 'üne ortalama olarak üç puan altında, kalan 27 maddeye de üç ile dört arasında puan verilmiştir. Bu maddelerden en yüksek puan verilen maddeler 13. ve 27. maddeler iken, en düşük puanlama yapılan maddeler 1. ve 29. maddelerdir. Bu sonuçlara göre lise öğrencilerin söz konusu nükleer enerji hakkındaki bilgi düzeylerinin, genel olarak ortalamanın üstünde olduğu söylenebilir.

Tablo 3. Lise Öğrencilerinin Nükleer Enerji Hakkındaki Bilgi Düzeylerinin Cinsiyete Göre Mann-Whitney U Testi Sonuçları

Tablo 4'te lise öğrencilerin nükleer enerji hakkındaki bilgi düzeylerinin lise türü değişkenine göre farklılaşma durumu incelenmiştir. Ankette yer alan 23 ve 28. maddeler hariç 28 maddenin farklılaştığı görülmektedir. Maddeler incelendiğinde 26. madde haricinde tüm maddelerde fen lisesinde okuyan lise öğrencilerinin lehine olduğu görülmektedir. Maddelerin çoğunun fen lisesinde okuyan lise öğrencilerinin lehine olması, fen liselerindeki eğitim, öğretim ve öğrenci kalitesine bağlanabilir. 26. maddede ise meslek lisesinde ve genel lisede okuyan öğrencilerin lehine olduğu görülmektedir.

Tablo 5'te lise öğrencilerin nükleer enerji hakkındaki bilgi düzeylerinin sınıf değişkenine göre farklılaşma durumu incelenmiştir. Ankette 17 maddenin (2, 3, 4, 5, 6, 7, 8, 9, 11, 12, 13, 14, 16, 18, 21, 25, 27) farklılaştığı görülmektedir. Maddelerdeki anlamlı fark incelendiğinde lise öğrencilerin nükleer enerji hakkındaki bilgi düzeylerinin sınıf değişkenine göre genellikle üst sınıflar lehine olduğu görülmektedir.

SONUÇ

Lise öğrencilerin nükleer enerji hakkındaki bilgi düzeylerinin bazı değişkenler açısından farklılık gösterip göstermediğinin belirlenmesi amaçlanan araştırmanın bulguları genel olarak değerlendirildiğinde aşağıdaki sonuçlar elde edilmiştir:

- Lise öğrencilerin söz konusu nükleer enerji hakkındaki bilgi düzeylerinin, genel olarak ortalamanın üstünde olduğu söylenebilir.
- Lise Öğrencilerinin nükleer enerji hakkındaki bilgi düzeylerinin cinsiyete göre 5, 7, 11, 22, 23, 24, 25, 27 ve 30. maddelere verilen puan ortalamaları bakımından erkek ve kadın öğrenciler arasındaki farklılıklar istatistiksel olarak anlamlı bulunmuştur.
- Lise Öğrencilerin Nükleer Enerji Hakkındaki Bilgi Düzeylerinin Lise Türü Değişkenine Göre anlamlı farklılıklar bulunmuştur. Maddelerin çoğunun fen lisesinde okuyan lise öğrencilerinin lehine olması, fen liselerindeki eğitim, öğretim ve öğrenci kalitesine bağlanabilir. Sadece 26. maddede ise meslek lisesinde ve genel lisede okuyan öğrencilerin lehine olduğu görülmektedir. Bunun nedenleri araştırılmalıdır.
- Lise öğrencilerin nükleer enerji hakkındaki bilgi düzeylerinin sınıf değişkenine göre 2, 3, 4, 5, 6, 7, 8, 9, 11, 12, 13, 14, 16, 18, 21, 25, 27 maddelere verilen puan ortalamaları bakımından anlamlı farklılıklar bulunmuştur. Maddelerdeki anlamlı fark incelendiğinde lise öğrencilerin nükleer enerji hakkındaki bilgi düzeylerinin sınıf değişkenine göre genellikle üst sınıflar lehine olduğu görülmektedir.

ÖZET: Öğrencilerin cebiri anlamlı öğrenmeleri; farklı ortamlara bilgiyi transfer edebilmeleri, kavramlar arası ilişkileri oluşturabilmeleri, cebirsel düşünebilme ve muhakeme edebilmeleri, öğrenme alanları arasında etkileşim kurabilmeleri, çeşitli durumlardaki değişimi analiz edebilmeleri ve edindikleri kazanımları çeşitli temsil biçimlerine dönüştürebilmeleriyle yakından ilgilidir. Bu çalışmada, ilköğretim seviyesindeki öğrenciler için cebir öğretiminde çoklu temsil temelli öğretimin yeri ve önemi tartışılarak, yapılan çalışmalar ışığında bu durumun gerekçesi ortaya konulmaya çalışılmıştır.

Anahtar sözcükler: cebir, cebir öğretimi, çoklu temsil temelli öğretim.

ABSTRACT: Meaningful learning of algebra is closely associated to that students can transfer the information to different environments, create relationships between concepts, use algebraic thinking and reasoning, form an interaction between learning domains, analyze changes in the various situations and change the acquired gains into the various representations. In this study, the role and importance of the multiple representation based instruction in algebra teaching for primary school students were discussed and the reason of this situation was tried to reveal in the lights of studies.

Key words: algebraic, algebraic teaching, multiple representation based instruction

GİRİŞ

Cebir, örüntülerin, kuralların ve sembollerin bir dilidir (O'Bannon, Reed ve Jones, 2002'den akt. Dede ve Peker, 2007:36). O halde cebir, dünyanın daha iyi algılanabilmesi için bir araçtır. Bu sayede cebir, nicel ilişkilerin analizinde, problemlerin çözümünde, modelleme durumlarında, temsiller için gerekli araçları ve dili sağlama ile genellemeleri belirtme gibi daha birçok matematiksel çabaların temel omurgası olarak hizmet verir. Bundan dolayı yarının işgücü temsilcileri olarak tüm öğrenciler, cebirin önemini ve yararını bilmeleri ve anlamlı olarak kabul etmeleri gerekir (Romberg ve Spence, 1995). Matematik ve öğretimi düşünüldüğünde cebirin özel bir yeri vardır. Çünkü cebir öğrencilerin matematiği anlamasında, matematiksel düşünmesinde ve matematik okuryazarı olmalarında oldukça önemlidir. Cebir okul matematiğinde önemli bir konu olmasa da okul matematiğini bütünleştirme de önemli bir anahtar kavramdır (NCTM, 2000). Stacey ve MacGragor (1997)'e göre, cebir öğrencilere soyut düşünmenin ve mantıksal çıkarım yapmanın kapılarını aralar. Lacampagne (1995),"cebir, matematiğin dilidir. O, tam manasıyla öğrenilmesi durumunda, ileri matematiksel konular için kapılar açar. O, öğrenilememesi durumunda üniversite ve teknolojiye dayalı kariyer kapılarını kapatır..." demiştir (akt. Dede ve Argün, 2003:180). Cebir, matematiğin geniş bir kültürünü içine alan küçük bir kültürü oluşturur. Öğrenciler, eski kültürden yani aritmetikten bu yeni kültüre yani cebire geçerken zorlanmaktadır. Kısaca kendisini bu yabancı kültürün (cebir) içerisinde bulan öğrenciler "kültürel şok" olarak adlandırılabilecek bir ortama girmektedirler (Lee, 1996).

Cebir bilgileriyle ilgili olarak öğretme/öğrenme güçlüklerinin olduğu yüzlerce yıl öncesinde fark edilmeye başlanmış fakat sorunların ne olduğu anlaşılamamıştır. Bu bağlamda, günümüzde bile çok sayıda öğrenci temel cebir bilgilerini ve becerilerini edinerek gerekli yeterlikleri edinememektedir (Ersoy ve Erbaş, 2005:20). Ülkemiz Milli Eğitim Bakanlığı bünyesinde yer alan Eğitimi Araştırma ve Geliştirme Daire Başkanlığı [EARGED] 1996 yılında, içinde cebir müfredatında bulunduğu bir rapor hazırlamıştır. Hazırlanan raporda öğrencilerden bazılarının birinci derecen cebirsel sözel ifadeleri içeren problemleri aritmetik işlemler kullanarak çözebildiklerini ancak birinci dereceden denklemlerin çözümlerini bulamadıkları ve cebirsel ifadeleri anlamakta belirli zorluklara sahip oldukları ifade edilmiştir.

Cebir öğretimi ve öğrenimi ilkokulda aritmetikten başlayarak ortaokul da denklemler, lise de ise fonksiyon bilgilerine kadar geniş bir alanı içine alan yelpazeye yayılır. Bu durum okul öncesi dönemden 12. sınıfa kadar eğitim programında tüm öğrencilere sağlanması gereken cebir alt öğrenme alanlarına yönelik konuları kapsayan cebir standartları süreçlerinden oluşmaktadır. Bu süreç NCTM (2000:223)'e göre *-örüntü, bağıntı ve fonksiyonları anlama, cebirsel sembolleri kullanarak matematiksel durum ve yapıları çözümleme ve sunma, matematiksel modelleri nicel ilişkileri anlamak ve sunmak için kullanmak, çeşitli durumlarda değişimi analiz etme-* olarak kategorilere ayrılmıştır. Bu kategorilerde yer alan 6-7 ve 8. sınıflara ait konuların alt öğrenme alanları ise şu şekildedir:

- Çeşitli şekilleri grafik, tablo, kelime ve mümkünse sembolik kurallarla açıklama, çözümleme ve genelleme yapmak.
- Bağıntıların farklı gösterim biçimlerini karşılaştırma ve ilişkilendirme yapma.
- Doğrusal ya da doğrusal olmayan fonksiyonları belirleme ve tablo, grafik ya da denklem kullanarak karşılaştırma yapmak.
- Değişkenlerin farklı kullanımlarını anlamak için ilk kavramsal anlamayı geliştirmek.
- Doğru grafikleri ile sembolik ifadelerin kesişim ve eğimlerine dikkat ederek aralarındaki ilişkiyi keşfetmek.
- Doğrusal ilişkileri içeren problemler çözme ve ifade etmek için sembolik cebir kullanmak.
- Doğrusal denklemleri çözmek ve cebirsel olarak ifade etmek için eşdeğer formüller oluşturmak ve belirlemek.
- Grafikleri, tabloları veya denklemleri kullanarak içeriği verilen problemleri modellemek ve çözmek.
- Doğrusal ilişkilerde sayısal değişimleri analiz etmek içi grafikleri kullanmak (NCTM, 2000:223).

Cebir, matematik dersi içerisinde önemli bir yere sahip konu alanlarından biridir ve özellikle son 25 yıl içerisinde cebirin öğretimine/öğrenimine/anlamına ve gelişen teknolojinin cebir öğretiminin etkisine yönelik birçok araştırma/çalışma faaliyetleri yürütülmüş, hala da yürütülmektedir. Yapılan bu çalışmalar sonucunda birçok ülke cebir öğretimi konusunda öğretim programlarında köklü değişikliklere ve düzenlemelere gitmiştir. Ancak yapılan değişikliklere ve düzenlemelere rağmen birçok ülkede öğrencilerin cebiri öğrenmedehala sıkıntı yaşadıkları görülmektedir (Baki, 1998; Dede ve Argün, 2003; Kieran, 1992). Bu durumu Cockcroft (1982:60) şu şekilde özetlemiştir: Cebir, öğrenciler arasında olumsuz tutumların ve önemli bir kafa karışıklığının nedenidir. Her ne kadar cebiri öğrenme/öğretme konusunda çok sayıda çalışmalar/araştırmalar yapılmış olsada, özellikle öğretmenlerin cebiri nasıl öğretebilecekleri ile etkili cebir öğrenme ortamlarının sahip olması gereken unsurların (gelişmelerin) neler olabileceğine yönelik çalışmalar çok az sayıdır. Bu durumun okullarda cebir öğretiminin geleneksel yöntemlere bağlı kalınarak sürdürülmesine neden olduğu düşünülmektedir (Doerr, 2004). Dede, Yalın ve Argün (2002)'e göre öğrencilerin cebir öğretiminde zorlanmalarının nedenleri; değişkenlerin farklı kullanımlarını ve genelleme yapmadaki rollerini bilememe ile değişkenleri yorumlayamama ve işlem yapamama olarak belirtmektedir. Bu durum Thomas ve Tall (2001)'e göre ise öğrencilerin, cebir aşamasındaki manipülasyon işlemlerinde zayıf olmaları ve başaramamaları ile ilgili bir durumdur.

YÖNTEM

Problem Durumu

Yaşadığımız çağa olan katkısı hem geçmişi hem de geleceği inşa etmedeki rolleri düşünüldüğünde matematiği anlamak, onun dilini iyi bilmekten geçer. Çünkü sahip olduğu semboller, tablolar, grafikler, çizgiler, sütunlar ve rakamlar matematiği ortak bir alan haline getirmektedir. Bu sayede tüm insanlık bu eşsiz hazineden faydalanmakta, ortak duygu ve düşünceler etrafında aynı dili rahatlıkla konuşabilmektedir. Aynı dili konuşabilmenin verdiği ilhamla matematikte birçok yenilikçi anlayış ortaya atılmakta ve matematiği öğrenmedeki zorlukların üstesinden gelebilecek yenilikçi öğrenme yaklaşımlarına ağırlık verilmektedir. Varlığı çok eskilere dayanmasına rağmen öğrenme ortamlarındaki kullanımı sürekli olarak ihmal edilen çoklu temsil temelli öğretim uygulamaları da bu yaklaşımlardan bir tanesidir. Matematiksel kavramların öğrenciler tarafından kavramsal olarak anlaşılabilmesi için araştırmacıların önerdiği en etkili yöntemlerden biri, öğretimde çoklu temsillerin kullanılmasıdır (Sevimli, 2009:9). Nitekim dünyanın her yerinde evrensel bir değere sahip matematiksel dilin çoklu gösterimleri hem öğrenmeyi anlamlı hale getirmesi hem de yeni öğrenmelere kolaylık sağlaması açısından değerlidir (NCTM, 2000; 2008). Çoklu temsil yaklaşımı matematik öğretimi ve öğrenimini etkileyen önemli bir faktördür. Bu yaklaşım, matematiksel ilişki, kavram veya kuralın sözle, grafikle, tabloyla ya da cebirsel sembol olarak sunulması diye düşünülebilir (Durmuş ve Yaman, 2002).

Bu çalışmada, ilköğretim seviyesindeki öğrenciler için cebir öğretiminde çoklu temsil temelli öğretimin yeri ve önemi tartışılarak, yapılan çalışmalar ışığında bu durumun gerekçesi ortaya konulmaya çalışılmıştır.

Çoklu Temsil Temelli Öğretim

Çoklu temsilleri kullanmanın önemi öğrencilerin matematik eğitimi boyunca vurgulanmalıdır. Özellikle günümüzde teknolojik araçlar artık öğrencilerin çoklu temsilleri kullanabilmelerine yönelik daha fazla ve farklı deneyimler yaşamalarına fırsat tanımaktadır. Bugün birçok yazılım paketi öğrencilere bir işlevi eş zamanlı olarak tablo, grafik ve denklem şeklinde görüntülemelerine imkan sağlamaktadır (NCTM, 2000:69). Schultz ve Waters (2000)'e göre çoklu temsil yaklaşımı kavramsal anlamayı geliştirdiği gibi öğrencileri daha yüksek seviyede matematik yapmak için hazırlar. Gerçek dünya matematiğine başvurur. Etkili olarak daha fazla teknoloji kullanımını sağlar ve öğrencileri farklı öğrenme stillerine adapte eder.

Çoklu temsil temelli öğretime ve çoklu temsillerin matematik öğretimi üzerindeki etkilerine geçmeden önce "temsil" kavramını açıklamaya çalışalım. Türk Dil Kurumu (2013) temsili; "birinin veya bir topluluğunun adına davranmak" şeklinde tanımlamıştır. Matematikte ise temsil kavramı matematiğin dilini oluşturmaktadır. Birçok alanda olduğu gibi matematik dilinin de gösterim biçimleri ve karşılıkları mevcuttur. Bu biçimlere, matematik eğitim bilimcileri "temsil" veya "gösterim" demektedir (Özgün-Koca, 1998). Kaput (1987)'e göre temsil, soyut kavram ve sembollerle; gerçek dünya içindeki somut nesnelere dönüşecek şekilde modelleme işlemi yapma ya da nesneler ve matematiksel semboller arasındaki ilişkidir. Confrey ve Smith (1991) ise temsilleri; denklemler, tablolar ve grafikler gibi matematiksel fikirleri temsil eden araçlar olarak yorumlamıştır. Temsil kavramının hem anlaşılabilirliğini artırmak hem de varlığına işaret etmek için gelişi güzel değil de etkili bir biçimde sunulması gerekir. Temsillerin etkinliğini artırmak için ise (i) temsilin bilişsel ve anlamsal özelliği, (ii) üzerinde çalışılan etkinliğin gerektirdikleri, (iii) içeriğin yapısı (önceki bilgiler ve bilişsel yapılar) olmak üzere üç önemli noktaya dikkat edilmelidir (Cox, 1999:343). Alanyazı incelendiğinde temsillerin içsel temsil ve dışsal temsil olmak üzere iki kısma ayrıldığı görülmektedir. Alanyazı doğrultusunda içsel ve dışsal temsillerle ilgili yapılan tanımlamalar ise şu şekildedir:

İçsel Temsiller: İçsel semboller, sözel-sözdizimsel, imgesel (hayal gücüne dayanan) biçimsel ve duygusal simgeler olmak üzere çeşitli formlardan oluşmaktadır ve içsel temsilleri doğrudan gözlemek mümkün değildir. Öğrencilerin problem çözme ve matematiksel süreç becerilerine yönelik birey davranışlarının ortaya koymuş olduğu bilişsel konfigürasyonlar içsel temsilleri oluşturur (Goldin ve Janvier, 1998). Goldin (1998b) içsel temsilleri, (1) sözel, (2) imgesel, (3) biçimsel notasyonal, (4) planlama, izleme, uygulama ve kontrol, (5) duygusal temsil sistemleri olmak üzere beş kategori altında toplamıştır.

Dışsal temsiller: Öğrencilerin kişisel sembolleri, doğal dilleri, görsel imgeleri ve uzamsal temsilleri ile matematiksel semboller, yapılar, işaretler, karakterler ve imgeler dışsal temsilleri oluşturur (Goldin ve Shteingold, 2001; Goldin ve Janvier, 1998). Janvier, Bednarz ve Belanger (1987:) dışsal temsillerin sembol, şema, diyagram, işaretler gibi düzenlemelere karşılık geldiğini belirtmiştir. Bu durum ise Cai (2005)'e göre, görünen nesnelere ya da kayıtlara karşılık gelen bireyin gerçekle ilgili görüşünden oluşmaktadır.

Çoklu temsilleri içsel ve dışsal temsiller olarak sınıflandıran araştırmacıların yanında çoklu temsil kavramını farklı bakış açısı ile sınıflandıran veya modelleyen araştırmacılara da rastlamak mümkündür. Örneğin, Lesh, Post ve Behr (1987) tarafından yapılan sınıflandırmada temsiller; durağan resimler, somut nesneler, yazılı semboller, gerçek hayat durumları ve konuşma dilinden oluşmaktadır (akt. Kılıç, 2009). Kaput (1987) temsillere yönelik modelini *"temsil eden ve edilen dünya"*, *"temsil eden ve edilen dünyanın görüşleri"* ve *"iki dünya arasındaki ilişki"* olarak açıklamaktadır.

Cebir Öğretiminde Çoklu Temsil Temelli Öğretim

Öğrencilerin cebiri anlamlı öğrenmeleri; farklı ortamlara bilgiyi transfer edebilmeleri, kavramlar arası ilişkileri oluşturabilmeleri, cebirsel düşünebilme ve muhakeme edebilmeleri, öğrenme alanları arasında etkileşim kurabilmeleri, çeşitli durumlardaki değişimi analiz edebilmeleri ve edindikleri kazanımları çeşitli temsil biçimlerine dönüştürebilmeleriyle yakından ilgilidir. Cebir öğrenme sürecinde öğretim materyallerinin ve somut nesnelerin kullanılması, bilgisayar destekli öğrenme ortamlarının oluşturulması ve çoklu temsillerden yararlanılmasının öğrencilerin cebir kavramlarını anlama, birbiriyle ilişkilendirebilme ve yapılandırma süreçlerine olumlu yönde katkı sağlamaktadır (Çıkla, 2004:166). Öğrencilere cebir kavramının öğretilmesinde çoklu temsillerden yararlanmak, kavramlar arası ilişkilerin inşasında, yapılandırılmasında ve anlaşılmasında pozitif yönde yararları bulunmaktadır. Özellikle matematiksel kavramların anlaşılmasını kolaylaştırması, esnek yapısı sayesinde matematiksel iletişimi kolaylaştırması, öğrencileri düşünmeye yöneltmesi ve bu düşünceleri yorumlamaya olanak sağlaması açısından çoklu temsiller, hem cebirsel düşünmenin hem de cebirsel muhakemenin gelişimine katkısı büyüktür (Çıkla, 2004; McGowan ve Tall, 2001; NCTM, 2000).

Cebir öğretimi sırasında karşılaşılan zorlukların temelinde öğrencilerin cebirsel işlemlerle baş başa kalması ve cebirin bilinmeyenler, eşitlikler ve denklemler şeklinde algılanması yatmaktadır. Lesh, Post ve Behr (1987)'e göre öğrenciler cebir konusunda okulda sınırlı bir bakış açısı kazanmakta ve öğrencilere cebir hakkında "düşünmek" yerine eşitliklerde işlem yapma ve yazma öğretilmektedir (akt. Sert, 2007:20). Oysaki cebir düşünebilmeyi, görebilmeyi, analiz edebilmeyi ve dönüşüm yapabilmeyi gerektirir. Tam bu noktada çoklu temsiller cebirin farklı yönlerini öğrencilere hissettirebilir ve cebirin sadece işlemsel düzeyden oluşmadığını göstererek temsiller arası geçişlere imkân tanıyabilir. Janvier, Bednarz ve Belanger (1987)'e göre matematiğin doğal bir parçası olan çoklu temsillerin matematik öğretiminde kullanılması problem çözme sürecinde bazı zorlukları azaltmaya yardımcı olabilir. Birçok araştırmacı gibi Schneider (1995) de cebirde çoklu temsillerin önemine vurgu yapmış ve temsilleri öğrencilere, matematiğe yönelik kavramları kelimelerde sözel, tablolarda sayısal, grafiklerde görsel ve sembollerde cebirsel olarak göstermeye yarayan bir araç olduğunu belirtmiştir.

Çoklu temsillerin cebir kavramlarının öğretilmesinde kullanılması birçok karmaşık yapıların değişik yönlerini ortaya çıkarmada, görsellik katarak somutlaştırmada, değişik bakış açıları kazandırmada ve öğrencileri öğrenmeye cesaretlendirmede büyük öneme sahip olduğu belirtilmektedir. Cebir öğretimin ve öğrenimin başından itibaren çeşitli temsillerin sunulması gerekir. Bu gösterimlerin cebirsel ilişkilere ait problemlerin çözümünde kullanılması öğrencilere hem derin hem de zengin anlamalar inşa etmelerine fırsat sağlar (Yerushalmy ve Schwartz, 1993:41). Günümüzde birçok yurt dışı indeksli kaynaklarda çoklu gösterimler ayrı bir konu başlığı altında ele alınmakta ve özellikle cebirsel kavramların öğretimi sırasında sıkça kullanılmasının öğrencilerin anlamlı öğrenmelerine hizmet edeceği belirtilmektedir (NCTM, 2000).

SONUÇLAR

Çoklu temsil temelli öğretimin etkinliğini artırmak için öğretmenin matematiksel bilginin çeşitli temsilleri hakkında bilgi sahibi olması gerekir. Örneğin, "Elimdeki 6 balondan 2 tanesi patladı. Kaç balonum kaldı?" ifadesi sözel temsili, gerçekten 6 balondan 2'sinin patlatılması olayı gerçek hayat durumu, balon yerine kullanılacak 6 nesneden 2 tanesinin ayrılarak modellenmesi somut nesneler, çeşitli şekillerin ya da resimlerin kullanılması resimle temsil, 6-2=? eşitlik ya da denklemler de sembolle temsili ifade etmektedir (Olkun ve Toluk-Uçar, 2006:11). Örnekten de anlaşılacağı üzere matematiksel kavramların ve modellerin inşasında çoklu temsillere olan gereksinim kaçınılmazdır. Bundan dolayı çoklu temsillerin öğrenme ortamlarına aktarılmasında öğreticilere önemli görevler ve sorumluluklar düşmektedir. Sonuç olarak diyebiliriz ki; öğretmenler birden fazla çoklu temsilleri kullanmaya öğrencileri teşvik etmeli ve onlar tarafından taşınan temsillerin matematiksel anlayış düzeyini değerlendirmeli, çoklu temsilleri etkili bir şekilde kullanmalarına ve geliştirmelerine rehberlik etmelidir (NCTM, 2000:136). Sonuç olarak çoklu temsil kullanımının ve aralarındaki geçişlerin cebir öğrenimi üzerinde önemli etkileri bulunmaktadır. Çoklu temsil uygulamaları, öğrencilerin zihinsel aktivitelerini harekete geçirerek hem kavramsal hem de işlemsel anlamanın gelişimine yardımcı olmaktadır. Dolaysıyla cebir öğrenme alanlarına ait kavramların öğrencilere etkin bir şekilde sunulmasında farklı temsil türlerinin kullanılması nitelikli bir eğitim anlayışının gelişimine faydaları vardır.

NOT: Bu çalışma, 2013.KB.EĞT.009 nolu proje kapsamında Dokuz Eylül Üniversitesi Bilimsel Araştırma Projeleri Koordinasyon Birimi tarafından desteklenen, ikinci yazar danışmanlığında, birinci yazar tarafından hazırlanan "Çoklu Temsil Temelli Öğretimin Öğrencilerin Cebirsel Muhakeme Becerilerine, Cebirsel Düşünme Düzeylerine ve Matematiğe Yönelik Tutumlarına Etkisi Üzerine Bir İnceleme" isimli doktora çalışmasının bir bölümünü oluşturmaktadır.

ABSTRACT: The purpose of this paper was to propose and explore the methodical and multimedia environment required for the acquisition of ICT competences in the field of Logo programming of future compulsory education teachers. According to the student teachers' education curriculum, among other ICT competence requirements, the future teachers are to acquire relevant knowledge and skills in Logo programming. In order to determine the level of competence acquired, a methodical-qualitative evaluation of the environment, in the form of a web application, has been conducted by 50 students of The Faculty of Teacher Education of the University of Zagreb. Research results show that the environment contributes to the more effective acquisition of ICT competences of future teachers, especially in the field of computer programming.

Key words: ICT competences, methodical competences, compulsory education teachers, Logo programming, multimedia environment.

INTRODUCTION

In the development of the National Curriculum Framework for pre-school education and general compulsory (7-14 years of age) and secondary education, which focuses on student competences, Ministry of Science, Education and Sports of the Republic of Croatia, in accordance with European and other countries, has adopted eight key competences for lifelong learning: *Communication in the mother tongue, Communication in foreign languages, Mathematical competence and basic competences in science and technology, Digital competence, Learning to learn, Social and civic competences, Sense of initiative and entrepreneurship, Cultural awareness and expression* (Ministry of Science, Education and Sports of the Republic of Croatia, 2011, p. 17).

The Faculty of Teacher Education of the University of Zagreb is training future pre-school and compulsory education teachers for their successful personal and professional development as teacher, professional and technician in the educational system (Mâţă, 2011). Student teachers, which will take on a roll as teacher of Informatics, require specific ICT knowledge and skills for effective and efficient use of digital learning tools in their teaching practice. When they graduate they receive a diploma which defines their ICT competences:

1. Using different operative systems and information technnologies for educational purposes in compulsory education subjects; development and servicing of educational information systems and educational databases.
2. Development of various educational software with the help of information technology; ability to choose and use educational software.
3. Retrieval, processing and storage of computer data; text procesing, processing of sounds, drawings and images for educational purposes.
4. Using the Internet and network services: transmission, storage and authentication of various Internet information; using electronic mail.
5. Preparation and implementation of multimedia projects in Intranet/Internet environment (preparation of computer presentations, creation of web pages etc.); organization and participation in distance on-line communication and on-line learning.
6. Statistical analysis and presentation of data with the help of information technology.
7. Basic programming knowledge and skills.

The aforementioned ICT competences include methodical competences, with its didactical, pedagogical and psychological aspects, which define how student teachers use information technnologies for educational purposes.

To achieve "Basic programming" competence, National plan and program for compulsory education, strictly defines "Problem solving and programming" lesson unit, which is conducted either by Logo programming language or by procedural programming language, like Basic and Pascal (Ministry of Science, Education and Sports of the Republic of Croatia, 2006, p. 310). Since The Faculty of Teacher Education of the University of Zagreb did not have any courses that would cover "Basic programming" competence, in the year 2013, we have started a new course for learning and teaching Logo for the 5th year students of Informatics module. In the first part of the course the student teachers learned philosophy, concepts and structures of Logo by listening to series of lectures and writing program assignments through which they learned how to program. In the second part of the course, the student teachers learned methodology of teaching compulsory education pupils Logo, developing multimedia projects which integrate different ICT skills and knowledge. This year, we developed a new methodical and multimedia environment as a *prototype – working raw material* for the acquisition of methodical and ICT competences in Terrapin Logo programming language, one of the dialects of Logo. Design, development and student teachers' evaluation of the environment are presented in this paper.

Logo programming language

Logo belongs to the 3rd generation of programming languages and it was created in the year 1967 by Seymour Papert and Wally Feurzeig, at Bolt, Beranek and Newman in MIT. It represents constructivist learning environment and powerful cognitive tool that enables and enriches critical thinking, creativity and higher order learning in learners. Logo's "idealistic" idea was to use computer in education as a "tutee" (Reeves, 1998, p. 18), where learners develop problem-solving skills by teaching computer (writing programs) to perform different tasks (write text, draw pictures, create 2D and 3D geometrical forms, create animations etc.). In this way, learners could actively construct their own knowledge, and become designers, artists, organizers and presenters of that knowledge (Reeves, 1998). Today, in education, Logo is mostly known for its "*turtle graphics*" principle, where learners write program commands to move "graphical cursor" in the form of a turtle and draw line graphics on screen. There are many dialects of Logo and in Croatian schools three are frequently used: Terrapin Logo, MSW Logo and UCBLogo.

Design and Development of methodical and multimedia environment

Methodical and multimedia environment was designed by *Adobe Flash CS4 Professional* program for developing web pages and animations. Environment was created as a *prototype – working raw material* to serve as project assignments through which student teachers: redevelop and reevaluate environment by changing technical quality, usability and scenario (Crozat, Hu & Trigano, 1999); redesign and upgrade didactic and multimedia materials for their colleague students and compulsory education pupils.

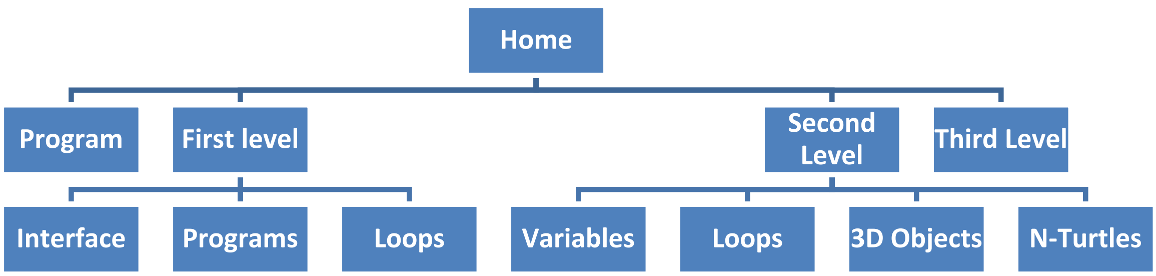

Figure 1. Navigational map of methodical and multimedia environment of Terrapin Logo language

Environment (Fig. 1) consists of five modules:

- **Home** – contains an archive of course material (PPT lecture presentations, student teachers' projects analysis, homework, competition assignments, list of Terrapin Logo commands),
- **Program** – contains basic information (text and video presentation) of Logo and its development,
- **First Level:**
    1. **Interface** – textual and graphical description of Terrapin Logo interface,

2. **Programs** – textual and graphical description and video tutorial on writing simple programs (procedures) with fixed parameters,
3. **Loops** – textual and graphical descriptions and video tutorials on writing programs (procedures) for drawing regular polygons, REPEAT loop, FOREACH loop.

- **Second Level:**
  1. **Variables** – textual and graphical description of definition of complex programs (procedures) with variables,
  2. **Loops** – textual and graphical descriptions and video tutorials for WHILE loop, FOR loop, MAKE command,
  3. **3D Objects** – textual and graphical descriptions and video tutorials on writing programs (procedures) for drawing three-dimensional objects: cube, rectangular cuboid and sphere.
- **Third Level** – contains additional textual and graphical descriptions and video material of Logo as constructivist learning environment and *task type-oriented* teaching method (Papp-Varga, Szlávi & Zsakó, 2008) for problem-solving process through explorative "real life" lessons as integration of different school subjects.

METHODS

Objective

The aim of this research was to evaluate methodical and multimedia quality of the environment for the acquisition of methodical and ICT competences in learning and teaching Terrapin Logo programming language for the 5th year student teachers of Informatics module.

Sample

Methodical-qualitative evaluation of the environment has been conducted by 50 students of The Faculty of Teacher Education of the University of Zagreb, 5th year, module Informatics. Students were from two generations: 2012/2103 and 2013/2014. Given that the number of men was insignificantly small compared to the number of women, the sample has not been divided on sub-samples.

Instrument

Questionnaire was designed to gather information from student teachers of Informatics about methodical-qualitative evaluation of the environment. The questionnaire consists of three parts. The first part consists of four questions (2, 3, 4) which students teachers had to rate on an 5-point Likert-type scale in order to evaluate methodical quality of the environment for acquiring programming knowledge and skills in Terrapin Logo programming language. The second part consists of three questions (1, 5, 6) which students teachers had to rate on an 5-point Likert-type scale in order to evaluate their methodical and ICT competences in teaching Terrapin Logo programming language. The third part consists of two questions (7, 8) where student teachers had to evaluate methodical appropriateness of the environment (5-point Likert-type scale) for compulsory education pupils of younger age (7-11) and methodical quality of the environment (writing personal opinions) from textual (theoretical), visual (graphical) and multimedia (video presentations) context.

Data collection

The methodical and multimedia environment was uploaded as a web application on the Department of Informatics' official web page. One part of the data was collected by paper-pencil testing and other part by electronic mail.

RESULTS AND DISCUSSION

Descriptive results

Table 1. Mean values and standard deviations in evaluation of methodical quality of the environment for acquiring programming knowledge and skills in Terrapin Logo

No.	Question	1	2	3	4	5	Mean	Std. Deviation
2a	Evaluate methodical quality of the environment in textual (theoretical) context	0	0	11	20	19	**4,16**	**3,25**
2b	Evaluate methodical quality of the environment in visual	0	1	4	13	32	**4,52**	**4,14**

	(graphical) context							
2c	Evaluate methodical quality of the environment in multimedia (video presentations) context	0	0	3	16	31	**4,56**	**4,12**
3	Evaluate "virtual teacher-guide" of the environment	0	0	8	20	22	**4,28**	**3,43**
4	Evaluate the environmental level of motivation for learning Terrapin Logo	0	1	6	30	13	**4,10**	**3,94**

In question number 2, student teachers evaluated the methodical quality of the environment in textual (theoretical) context, with a mean score of 4,16 (SD=3,25), which means that most of them (39) consider textual context to be of very good and excellent quality. Visual (graphical) context of the environment was evaluated with a mean score of 4,52 (SD=4,14) which means that most of the student teachers (45) consider visual context to be of an excellent quality. Multimedia (video presentations) context of the environment was evaluated with a mean score of 4,56 (SD=4,12) which means that almost all the student teachers (47) consider multimedia context to be of an excellent quality.

In question number 3, student teachers evaluated "virtual teacher-guide" of the environment with a mean score of 4,28 (SD=3,43), which means that most of them (42) consider "virtual teacher-guide" exceptionally successful guidance.

In question number 4, student teachers evaluated environmental level of motivation for learning Terrapin Logo with a mean score of 4,10 (SD=3,94), which means that most of them (43) consider environment highly motivational.

Table 2. Mean values and standard deviation in evaluation of methodical and ICT competences in teaching Terrapin Logo

No.	Question	1	2	3	4	5	Mean	Std. Deviation
1	Evaluate the environment level of contribution to the acquisition of your methodical competences	0	0	5	24	21	**4,32**	**3,68**
5	Evaluate readiness to use this environment in your future work with compulsory education pupils	0	0	3	26	21	**4,36**	**3,91**

In question number 1, student teachers evaluated the environment level of contribution to acquisition of their methodical competences for teaching Terrapin Logo with a mean score of 4,32 (SD=3,68), which means that most of them (45) consider that the environment can greatly contribute to the development of their competences.

In question number 5, student teachers evaluated their readiness to use the environment in their future work with compulsory education pupils with a mean score of 4,36 (SD=3,91), which means that most of them (47) are ready to and are interested in using the environment in their future work.

In question number 6, student teachers evaluated their ability to design and develop similar environment for teaching compulsory education pupils Logo, using programs for developing web pages and animations. 32% of them stated they had the necessary ICT competences to design and develop such environment. 20% of them stated they did not have the necessary ICT competences, and 48% of them were not confident in their abilities to perform such a task. Most of the student teachers who expressed their readiness and were confident in their abilities, belong to first generation 2012/2013 of Logo programming language course, which implies that the second generation feels less confident about taking on such a task, which can be changed with adequate teaching practice after they received basic training in this field.

In question number 7, student teachers evaluated methodical appropriateness of the environment for compulsory education pupils of younger age (7-11), with a mean score of 3,98 (SD=3,75), which means that most of them (41) consider the environment to be highly appropriate for that specific age. In this case, student teachers had only one complaint on the textual (theoretical) context of the environment, suggesting upgrading it with a more detailed explanation of certain abstract terms, like "interface", "loop", "variable", "procedure", etc.

Student teachers' suggestions

In question number 8, student teachers evaluated methodical quality of the environment in a textual (theoretical), visual (graphical) and multimedia context. With regard to the textual context, they consider textual information to be "*well synchronized with the multimedia elements (video presentations)*" and highlighted the necessity to "*adapt the textual information of the environment to compulsory education pupils of younger age (7-11) who would go through the learning process with the guidance of their teachers*". The reason for this is that the pupils of that age are not familiar with certain abstract terms, like “interface”, “loop”, “variable”, “procedure” etc.

With regard to the visual context, they consider visual (graphical) information to be “*sufficiently motivating for students, with good balance between visual and textual context and simple with concise information*”. They proposed “*increasing icon size in the entire environment and Home module and upgrading the environment with certain features that are visually attractive to children, like a picture or an animation of a turtle or some other character*”, which would play the role of a “virtual teacher-guide”. With regard to the design of the environment, they suggested redesigning it into a more adequate form by “*separating the content into two different modules: teacher module (guidelines and extra class materials) and pupil module (‘step-by-step’ guidelines in the learning process and detailed visual explanations of the program's interface)*”.

With regard to the multimedia, they “*liked very much “step-by-step” explanations of the learning material*” and highlighted the importance of the “video tutorial” approach in the learning process. They described video presentations as “*very clear and refreshing*” and suggested “*adding more presentations with more detailed animations of turtle movements, where each movement should be covered with the corresponding Logo command*”. They also suggested increasing video presentations for “*complex examples in programming assignments, where learners could watch the video and solve the problem at the same time*”. It would also facilitate learning process for learners with “*attention deficit disorder, who could stop the video at any point*” and recapitulate their knowledge. From the phonetic aspect, the student teachers highlighted “*insufficient quality of the speaker in terms of accent and intonation of individual words in sentences, which can make it difficult for learners to accept and memorize the content*”.

Although the student teachers were asked to evaluate these three aspects of the environment, they added one more on their own initiative – *Programming context*. They suggested certain improvements in explaining “*‘Tellall’ Logo command when working with multiple turtles and placing a separate link inside the environment for the explanation of program loops, which would be visible and accessible to the learners*”. For better understanding of certain program terms, like “*program loops and interior or exterior angles of regular polygons*”, they highlighted “*the necessity to translate them into Croatian language, what would help learners to understand its principles better*”.

CONCLUSION

Proposed methodical and multimedia environment presents an adequate tool for the acquisition of student teachers’ methodical and ICT competences in the field of constructivist programming language, Terrapin Logo. Student teachers of Informatics have evaluated the environment with very high grades from all of its aspects. They consider it to be something “*new in education and a very useful example of e-learning*”, which helps them to broaden their programming experience and upgrade their digital competence.

ORTAOKUL FEN VE TEKNOLOJİ DERSLERİNDE LABORATUVAR KULLANIMINA YÖNELİK ÖĞRENCİ GÖRÜŞLERİ

STUDENTS' VIEVS FOR THE USE OF LABORATORY IN SECONDARY SCHOOL SCIENCE AND TECHNOLOGY COURSE

Burcu ANILAN
Eskişehir Osmangazi Üniversitesi, Eğitim Fakültesi
burcud@ogu.edu.tr

ÖZET: Bu araştırmanın amacı ortaokul öğrencilerinin fen ve teknoloji derslerindeki laboratuvar kullanımına yönelik görüşlerini belirlemektir. Araştırma var olan durumu ortaya koymaya çalışan ve nitel yöntemle gerçekleştirilen betimsel bir araştırmadır. Araştırmanın verileri araştırmacı tarafından geliştirilen yarı yapılandırılmış görüşme formu ile toplanmıştır. Veriler Eskişehir il merkezindeki ortaokullarda öğenim gören 20 yedinci sınıf öğrencisinden toplanmıştır. Veriler betimsel analiz tekniği ile çözümlenmiştir. Çözümlemede görüşme soruları ana tema olarak alınmış ve beş tema oluşturulmuştur. Verilerin çözümlenmesi sonucunda: derslerde laboratuvar kullanıldığı ancak bunun yeterli olmadığı; derslerde yapılan deneylerin ilgi çekici bulunduğu ve tümüyle beklentileri karşılamadığı; gerek laboratuvar koşullarının iyi olmaması gerekse öğretmenlerin tutum ve davranışlarındaki olumsuzluğun öğrencilerin hem derse olan ilgilerini hem de ders içindeki tutum ve davranışlarını olumsuz etkilediği görülmüştür.

Anahtar sözcükler: ortaokul, fen ve teknoloji dersi, laboratuvar, öğrenci görüşü

ABSTRACT: The purpose of this study of secondary school students in science and technology courses for laboratory is to determine their opinions. The research is a descriptive research which is trying to put out the existing state and is carrying out with qualitative research. The research data were collected by semi-structured interview form developed by the researcher. Data were collected from 20 seventh graders who study in secondary schools in the city of Eskisehir. Data were analyzed by descriptive analysis technique. Interview questions are taken as the main theme in the analysis and five themes were created. As a result of the data analysis: laboratory is used in class, but it is not enough; in the course of the experiments found interesting and which is not fully meet our expectations; both laboratory conditions are not good enough and the negativity of behaviors and attitudes of teachers effect adversely students and their attitudes and behaviors in lessons as well as affect their attention to the course.

Key words: secondary school, science and technology courses, laboratory, students' view

GİRİŞ

İnsanoğlu var olduğu günden beri içinde yaşadığı çevreyi, doğayı ve evrende olup biten her şeyi hep merak etmiştir. İnsanoğlunun çevresine ve doğaya duyduğu bu merak ve araştırma isteği fen bilimlerinin doğmasına öncülük etmiştir. Fen bilimleri, canlı ve cansız varlıkları, bunlar arasındaki ilişkileri sebep-sonuç ilişkisi içinde incelemeye çalışan bir bilim dalıdır. Fen bilimleri doğanın gerçeklerini bulmaya, olayları açıklamaya, kontrol etmeye ve önceden kestirmeye çalışır. Bu nedenle fen bilimleri insanoğlunun doğayı ve kendini anlama çabalarının bir ürünüdür (Collette ve Chiapetta, 1989).

Doğa ve doğa olaylarını doğru değerlendirebilmek için iyi bir fen eğitimi almış olmak şarttır. Bu nedenle çocuklara feni sevdirebilmek, her gün karşılaştıkları birçok olayın fenin birer parçası olduğunu gösterebilmek için yaşadıkları çevreyi büyük bir fen laboratuvarı haline getirmek gerekmektedir. Laboratuvar, bazı kavram veya konuların öğrenciye bizzat yaptırarak, denenerek veya gösterilerek öğretildiği sınırları belirlenmiş ve kontrol edilebilir bir ortam (Güneş vd., 2013) olarak tanımlanabilir. Laboratuvar, bireylerin zihinsel becerilerini ve el becerilerini bir arada kullanmaları ve geliştirmeleri için onlara fırsatlar sunan bir yöntem olarak da bilinmektedir.

Laboratuvar yöntemi, fen bilimleri öğretiminde en sık başvurulan, etkili ve kalıcı öğrenmeyi sağlayan bir yöntemdir. Laboratuvar yöntemi, zihinsel etkinliklere önem veren, öğrencilerin bireysel ya da gruplar halinde çalışmasına olanak tanıyan, bireylerin el becerileri ve işlem yeteneklerinin gelişmesine yardım eden bir yöntemidir. Laboratuvar yöntemi ile öğrenciler bilgiyi, ezberlemeden, gözlem ve uygulama yaparak, bilgiyi kullanma yollarını öğrenerek ve öğrendiklerini fen kavramları ile ilişkilendirerek kazanırlar. Bu yolla bireyler fen kavramlarını anlama, akılda tutma, eleştirel düşünme, fikir üretme, yorumlama ve günlük yaşamla ilişkilendirmede başarılı olurlar (Kaya ve Böyük, 2011).

Hiç kuşkusuz etkili fen öğrenimi yaparak ve yaşayarak öğrenmeye dayanır. Bu da fen öğretiminin laboratuar ortamında yapılmasını gerektirmektedir. Fen öğretiminde laboratuvar uygulamalarının fene olan ilgiyi arttırdığı, fen konularının daha etkili ve kalıcı öğrenilmesine katkı sağladığı bilinmesine rağmen laboratuvar uygulamalarına çeşitli gerekçelerle gereken önemin verilmediği birçok araştırmayla ortaya konulmuştur (Akdeniz, 1997; Alpaut, 1993; Ayas, Çepni ve Akdeniz, 1994; Böyük, Demir ve Erol 2010; Çepni, Akdeniz ve Ayas, 1995; Değirmençay, 1999; Ekici, 1996; Ekici vd., 2002; Erten, 1991; Güneş vd., 2013; Gürdal,1991; Karaca, Uluçınar ve Cansaran, 2006; Kaya ve Böyük, 2011; Saka, 2002). Oysa fen öğretiminde laboratuvarda gerçekleştirilen deneysel uygulamalar öğrenciler için çok büyük önem taşımaktadır. Özellikle öğrencilerin anlamakta ve kavramakta güçlük çektiği fen konularını laboratuvar ortamında yaparak yaşayarak öğrenmelerinin daha kolay, etkili ve kalıcı olduğu alan yazında sıkça vurgulanmaktadır (Çallıca vd., 2001; Gürdal, 1997; Güneş vd., 2011; Güzel, 2001; Hofstein, 2004 Singer, Hilton ve Schweingruber, 2005). Ancak laboratuvar uygulamalarının istenen nitelikte gerçekleştirilmesi öğretmenlerin nitelikleri ve tutumlarıyla yakından ilişkilidir. Nitekim bu konuda yapılan araştırmalar laboratuvar uygulamalarının malzeme yetersizliği, ders saatinin az olması, ortamın uygun olmaması, laboratuvar konusunda yeterli bilgiye sahip olunmaması, laboratuvar ortamında kontrolünün zor olması gibi nedenlerle gereğince yapılamadığını göstermektedir (Kaya ve Böyük, 2011). Daha önceki çalışmalarda laboratuvar kullanımının değişik nedenlerle yeterince yapılmadığı saptanmış olmasına karşın (Güneş vd., 2013) bunun öğrencilerce nasıl görüldüğüne pek değinilmemiştir. Bu nedenle bu çalışmada ortaokul fen ve teknoloji derslerindeki laboratuvar kullanımının öğrenci görüşlerine göre belirlenmesi amaçlanmıştır.

YÖNTEM

Ortaokul öğrencilerinin fen ve teknoloji derslerindeki laboratuvar kullanımına yönelik görüşlerini belirlemeyi amaçlayan bu araştırmada nitel bir araştırmadır. Araştırma var olan durumu ortaya koymaya çalışan betimsel bir çalışmadır. Araştırmanın verileri araştırmacı tarafından hazırlanan yarı yapılandırılmış görüşme formu ile toplanmıştır. Görüşme sorularının kapsam geçerliği için uzman görüşlerine başvurulmuştur. Veriler Eskişehir il merkezindeki ortaokullarda öğenim gören 20 yedinci sınıf öğrencisinden toplanmıştır. Görüşmeler araştırmacı tarafından, gönüllülük esasına göre ve izin alınarak araştırmaya katılan öğrencilerin öğrenim gördüğü okullarda yapılmıştır. Görüşmeler öğrenci kantininde ve sınıflarda yapılmış ve ortalama 8-12 dakika sürmüştür. Ses kaydına alınan görüşmeler önce yazıya aktarılmış ve katılımcı teyidi sağlanmıştır. Bu amaçla görüşmecilerden rasgele seçilen 5 öğrenciyle kendileriyle yapılan görüşmenin dökümleri paylaşılmıştır. Elde edilen veriler betimsel analiz tekniğiyle çözümlenmiştir. Verilerin çözümlenmesinde görüşme soruları ana temalar olarak alınmıştır. Buna göre; Fen ve teknoloji derslerinde laboratuvar kullanımı; Laboratuvarda yapılan deneylerin ilgi çekiciliği; Fen ve teknoloji öğretmeni olunması durumunda laboratuvarda yapılacaklar; Laboratuvar uygulamalarını etkileyen faktörler ve Laboratuvar kavramına yüklenen anlam olmak üzere beş tema oluşmuştur.

Araştırmanın geçerliğini sağlamak için katılımcı ve meslektaş teyidi alınmış ve katılımcıların görüşlerinden doğrudan alıntılar yapılmıştır. Araştırma güvenirliği için ise Stemler'in (2001) tekrarlanabilirlik ya da tek kodlayıcı güvenirliği dediği yol izlenmiştir. Buna göre araştırmacı kodlamaları yaptıktan belli bir süre sonra aynı veri setini tekrar kodlamış ve kodlama güvenirliğine bakılmıştır. Bunun için Miles ve Huberman'ın (1994) güvenirlik formülü kullanılmıştır. Hesaplamalar sonucunda güvenirlik %95 çıkmış ve araştırma güvenilir kabul edilmiştir.

BULGULAR

Fen ve Teknoloji Derslerinde Laboratuvar Kullanımı

Araştırmaya katılan öğrencilerin Fen ve teknoloji dersinde laboratuvar kullanımına yönelik görüşleri farklılık göstermektedir. Öğrencilerin yarısı (n=10) derslerinde laboratuvar kullandıklarını ifade etmektedir. Öğrenciler laboratuvarda ders yapmanın öğrenmeyi kolaylaştırdığı ve kalıcılığı arttırdığı görüşündedirler. Konuyla ilgili bazı öğrenci ifadeleri şöyledir:
"Derslerimizde laboratuvarı kullanıyoruz. Dersi anlamamızı sağlıyor." (Ö5).
"… Çünkü deney yapmak için uygun bir yer. Bir şeyleri deneyerek insan daha iyi öğrenir" (Ö14).
"Evet, laboratuvarı kullanıyoruz. Ders kitabımızda deneyler oluyor. Deneyleri laboratuvarda yapıyoruz. Görerek konuları daha iyi anlıyoruz." (Ö16).

Öğrenci ifadelerinde de görüldüğü gibi öğrenciler yaparak yaşayarak öğrenmenin önemine dikkat çekmektedirler. Bu da aslında öğrenmenin bir yaşantı ürünü olduğuna yapılan bir vurgudur.

Araştırmaya katılan öğrencilerin bir kısmı ise (n=6) derslerini bazen laboratuvarda yaptıklarını belirtmişlerdir. Öğrenciler ifadelerinde özellikle öğretmen tutumlarına işaret etmektedirler. Derslerinin belli dönem laboratuvarda yapıldığını ancak bu dönemden sonra derslerin sınıfta yapılmaya başladığını vurgulamışlardır. Öğrencilerin bazı ifadeleri şöyledir:
"Birinci dönem kullanıyorduk ama ikinci dönem derslerimizin çoğunu sınıfımızda yapıyoruz. Birinci dönem laboratuvarda çeşitli deneyler yapıyorduk. Şimdi yapmıyoruz." (Ö12)
"Okulun ilk dönemi derslerimizin çoğu laboratuvarda geçiyordu. İkinci dönem hiç kullanmadık. Çünkü hocamız derslerin sınıfta daha iyi, akıcı ve etkili olduğunu söylüyor." (Ö13).
"Evet, laboratuvarı bir ara kullanıyorduk. Belli bir zaman sonra dersi sınıfta işlemeye başladık ve hala sınıfta işliyoruz." (Ö18).

Öğrencilerin ifadelerinden de anlaşılacağı üzere derslerin belli bir dönem laboratuvarda yapıldığı ve öğretmenin kararıyla derslerin sınıfta yapılmaya başlandığı görülmektedir. Ancak öğretmenin kararını etkileyen faktörlerin neler olduğu belli olmamakla birlikte, laboratuvarda sınıf kontrolünün zor olması öğretmenin böyle bir karar almasında etken olabilir.

Araştırmaya katılan 4 öğrenci ise (Ö9, Ö11, Ö19, Ö20) laboratuvarı hiç kullanmadıklarını belirtmiştir. Bu görüşte olan öğrenciler neden laboratuvarda ders yapmadıklarına ilişkin herhangi bir açıklamada bulunmadıklarından yorum yapmak güçtür. Ancak öğretmen kararının etkili olduğu düşünülebilir.

Laboratuvarda Yapılan Deneylerin İlgi Çekiciliği

Araştırmaya katılan öğrencilerden ikisi hariç (Ö19 ve Ö20) geri kalanın tamamı, fen ve teknoloji dersinde laboratuvarda yapılan ya da kendilerinin yaptıkları deneylerin ilgilerini çektiğini belirtmiştir. Deneyleri ilginç bulmadıklarını belirten iki öğrencinin de aslında ilginç bulmadığı deneyler değildir. Bu iki öğrenci deney yapamadıkları için deneyleri ilginç bulmadıklarını ifade etmektedir. Öğrenciler görüşlerini şu şekilde ifade etmişlerdir:
"Hayır, ilgimi çekmiyor. Laboratuvarda deney yapmıyoruz genellikle yazı yazıyoruz." (Ö19).
"Deney Yapmıyoruz ki ilgimizi çeksin." (Ö20).

Deneyleri ilgi çekici bulan öğrenciler ise daha fazla beklenti içindeler. Bu durum gerçekte öğrencilerin fene ilgi duyduklarını göstermekle birlikte içerik ya da içeriğin sunumuyla ilgili beklentilerinin de gerçekleşmediğinin bir göstergesi olabilir. Okulda, derslerde yapılan deneyleri ilginç bulmalarına rağmen daha fazla beklenti içinde olan öğrencilerin bazılarının ifadeleri de şöyledir:
"Deneyler ilgimi çekiyor. Ancak daha büyük riskli şeyler olsa daha iyi olurdu." (Ö1).
"Evet, çekiyor. Daha yeni deneylerin olmasını isterdim. Yeni araçlarla deneyleri yapmak isterdim." (Ö16).
"Evet çekiyor. Keşke daha büyük deneyler yapabilsek…" (Ö3).
Görüldüğü üzere öğrenciler fen derslerinde yapılan deneyleri ilginç bulmakla birlikte daha fazla beklenti içindeler.

Fen Ve Teknoloji Öğretmeni Olunması Durumunda Laboratuvarda Yapılacaklar

Araştırmaya katılan öğrenciler, eğer kendileri fen ve teknoloji öğretmeni olsalardı, laboratuvara daha fazla zaman ayıracaklarını, daha küçük gruplarla çalışacaklarını, öğrencilere daha fazla uygulama olanağı sağlayacaklarını, daha ilgi çekici ve günlük yaşamda işe yarayacak deneyler yaptıracaklarını ifade etmişlerdir. Öğrencilerden bazılarının ifadeleri şöyledir:
"Daha büyük laboratuvarda, daha küçük gruplar halinde yapardım." (Ö2).
"Daha çok saat ayırırdım. Eğer fen iki saat ise bir saatini, dört saat ise iki saatini laboratuvara ayırırdım." (Ö3).
"Öğrencilerin hepsine deney yaptırırdım. Daha ilgi çekici deneyler yapardım. Sabun üretimi gibi işe yarayacak deneyler yaptırırdım." (Ö6).
"Eğer fen ve teknoloji öğretmeni olsaydım; öğrencilerimin derste sıkılmasını önlemek için elimden geleni yapardım. Laboratuvarda ise grup çalışmalarını ve etkinlikleri oldukça sık yaparak çalışmalarımı geliştirirdim." (Ö13).
"Ders kitabındaki bütün deneyleri öğrencilerimle laboratuvarda yapardım. Öğrencilerim konuları daha iyi anlardı." (Ö16).

Öğrenci ifadelerinden de anlaşılacağı üzere öğrencilerin fen ve teknoloji derslerinde öğretmenlerden birtakım beklentileri vardır. Öğrenme öğretme sürecinden etkin verimin alınabilmesi için öğrencilerin belirtmiş olduğu bu örtük beklentilerin dikkate alınmasında yarar vardır.

Laboratuvar Uygulamalarını Etkileyen Faktörler

Öğrenciler laboratuvar çalışmalarını olumsuz etkileyen unsurlardan da söz etmişlerdir. Bunlar genellikle laboratuvar ortamıyla ve öğretmen davranışlarıyla ilişkilidir. Öğrenciler laboratuvardaki oturma düzeni ve oturma yerlerinden (Ö1, Ö3, Ö4); laboratuvar malzemelerin eski ve yetersiz oluşundan (Ö2, Ö9, Ö12); laboratuvarın çok gürültülü oluşundan (Ö6, Ö7, Ö11, Ö18); öğretmenin baskıcı ve deney malzemelerine zarar vermeleri endişesiyle malzemelere dokundurmamasından (Ö5, Ö6, Ö8, Ö12, Ö13, Ö14, Ö15, Ö17) sıkıntı duymaktadırlar. Öğrencilerin konuya ilişkin ifadelerinden bazıları şöyledir:
"Sandalye ve oturma kavgası yapılıyor." (Ö2).
"Sınıfın gürültülü olması, malzemeler kırılacak diye öğretmenin dokundurmaması." (Ö6).
"… bunlardan bazıları örneğin malzemelerimiz olmuyor ve hocamızın bazı baskıları bizi dersten soğutuyor ve ilgimizi dağıtıyor. Fen ve teknoloji dersinden soğuyoruz." (Ö12).
"Öğretmenimizin bize bazen hakaret etmesi." (Ö14).
"Olumsuz etkileyen durumlar var. Eşyalar cam deney tüpleri kırılırsa diye korkuyorum." (Ö15).
Görüldüğü gibi gerek laboratuvar koşullarının iyi olmaması gerekse öğretmenin tutum ve davranışlarındaki olumsuzluk öğrencilerin hem derse olan ilgilerini hem de ders içindeki tutum ve davranışlarını olumsuz etkilemektedir. Söz konusu olumsuzlukların giderilmesi etkili öğrenme-öğretme süreçlerinin ve ortamlarının oluşturulması bakımından oldukça önemlidir.

Laboratuvar Kavramına Yüklenen Anlam

Araştırmaya katılan öğrenciler için laboratuvar kavramı farklı çağrışımlar oluşturmakla birlikte bu kavramlar iki temel kategoride toplanmaktadır. Deneylerin yapıldığı ve çeşitli deney malzemelerinin bulunduğu mekan olarak laboratuvar (Ö1, Ö5, Ö6, Ö7, Ö8, Ö9, Ö11, Ö12, Ö14, Ö15, Ö19) ve yaparak yaşayarak öğrenmenin gerçekleştiği yer ve eğlenceli öğrenme ortamı olarak laboratuvar (Ö2, Ö3, Ö4, Ö10, Ö13, Ö16, Ö17, Ö18). Öğrencilerin bu konudaki görüşleri şöyledir:
"Deneylerin yapıldığı ve çeşitli malzemelerin bulunduğu yer." (Ö1).
"Yaşayarak öğrenilen yer." (Ö2)
"Dersin eğlenceli geçtiği, yaparak öğrendiğimiz bir ortam." (Ö4).
"Deneylerin yapıldığı uygun derslik." (Ö14).
"Dersin daha iyi anlaşıldığı ve deneyler yaparak işlendiği yer." (Ö17).
Yukarıdaki ifadelerden de anlaşıldığı üzere öğrenciler laboratuvara hem somut hem de soyut anlamlar yüklemektedir. Buna göre laboratuvar somut bakış açısıyla fiziki bir mekan, soyut bakış açısıyla da bir öğrenme biçimidir. Öğrencilerin laboratuvarı fiziki bir mekan olmanın dışında bir öğrenme yolu olarak görmeleri aslında dikkat çekicidir.

SONUÇ

Ortaokul öğrencilerinin fen ve teknoloji derslerindeki laboratuvar kullanımına yönelik görüşlerini belirlemeyi amaçlayan bu araştırmada aşağıdaki sonuçlara ulaşılmıştır.

1. Araştırmaya katılan öğrencilerin büyük çoğunluğu derslerinde laboratuvar kullandıklarını ifade etmekle birlikte bunun yeterli olmadığı görüşündedir.
2. Araştırmaya katılan öğrencilerin hemen hemen tamamı fen ve teknoloji dersinde laboratuvarda yapılan ya da kendilerinin yaptıkları deneylerin ilgilerini çektiği ancak tümüyle beklentilerini karşılamadığı düşüncesindedir.
3. Araştırmada yer alan öğrenciler, eğer kendileri fen ve teknoloji öğretmeni olsalar, laboratuvara daha fazla zaman ayıracaklar, daha küçük gruplarla çalışacaklar, öğrencilere daha fazla uygulama olanağı sunacaklar, daha ilgi çekici ve günlük yaşamda işe yarayacak deneyler yaptıracaklarını belirtmektedirler.
4. Gerek laboratuvar koşullarının iyi olmaması gerekse öğretmenlerin tutum ve davranışlarındaki olumsuzluk, öğrencilerin hem derse olan ilgilerini hem de ders içindeki tutum ve davranışlarını olumsuz etkilemektedir.
5. Araştırmaya katılan öğrenciler için laboratuvar kavramı, deneylerin yapıldığı ve çeşitli deney malzemelerinin bulunduğu mekan ve yaparak yaşayarak öğrenmenin gerçekleştiği eğlenceli öğrenme ortamı anlamına gelmektedir.

EXAMINATION OF ATTITUDES OF COMPULSORY EDUCATION TEACHERS IN THE REPUBLIC OF CROATIA TOWARD THE INTEGRATION OF ICT TECHNOLOGY IN DAILY WORK

Ljubica BAKIĆ-TOMIĆ
University NORTH Croatia
ljbakictomic@gmail.com

ABSTRACT: There are a number of measurement instruments in the field of education the aims of which are to measure various aspects of educational technology. The instrument that we used in this study is a survey of social and technical factors affecting teachers' use of technology designed by E. Papanastasiou and C. Angeli in 2008. The sample of this study included 413 teachers teaching in public elementary schools in Zagreb. The aim of this study is to show social and technical factors that play an important role in the successful integration of ICT in schools and to answer the question to what extent and how each of these factors affects the successful integration of ICT in schools.

Key words: Teachers' use of ICT, social factors affecting teachers' use of technology, technical factors affecting teachers' use of technology, public elementary schools in Zagreb

INTRODUCTION

ICT has changed the processes of teaching and learning and has had a significant impact on education. The use of ICT in education in a productive way can be influenced by many factors. One of these factors is teachers' attitudes toward the use of technology in the teaching and learning processes. Rogers` Innovation Decision Process Theory [21] states that an innovation's diffusion is a process which occurs over a time period through five stages: Knowledge, Persuasion, Decision, Implementation and Confirmation. Accordingly, ''the innovation-decision process is the process through which an individual (or other decision-making unit) moves (1) from initial knowledge about an innovation, (2) toward forming an attitude toward the innovation, (3) the decision of either adoption or rejection, (4) implementation and (5) confirmation of this decision'' [21]. This theory explains how teachers' attitudes have either a direct or an indirect influence on the teachers' use of technology in classrooms [20].

Zhao and Cziko are of the opinion that aspects of individual attitudes are the main factors influencing a teacher's use of ICT [27]. The teachers must be convinced that the use of technology can help achieve learning objectives but also lift the learning process to a higher level. Many studies confirmed that the important predictor of future ICT use were teachers' attitudes toward it ([25], [16], [1], [15], [3], [14], [26]). Researchers ([23],[4]) found that certain teachers' attitudes are obstructions to the successful integration of ICT in schools. According to Kersaint et al. [12] teachers who have positive attitudes toward technology feel more comfortable using it and usually incorporate it into their teaching. It was also found that personal characteristics such as age and teaching experience had a negative correlation with attitudes whereas gender and teaching methods were found to be insignificant as predictors of teachers' attitudes toward ICT [24].

Teachers' attitude toward technology can predict teacher and student technology use, but also the use of various instructional methods ($p < 0.05$). Sang et al. [25] focused on the impact of Chinese student teachers' gender, constructivist teaching beliefs, teaching self-efficacy, computer self-efficacy, and computer attitudes on their prospective ICT use. The findings confirmed the results of the study by Palak and Walls [16], that the strongest predictor of future ICT use were teachers' attitudes toward it.

One other aspect which has an influence on the adoption and use of ICT among teachers is computer self-efficacy [20], which refers to the ability of applying one's skills when using technology for broader tasks. A greater sense of computer self-efficacy has been shown to influence individuals' choice regarding computer usage and adoption in general. In the case of teachers, research suggests that a strong sense of computer self-efficacy among teachers affects how often and the way ICT is used in everyday instructional practice ([5],[6],[18]).

Research on teachers' use of ICT in education suggests that attitudes have either a direct or indirect influence on a teachers' use of technology in classrooms. The direct influence of attitudes can be categorised into two groups: attitudes toward technology ([8],[22]) and attitudes to ICT use in education ([2],[1],[9],[11],[19]). One example where attitudes have an indirect influence on ICT use in education is given in the research conducted by Cox, Preston and Cox [7] in which attitudes seemed to influence teachers' motivation to use ICT. According to the authors, motivation is a factor which exerts a direct influence. Teachers' attitude toward ICT will also promote innovative use of ICT [10]. Positive attitudes to ICT and its use in education are often considered as enabling factors and negative attitudes as disabling factors ([10],[13],[19]). There seems to be some lack in data however on the link between the attitude toward use of ICT in school and ICT in daily work. According to some researches there seems to be a link between the self-efficacy theory and attitudes to ICT use as positively related to experience. It can be concluded that familiarity with technology use makes people regard ICT use more positively, which also results in a greater feeling of self-efficacy [18].

METHODS

Research aim

The aim of this research was to examine attitudes of compulsory education teachers in the Republic of Croatia toward the daily use of ICT in teaching.

Research problem

- To determine descriptive values for teachers' attitudes toward the use of ICT in schools
- To determine if there's a correlation between teachers' working life and age, and their attitudes toward the use of ICT in schools
- To determine if there is any statistically significant difference between attitudes toward the use of ICT between teachers of compulsory education working in both lower and higher grades
- To determine correlation between weekly frequency of the ICT use in specific subjects and their attitude toward the ICT

Methodology and Sample

Research instrument for this study was a questionnaire by Papanastasiou and Angeli[17]. The questionnaire was a part of a large research project and authors constructed it in 2008 for the needs of their studies. It consisted of seven sections: 1) demographic information related to teachers, 2) knowledge of computer software, 3) frequency of software use for personal purpose, 4) frequency of software use for specific subjects in classroom practise, 5) teachers' attitudes toward ICT integration, 6) teachers' percieved self-confidence in the ICT use, 7) school climate and technical support. For the purpose of this research we only used section 1, section 3 and section 5. All other sections except for section one consisted of a Likert-type scale, with possible answers: 1-completely disagree, 2-disagree, 3-neutral, 4-agree, 5-completely agree.

This research was conducted in the Republic of Croatia in 2013. The survey was done in 18 compulsory education schools in Zagreb, the capital of Croatia, where ¼ of the global population of the Republic of Croatia lives.Thesample consisted on the whole of 413 compulsory education teachers. Compulsory education in the Republic of Croatia lasts 8 yearsand it is divided into two stages- lower grades (from first to fourth) and higher grades (from fifth to eighth). The sample consists of 91,3 % of female teachers and 8,7 % of male teachers. 47 % teachers in lower grades 43,1 % in higher grades and 9,9 % in both lower and higher grades. The average teachers' age in the sample was 40,65, ranging from 24 to 65. Teachers who were tested have an average of 14,9 years experience in teaching, ranging from less than one year (only 2,7 %) to 45 years.

RESULTS AND DISCUSSION

Table 1. Descriptive analysis of teachers' attitudes toward the use of ICT in schools (sample consisted of 410 teachers)

Attitudes	Mean	Std. Deviation	Std. Error Mean
AT1	4,338	0,889	0,046
AT2	1,813	1,073	0,055
AT3	2,521	1,269	0,066
AT4	1,741	1,067	0,055
AT5	3,923	1,053	0,054

AT6	1,573	0,961	0,049
AT7	4,488	0,814	0,042
AT8	3,739	1,161	0,060
AT9	3,667	1,142	0,059
AT10	3,334	1,231	0,064
AT11	2,192	1,243	0,064
AT12	4,083	0,900	0,046
AT13	3,109	1,168	0,060
AT14	3,912	1,027	0,053
AT15	2,083	1,089	0,056

LEGEND: AT 1- I feel comfortable with the idea of the computer as a tool in teaching and learning, AT 2 - the use of computers in teaching and learning stresses me out, AT 3 - if something goes wrong I will not know how to fix it, AT 4 - the idea of using a computer in teaching and learning makes me skeptical, AT5- the use of the computer as a learning tool excites me, AT6- the use of computers in teaching and learning scares me, AT7 - the computer is a valuable tool for teachers, AT8- the computer will change the way I teach, AT9- the computer will change the way students learn in my classes, AT10- I can do what the computer can do equally as well, AT11- The computer is not conducive to student learning because it is not easy to use, AT12- The computer helps students understand concepts in more effective ways, AT13- The computer helps students learn because it allows them to express their thinking in better and different ways, AT14- The computer helps teachers to teach in more effective ways, AT15- The computer is not conducive to good teaching because it creates technical problems.

Following statements reflect positive teachers' attitudes: teachers feel comfortable while using computers as tools in teaching and learning, the computer is a valuable tool in teaching, the computer helps students learn because it allows them to express their thinking in better and different ways and it helps students understand concepts in more effective ways (M>4). Statements that reflect negative teachers' attitudeshad a very low score, which inother words means that they are rarely present. Those statements that indicate moderately strong teachers' attitude toward the use of ICT are possibly showing that teachers are sceptical about computers helping students to understand concepts in a more effective way.This can point to moderately expressed belief that the computer will change the way students learn.

Table 2. Correlation between teachers' attitudes toward the ICT use and age and work life (N=410)

LEGEND: AT 1- I feel comfortable with the idea of the computer as a tool in teaching and learning, AT 2 - the use of computers in teaching and learning stresses me out, AT 3 - if something goes wrong I will not know how to fix it, AT 4 - the idea of using a computer in teaching and learning makes me skeptical, AT5- the use of the computer as a learning tool excites me, AT6- the use of computers in teaching and learning scares me, AT7 - the computer is a valuable tool for teachers, AT8- the computer will change the way I teach, AT9- the computer will change the way students learn in my classes, AT10- I can do what the computer can do equally as well, AT11- The computer is not conducive to student learning because it is not easy to use, AT12- The computer helps students understand concepts in more effective ways, AT13- The computer helps students learn because it allows them to express their thinking in better and different ways, AT14- The computer helps teachers to teach in more effective ways, AT15- The computer is not conducive to good teaching because it creates technical problems.

Out of 15 possible correlations between attitude toward the use of ICT and age, 10 are statistically significant. All statistically significant correlations are low and it can be generally said that age shows low correlation with attitudes toward the use of ICT in education. Principally older teachers show more negative attitudes toward the use of ICT in schools. Younger teachers seem to consider ICT as a valuable tool and that it can positively influence both teachers and pupils.

Similar correlations have been found in connection with work life. Out of 15 possible correlations between attitude and age, 10 are statistically significant. All statistically significant correlations have been found in the same attitude items, seem to be going in the same direction and show similar values, as it has been shown in the correlation analysis between the age and use of ICT in schools.

No statistically significant differences have been found in attitudes toward the use of ICT between higher and lower grades teachers, which leads us to the conclusion that all compulsory education teachers in Croatia have equally positive attitudes toward the use of ICT in schools (the results of the differences analysis have not been shown in tables because of the huge amount of data).

Table 3. Correlation between teachers' attitudes toward the ICT use and weekly frequency od ICT use for specific subjects (N=410)

LEGEND: AT 1- I feel comfortable with the idea of the computer as a tool in teaching and learning, AT 2 - the use of computers in teaching and learning stresses me out, AT 3 - if something goes wrong I will not know how to fix it, AT 4 - the idea of using a computer in teaching and learning makes me skeptical, AT5- the use of the computer as a learning tool excites me, AT6- the use of computers in teaching and learning scares me, AT7 - the computer is a valuable tool for teachers, AT8- the computer will change the way I teach, AT9- the computer will change the way students learn in my classes, AT10- I can do what the computer can do equally as well, AT11- The computer is not conducive to student learning because it is not easy to use, AT12- The computer helps students understand concepts in more effective ways, AT13- The computer helps students learn because it allows them to express their thinking in better and different ways, AT14- The computer helps teachers to teach in more effective ways, AT15- The computer is not conducive to good teaching because it creates technical problems.

Out of 15 possible correlations between attitudes toward the use of ICT in schools and the weekly frequency of ICT use for specific subjects, the largest number of statistically significant correlations have been found for Science (6), Maths (5), Art, Music and Physical Education (1), whereas no stastistically significant correlations between attitudes and the weekly frequency of ICT use for Croatian. All statistically significant correlations are very low and it can be generally said that the weekly frequency of ICT for different school subjects shows low correlation between attitudes and the use of ICT in school in the desirable direction (positive attitudes toward the use of ICT, Table 3).

Table 4.Correlation between teachers' attitudes toward the use of ICT and weekly frequency of common ICT software regardless of specific subjects (N=410)

LEGEND: AT 1- I feel comfortable with the idea of the computer as a tool in teaching and learning, AT 2 - the use of computers in teaching and learning stresses me out, AT 3 - if something goes wrong I will not know how to fix it, AT 4 - the idea of using a computer in teaching and learning makes me skeptical, AT5- the use of the computer as a learning tool excites me, AT6- the use of computers in teaching and learning scares me, AT7 - the computer is a valuable tool for teachers, AT8- the computer will change the way I teach, AT9- the computer will change the way students learn in my classes, AT10- I can do what the computer can do equally as well, AT11- The computer is not conducive to student learning because it is not easy to use, AT12- The computer helps students understand concepts in more effective ways, AT13- The computer helps students learn because it allows them to express their thinking in better and different ways, AT14- The computer helps teachers to teach in more effective ways, AT15- The computer is not conducive to good teaching because it creates technical problems.

The correlation between teachers' attitudes toward the application of ICT in school and the weekly use of common ICT programs is mostly statistically significant and positive, but low. In other words the more teachers use a certain type of ICT programs the more positive attitudes toward the ICT use in school they show and vice versa. The lowest correlation has been found between attitudes toward the use of computers in schools and the use of MS Access.

Table 5. Correlation between the teachers' attitudes toward the use of ICT in school and weekly frequency of specialised ICT programs use regardless of the school subject (N=410)

LEGEND: AT 1- I feel comfortable with the idea of the computer as a tool in teaching and learning, AT 2 - the use of computers in teaching and learning stresses me out, AT 3 - if something goes wrong I will not know how to fix it, AT 4 - the idea of using a computer in teaching and learning makes me skeptical, AT5- the use of the computer as a learning tool excites me, AT6- the use of computers in teaching and learning scares me, AT7 - the computer is a valuable tool for teachers, AT8- the computer will change the way I teach, AT9- the computer will change the way students learn in my classes, AT10- I can do what the computer can do equally as well, AT11- The computer is not conducive to student learning because it is not easy to use, AT12- The computer helps students understand concepts in more effective ways, AT13- The computer helps students learn because it allows them to express their thinking in better and different ways, AT14- The computer helps teachers to teach in more effective ways, AT15- The computer is not conducive to good teaching because it creates technical problems.

The correlation between teachers' general attitudes toward the use of ICT and the weekly frequency of specialised software use has been shown to be statistically less significant than between general attitudes and common software use. Statistically significant correlations are low to very low and moving in the expected direction: the more often teachers use a certain kind of specialised programs the more positive attitudes toward the ICT use he seems to show and vice versa. Correlation has been found most often between teachers' attitude toward the use of ICT and Photoshop, whereas it has been found less often between attitudes and the use of educational CDs and educational games. The largest number of statistically significant correlations has been found for the following attitude item: *the computer helps students learn because it allows them to express their thinking in better and different ways*.

CONCLUSION

Croatian teachers have mostly positive attitudes toward the use of ICT in schools. Younger teachers and those with shorter work life seem to consider ICT as a valuable tool and that it can positively influence both teachers and pupils. No statistically significant correlation between the attitudes of lower and higher grades teachers, which leads us to the conclusion that all compulsory education teachers in Croatia have similar positive attitudes toward the use of ICT in compulsory education. Weekly frequency of ICT programs use for different school subjects show low correlation with attitudes toward ICT use in a desirable direction (positive attitudes toward the use of ICT). The more often teachers use a certain kind of ICT programs the more positive attitudes toward the use of ICT in school and vice versa. Finally it has been shown that more frequent use of certain kind of specialised ICT programs is connected with more positive attitudes toward the use of ICT in schools, although this tendency is less pronounced with regard to specialised software than with regard to common software.

ÖZET: Bu çalışmanın amacı, fizik öğretmen adaylarının bazı elektrik kavramları konusunda sahip oldukları bilgilerin, kullanılan semiyotik kaynaklar (jest, mimik, söz) üzerindeki yansımalarını belirlemektir. Araştırma, nitel araştırma modellerinden durum çalışmasına örnektir. Çalışma grubu, ölçüt örnekleme yöntemiyle seçilmiş, beş fizik öğretmen adayından oluşmaktadır. Veriler, gözlem ve görüşme kayıtlarıyla toplanmış ve betimsel analize göre değerlendirilmiştir. Araştırma sürecinde, belirtke tablosu oluşturularak on kavram seçilmiş ve araştırmanın geçerlik ve güvenirliği için gerekli koşullar sağlanmıştır. Araştırma kapsamındaki kamera kayıtları ve gözlem analizlerine göre, öğretmen adayların çoğunlukla vurgu ve işaret jestlerine başvurdukları gözlenmiştir. Yaptıkları metaforik jestlerle ise soyut düşüncelerini açığa çıkarmışlardır. Örneğin, ellerini yuvarlak yaparak yükün küresel olduğunu belirtmişler, pozitif ve negatif yükleri modellerken ise farklı göstergeler kullanmışlardır. Yükü fazla olan cismi, az olana göre daha yukarıda tutarak sayı doğrusunun artan yönüne göre modelleme yapmışlardır. Araştırmada, konuşmalara eşlik eden semiyotik kaynakların anlam oluşturma ve düşünceyi aktarma sürecinin önemli bir unsuru olduğu gözlenmiştir. Çalışmanın analiz süreci devam etmektedir.

Anahtar sözcükler: fizik, eğitim, semiyotik, jest, elektrik

ABSTRACT: The aim of this study, prospective physics teachers who use semiotics resources determine in physics education how to use this approach. The method of this study is qualitative research. The study group selected by the Criteria Sampling Method, consists of five prospective physics teachers. The data gathered through observation and interview records and datas was evaluated according to descriptive analysis. In the research process, ten concepts was chosen with creating a table of specifications. Analysis according to the camera records, observations, deictic and beat gestures has been observed mostly by the prospective physics teachers. Metaphoric gestures have revealed the thoughts which is abstract. For example, they have said that electric charges have spherical shape. When modelling positive and negative charges, they use different indicators. In this study, we observed that gesture is an important element of the process of creating the meaning. The study is continuing the process of analysis.

Key words: physics, education, semiotic, gesture, electricity

GİRİŞ

Sözel göstergelerin kullanımı semiyotiğin sadece bir dalıdır. Bu anlamda semiyotik, sözsüz iletişimi içine alan daha genel bir kavramdır. Göstergeler, kelimeler, resimler, grafikler, beden dili, trafik işaretleri vb. ni içerir. Jestlerin, semiyotik anlamda önemi çok büyüktür. Çünkü beden dilinin çoğunluğunu jestler oluşturur. Bu nedenle jestleri, sözsüz göstergeler başlığı altına alabiliriz.

Kendon'a göre sözel olmayan iletişimin bir parçası olan jestler konuşmanın kendisinden ayrı tutulamazlar (Kendon, 2000). McNeill jestleri insanlar konuştukları zaman ortaya çıkan el kol hareketleri olarak tanımlamıştır (McNeill, 1992, s. 1). Bu yaklaşımda jestler konuşmadan ayrı olarak görülmüştür ama konuşma diliyle ilişkilendirilmiştir. Bu tanım çok geniş kapsamlı bir tanımdır. Hangi tanım alınırsa alınsın jestler biraz belirsiz bir kavramdır ve neyin jest olduğu ve neyin jest olmadığı arasında kesin bir çizgi yoktur.

Fizik öğrenme ortamlarında jestler el ve kolların hareketi olarak görülebilir ama bu hareketler, yazı yazmak, bir araç kullanmak gibi bir eylemin parçaları olmaktan ziyade öğretmenin ve öğrencilerin fiziksel etkinliklerde kullandıkları hareketler olmalıdır.

Son zamanlarda çeşitli araştırmalar jestlerin sadece iletişimde önemli olmadığını aynı zamanda bilişsel olarak da önemli olduğunu göstermektedirler. Yine Sabena (2008) bir çalışmasında, Vygotsky'nin (1934/1986, s.218) düşünce sadece kelimelerle ifade edilmez, onlarla var olur varsayımıyla paralel olarak McNeill'in (1992) jestlerin düşünceyi sadece yansıtmadıklarını aynı zamanda düşüncenin üzerinde etkiye sahip olduklarını belirttiğini ifade etmiştir.

McNeill (1992) jestleri, dört başlık altında toplamıştır. Bunlar; ikonik, metaforik, işaret ve vurgu jestleridir.

İkonik Jestler (Iconic Gestures)

Konuşmanın anlamsal içeriği ile benzer nitelik taşır.

Metaforik Jestler (Metaphoric Gestures)

Ekman ve Friesen'e (1969) göre metaforik jestler ikonik jestlere benzerdirler yalnız metaforik jestler resimseldirler. Fakat burada resimsel içerik somut bir nesne veya hareketten ziyade bir fikri sunar. O halde metaforik bir jest soyut bir kavramın görselleştirilmesini içerir.

İşaret Jestleri (Deictic Gesture)

Bu jestler işaretleme jestleridir. Somut dünyadaki olayları, nesneleri, yerleri gösterir (Radford, Schubring ve Seeger, 2008). İşaret jestleri bedenin bütün uzuvlarıyla gerçekleştirilebilmesine rağmen genellikle işaret parmağı kullanılmaktadır. Bu durumda gerçekte işaret edilen bir nesne yoktur.

Sabena (2008), matematik eğitiminde jestler üzerine yaptığı çalışmasında McNeill'in bunu şu şekilde ifade ettiğini söyler:

"Konuşmacı bir boşluğu işaret eder ama aslında o boşluk boş değildir. Önemli kavramlarla doludur. Bu tip soyut gösterimler, kavramların soyut olarak verildiği boşluğun kullanımını vurgular." (McNeill, 1992, s. 173).

Vurgu Jestleri (Beat Gesture)

Konuşmanın etkisi ile ellerin hareket etmesidir. Konuşmacı jeste eşlik eden cümle veya kelimeye vurgu yapar.

Bir jest birden fazla anlam taşıyabilir. İki jest birlikte kullanılmasıyla daha büyük kompleks hiyerarşik olarak daha ileri bir anlam oluşturmazlar ama dilde bu olur.

Bu bilgilerden hareketle, öğrenme ortamında öğrencilerin bir fiziksel kavramı anlatırken kullandıkları jestlerden anlatmak istedikleri kavram hakkındaki düşüncelerini anlamak mümkündür. Konuşma esnasında yapılan jestlerden, o kavram hakkındaki yanlış anlamaları, kavram kargaşaları ve hatta ayrıntılı görüşmelerle kavram yanılgıları ortaya çıkarılabilir. Fizik eğitiminde semiyotiğin uygulamasının araştırmacılar, öğretmenler ve öğrenciler arasında ortak, farklı ve "SOMUT" bir dil oluşturmaya yardımcı olabileceği de önerilmektedir (Pantidos, Valakas, Vitoratos ve Ravanis, 2008).

Yapılan literatür taramasında, özellikle matematik eğitiminde semiyotik perspektifin kullanıldığı görülmüştür. Ancak Türkiye'de fizik eğitiminde bu içerikte yapılmış bir çalışmaya rastlanmamıştır. Bu alanda yapılan çalışmaların az sayıda olması, semiyotik konusunda çalışma yapılmasını gerekli kılmaktadır.

Bu çerçevede araştırmanın ana hedefi, fizik eğitiminde semiyotik yaklaşımın nasıl kullanıldığını belirlemektir. Bu hedef doğrultusunda, öğrencilerin kullandığı jestlerin Mcneill'in sınıflandırmasına göre hangi jest grubuna girdiği belirlenmeye çalışılmış ve kullanılan jestlerin analizi yapılmaya çalışılmıştır.

Bu araştırmanın en temel amacı, fizik öğretmen adaylarının bazı elektrik kavramları konusunda sahip oldukları bilgilerin, öğretmen adaylarının kullandıkları semiyotik kaynaklar üzerindeki yansımalarını belirlemektir**.** . Bu kapsamda, öğretmen adaylarının bazı temel kavramları semiyotik kaynaklarla ilişkilendirerek nasıl açıkladıkları, sıklıkla kullanılan semiyotik kaynakların neler olduğu, kullandıkları jestlerin McNeill'in sınıflandırmasına göre hangi jest grubuna girdiği incelenmiştir.

YÖNTEM

Araştırmanın Modeli

Araştırma, nitel araştırma modellerinden durum (örnek olay) çalışmasına örnektir. Durum çalışmaları, bilimsel sorulara cevap aramada kullanılan ayırt edici bir yaklaşım olarak görülmektedir. McMillan (2000), durum çalışmalarını bir ya da daha fazla olayın, ortamın, programın, sosyal grubun ya da diğer birbirine bağlı sistemlerin derinlemesine incelendiği yöntem olarak tanımlamaktadır.

Araştırmalarda durum çalışmaları, a)bir olayı meydana getiren ayrıntıları tanımlamak ve görmek, b) bir olaya ilişkin olası açıklamaları geliştirmek, c)bir olayı değerlendirmek amacı ile kullanılır (Gall, Borg ve Gall, 1996). Bu yüzden bu modelin çalışmaya en uygun model olduğu düşünülmektedir.

Çalışma Grubu

Çalışma grubu, Gazi Üniversitesi Gazi Eğitim Fakültesi'nde öğrenim gören ve temel elektrik dersini almış beş fizik öğretmen adayından oluşturulmuştur. Tüm adaylar; A1, A2, A3, A4, A5 olarak kodlanmıştır.

Veri Toplama Araçları

Görüşmeler başlamadan önce, temel elektrik konuları ile ilgili bir belirtke tablosu hazırlanmıştır. Araştırmaya dahil edilecek kavramlar için belirtke tablosunda yer verilen kriterler; kavramın öğrenciler için kolay anlaşılabilir olması, kavramların soyut olması, kavramların somutlaştırılacak göstergeler kullanmaya elverişli olması ve aynı kavramın farklı göstergelerle ifade edilmesidir.

Araştırma sürecinde belirlenen kriterlere göre on kavram seçilmiş ve araştırmanın geçerlik ve güvenirliği için gerekli koşullar sağlanmıştır. Seçilen kavramlar; elektrik yüklerinin özellikleri, statik elektrik, iletken ve yalıtkanlar, elektrik alan ve elektrik alan çizgileri, elektriksel potansiyel ve potansiyel fark, voltmetre, elektromotor kuvveti, elektrik akımı ve ampermetre, direnç, kondansatör ve sığa'dır.

Bu çalışmada kullanılan veri toplama araçları, kamera kayıtları ve gözlemlerdir. Fizik öğretmen adaylarının temel elektrik konularında sahip oldukları bilgileri, hangi semiyotik kaynaklar ile ifade ettiğini tespit edebilmek için kamera kayıtları kullanılmıştır. Beş fizik öğretmen adayı ile ayrı ayrı yapılan görüşmeler kayıt altına alınmıştır.

Verilerin Toplanması

Veriler, gözlem ve kamera kayıtları ile toplanmıştır. Araştırma, yüksek lisans tez çalışması kapsamındadır. Görüşmelere yeni başlanmıştır ve sadece elektrik yükleri ve statik elektrik kavramları ile ilgili görüşmeler yapılabilmiştir. Araştırmanın uygulama ve analiz süreçleri devam etmektedir.

Verilerin Çözümlenmesi ve Yorumlanması

Veriler, uzman yardımı alarak araştırmacı tarafından, betimsel analiz yapılarak çözümlenmiştir.

Kamera kayıtlarında dikkat ettiğimiz nokta, fizik öğretmen adaylarının bazı elektrik kavramları konusunda sahip oldukları bilgileri, uygun semiyotik kaynaklar ile ifade edip edemediğidir. Görüşme sırasında, kullandıkları semiyotik kaynağa bağlı olarak sorulan ek sorularla, fizik öğretmen adaylarının hangi noktalarda doğru hangi noktalarda yanlış düşündükleri belirlenmeye çalışılmıştır.

Çalışmamız nitel bir çalışma olduğundan, doğrudan bir genelleme yapmak mümkün olmayacaktır. Bu nedenle, sonuçların ne ölçüde genellenebileceğine dair yorumlar yapılacaktır. Analizler, ham verilerin bir uzman tarafından incelenmesi ile teyit edilecektir.

BULGULAR

Yapılan kamera kayıtları ve gözlem analizlerine göre, öğretmen adayların çoğunlukla vurgu ve işaret jestlerine başvurdukları gözlenmiştir. Yaptıkları metaforik jestlerle ise soyut düşüncelerini açığa çıkarmışlardır. Aşağıda, kamera kayıtlarından iki alıntıya yer verilmiştir.

> Araştırmacı: Yük denildiği zaman zihninizde oluşan yapıyı tanımlayabilir misiniz?
>
> A1: Hocam, yük böyle noktasal değil mi? Yani, aklıma direk bir nokta geliyor.
>
> Araştırmacı: Noktasal derken çok küçük olduğunu belirtmek için mi noktasal diyorsun yoksa başka bir sebebi mi var?
>
> A1: Genelde daire, çember en mükemmel şekil oluyor ya, yük ve atom en mükemmele yakın şekillerdir, aklıma hep öyle geliyor.

A1 ile kodlanmış fizik öğretmen adayı, yükü tanımlarken yükün noktasal olduğunu söylemiş ve bir taraftan da işaret parmağı ile havaya bir nokta koymuştur. En mükemmel şekle sahip olduğu için yükün küresel olması gerektiğini belirtmiştir. Bu konuşmaya, işaret ve metaforik jestler eşlik etmiştir. İncelenen kayıtlara göre, diğer öğretmen adaylarının da yük algısının küresel olduğu sonucuna varılmıştır.

> Araştırmacı: Sizin de söylediğiniz gibi iki çeşit elektrik yükü bulunmaktadır. Pozitif ve negatif. Bir şeyin pozitif veya negatif yüklü olması hakkındaki algınız nedir?
>
> A2: Ya mesela benim aklıma şey deneyi geliyor. Bir altın plakaya alfa parçacığı gönderiliyor. Hani orda sapma miktarına bakarak pozitif mi negatif mi olduğu belirleniyor.
>
> Araştırmacı: Yani ikisi farklı mıdır? Pozitif ve negatif yükü somutlaştırabilir misin?
>
> A2: Bu pozitif bu negatif.
>
> Araştırmacı: Negatife pozitif diyemez miydik?
>
> A2: O zaman pozitife de negatif derdik.

Pozitif ve negatif yükler modellenirken farklı göstergeler kullanılmıştır. A2 ile kodlanan fizik öğretmen adayı, elleriyle iki yuvarlak oluşturmuştur. Pozitif yükü gösterirken sol bileği yukarı bakarken, negatif yükü gösterirken sağ bileği aşağıya yönelmiştir. Sözlerine, metaforik jestler eşlik etmiştir. Ayrıca, konuşması boyunca, elleriyle vurgu jestleri yapmıştır. Pozitif ve negatif isimlendirmesinin de bir kabulden ibaret olduğunu belirtmiştir.

Ayrıca, yükü fazla olan cismi, az olana göre daha yukarıda tutarak sayı doğrusunun artan yönüne göre modelleme yapmışlardır.

Araştırmada, konuşmalara eşlik eden jestlerin anlam oluşturma ve düşünceyi aktarma sürecinin önemli bir unsuru olduğu gözlenmiştir.

SONUÇ

Bu araştırmada, Gazi Üniversitesi Gazi Eğitim Fakültesi'nde öğrenim gören ve elektrik ve manyetizma dersini almış beş fizik öğretmen adayı ile bazı elektrik kavramları ile ilgili çalışmalar yapılmıştır. Bu çalışmada, elektrik yüklerinin özellikleri, statik elektrik, iletken ve yalıtkanlar, elektrik alan ve elektrik alan çizgileri, elektriksel potansiyel ve potansiyel fark, voltmetre, elektromotor kuvveti, elektrik akımı ve ampermetre, direnç, kondansatör ve sığa kavramlarının analizi yapılarak araştırma sorularına cevap aranmıştır.

Görüşmeler, kamera ile kayıt altına alınmıştır. Fizik öğretmen adaylarının bu temel kavramları semiyotik kaynaklarla ilişkilendirerek nasıl açıkladıkları, sıklıkla kullanılan semiyotik kaynakların neler olduğu incelenmiş, kullandıkları jestler McNeill' in sınıflandırmasına göre sınıflandırılmaya çalışılmıştır.

Fizik öğretmen adaylarının görüşlerini belirtirken jestler yaptıkları ve bu jestlerin düşüncelerinin oluşumuna ve düşüncelerini ifade etmelerine yardımcı olduğu gözlenmiştir. Öğretmen adaylarının sıklıkla kullandığı jestler, işaret ve vurgu jestleri olmuştur. Kavramları açıklarken, sözle ifade edemediği bazı durumları anlatırken vurgu jestleri ön plana çıkmıştır.

Zihinlerindeki soyut kavramları somutlaştırırken metaforik jestleri kullanmışlardır. Örneğin, ellerini yuvarlak yaparak yükün küresel olduğunu belirtmişler, pozitif ve negatif yükleri modellerken ise ikisi için farklı göstergeler kullanarak ikisinin farklı olduğunu anlatmışlardır. Yükü fazla olan cismi az olana göre daha yukarıda tutarak sayı doğrusunun artan yönüne göre modelleme yapmışlardır. Konuşmalara eşlik eden jestlerin anlam oluşturma ve düşünceleri aktarma sürecinin önemli bir unsuru olduğu gözlenmiştir.

ÖNERİLER

Fizikteki diğer kavramlarla ilgili ortaya çıkan jestler tespit edilebilir.

Çalışma daha geniş öğrenci kitlesine uygulanabilir.

Sadece öğrencilerin değil öğretmenlerin de sürece katıldığı bir çalışma yapılabilir.

Çalışma, daha da geliştirilerek öğretmen-öğrenci arasında ortak bir dil geliştirilebilir. Öğrencilerin kavramlara ait yaptıkları jestler sınıflandırılarak çoğunluğun tercih ettiği jest ile o kavram eşleştirilebilir.

Bu araştırmanın amacı, öğretmen adaylarının öğretim teknolojileri ve materyal tasarımı (ÖTMT) dersine yönelik tutumlarını ortaya koymak ve bu tutumları ile öğretmen öz-yeterlilik algıları arasındaki ilişkiyi incelemektir. Araştırma betimsel türde tarama modeline göre yapılacaktır. Araştırmanın çalışma grubunu, öğretim teknolojileri ve materyal tasarımı dersini almış olan öğretmen adayları oluşturacaktır. Verilerin toplanması sürecinde Çapa vd. (2005) tarafından Türkçe'ye uyarlanan "Öğretmen Öz-Yeterlilik Ölçeği" ile Çetin vd. (2013) tarafından geçerlik ve güvenirlik çalışması yapılan "Öğretim Teknolojileri ve Materyal Tasarımı Dersine Yönelik Tutum Ölçeği" kullanılacaktır.

The purpose of this study is to reveal the attitudes of teacher candidates towards instructional technologies and material design (ITMD) course and to examine the relationship between their attitudes and teacher self-efficacies perceptions. The study will be based on descriptive scanning model. The sample of the study consists of all teacher candidates that received instructional technologies and material design course. In the collection of data, "Teacher Self-Efficacy Scale" adapted by Çapa et al. (2005) into Turkish and "Attitudes Towards Instructional Technologies And Material Development Course Scale" developed by Çetin et al (2013) will be used.

Keywords: Teacher Candidates, ITMD course, attitude, self-efficacy

ÖZET: Bu araştırmanın temel amacı, öğretmenlerin cinsel sağlık bilgi düzeylerini belirlemektir. Araştırmaya Türkiye' de görev yapmakta olan 462 ilkokul, ortaokul ve lise öğretmeni katılmıştır. Araştırma, mevcut olan durumu saptamaya yönelik olduğundan ilişkisel tarama modelinde bir çalışma olarak yürütülmüştür.

Araştırma kapsamında ölçeğin güvenirliğini belirlemek için cronbach alfa korelasyon katsayısı hesaplanmış ve 0,782 olarak bulunmuştur. Katılımcıların kişisel özelliklerine ilişkin bulgular yüzde ve sıklık istatistikleri ile çözümlenmiştir. Verilerin analizinde t-testi ve ANOVA kullanılmıştır 5'li likert tipi "Cinsel Sağlık Bilgisi" ölçeğinden alınabilecek puanlar 1 ile 5 arasındadır.

Öğretmenlerin cinsel sağlık bilgisi düzeylerinin yüksek olduğu söylenebilir. Ayrıca yapılan analizler sonucunda kadın öğretmenlerin erkek öğretmenlerden, evli öğretmenlerin bekar öğretmenlerden, lisansta cinsel sağlık bilgisi dersi alanların almayanlardan ve cinsel sağlık eğitimi alanların almayanlardan cinsel sağlık bilgisi düzeylerinin anlamlı derecede daha yüksek olduğu bulunmuştur.

Anahtar sözcükler: Cinsel sağlık, cinsel sağlık bilgisi, öğretmen

ABSTRACT: The aim of this study is to examin the level of sexual health knowledge of teachers. The sample of the study is constituted of 462 teachers working at primary, secondary and high schools in Turkey. As the study is oriented at determining the current status, it was conducted as a relational screening model study.

The cronbach alpha correlation coefficient was calculated and determined to be 0.782. Findings regarding the personal details of the participants were analyzed with percentile and frequency statistics. In the analysis of data, t-test and ANOVA was used. The points that can be obtained from the 5 point likert "Sexual Health Knowledge" scale are between 1 and 5.

It can be observed that teachers have a high level of sexual health knowledge. It can be observed that the levels of sexual health knowledge of female teachers are significantly higher than those of male teachers. It can be observed that the levels of sexual health knowledge of married teachers are significantly higher than those of single teachers. It can be observed that the levels of sexual health knowledge of teachers that had sexual health lesson at university are significantly higher than those of other teachers.It can be observed that the levels of sexual health knowledge of teachers that had sexual health training are significantly higher than those of other teachers.

Key words: Sexual health, sexual health knowledge, teacher

TÜRKİYE VE ÇİN-TAYVAN 8. SINIF DÜZEYİ MATEMATİK ÖĞRETİM PROGRAMLARININ VE TIMSS SONUÇLARININ KARŞILAŞTIRILMASI

ÖZET: Karşılaştırmalı eğitim genel olarak ülkelerin eğitim sistemleri hakkında fikir vermekle beraber eğitim programlarının geliştirilmesi ve uygulamada yaşanan bazı sorunlar, eğitim yönetimi, öğretmen yetiştirme gibi pek çok özel alanlarda dünyada ne gibi gelişmeler yaşandığı ve sorunlara ne gibi çözümler bulunduğu hakkında da fikir verebilmektedir. Bu kapsamda eğitim sistemlerinin diğer eğitim sistemleri ile karşılaştırılması çalışmaları artmaktadır. Özellikle son zamanlarda uluslararası sınavlarda (TIMSS, PISA) matematik açısından pek çok gelişmiş ülkeyi geride bırakarak ilk sıralara yerleşen Doğu Asya ülkelerinin matematik eğitimleri dikkat çekmektedir. Bu doğrultuda bu araştırma son zamanlarda TIMSS ve PISA gibi uluslararası düzeyde ülkelerin matematik başarılarını ölçen sınavlarda üst sıralamalarda yer alan Çin-Tayvan ve bu sınavlarda ortalamanın altında yer alan ülkemizin 8.sınıf düzeyi matematik öğretim programlarını çeşitli değişkenler açısından karşılaştırmayı ve ülkemizde yapılacak olan program geliştirme çalışmalarına katkı sağlamayı amaçlamaktadır. Türkiye ile Çin-Tayvan ülkelerinin 8. sınıf düzeyinde matematik öğretim programları içerik, genel amaçları ve felsefeleri, öğrenme alanları, haftalık matematik ders süreleri karşılaştırılarak benzerlik ve farklılıklara ve TIMSS 2011 matematik sonuçlarına yer verilmiştir. Yöntem olarak araştırma nitel bir çalışma olup araştırma yaklaşımı ise karşılaştırmalı eğitim yaklaşımlarından yatay yaklaşımdır. Araştırmada kullanılan veriler (öğretim programları) Türkiye için Talim Terbiye Kurulu'nun resmi internet sitesinden (MEB, 2013) elde edilirken Çin-Tayvan matematik programı APEC (Asya Pasifik Ekonomik İşbirliği) internet sitesinden elde edilmiştir. Araştırma verileri doküman analizi yöntemiyle analiz edilmiştir.

ABSTRACT: Comparative educaion gives an idea not only about education systems of the countries but also about the developments and solutions to the problems in the World like processes of the curriculum development and some problems in practice, educational administration, teacher education. In this context, studies about the comparisons of educational systems is increasing. Especially recently, Mathematics education systems of eastern asian countries which outdistanced most of other developed countries in international exams (TIMSS, PISA) are standing out. This study aims to compare the eighth grade mathematics curriculums of recently high ranking Chinese-Taipei and our country which is under average in international exams measuring mathematics achievement of countries like TIMSS and PISA; and to contribute to the future curriculum development studies in our country. 8th grade mathematics curriculums of Turkey and Chinese-Taipei were compared in terms of content, general purpose and philosophies, learning areas, weekly lesson times and similarities and differences and TIMSS 2011 mathematics results were given. The study is a qualitative study and horizontal approach of comparative education approcahes was used. The data was gained from Talim Terbiye Kurulu (MEB, 2013) and APEC (Asia Pasific Economic Coorparation) websites. The data was analysed using document analysis.

Key words: Mathematics Curriculum, Comparative Education, Curriculums.

IMPACTS OF ERGONOMICS ON SUDANESE HIGHER EDUCATION INSTITUTIONS ICT CLASS ROOMS

ABSTRACT: Ergonomic computer field is the science concerned with conniving safe and comfortable situations for the users of information and communication technology equipment's. In the computer field, ergonomics plays very important factor in the design of all computer equipment's, therefore in Sudanese higher education Institutions (HEI) ICT class rooms will be affected directly with how the equipment's will be arranged and the environments itself.

Due to the current situation of ICT class rooms, Sudanese higher education Institutions were facing problems in the learning activities as most of these class rooms were not equipped and arranged properly using ergonomic steps and processes due to the lack of perception of the importance of the ergonomics.
Research paper will focus on the impact of Ergonomics on Sudanese higher education Institutions ICT class. The researcher collected data from Different universities in Sudanese HEI. The research questionnaires will be analyzed using SPSS. Descriptive Statistics and the distribution of respondents and percentage of responses to the questions in the questionnaire analysis will be presented to find the results.
The Results of the paper will be presented based on the basic ergonomics roles and including the main issues of the ergonomics, which will help these institutions to improve the ICT class rooms and teaching accessibility, Support students /teacher to adopt better pedagogical and provide over all cognizance of the general knowledge.

Keywords: Knowledge management; Ergonomics; Sudanese Higher Education institutions, information and communication Technologies, ICT class Room.

1. INTRODUCTION

This paper will discuss how the ergonomic will affect on Sudanese higher education Institutions ICT class rooms. The paper contains useful information and ideas about the importance of computer ergonomics from the students' academic achievements specifically information and communication technology equipment's Adjustment in the learning class rooms.

2. BACKGROUND

This part will contain the definition of paper keywords and including the

3. Literature Review

This section provides a review of the basic literature which will help to design the contexts of the study paper. The review for the study includes Ergonomics; Sudanese Higher Education institutions, information and communication Technologies, ICT class Room.

3.1. Ergonomics

The science of fitting the work situation, work demands and work practices to the competences of the working people to keep safety, efficiency and excellence of work"
Ergonomics at Work Inc., 2002.

Ergonomics relates information about human behavior, aptitudes and boundaries and other features to the design of computer tools, machines, accessories, jobs and environments for creative, safe, comfortable and actual human use" (McCormick and Sanders, 1992).

3.2. Sudanese Higher Education

Education is a basic human right, so the revolution of higher education in Sudan is going on the same linear specifically. Incredibly, there have been more than ninty colleges and universities in Sudan, 70% are public and 30% are private, most of these universities they are use the ICT tools in the learning activities.
Nowadays, KBS make extensive use of ICT, especially the knowledge base and Internet because of its potential in advancing interactivity between users**.**

3.3. Information and communication Technologies

Information and Communication Technology (ICT) is a large umbrella term that contains all the practical equipment to procedure and communicate information. ICT contains two features of information technology and communication technology. Information technology includes all materials relating to the processing, usage as instrument, operation, and organization of information (AGDE, 2010).

3.4. ICT Class room

According to Cox, Preston & Cox (1999) the use of ICT in classrooms include: Making educations more interesting, more pleasant for teachers and students, more varied, more inspiring, and Helpful of productive learning. General, it is strong that the emotional factors of a teacher's will facilitate and barriers to teacher use of technology in the classroom. Those facilitators will make successful ICT classroom.

3.5. Computer Ergonomic Issues

As mentioned by DBCVSRI, Health & Safety Coordinator Leslie Steinberg (40329) and Anderson (1997)Adjusting the workstation to best appropriate of staff/students in education actives will include the following items: Workstation Design(desks, chairs, space, layout), Work Postures (sitting, standing, reaching, lifting), Work Organization (Pace, Breaks, Variety), Tools, Equipment, and Furniture Design (body size, height, gender, promoting neutral postures, reduced vibration, exposure to acceptable lighting, noise, temperature), Manual Materials Handling (lifting, lowering, pulling, pushing, carrying and holding materials), Work Environment (ventilation, noise, temperature & humidity, lighting and vision).

3.6. The Problem

Although the growing use of ICT tools in Sudanese HEI still they did not gain the full effective and advantages of using ICT in the education activities, this could it be a reflection of the less acknowledgement of the role of ergonomic in the applying and designing ICT tools and equipment's in the classrooms. Based on the problem raised the following research question is posed:
How the computer ergonomic will effect on Sudanese higher education Institutions ICT class rooms?

3.7. Research Model

The following research model (Figure 1) was developed based on the Computer Ergonomic Issues identified in the literature in order to assist this study in answering the above questions.

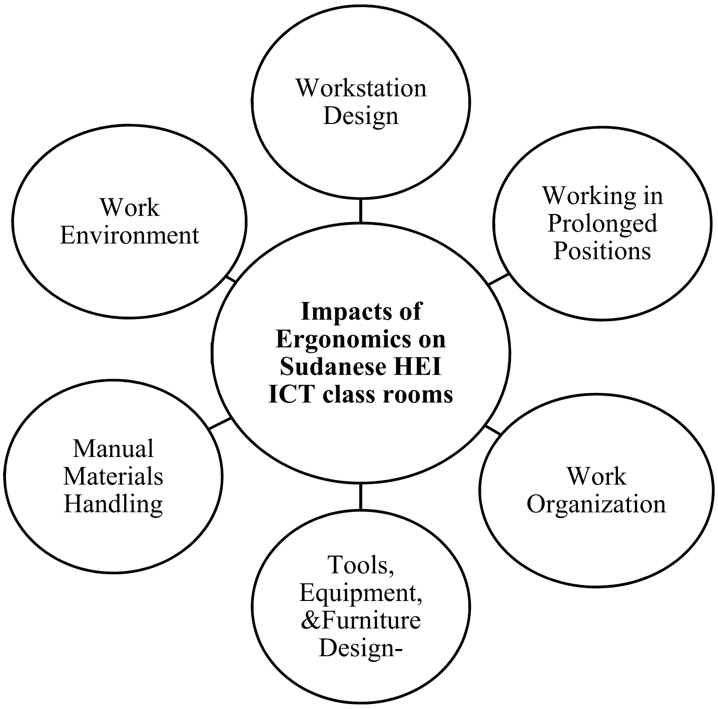

Figure 1: Computer Ergonomics Issues in Sudanese HEI ICT classrooms

4. METHODOLOGY AND SAMPLING

Descriptive statistics techniques was be used to analyze the data. The questionnaire technique of data collection was used. A multiple Sudanese Universities/ Colleges purposively selected as participant of the questionnaire. The selection of these participants was based on their specialization. Statistical Package for the Social Sciences (SPSS) used to answer the research question.
There are approximately 97 university / College in Sudan with a target population of approximately 650,000 students and 21000 academic staff.
Even though 300 questionnaires were distributed to the participants, only 95 (31.7%) questionnaires were not returned. Only 161 (53.7%) copies were completely answered. The remaining of 44 (14.7%) questionnaires could not be included in the study due to incomplete data or poor responses (see Figure 2).

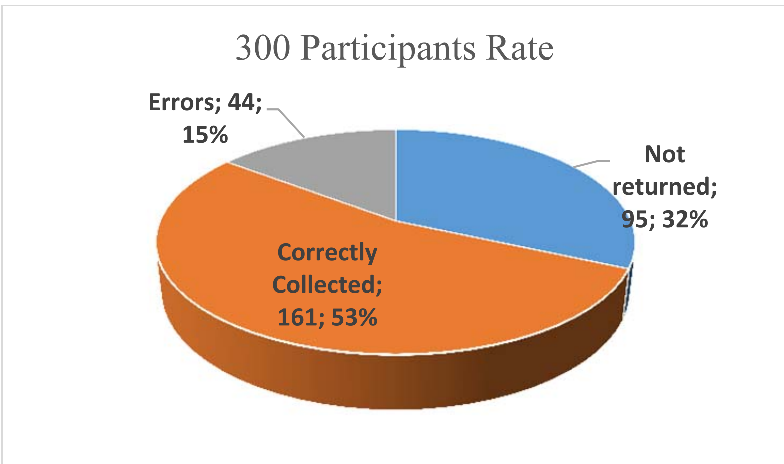

Figure 2: Staff/Students Response Rate

5. DATA ANALYSIS AND RESULT

Quantitative approach was used to answer the question about the Impacts of Ergonomics on Sudanese higher education Institutions ICT class rooms from the participants' point of view. This will include data has been collected from multiple Sudanese Universities/ Colleges to select the participants of the questionnaire.Table 1 mentioned the repose of the participant.

Table 1: The Participants Feedback

Ergonomic Issue	Ergonomic tips	Applied	Not Applied	Feedback
Workstation Design	Desks	19%	81%	Negative on impact tools or equipment
	Chairs	12%	88%	Affect with stiffness or cramping
	Space	32%	68%	Nose and stress
	Layout	13%	87%	Negative affect with Compression or contact stress
Working in Prolonged Positions Sitting/Standing-	Postures	25%	75%	Body pain
	Footwear	0%	100%	Foot and back pain and Bending
	Floors	66%	34%	Affect negatively with Nose
Work Organization	Pace	8%	92%	Compression or contact stress
	Breaks	16%	84%	Affect with Forceful exertions
	Variety	12%	88%	Out of mode and understanding
Tools, Equipment, and Furniture Design-	Body	10%	90%	Body Pain, numbness & tingling
	Gender	0%	100%	Female Awkward postures
	Postures	19%	81%	Static or sustained postures
	Vibration	12%	88%	Damage of equipment's and stress for users
	Lighting	9%	81%	Forceful exertions and Stress
	Noise	13%	87%	Compression or contact stress
	Temperature	15%	85%	Uncomfortably, Stress
Manual Materials Handling	Lifting	5%	95%	Compression or contact stress
	Pulling	7%	93%	Compression or contact stress
	Pushing	10%	90%	Compression or contact stress
	Holding Materials	2%	98%	Compression or contact stress
Work Environment	Ventilation	50%	50%	Very bad health environment
	Noise	10%	90%	Inconvenience and stress
	Humidity	60%	40%	Pain and shortness of breath
	Lighting & Vision	45%	55%	Eye strain

6. DISCUSSION CONCLUSION

The computer ergonomic offer very influential procedures to higher education institution classrooms in the Sudan. However, Ergonomics is important because it makes staff/student be in better health environments and be more effective as they work in enjoyable environments. Ergonomics usually recovers productivity in learning area as has been stated in several of the studies reviewed. This research paper explore the Impacts of Ergonomics on Sudanese higher education Institutions ICT class rooms

The analysis and findings of the results obtained from the data that were generated through the distribution of questionnaires are presented in this paper.

Of the overall computer ergonomic issues the analysis show firstly that the Manual Materials Handling is the less issues with average percentage of (6 to 94), that Sudanese HEI were caring when they design the ICT classrooms and techniques, therefore this will affect negatively in compression or contact environment of students /staff. The second Issues issue is Work Organization with with average percentage of (12 to 88), accordingly there is negative affection (Body, foot, back pain). The third issue is Tools, Equipment, and Furniture Design with average percentage (13 to 87), Resulting in the destruction of the classroom devices. The fourth issue is Workstation Design with average percentage (19 t0 81), thus will affect in ICT classrooms with negatively on tools or equipment, with stiffness or cramping, and Compression or contact stress. The Fifth issues is Working in Prolonged Positions Sitting/Standing- with average percentage of (30 to 70), so the ICT class room students will be affecting with foot and back, Bending, and noise. The last issue is Work Environment with average percentage (41 t0 59), accordingly there will be Very bad health environment, Inconvenience and stress, Pain and shortness of breath and Eye strain for Sudanese ICT class rooms staff/students.

The overall participant's feedback on of the computer ergonomic issues has been applied in Sudanese HEI classroom shows that the average is 19% only applied correctly, while to average 81% were not applying the computer ergonomic issues which will affect negatively in the Sudanese higher education Institutions ICT class rooms.

In spite most of Sudanese HEI were using the ICT tools in their classrooms unfortunately they did belief the importance of ergonomic in the designing of their class rooms and computer equipment's

This research study contributes to the body of knowledge by explaining the basic procedures of computer ergonomic. The study harmonized the existing argument in the literature by enhancing the findings of Marklin, R., Simoneau. (2004) Hedge (1999).

The Limitations of this study is the participant of our questionnaire survey conducted within some Sudanese universities/ colleges, the results of the study therefore may not be generalizable to all other institutions.

ABSTRACT: The aim of study is to determine the effectiveness of a differentiated program on attitudes of gifted students. For this purpose, one unit in Science and Technology course named "Earth, Sun and Moon" was differentiated on the bases of scientific creativity skills, Parallel Curriculum Model and Grid Model. The study was conducted with a total number of 21 students, 11 of them being in the experimental group and 10 of them being in the control group. The subjects were 5th grade students of a school in which gifted and talented students instructed in Istanbul. In order to collect data, The Scale of Attitude towards Science developed by Baykul (1990) was used. In the statistical analysis of data collected from these tests, mean, standard deviation, Mann Whitney-U and Wilcoxon Signed-Ranks Tests were used. The results of the study revealed that the differentiated science program developed for the gifted and talented students increased the attitude scores of the subjects towards science.

PROSPECTİVE MATHEMATİCS TEACHERS' PREFERENCES FOR INSTRUMENTAL ORCHESTRATİON TYPES AND ENDORSED NORMS

Tuğçe KOZAKLI

Rüya ŞAY

Hatice AKKOÇ

As a result of the emphasis on integrating technology into instruction, there is a growing need for research on teachers' and prospective teachers' choices, strategies, views and endorsed norms. This study aims to explore social and socio-mathematical norms embraced by prospective mathematics teachers during their technology-integrated lessons. Technology integration practices will be investigated through the lens of instrumental orchestration. With this aim, a case study was conducted. The participants of the study are two female prospective mathematics teachers who were enrolled in a teacher preparation course. Through collaboration, they prepared and taught a lesson on functions in one of the partnership schools using Graphics Calculus software. Data was collected through observations and semi-structured interviews. Findings will be discussed with regard to participants' preferences for orchestration types, social and socio-mathematical norms embraced by them and how these norms influence their preferences for using a particular orchestration type.

Keywords: Instrumental orchestration, social norms, socio-mathematical norms, prospective mathematics teachers

BİLİM SÖZDE-BİLİM AYRIMI BAĞLAMINDA PLANLANMIŞ ÖĞRETİM SÜRECİNİN ORTAOKUL ÖĞRENCİLERİNİN AKADEMİK BİLGİ DÜZEYLERİNE ETKİSİ

THE EFFECT OF THE TEACHING PROCESS PLANNED WITHIN THE CONTEXT OF SCIENCE –PSEUDOSCIENCE DISTINCTION ON THE ACADEMIC KNOWLEDGE LEVELS OF MIDDLE SCHOOL STUDENTS

ÖZET: Bilimsel okuryazarlığın, bilimsel içerik – terminoloji boyutuna odaklanan bu çalışma bilim sözde-bilim ayrımı tartışması bağlamında planlanan bir öğretim sürecinin ortaokul öğrencilerinin akademik başarılarına etkisini araştırmaktadır. Araştırma sürecinde Fen Bilimleri Dersi Öğretim Programı'nda (MEB, 2006) yer alan kazanımlarla ilişkilendirilen sözde-bilimsel vakalar önceden planlanmış bir dizi etkinlik aracılığı ile öğrencilere sunulmuş, uygulamalar yaptırılmış ve hem genel hem de gruplar halinde tartışmaya konu edilmiştir. Çalışma grubunda 21 ortaokul son sınıf öğrencisinin yer aldığı araştırmanın veri toplama aracını, araştırmacılar tarafından geliştirilen "Akademik Bilgi Testi" (ABT) oluşturmuştur. ABT eğitim sürecinden önce ve sonra olmak üzere her öğrenciye toplam iki kez uygulanmıştır. ABT'den elde edilen veriler hem araştırmacı hem de fen eğitimi alanında uzman araştırmacılar tarafından farklı zamanlarda iki kez kodlanarak üç farklı kategoriye ayrılmıştır. Toplanan veriler PASW 18.0 paket programında analiz edilmiştir. İlişkili grupların testlerinin ölçülmesi için bağımlı değişkenlerin ordinal olduğu durumlarda İşaret ve Wilcoxon İşaretli Sıralar Testi'nin uygulanması (Siegel, 1957) önerildiğinden, analiz yapılırken toplanan verilere bahsi geçen testler uygulanmıştır. Ulaşılan bulgular, bilim sözde-bilim bağlamı esas alınarak hazırlanan etkinliklerin, öğrencilerin ilgili kazanımlara yönelik akademik bilgi düzeylerinde anlamlı bir farklılık oluşturduğunu ortaya koymaktadır.

Anahtar sözcükler: bilim sözde-bilim ayrımı, bilimsel okuryazarlık, bilimsel içerik – terminoloji

ABSTRACT: This study, which focused on the scientific content – terminology dimension of scientific literacy, aimed at investigating the effect of the teaching process planned within the context of debate on science – pseudoscience distinction on the academic achievement of middle school students. In the research process, pseudoscientific cases associated with the acquisitions included in the Science Course Curriculum (MEB, 2006) were presented to the students via a series of activities planned in advance. Then they were discussed both generally and in groups. The study group consisted of 21 final year middle school students. Data were collected by means of the "Academic Knowledge Test (AKT)" developed by the researchers. AKT was administered to each student twice: once at the beginning of the education process; and once at the end of the education process. The data obtained via AKT were divided into three different categories through two coding operations at different times by the researchers and the specialists in the field of science education. The collected data were analyzed by means of PASW 18.0. Sign test and Wilcoxon signed-rank test are suggested to be used for measuring the tests of associated groups when dependent variables are ordinal (Siegel, 1957). Thus, the above-mentioned tests were administered to the gathered data during analyses in the present study. The research findings revealed that the activities prepared within the context of science – pseudoscience distinction created a significant difference in the academic knowledge levels of the students regarding related acquisitions.

Key words: science – pseudoscience distinction, scientific literacy, scientific content – terminology

YILDIZLAR KONUSUNUN ÖĞRETİMİNE YÖNELİK BİR DERS MATERYALİNİN GELİŞTİRİLMESİ, UYGULANMASI VE ETKİLİLİĞİNİN DEĞERLENDİRİLMESİ

DEVELOPING, APPLYING AND EVALUATING THE EFFECTIVENESS OF THE TEACHING MATERIAL ABOUT STARS

ÖZET: Bu çalışmanın amacı, yıldızlar konusunda yapılandırmacı öğrenme yaklaşımının 5E modeline uygun bir ders materyalinin geliştirilmesi, uygulanması ve etkililiğinin değerlendirilmesidir. Astronomi dersi kapsamında basit deneysel araştırma yöntemiyle yürütülen çalışmanın örneklemini Fen Bilgisi Öğretmenliği Anabilim Dalı 4.sınıfında öğrenim gören 25 öğretmen adayı oluşturmaktadır. Çalışmada, ön ve son test olarak kullanılmak üzere kelime ilişkilendirme testinden (KİT) yararlanılmıştır. KİT'ten elde edilen veriler frekanslanarak kavram ağları haline dönüştürülmüştür. Uygulamadan sonra yapılan KİT'in sonuçlarına yönelik kavram ağının, uygulama öncesi verileri ile oluşturulan kavram ağıyla paralellik göstermesine rağmen daha kompleks ve konuya yönelik daha fazla kavram içeren bir yapıya sahip olduğu görülmektedir. Bu kavram ağında ilk kavram ağında olmayan "hidrojen" ve "helyum" gibi yıldızların yapısına dair; "nötron yıldızı", "beyaz cüce", "dev yıldız", "kütle", "tür" ve "tayf" gibi yıldızların sınıflandırılmasına dair kavramlar bulunmaktadır. Sonuç olarak, öğretmen adaylarının yıldızlar hakkında istenilen düzeyde bilgi sahibi olmadıkları tespit edilse de, hazırlanan ve uygulanan materyalin adayların konu ile ilgili bilgilerinin gelişmesine katkı sağladığı söylenebilir.

Anahtar Sözcükler: Astronomi Eğitimi, Fen Bilgisi Öğretmen Adayı, Materyal Geliştirme, Yıldız, 5E Modeli

ABSTRACT: The purpose of this study is to develop, to apply and to evaluate the effectiveness of the teaching material about stars based on 5E model. At this study which was used the simple experimental model, the sample of the study consist of 25 teacher candidates who take the astronomy course from the Elementary Science Education department. As a data collection tool, the word association test (WAT) is used before and after the instruction. The data obtained from the WAT is determined the distribution of frequency and drawn the concept networks. Although the (2^{nd}) concept network obtained from the WAT which is done after instruction have in common with the (1^{st}) concept network obtained from the WAT which is done before instruction, it is seen that the 2^{nd} concept network have a structure consisting of more complex and have more concepts. This concept network has concepts about stars' structure like hydrogen and helium and concepts about stars' classification like neutron star, white dwarf, giant star, mass, kind and spectrum, but the first one hasn't. As a result, it can be said that the teaching material in this study contributed to the teacher candidate's knowledge development of the subject.

Key words: Astronomy education, Elementary science teacher candidate, Designing material, Star, 5E model.

GİRİŞ

Evrenin ve evrendeki gök cisimlerinin meydana gelişini, yapısını ve hareketlerini geçmişten geleceğe doğru inceleyen ve temel bilimlerin içinde önemli bir yere sahip en eski bilim dallarından biri olan (URL-1) Astronomi'de yer alan konu ve kavramları son yıllarda araştırmacılar tarafından sıkça tercih edilen araştırma konuları arasında yer almaktadır. Literatür incelendiğinde; katılımcıların bilgi/anlama düzeylerini (İyibil, 2010; Taşcan, 2013; Ünsal, Güneş & Ergin 2001), kavram yanılgılarını (Bülbül, İyibil & Şahin, 2012; Ekiz & Akbaş, 2005; Emrahoğlu & Öztürk, 2009), kavramsal değişim süreçlerini (Ercan, Taşdere & Ercan, 2010; Şahin, Bülbül & Durukan, 2013), zihinsel modellerini (İyibil & Sağlam Arslan, 2010; Kurnaz & Değirmenci, 2012) ve tutumlarını (Bektaşlı, 2013; Canbazoğlu Bilici, Öner Armağan, Kozcu Çakır & Yürük, 2012; Uçar &

Demircioğlu, 2011; Wittman, 2009) inceleyen çeşitli çalışmaların yürütüldüğü görülmektedir. Ancak farklı şekillerde açıklanmaya ve çizilmeye çalışılan yıldızlar konusu az sayıda araştırmacının dikkatini çekmiş ve bu kavram ile ilgili çalışmalar yürütülmüştür. Bu araştırmacılardan Emrahoğlu ve Öztürk (2009), fen bilgisi öğretmen adaylarının; *yıldızın tanımıyla ilgili*: yıldızların gezegen olduğu, ışık gücünü Güneş' ten aldığı ve Güneş' in yıldız olmadığı; *yıldızların kütleleri renkleri ışıma güçleri arasındaki bağıntıyla ilgili*: ışıma gücü fazla olan yıldızların kırmızı, ışıma gücü az olan yıldızların ise mavi renkte görüneceğini düşündükleri ve *yıldızların ölümüyle ilgili:* yıldızların büyüklükleri ile patlama sonucu oluşan ürün arasında doğru bağlantıyı kuramadıkları ve karadelik ile karanlık enerjiyi birbirine karıştırdıkları görülmektedir. Chiu, Weng, ve Chern (1993) çalışmalarında ilkokul üçüncü ve beşinci sınıf toplam 16 öğrencinin yıldızlara dair algılamalarını araştırmışlardır. Öğrencilerin yıldız kavramı ile ilgili sınırlı bilgilere sahip oldukları ve tanımlarının günlük yaşantılarına ve tamamlanmamış bilimsel bilgilere dayanmakta olduğu görülmüştür. Aynı kavramın anlaşılma düzeyini araştıran Agan (2004) lise ve üniversite 1. sınıf öğrencileri ile çalışmıştır. Çalışması kapsamında gerçekleştirilen lise seviyesindeki astronomi kursunun öğrencilerin kısa sürede yıldız kavramına ilişkin bilimsel bilgiler geliştirmelerine yardımcı olduğunu ortaya koymuştur. Bailey (2006), öğrencilerin yıldızlara ait anlamalarını ortaya çıkarmak amacıyla gerçekleştirdiği çalışmasında, öğrencilerin önemli bir bölümümün yıldızların gazlardan oluştuğunu düşündüğünü, yarısına yakınının yıldızların yandıklarından dolayı parladığına inandıklarını ve çok az bir bölümünün yıldızların enerji kaynağı olarak füzyon tepkimelerini kullandıklarını düşündüklerini göstermiştir. Öğretmen adaylarının yıldız kavramına yönelik zihinsel modellerini inceleyen İyibil ve Sağlam-Arslan (2010), geleceğin fizik öğretmenlerinin bilimsel olmayan bilgileri içeren zihinsel model türlerine sahip olduklarını ortaya çıkarmıştır. Yıldızlar konusuna yönelik bir öğrenme yaklaşımına dayalı olarak hazırlanan herhangi bir ders materyaline rastlanılmamış olması bu çalışmanın gerçekleştirilmesinin altında yatan temel gerekçedir. Bu bağlamda çalışmanın amacı, yıldızlar konusuna yönelik yapılandırmacı öğrenme yaklaşımına dayanan bir ders materyali geliştirmek, uygulamak ve etkililiğini değerlendirmektir.

YÖNTEM

Kontrol grubu olmaksızın aynı örneklem grubu üzerinde ön test-son test uygulaması yapılarak gerçekleştirildiğinden, çalışma basit deneysel araştırma yöntemiyle yürütülmüştür (Büyüköztürk, Kılıç Çakmak, Akgün, Karadeniz ve Demirel, 2012).

Örneklem

Çalışmanın örneklemini Fen Bilgisi Öğretmenliği Anabilim Dalı 4.sınıfında öğrenim gören ve astronomi dersini alan 25 öğretmen adayı oluşturmaktadır.

Veri Toplama Aracı ve Verilerin Analizi

Çalışmada veri toplama aracı olarak, Kelime İlişkilendirme Testi'nden (KİT) yararlanılmıştır. Öğrencilerin bilişsel yapısını incelemeyi kolaylaştıran bu teknik, kavram değişim stratejileri arasında ölçme-değerlendirme tekniği olarak kullanılmaktadır (Ercan ve diğerleri, 2010). Materyalin uygulanmasından önce ve materyal uygulandıktan sonra KİT uygulanmıştır. Ders içeriği ve literatürde yer alan çalışmalar incelenerek 7 tane anahtar kavram seçilmiştir. Seçilen anahtar kavramlar; evren, gökada, yıldız, gezegen, süpernova, karadelik ve Güneş'tir. Öğretmen adaylarına KİT'e yönelik açıklamalar yapılmış ve her bir kavram için bir dakika süre verilmiştir. Öğretmen adayları bu süre içerisinde anahtar kavram ile ilişkili olduğunu düşündüğü kelimeleri sırayla yazmıştır.

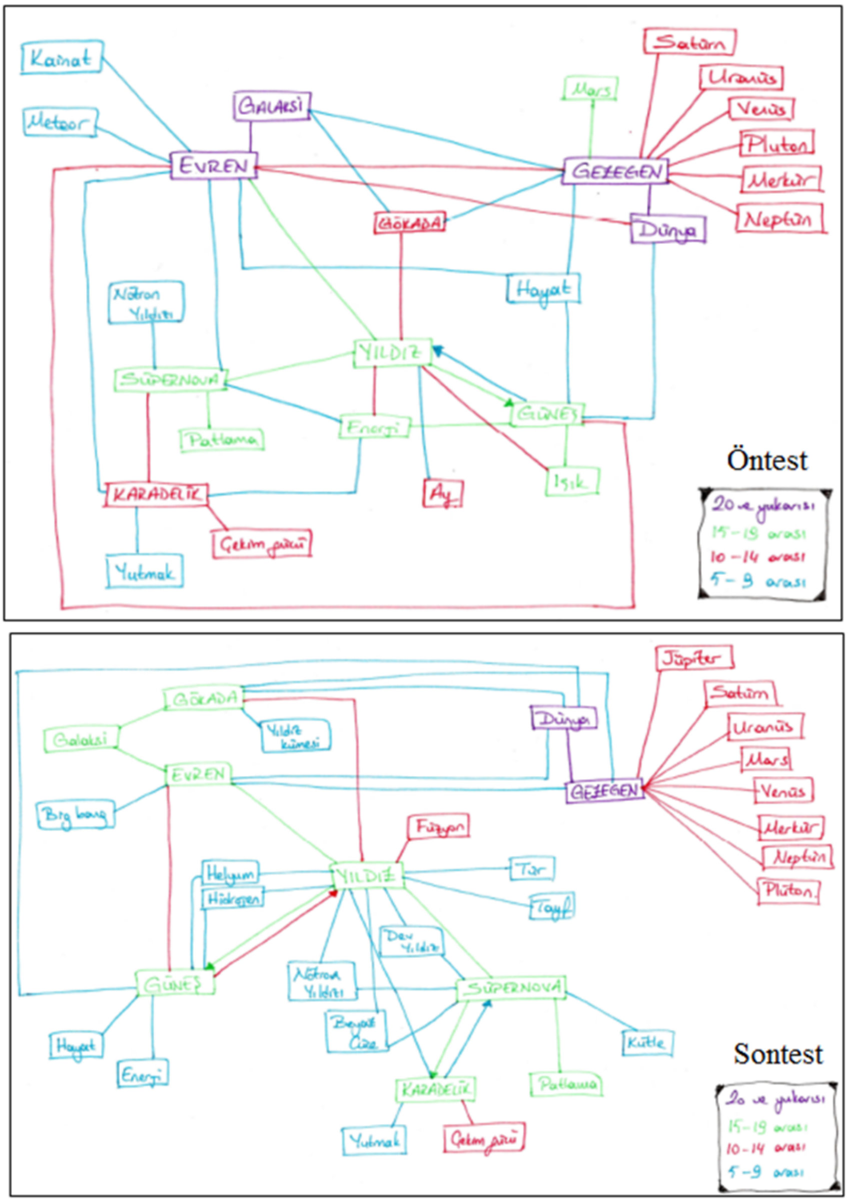
KİT analiz edilirken, kavram ağlarının hazırlanması için Bahar, Johnstone ve Sutcliffe (1999) tarafından ortaya konulan Kesme Noktası (KN) tekniği kullanılmıştır. İlk önce, hangi anahtar kavram için hangi kelimelerin yâda kavramların kaçar defa tekrarlandığını gösteren bir frekans tablosu oluşturulmuştur (EK-1). Bilişsel yapıyı ve kavramsal değişimi net bir şekilde göstermesi amacıyla bu frekans tablosu baz alınarak, kesme noktaları belirlenmiş ve kavram ağı oluşturulmuştur. Bu tekniği Ercan ve diğerleri (2010) kısaca aşağıdaki gibi açıklamışlardır.

> *"Kelime ilişkilendirme testinde yer alan herhangi bir anahtar kavram için en fazla verilen cevap kelimenin 3-5 sayı aşağısı kesme noktası olarak kullanılır. Bu cevap frekansın üstünde bulunan cevaplar kavram ağının ilk kısmındaki bölüme yazılır. Daha sonra kesme noktası belirli aralıklar ile aşağıya çekilir ve tüm anahtar kelimeler kavram ağında çıkıncaya kadar işlem devam eder."*

Çalışmamız için belirlenen kesme noktaları '20 ve yukarısı', '15-19 arası', '10-14 arası' ve '5-9 arası'dır. Her bir kesme noktası kavram ağında farklı bir renkle temsil edilmiştir.

BULGULAR

KİT'ten elde edilen verilerin analizi sonucunda, çizilen kavram ağları aşağıdaki şekilde sunulmuştur (Şekil.1).



Şekil 1. Öğretmen Adaylarının KİT'ten Elde Edilen Kavram Ağları

Uygulamadan önce yapılan KİT sonuçları, öğretmen adaylarının aklına evren kavramı için, galaksi, yıldız, güneş, dünya, karadelik, kainat, hayat ve gezegen gibi farklı kavramlar geldiğini göstermektedir. Gökada denildiğinde gökadanın eş anlamlı ifadesi olan galaksi, yıldızı ve gezegen kavramları adayların cevaplarıdır. Yıldız kavramı denildiğinde ay, güneş, enerji ve ışık akıllara gelmektedir. Gezegen denildiği ise adaylar ilk önce dünya, mars gibi gezegenleri sıralamışlardır. Bu kavram için galaksi ve hayat kelimelerini belirten adaylar da vardır. Süpernova kavramı için ise adaylar patlama, karadelik, yıldız ve nötron yıldızı ifadelerini kullanmışlardır. Beyaz cüce ifadesinin kullanılmamış olduğu görülmektedir. Karadelik denildiğinde ise adayların aklına çekim gücü, yutmak ve enerji ifadeleri gelmektedir. Son olarak güneş için adaylar, yıldız, enerji, hayat, ışık ve dünya kelimelerini belirtmişlerdir. Bu noktada dikkat çeken, adayların yıldız kavramı için Güneş'i dile getirdiği sayı, güneş kavramı için yıldızı dile getirdiği sayıdan fazladır. Bu durumda adayların Güneş'in bir yıldız olduğu konusunda yanılgılara/tereddütlere sahip olduklarını gösterebilir.
Uygulamadan sonraki KİT sonuçları ise, ilk kavram ağıyla paralel kısımlara sahip olmasına rağmen daha kompleks ve konuya yönelik daha fazla kavram içeren bir yapıya sahiptir. Bu kavram ağında ilk kavram ağında olmayan hidrojen, helyum gibi yıldızların yapısına dair; nötron yıldızı, beyaz cüce, dev yıldız, kütle, tür ve tayf gibi yıldızların sınıflandırılmasına dair kavramlar bulunmaktadır.

SONUÇ

Yapılandırmacı öğrenme yaklaşımının 5E modeline dayalı geliştirilen ders materyalinin etkililiğini araştırmak amacıyla yapılan bu çalışma kapsamında elde edilen bulgular, öğretmen adaylarının konu hakkında daha fazla kavram ifade edebildiklerini göstermektedir. Bu durum, geliştirilen ders materyalinin etkili olduğunu gösterebilir. Son test olarak kullanılan KİT sonuçları ile oluşturulan kavram ağı daha kompleks ve konuyla ilgili daha çok kavrama sahiptir. Ancak öğretmen adaylarının konu ile ilgili kavramlar arasında henüz yeterince ilişki kuramadıkları da düşünülmektedir.

ÖNERİLER

Adayların astronomi dersi almasına rağmen yıldızlar konusunda yeterli düzeyde bilgiye sahip olmamaları önemli bir durumdur. Literatürde yer alan çalışmalarda da belirlenen, örneğin Emrahoğlu ve Öztürk (2009), katılımcıların sahip oldukları 'sıcak yıldızlar kırmızıdır, yıldız ışık gücünü Güneş'ten almaktadır' gibi yanılgılar ve 'yıldızların büyüklükleri ile patlaması sonucu oluşan ürünler arasında ilişki kuramadıkları' gibi bilgi eksiklikleri bu durumun kanıtı niteliğindedir. Dolayısıyla, katılımcıların yıldızlara ait algı ve bilgilerinin ortaya çıkarılması için daha ayrıntılı çalışmalar yapılmalı ve bu çalışmalar sayesinde ortaya çıkarılan eksikliklerin giderilmesi önerilebilir. Astronomi dersinin öğretimi sırasında yararlanılan öğretim yöntemleri değiştirilebilir ve bu çalışmada kullanılan ders materyali gibi materyaller hazırlanarak öğretmen adaylarının ilgisi derse yöneltilebilir. Bununla birlikte, görsel ve 3 boyutlu ders materyalleri kullanılarak öğrenme ortamları da zenginleştirilebilir. Ayrıca, konuda yer alan kavramlar arasındaki ilişkilere de vurgu yapmak amacıyla kavram haritası, anlam çözümleme tablosu gibi tekniklere de ders materyallerinde yer verilmesi önerilmektedir.

ÖZET: Bu araştırmanın amacı, 2005 ve 2013 Fen Bilimleri Dersi Öğretim Programına göre hazırlanmış olan 5. Sınıf Fen Bilimleri ders kitaplarında yer alan etkinliklerin çeşitli yönlerden incelenmesidir. Çalışma kapsamında 2012-2013 eğitim öğretim yılında okutulan iki Fen Bilimleri ders kitabı ve 2013-2014 eğitim öğretim yılında 5. Sınıflar için okutulan iki Fen Bilimleri ders kitabı analiz edilmiştir. Araştırmanın türü nitel araştırmadır. Veriler doküman analizi tekniği ile çözümlenmiştir. Buna göre 2005 programına göre hazırlanan ders kitaplarında yer alan etkinlik sayısının daha fazla olduğu belirlenmiştir. 2005 programına göre hazırlanan çalışma kitaplarında yer alan etkinliklerin öğrencileri değerlendirmeye yönelik hazırlandıkları belirlenmiştir. Araştırmanın sonunda bulgulara dayalı olarak önerilere yer verilmiştir.

Anahtar Sözcükler: Fen Bilimleri, Nitel araştırma, Etkinlik

PREPARED BY ACCORDING TO 2005 AND 2013 SCIENCE CIRRICULUM 5TH GRADE TEXTBOOKS INVESTIGATION FROM VARIOUS ASPECTS OF THE ACTIVITIES

Şahin İDİN

ABSTRACT The purpose of this study, prepared by according to 2005 and 2013, Science Curriculum 5th Grade Science in textbooks is to examine various aspects of the activities. Working under the 2012-2013 academic year two of Sciences taught in textbooks and in the academic year 2013-2014 for Grade 5 Science textbook taught two were analyzed. The type of research is qualitative research. Data were analyzed by document analysis techniques. According to the 2005 program prepared by the higher number of events taking place in the textbooks was determined. 2005 program of events taking place in the workbook prepared by the students were determined to be prepared for evaluation. At the end of the study recommendations are given based on the evidence.

Keywords: Natural sciences, qualitative research, activity

TURKISH VERSION OF STATISTICAL REASONING ASSESSMENT (SRA)

Rabia KARATOPRAK

Gülseren KARAGÖZ AKAR

The purpose of this study is to adapt Statistical Reasoning Assessment (SRA) (Garfield, 2003) in Turkish context. SRA was developed in 1998 and was distributed in the field in 2003. SRA was also used as a valid and reliable instrument in some other studies (Garfield, 1998; Garfield, 2003; Templear, 2004). In order to adapt SRA, processes of i) translation, ii) determining equivalence of the items, iii) examining validity and reliability of the instrument were done (e.g. Hambleton & Patsula, 1998; Kılıçer & Odabaşı, 2010). For "i", it is translated to Turkish language by three people including the first researcher. The first researcher and the second author edited the translated test independently and they discussed and reached upon an agreement about the final version of the test. For "ii", three experts studying in the related area reviewed the original and adapted version of SRA to examine equivalency of the two forms. Also one measurement expert and graduate students discussed the equivalency of the items in a four hour period. For "iii", experts agreed on both forms of SRA as equivalent. Since the original version was valid and both forms were equivalent, the adapted version was accepted as valid based on the judgmental decisions of the experts. Judgmental decisions about the validity of an instrument could be sufficient as long as cross-cultural comparison will not be done (Hambleton & Patsula, 1998). Then 73 monolingual university students taking undergraduate education in English took the original version and 3 weeks later they retook the Turkish version. Pearson-r correlation coefficient was calculated. Since test-retest reliability analysis was used in original study, test-retest reliability analysis is still to be conducted. Since this is an ongoing research study, in the full text submission, results of the analysis at a final stage will be provided.

HOW DO THE PUPİLS' PARENTS TAKE A STAND TO THE STUDYİNG OF THE CRAFTS İN FİNLAND?

Antti HİLMOLA

I carry out the research project of the crafts 2013-2014 in Finland at the moment. In Finnish basic education, the subject of crafts includes two different tracks, technical work and textile work. The curriculum is common in which technological know-how is emphasized. The research material consists of the parents' questionnaire, teacher questionnaire and pupil questionnaire. Except for the parents' questionnaire, the collecting of the research material is unfinished. In this paper the starting points and the results of the parents' questionnaire are examined. In the parents' questionnaire, the parents (N = 1390) of the pupils of the seventh grade in Finnish basic education took a stand both to the skills of the crafts of their children and to the interestingness and the usefulness of the crafts subject. The questionnaire was carried out as a Survey type electric questionnaire in the Internet at the end of the year 2013.

According to the parents of the pupils of the seventh grade, their children know the crafts well and they regard the subject as interesting. Furthermore, according to the opinion of parents, the crafts subject is a useful subject from the viewpoint of the future of their children. Results of this kind: Are opposite in relation to the Finnish education policy. According to the time allocated for lessons in basic education (Act of Finnish Government 2012), the number of classroom hours devoted to crafts will decrease in the upper grades beginning in 2016. The change is questionable from the viewpoint of educational policy. Pupils and the pupils' parents will not be listened to when the Finnish school system is developed. The school is developed as civil servant decisions.

ÖZET: Çağımızın değişen şartlarına bağlı olarak ortaya çıkan ihtiyaçlar göz önüne alındığında, fen ve matematik eğitiminin salt teorik yaklaşımlardan ziyade disiplinler arası işbirliği yaklaşımı ile yürütülmesi kaçınılmaz bir gereksinimdir. Bu doğrultuda ortaya çıkan STEM eğitimi, klasik ve ezbere dayalı eğitim yaklaşımları yerine, disiplinler arası işbirliğini temel alan, ilişkilendirme, problem çözme becerileri ekseninde bir eğitim modelidir. STEM uygulamaları eğitimin her kademesinde kullanılabilmektedir. Bu bağlamda bireyin öğrenmelerinin temelini oluşturacak okul öncesi eğitimi önemli bir yer tutmaktadır. Bu çalışmada Okul öncesi STEM uygulamalarına yönelik öğretmen görüşlerini belirlemek amaçlanmıştır.

Araştırma Kayseri İl Milli Eğitim Müdürlüğü tarafından yürütülen STEM projesi kapsamında pilot okul olarak belirlenen Melikgazi Anaokulunda gerçekleştirilmiştir. Araştırmada veri toplanırken okul öncesi eğitimde STEM uygulamalarına yönelik anket ve gözlem tekniklerinden faydalanılmıştır. Etkinlikler 4 ay boyunca devam etmiş, elde edilen nicel veriler SPSS 17.00 paket programı aracılığı ile 0,05 anlamlılık düzeyinde değerlendirilmiştir. Araştırma sonucunda, öğretmenlerin okul öncesi STEM uygulamalarına yönelik olumlu görüşlere sahip oldukları belirlenmiştir.

Anahtar sözcükler: Okul öncesi, STEM, Öğretmen.

ABSTRACT: The STEM education emerging with this motivation is an education model based on interdisciplinary cooperation focusing on reasoning and problem solving skills instead of classical and memorization based education approaches.STEM applications can be used in every stage of the education. In this context, preschool education, which lays the foundation for the personal development, is a very important phase. The goal of this study is to determine the opinions of teachers towards preschool STEM applications

Study is carried out in Melikgazi Kindergarten that is selected by the Kayseri Provincial Directorate for National Education. Surveys and observations are utilized for collecting data on STEM applications in preschool education. The activities are carried out for four months and the data is analyzed using the SPSS 17.00 software at 0.05 significance level. The study concluded that the teachers have positive opinion for STEM applications.

Key words: pre-school, STEM, Teacher

GİRİŞ

Teknolojik gelişmelerin yaşamımızın her alanında etkisinin görüldüğü günümüzde gelişmiş ülkeler yetiştirdikleri bireylerin; fen ve teknoloji okur-yazarı olmalarının yanı sıra, bilgi teknolojilerini etkili kullanma, problem çözme, eleştirel düşünme, sorumluluk alma ve takım çalışması yapma gibi üst düzey becerilere de sahip olmalarını beklemektedir(Çavaş, Özdoğru& Kesercioğlu, 2012). Bu sayede bireylerin kazandıkları bilgi ve becerileri günlük yaşama transfer edebilmesi, her gün karşılaştıkları yeni problemlere çözüm yolları üretmeleri amaçlanmaktadır. Bunun en önemli nedeni ülkelerin ekonomik ve bilimsel alanda uluslararası arenada kendini gösterebilmesi ancak inovasyon sayesinde olabilmesidir. İnovatif faaliyetlerinin gerçekleşebilmesi ise bu alanlarda yetişmiş nitelikli insan gücüne bağlıdır. Tabi ki bu alanlarda takım çalışması ve disiplinler arası çalışma son derece önemlidir. Çağımızın bu değişen ihtiyaçlarını karşılayabilmek için bir ülkenin bilimsel ve ekonomik alanlardaki liderliğinin ve yetkinliğinin sağlanması ve sürdürülmesi amacıyla STEM eğitimi ihtiyacı ortaya çıkmıştır.
STEM (Science- Technology- Engineering-Mathematics) disiplinler arası bir öğrenim yaklaşımıdır. Bu yaklaşımda amaç akademik disiplinleri gerçek hayattan konularla ilişki kurularak öğrencilerin bilimi, teknolojiyi, mühendislik ve matematik konularını okul, toplum, iş ve küresel girişimlerde kullanarak; yeni ekonomide rekabet edebilecek çağın gereklerine uygun STEM okuryazarları yetiştirmesidir. Bir ülkenin ekonomideki başarısının temelinin eğitim olduğu düşünüldüğünde bu alanda söz sahibi olmak isteyen ülkeler için STEM eğitimi kaçınılmaz bir gereksinimdir.

STEM eğitimleri farklı yaş guruplarını, okul öncesi eğitimden doktora sonrası eğitimlere kadar okul içi ve dışı eğitimleri kapsayan bir yaklaşımdır. Bu dönemler içerisinde bireyin sonraki yaşamındaki öğrenmelerinin temelini oluşturacak okul öncesi eğitimi son derece önemli bir yer tutmaktadır. Çocukların öğrenme kalitesini artırmak, öğrenmelerini kolaylaştırmak, onları öğrenmeye karşı istekli kılmak, araştırma yapmaya teşvik etmek ve öğrenmelerini anlamlı hale getirmek okulöncesi dönemde kullanılan pek çok yeni yaklaşımın hedefleri arasındadır (Çakar ve Üstün, 2006). Bu dönemde neden-sonuç ilişkilerini kurabilen, problemleri tanımlayıp çözümler üretebilen, yaratıcı bireyler yetiştirmek için çocukların yaşayarak, deneyerek, gözlem yaparak, kendisini keşfetmesine olanak sağlayan öğrenme ortamları hazırlamak son derece önemlidir (Şahin, 2006). Bu açıdan bakıldığında okul öncesi eğitimde STEM uygulamaları, istenilen düzeyde bir STEM eğitiminin gerçekleşmesi için bir zorunluluktur.

STEM disiplinlerinin içerisinde Fen ve Matematik önemli bir yer tutmaktadır. Eğer fen programında istenilen başarıya ulaşılmak isteniyorsa okul öncesi düzeyinden başlayarak çocuklara araştırma yapma olanağı verilmelidir (Howe, 1975) Çocukları bilim ile tanıştırmada en iyi zaman onların çevrelerindeki dünyayı merak etmeye başladıkları zamandır. Meraklı olmak çocukların doğası gereğidir ve bilimsel duyarlılığın geliştirilmesi için bir temeldir (Akman ve diğ., 2011). Dikkatleri çok kısa süreli olan okul öncesi dönem öğrencilerinin etkinliklere daha uzun süreli katılımlarının sağlanması için öğretmenlere büyük sorumluluklar düşmektedir (Yaşar, 1993).

Okul öncesi eğitimde öğrencilerin bu alanlarda yönlendirilmesinde ve gelişiminde öğretmenlerin rolü büyüktür. Çocukların bilim ile tanıştırılmasında en iyi zaman olan okul öncesi eğitimde, bilimsel süreç becerilerinin ve yeterliliklerinin kazandırılmasında okul öncesi eğitim öğretmenlerinin; nitelikli bir eğitim vermesi, buna yönelik bir ortam oluşturabilmesi ve kazandırılması istenilen yeterlilikler için uygun materyal ve yöntemi tespit edebilmesi, bilimsel düşünme süreçlerini etkin bir şekilde kullanabilmesi gereklidir.

Bu çalışmada okul öncesi Kayseri İl Milli eğitim Müdürlüğü bünyesinde yürütülen STEM projesi kapsamında pilot okul olarak belirlenen Melikgazi Anaokulundaki STEM uygulamalarına yönelik öğretmen görüşlerini tespit etmek amaçlanmıştır.

YÖNTEM

Durum çalışması yaklaşımı kullanılarak (Meriam,1988) yürütülen bu çalışmada okul öncesi öğretmenlerinin STEM uygulamalarına yönelik görüşlerini tespit etmek amaçlanmıştır.

Araştırma Grubu

Çalışma grubunu, Kayseri İl Milli Eğitim Müdürlüğü bünyesinde yürütülen STEM projesi kapsamında pilot okul olarak belirlenen ve STEM uygulamalarının gerçekleştiği Melikgazi Anaokulunda görev yapan 20 öğretmen oluşturmuştur.

Uygulama Yöntemi

Uygulamalar eylül ayı itibarı ile başlamış ocak ayında sonlandırılmıştır. Uygulamalar için Cuma günleri STEM günü olarak belirlenmiş ve bu günde önceden belirlenen STEM uygulamaları bütün sınıflarda eş zamanlı olarak gerçekleştirilmiştir. Uygulamalar esnasında STEM eğitimi için özel olarak kullanılan Fischer Technik BASIC, Edu EVA ve Edu TIP materyalleri ayrıca etkinliklere uygun okul öncesi eğitim materyalleri kullanılmıştır. Yapılan uygulamalar okul öncesi eğitim müfredatına uygun olarak gerçekleştirilmiştir. Gerçekleştirilen uygulamalar; 3 boyutlu modeller oluşturma, vücudumu tanıyorum, Mıknatıs, uzayı tanıyorum, Bitki büyümesi ve gelişmesi, Mevsimlerin oluşumu, basit makineler, renk oluşumu, matematik uygulamalarıdır.

Veri Toplama Aracı ve İstatistiksel Analiz

Araştırma ile ilgili veriler "Okul öncesi Eğitimde STEM Eğitim Materyallerinin Kullanımına Yönelik Anket" uygulamalar sonrası öğretmenlere uygulanmıştır.

Araştırmada kullanılan, "Okul öncesi Eğitimde STEM Eğitim Materyallerinin Kullanımına Yönelik Anket"in orijinal hali Kol(2012) tarafından geliştirilmiş ve araştırmacılar tarafından uyarlanmıştır. Araştırmada kullanılan anket iki bölümden oluşmaktadır; birinci bölümde kişisel bilgiler, ikinci bölümde ise öğretim materyallerine ilişkin beşli likert türünde (1)Hiç katılmıyorum-HK, (2) Katılmıyorum-Ktm, (3) Kararsızım-Kar, (4)Katılıyorum-K, (5)Tamamen katılıyorum-TK şeklinde olmak üzere toplam 20 madde mevcuttur.

Bu araştırmada uygulamadan elde edilen nicel veriler SPSS 17.00 paket programı kullanılarak analiz edilmiştir. Öğretmenlerin kıdem durumları ve mezun olunan okul türüne göre farklılıkları ile "Okul öncesi Eğitimde STEM Eğitim Materyallerinin Kullanımına Yönelik Anket" puanları arasında anlamlı fark olup olmadığını belirlemek için ki-kare testi kullanılmıştır. Veriler 0,05 anlamlılık düzeyinde değerlendirilmiştir.

BULGULAR

Uygulamalar tamamlandıktan sonra "Öğretmen kişisel formu, Okul öncesi Eğitimde STEM Eğitim Materyallerinin Kullanımına Yönelik Anket" uygulamalar esnasında yapılan gözlemler sonucunda elde edilen bilgilerin analizi sonrası çıkan sonuçlar;

Okul öncesi Eğitimde STEM Eğitim Materyallerinin Kullanımına Yönelik Anket Sonuçları

Araştırma sonucunda öğrencilere uygulanan Okul öncesi Eğitimde STEM Eğitim Materyallerinin Kullanımına Yönelik Anket sorularına katılımcıların verdiği sonuçlar tablo.1 de verilmiştir.

Tablo 1. Araştırmada Kullanılan Okul Öncesi Eğitimde STEM Eğitim Materyallerinin Kullanımına Yönelik Anket Soruları ve Araştırmaya Katılan Öğrencilerin Sorulara Verdiği Cevapların Dağılımı

Tablo 1. İncelendiğinde öğretmenlerin STEM eğitim materyallerinin kullanımı okul öncesi eğitime olumlu katkı sağlar maddesinde %55'inin tamamen katıldığı %20'sinin ise katıldığı ve ortalama puanının 4,15 olduğu görülmüştür. STEM eğitim materyalleri çocukların cesaret duygusunu geliştirir maddesinde %30'unun tamamen katıldığı %50'sinin ise katıldığı ve ortalama puanının 4,10 olduğu görülmüştür. STEM eğitim materyallerinin kullanımı grupla birlikte hareket etme ve gruba uyma alışkanlığı kazandırarak çocukların sosyalleşmesini sağlar maddesinde %40'ınınn tamamen katıldığı %50'sinin ise katıldığı ve ortalama puanının 4,30 olduğu görülmüştür. STEM eğitimi bilginin daha kalıcı olmasını sağlar maddesinde %55'ininn tamamen katıldığı %25'inin ise katıldığı ve ortalama puanının 4,25 olduğu görülmüştür. STEM eğitim materyalleriyle yapılan etkinlikler okul öncesi dönem çocuğunun gelişim düzeyini arttırmaktadır maddesinde %35'inin tamamen katıldığı %45'inin ise katıldığı ve ortalama puanının 4,05 olduğu görülmüştür. STEM eğitimi çocuğun gelişimine olumlu katkı sağlar maddesinde %55'inin tamamen katıldığı %35'inin ise katıldığı ve ortalama puanının 4,45 ile en yüksek puan olduğu görülmüştür. Okul öncesi eğitimde STEM materyal eğitimi gereksizdir ve Deneyimli öğretmenlerin nitelikli bir eğitim verebilmeleri için STEM eğitim materyallerine ihtiyaç yoktur maddeleri 1,75 ile en düşük puana sahip olduğu görülmüştür.

Öğretmenlerin Mesleki Deneyimleri Değişkenine Göre Okul Öncesi Eğitimde STEM Eğitim Materyallerinin Kullanımına Yönelik Anket Sonuçları

Araştırmaya katılan öğretmenlerin mesleki deneyimlerine göre Okul Öncesi Eğitimde STEM Eğitim Materyallerinin Kullanımına Yönelik Anket puanları incelenmiş olup elde edilen sonuçlara göre istatistiksel açıdan anlamlı bir fark bulunmamıştır.

Öğretmenlerin Mezun Oldukları Fakülte Değişkenine Göre Okul Öncesi Eğitimde STEM Eğitim Materyallerinin Kullanımına Yönelik Anket Sonuçları

Araştırmaya katılan öğretmenlerin mezun oldukları fakültelere göre Okul Öncesi Eğitimde STEM Eğitim Materyallerinin Kullanımına Yönelik Anket puanları incelenmiş olup elde edilen sonuçlar; STEM eğitimi materyallerini kullanabilmek için teknik bilgilerim yeterlidir maddesinde istatistiksel açıdan anlamlı bir fark bulunurken (χ^2=6,021; $P=0.046 < 0.05$) diğer maddelerde anlamlı bir farka rastlanmamıştır.

SONUÇ

Araştırma sonucunda, öğretmenlerin okul öncesi STEM uygulamalarına yönelik oldukça olumlu görüşlere sahip oldukları belirlenmiştir. Etkinlikler boyunca yapılan gözlemler ve etkinlikler sonrasında uygulanan anket sonuçlarına göre okul öncesi öğretmenlerinin; okul öncesi eğitimde STEM uygulamalarının okul öncesi eğitime katkı sağladığı, çocukların cesaret duygusunu geliştirdiği, bilgilerin daha kalıcı hale gelmesini sağladığı, çocuk gelişimine olumlu katkı sağladığı yönünde görüşlere sahip olduğu belirlenmiştir. Ayrıca STEM uygulamalarının ve materyal kullanımının birlikte hareket etme ve gruba uyma alışkanlığı kazandırmasında öğretmenlerin olumlu görüş bildirmesi araştırmanın ilgi çekici sonuçlarından biri olarak karşımıza çıkmaktadır. Çünkü STEM eğitiminin amaçlarından ve sağladığı faydalardan biri de ekip çalışmasıdır.

Literatürde yapılan çalışmalar okul öncesi öğretmenlerinin fen eğitimine yönelik olumlu ya da olumsuz düşünceye sahip olmanın önemi üzerinde durmaktadır. Öğretmenlerin düşüncelerinin yalnızca kendilerini etkilemediği aynı zamanda sınıf içindeki fen etkinlikleri ve dolayısıyla çocukların fen eğitimine karşı düşüncelerinin olumlu ya da olumsuz olmasını da etkilediği görülmektedir(Kefi,2013). Bu açıdan araştırma sonucunda STEM eğitimi ve uygulamalarına yönelik öğretmen görüşlerinin olumlu çıkması son derece önemlidir.

Araştırma sonucunda öğretmenlerin STEM eğitimi ve uygulamalarına yönelik görüşlerinde meslekteki kıdem yıllarına göre anlamlı bir fark bulunmadığı belirlenmiştir.

Araştırma sonucunda öğretmenlerin STEM eğitimi ve uygulamalarına yönelik görüşleri ile mezun oldukları fakülte düzeyinde yapılan karşılaştırmada teknik bilgilerin yeterliliği maddesinde anlamlı bir fark bulunması öğretmenlerin STEM disiplinleri konusunda yeterlilikleri arasında fark olduğu ortaya çıkmıştır.

Araştırma sonucunda elde edilen veriler değerlendirildiğinde; günümüz bilgi ve teknoloji çağında eğitimde istenilen hedeflere ulaşılabilmesi için STEM eğitimi ve uygulamalarının okul öncesi eğitimde kullanılmasının kayda değer yararlar sağlayacağı düşünülmektedir.

ÖNERİLER

Okul öncesi eğitimin, çocuğun ileriki öğrenim hayatına etkisindeki sahip olduğu önem düşünüldüğünde okul öncesi eğitimde STEM eğitimi ve uygulamalarının daha etkin ve yaygın olarak kullanılması gerektiği düşünülmektedir. Ayrıca okul öncesi öğretmenlerinin bu alanlardaki bilgi, donanım ve yeterlilik düzeylerinin artırılması amacıyla uzman kişiler rehberliğinde hizmet içi eğitim kursları planlanmalı ve gerekli sıklıklarla uygulanmalıdır.

Çalışmanın, Kayseri ilinde pilot okul olarak belirlenen tek bir okuldaki sınırlı sayıda okul öncesi öğretmeniyle yürütülmüş olduğundan daha kapsamlı ve geniş bir örneklemi içeren çalışmalar yürütülmelidir. Çalışmanın bu alanda çalışacak araştırmalara rehberlik edecek pilot bir çalışma olduğu düşünülmektedir.

ÖZET: Bilimin doğası boyutuyla ilgili olarak yapılan gelişmeler kapsamında, konuyla ilgili literatür taranmış ve bilimin doğasını anlamaya yönelik etkinliklerin yeterli seviyede olmadığı görülmüştür. Bu amaçla 5.sınıf "Madde ve Değişim" ünitesi kapsamında yeni etkinlikler geliştirilmiş ve etkinliklerin etkililiği sınanmıştır. Çalışma Tokat il merkezine bağlı bir ortaokulda 5.sınıfta öğrenim gören iki sınıftan toplam 30 öğrenciyle gerçekleştirilmiştir.İlgili üniteye yönelik geliştirilen "Termoskoptan Termometreye", "Tombala Oyunu" etkinlikleri ve literatürden"Bilim Çarkı" etkinliği deney grubuna uygulanmış, kontrol grubuna ise bilimin doğası kazanımları ders kitabı içeriği ile bütünleştirilerek sunulmuştur. Deney ve kontrol grubuna ön-son test olarak VNOS-E anketi uygulanmış, uygulanan anketler üç araştırmacı tarafından kodlanarak tutarlılık katsayısı 0,78 olarak hesaplanmıştır. Elde edilen bulgulara göre, deney grubunda bilimin doğasına yönelik görüşlerinin tamamında pozitif yönde bir değişme olmuş, iki grubun son test puanları arasında deney grubu leyhine anlamlı fark bulunmuştur. Çalışma sonunda ilgililere gerekli ve uygulanabilir öneriler sunulmuştur.

Anahtar Kelimeler: Bilimin doğası, "Madde ve Değişim" ünitesi, 5. Sınıf Etkinlikleri, VNOS-E anketi

Abstract: Within the context of new findings about nature of science, literature has been reviewed and it was seen that the activities to develop nature of science understanding were not adequate. For this reason, new activities were developed as a part of 5th grade 'Matter and Change' unit and their effectiveness was tested. The research was conducted with 5th grade students from two classrooms, who were attending to a middle school in Tokat city center. Activities developed about the unit; 'Thermoscope to Thermometer', 'Lotto Game' and 'Science Wheel' activity from the literature were applied to experimental group with textbook content, as for control group the nature of science concepts were integrated with textbook content. VNOS-E questionnaire was conducted both for pretest and posttest to experimental and control group, the questionnaires were coded by three researchers and the coefficient of consistency was calculated as 0,78. Results indicated that, experimental group's view of nature of science in all dimensions was changed in a positive way, a significant difference was found between the posttests of two groups in experimental group's favor. As a result, essential and applicable suggestions were made for those who concerned.

KeyWords: Nature of Science, 'MatterandChange' unit, 5thgradeactivities, VNOS-E Questionnaire

GİRİŞ

Bilimsel gelişmelerin yoğun olarak yaşandığı günümüzde,birçok ülkede, fen eğitiminin nihai amacı, tüm bireylerin bilimsel okuryazarlığını geliştirmek olarak ifade edilmektedir. Bilimsel okuryazarlık,bireyin bilim ve teknoloji anlayışını gerektiren durumlarda sorumluluk gösteren kararlar vermesi ve bilişsel harekete geçebilmek için gerekli bilgi ve beceriye sahip olması olarak tanımlanmaktadır (Laugsksch, 2000).Küresel iklim değişikliği, enerji kaynakları, kök hücre araştırmaları ve modern tıptaki birçok gelişmelerle ilgili sosyobilimselsorunlar sadece bilim insanlarını ve bu alanlarda çalışan diğer uzmanları değil, toplumun tüm bireyleri ilgilendiren konulardır. Bilimsel okuryazarlığı yüksek olan bireyler bu konularda fikir yürüterek süreçlere katılım gösterebilirler. Bu nedenle bilimsel okuryazarlığın geliştirilmesi ve bunun için ise bilimin doğasının anlaşılması önemlidir (Fowler, Zeidler&Sadler, 2009). Yenilenen fen bilimleri eğitim programında fen-teknoloji-toplum ve çevre öğrenme alanlarında sosyo-bilimsel konulara yönelik muhakeme yapma becerisine ve bilimin doğasını anlamaya yer verilmiştir (MEB, 2013).Araştırmacıların ortak bir tanımlaması olmaksızın bilimin doğası; McComas, Clough ve Almazroa (2002) tarafından, bilimin ne olduğu, nasıl çalıştığı, bilim insanlarının sosyal bir grup olarak nasıl çalıştıkları ve toplumun bilimsel çabaları nasıl yönlendirdiği ve nasıl tepki verdiği gibi konuların açıklanmasında; psikoloji gibi bilişsel bilimlerden araştırma ile bütünleştirilmiş bilim felsefesini, bilim tarihini ve bilim sosyolojisini içeren çeşitli sosyal bilimlerin bir karışımı olarak tanımlamışlardır. Fen eğitimcileri için ise bilimin doğasının; bilim felsefesi, bilim tarihi, bilim sosyolojisi ve bilim psikolojisinin fen öğretimi ve fen öğrenmeye uygulanırken ve onları potansiyel olarak etkilerken üzerine gittiği sorunların kesişmesini ifade ettiğini ve fen eğitimcilerine bilimi öğretmede yol gösteren temel yapılardan olduğunu belirtmişlerdir. Bilim ve bilimin doğası üzerinde çalışan araştırmacılara göre bilimin doğası ile ilgili bahsedilmesi gereken özellikler: (1) Bilimsel bilginin değişebilir doğası, (2) Bilimsel bilginin deneye dayalı doğası, (3) Subjektiflik, (4) Bilimsel bilginin yaratıcı doğası, (5) Bilimsel bilginin sosyal ve kültürel yapısı, (6) Gözlemler, çıkarımlar , (7) Bilimsel teoriler ve başlıklar, (8) Bilimsel bilginin teori kökenli doğası, (9) Bilimsel yöntem miti olarak sıralamaktadır (Lederman, Abd-El-Khalick, Bell ve Schwartz, 2002).Bilimin doğası; bilimin ne olduğu ve hangi rolleri içerdiğini, bilim insanlarının kim olduğu ve hangi rolleri üstlendiklerini, bilimsel ipuçlarını, gözlemleri, olayları, kuralları, kanunları ve bilimsel yöntemi, bilimin nasıl yapıldığını anlamayı kapsamaktadır (Taşar, 2003).

Öğrencilerde bilimin doğası anlayışlarını geliştirmek üzere genel olarak üç yaklaşım vardır. Bunlar tarihsel, dolaylı ve doğrudan-yansıtıcı yaklaşımlardır. Araştırmalar bu üçü arasından en etkili yöntemin doğrudan-yansıtıcı yaklaşım olduğunu göstermektedir. Doğrudan-yansıtıcı yaklaşım birçok farklı gruba bilimin doğasını öğretmede etkili bulunmuş bir yaklaşım türüdür (Abd-el-Khalick&Lederman, 2000).Öğrencilerin erken sınıflarda bilimin doğası anlayışlarının geliştirilmesi, onların ilerleyen sınıflarda hem bilimin doğasını hem de fen ders içeriğini daha iyi anlamalarına yardımcı olabilir (Akerson, Buck, Donnelly, Nargund-Joshi&Weiland, 2011). Akerson ve Donnelly (2010) doğrudan-yansıtıcı yöntemin okul öncesi dönemdeki çocuklara bilimin doğasını öğretmede dahi başarılı bir yaklaşım olduğunu belirtmişlerdir. Akerson, Nargund-Joshi, Weiland, Pongsenon ve Avsar (2013) ilkokul üçüncü sınıf öğrencilerine (Amerikan eğitim sistemine göre 8 yaş grubu) doğrudan-yansıtıcı yaklaşımı bir öğretim yılı boyunca uygulamışlar ve etkili olduğunu görmüşlerdir. Doğrudan-yansıtıcı yaklaşıma dayalı bilimin doğası öğretimi sonucunda durumsal olarak seçtikleri üç öğrenciden düşük başarılı öğrencinin bilimin doğasını tartışabildiği, orta düzeyde başarılı öğrencinin bilimin doğasını tartışabildiği ve hakkında yazabildiği, yüksek başarılı öğrencinin ise bilimin doğası hakkında tartışabildiği, yazabildiği ve bilimin doğası ile ilgili sorular öne sürdüğü görülmüştür. Öğrencilerin bilimin doğasının daha somut olan boyutlarını (deneysel veriler ve gözlem ve çıkarım arasındaki fark gibi), bilimin doğası ile ilgili soyut fikirlere göre (öznellik, yaratıcı ve değişebilir oluşu) daha kolay öğrendikleri görülmüştür. Bu nedenle Akerson ve ark. (2013) küçük yaştaki öğrencilere bilimin doğası öğretilirken önce daha somut boyutlara daha sonra soyut boyutlara vurgu yapılması gerektiğini belirtmişlerdir.

Literatürde bilimin doğası ile ilgili çoğu araştırmada bilimin doğasının fen ders içeriğinden bağımsız olarak verildiği görülmüştür. Ayrıca ilkokul, ortaokul beşincisınıf ve okul öncesi dönem öğrencileriyle yapılan çalışmalar oldukça sınırlı sayıdadır. Bu çalışmada beşinci sınıf öğrencileri çalışma grubu olarak seçilmiş ve "Madde ve Değişim" ünitesine bütünleşmiş etkinliklerle doğrudan-yansıtıcı yaklaşım benimsenerek, öğrencilerin bilimin doğası hakkındaki görüşleri incelenmiştir. Bu araştırmanın örneklem olarak beşinci sınıf öğrencilerinin seçilmesi ve "Madde ve Değişim" ünitesine yönelik yeni bilimin doğası etkinlikleri içermesinden dolayı erken yaşta bilimin doğası öğretimi ile ilgili çalışmalara ışık tutacağı düşünülmektedir.

YÖNTEM

Araştırma Modeli

Araştırmada ön test son test kontrol gruplu yarı-deneysel yöntem kullanılmıştır. Uygulama yapılan okuldakibeşinci sınıf şubelerinden biri deney grubu, bir diğeri ise kontrol grubu olarak seçilmiş, çalışma öncesinde ve sonrasında her iki gruba da bilimin doğası hakkındaki görüşlerini belirlemek amacıyla bilimin doğası anketi uygulanmıştır.

Araştırmanın Örneklemi

Çalışma; Tokat iline bağlı merkez bir köyde bulunan bir ortaokulda öğrenim görmekte olan toplam 30 beşinci sınıf öğrencisi ile gerçekleştirilmiştir. Uygulama yapılan okulda iki tane beşinci sınıf şubesi bulunmaktadır. Şubelerde bulunan öğrencilerin sosyoekonomik düzeyleri, başarı ortalamaları ve aile profilleri eşit durumdadır. Bu öğrencilerin derslerine de yine aynı öğretmenler girmektedir.Çalışma kapsamında 15'er öğrenci içerenşubelerden seçkisiz olarak deney ve kontrol grupları belirlenmiştir. "Madde ve Değişim" ünitesi boyunca kontrol grubunda 5. sınıfFen Bilimleri ders kitabında yer alan etkinlikler uygulanmış, bilimin doğası boyutları ile ilgili farklı bir etkinlik yapılmamıştır. Deney grubunda ise; araştırmacılar tarafından geliştirilen bilimin doğası etkinlikleri"Madde ve Değişim" ünitesinin öğretimi ile birleştirilerekdoğrudan yansıtıcı yaklaşımla uygulamalar yapılmıştır. Çalışma yapılan her iki sınıfta da daha önceden bilimin doğası boyutları ile ilgili herhangi bir öğretim yapılmamıştır.

Veri Toplama Araçları

Çalışmada veri toplama aracı olarak Lederman ve Ko (2004) tarafından geliştirilen ve Erenoğlu (2010) tarafından literatürümüze kazandırılan VNOS-E anketi kullanılmıştır.Anketin içerdiği sorularla ilgili alt boyutlar aşağıdaki tabloda yer almaktadır.

Tablo 1.VNOS-E Ölçeğinin Alt Boyutları

Bilimin Doğası Boyutları	VNOS-E Soruları						
	1	2	3	4	5	6	7
Bilimsel bilgi güvenilirdir ama değişebilir	X		X	X		X	
Bilimsel bilgi mantıksal, matematiksel ve deneysel çıkarımlar içerir	X	X					
Bilimsel bilgi özneldir	X				X		
Bilimsel bilginin elde edilmesinde hayal gücü ve yaratıcılığın önemli bir rolü vardır	X			X			X
Gözlem ve çıkarım farklı şeylerdir	X			X		X	

Kaynak: Seçkin, 2013; 34.

Uygulamalar

Araştırma, 5. sınıf öğrencileriyle Fen Bilimleri dersinde "Madde ve Değişim" ünitesinin öğretimi sırasında5 hafta boyunca toplam 20 ders saatinde yürütülmüştür. Deney grubunda doğrudan yansıtıcı yaklaşımla bilimin doğası öğretilirken, kontrol grubunda Fen Bilimleri dersiöğretim programına bağlı kalınmış, ders kitabı içeriği dışında bilimin doğası ile ilgili doğrudan herhangi bir uygulama yapılmamıştır.

Deney Grubunda Kullanılan Etkinlikler

Araştırmada doğrudan yaklaşıma uygun olarak araştırmacılar tarafından geliştirilen "Termoskoptan Termometreye" adlı bir drama etkinliği ve "Tombala Oyunu" etkinliği ile birlikte literatürde yer alan "Kavram Çarkı ile Bilim"etkinliğinin konuya uyarlaması yapılarak uygulanmıştır.Araştırmacılar tarafından geliştirilen etkinlikler için uzman görüşü alınmış ve etkinlikler ders programına entegre edilerek kullanılmıştır. Tablo 2'de etkinlikler ve bu etkinliklerin yansıttığı bilimin doğasının boyutları verilmiştir. Ayrıcailgili etkinliklere ait açıklamalar sunulmuştur.

Tablo 2. Hazırlanan Etkinliklerin Bilimin Doğası Boyutları

Bilimin Doğası Boyutları	Kullanılan Etkinlikler		
	Bilim Çarkı	Termoskoptan Termometreye	Tombala Oyunu
Bilimsel bilgi güvenilirdir ama değişebilir	X	X	
Bilimsel bilgi mantıksal, matematiksel ve deneysel çıkarımlar içerir	X	X	X
Bilimsel bilgi özneldir		X	
Bilimsel bilginin elde edilmesinde hayal gücü ve yaratıcılığın önemli bir rolü vardır	X		
Gözlem ve çıkarım farklı şeylerdir	X		X

Kavram Çarkı ile Bilim: Öğrencilerin bilim, bilim insanı ve bilimsel bilgi ile ilgili fikirlerini ortaya çıkarmayı amaçlayan bir etkinliktir (Doğan, Çakıroğlu, Bilican ve Çavuş, 2010). Etkinlik uygulanırken öğrencilerin maddenin halleri ile ilgili sınıfta uygulanan deneylerden gözlem ve çıkarımlara ulaşmaları beklenmektedir. Etkinlikte öğrencilerin verdikleri cevaplarla tahtaya bir bilim çarkı oluşturulmuştur.

Tombala Oyunu:Öğretmen sınıftan önceden belirlediği altı öğrenci seçer ve öğrencilerin birbirini görebileceği biçimde sınıfta oturma düzenlemesi yapar. Ardından hazırlanan tombala kartonlarını seçilenöğrencilere verir. Başka bir öğrenci daha seçerek ona da içinde renkli kartonların bulunduğu poşet verir. Poşetin içinde Genleşme, Büzülme, Kaynama, Yoğunlaşmave Süblimleşme kavramlarını temsil edecek resimler bulunmaktadır. Her bir öğrenci hangi kavramı temsil ediyorsa o öğrenci tombala poşetinden çıkan resmi alır ve oyununu oynar. Öğretmen bu esnada, diğer öğrencilere arkadaşlarını gözlemlemelerini ve hangi arkadaşlarının hangi kavramı temsil ettiğini bulmalarını ister. Gözlem ve ardından çıkarımlarını açıklamalarını ister.
Termoskoptan Termometreye:Drama, okuma parçası ve tartışmalardan oluşan bir etkinliktir. Etkinlikte öncelikle öğrencilere evde çalışmaları için drama etkinlikleri verilir, termometrenin yapımını araştırmaları istenir. Yapacakları deneylerde kullanılacak malzemeler önceden temin edilir. Daha sonra içinde sıcak su bulunan şişe ucuna geçirilen balonun şişmesi deneyi yapılır. Öğrencilerin havanın genleştiğinde hacminin arttığı sonucuna ulaşmaları beklenir. "Termoskoptan Termometreye" okuma parçası okutulur ve ardından drama etkinliğine geçilir. Drama; Galileo ve onunla birlikte Viyana'da yaşayan arkadaşları SantorioSantorio ve GianFrancescoSagredo arasında geçen bir konuşmaya dayanmaktadır. Konuşmaların ardından o dönemde yapılan icadın eksikliklerinden bahsedilmekte ve modern termometreye geçiş ihtiyacı vurgulanmaktadır.

Verilerin Analizi

Deney ve kontrol gruplarına bilimin doğası anketi ön ve son test olarak uygulanmıştır. Uygulanan testler üç araştırmacı tarafından okunarak yanlış cevap, yetersiz; kısmen yeterli cevap, uygun; istenen düzeyde verilen cevaplar modern görüş olarak kodlanmış ve sırasıyla 0, 1 ve 2 şeklinde puanlandırılmıştır. Çalışmada kodlayıcı tutarlılığı 0,78 olarak hesaplanmıştır. Öğrenci cevaplarının betimsel analizi yapılarak bilimin doğası boyutlarındaki değişim ön test ve son test sonuçlarının karşılaştırılması ile tespit edilmeye çalışılmıştır.

BULGULAR

Deney ve kontrol gruplarına uygulanan bilimin doğası anketininön ve son test puanlarının betimsel analizi Tablo 3'de verilmiştir.

Tablo 3. Grupların Ön- Son Test Puanlarının Bilimin Doğası Alt Boyutlarına Göre Betimsel Analizi

Grup			1			2			3			4			5			6			7		
			0	1	2	0	1	2	0	1	2	0	1	2	0	1	2	0	1	2	0	1	2

0: Yetersiz 1: Uygun 2: Modern görüş

Grupların öntestte sorulara verdikleri cevaplar kategoriler bazında incelendiğinde yaklaşık olarak her iki grubun benzer puanlar aldığı görülmüştür. Son test puanlarına bakıldığında yetersiz cevaplardaki yüzdelerdeki değişimin deney grubunda tüm sorularda düşüş, kontrol grubunda 4. soruda ve 7. soruda artış şeklinde olduğu görülmüştür. Uygun görüşlerin oranı deney grubunda 1-2 ve 5. soru için artış göstermiş, 3-6 ve 7. sorularda değişmemiş; 4. soruda azalmıştır. Kontrol grubunda ise 4. ve 7. soruda azalma diğerlerinde artma olmuştur. Modern görüşlerde ise deney grubunda 2. soruda değişme olmazken diğer sorularda artış olmuştur; kontrol grubunda ilk soruda azalma, 3 ve 7.soruda artma ve diğerlerinde değişme olmamıştır.

Bilimin doğası boyutlarına göre son test puanları "Bilimsel bilgi güvenilirdir ama değişebilir" boyutu için 1, 3, 4, 6. sorularda incelendiğindeöğretim sonrasında deney grubunda uygun ve modern görüşler birinci soruda %40 (%20'den %60'a), 3. soruda %27 (53'ten 80'e), 4. soruda %7 (47'den 54'e) ve 6.soruda %20 (34'ten 54'e) yükselmiştir. Kontrol grubunda ise sırasıyla sorulardaki değişim yüzdeleri 0, 26, -44 ve 7 oranındadır. "Bilimsel bilgi mantıksal, matematiksel ve deneysel çıkarımlar içerir" boyutuyla ilgili olan 1. ve 2. soruya verilen cevaplar yetersiz görüşlerin uygun görüşe büyük oranda dönüştüğü (2. soruda uygun görüş deney grubunda %13 ten %80'e, kontrol grubunda %7'den %67'ye),deney ve kontrol grubunda değişim yüzdelerinin 67 ve 60 olduğu görülmüştür. "Bilimsel bilgi özneldir" boyutuyla ilgili olan 1 ve 5. sorudan 5. Soru için uygun ve modern görüşlerin toplamındaki değişim %26 deney grubunda %7 kontrol grubundadır."Bilimsel bilginin elde edilmesinde hayal gücü ve yaratıcılığın önemli bir rolü vardır" boyutunda yer alan 1.,4. ve 7. Sorular incelendiğinde 7. soruda değişimin deney grubunda %20 kontrolde %3 olduğu görüşmüştür. Son boyut olan

“Gözlem ve çıkarım farklı şeylerdir” 1., 4. ve 6. soruları içermektedir ki birinci alt boyutla aynı değerlerde sırasıyla yüzde 40, 7 ve 20 deney grubu lehine artış gözlenmiştir.

Bilimin doğasıyla ilgili tüm boyutlarda deney grubunun puan artığının fazla olduğu görülmektedir. “Bilimsel bilgi güvenilirdir ama değişebilir” ,“Bilimsel bilginin elde edilmesinde hayal gücü ve yaratıcılığın önemli bir rolü vardır”,“Bilimsel bilgi özneldir” “Gözlem ve çıkarım farklı şeylerdir” boyutlarında değişim daha fazladır.

Deney ve kontrol grubunun ön test ve son test puanlarının karşılaştırılmasında hangi tür istatistiksel analizi yapılacağını belirlemek için verilerin normal dağılım gösterip göstermediği Kolmogorov –Smirnovtesti ile kontrol edilmiştir. Kontrol grubu için ön test değerleri K –S z=0,599 p=0,866 ve son test z=0,527 p= 0,944 bulunmuştur. Deney grubu için K-S z=0,778 p=0,580 ve son test z=0,672 p=0,757 bulunmuştur ki p|>0,05 verilerin normal dağılımını göstermektedir. Parametrik testler uygulanabilir (Pallant, 2005)

Grupların ön ve son test puanlarının karşılaştırılması için yapılan ilişkisiz örneklemler t testi sonuçları Tablo 4’te verilmiştir.

Tablo 4.Ön ve son test puanlarına ait t testi sonuçları

	Gruplar	N	$\bar{X}$	S	sd	t	p
Öntest	Kontrol	15	2,53	1,73	28	-0,344	0,733
	Deney	15	2,80	2,45			
Sontest	Kontrol	15	3,20	2,21	28	-2,365	0,025*
	Deney	15	6,00	4,02			

Tablo 4’den de görüleceği üzere öğrencilerin ön test puanları arasında anlamlı farklılık yoktur (t=-0,344,p>0.05). Buna göre etkinlikler yapılmadan önce bilimin doğası hakkındaki görüşler bakımından iki grubunda birbirine benzer olduğu söylenebilir. Ünitenin bitiminde bilimin doğası ile ilgili etkinlikler ek olarak deney grubunda uygulandıktan sonra son test puanları arasında anlamlı farklılık bulunmuştur (t=-2,365, p<0,05). Bu bilimin doğasına yönelik yapılan etkinliklerin öğrencilerin bilimin doğası hakkındaki görüşlerini geliştirmede etkili olduğunu göstermektedir. Hesaplanan etki büyüklüğü (etki büyüklüğü: η^2=0,2)oldukça geniştir (Büyüköztürk, 2012). Buna göre bilimin doğasında görülen varyansın yaklaşık %20’sinin uygulanan etkinliklerden kaynaklandığı söylenebilir.

Kontrol grubunda sadece programda yer alan etkinlikler uygulanmıştır. Her ne kadar programda bilimin doğasının öğretimine vurgu yapılsa da, bunun uygun etkinlik ve yaklaşımlarla yeterince desteklenmediği açıktır. Bu durumda, bilimin doğasına yönelik aktivitelerin kullanımının, bu tür aktivitelerin kullanılmadığı ders işleyişine göre anlamlı düzeyde etkili olduğu ileri sürülebilir.

TARTIŞMA

Bu çalışmada 5. sınıf öğrencilerinin bilimin doğasını anlayışlarınıgeliştirmek amacıyla hazırlanan etkinliklerin uygulanması sonucunda, öğrencilerin bilimin doğası hakkındaki görüşlerinde meydana gelen değişimler incelenmiştir.Deney grubunda ders kitabındaki etkinlerin yanında farklı etkinlikler uygulanmış, kontrol grubunda ise fen bilimleri öğretim programına uygun olarak kullanılan 5. sınıf Fen Bilimleri ders kitabındaki etkinlikler dışında herhangi bir etkinlik uygulanmıştır. Uygulanan etkinlikler sonucunda; deney grubunun bilimin doğası anketi puanlarında anlamlı farklılık olduğu görülmüş ancak kontrol grubunun puanlarında anlamlı bir farklılık görülmemiştir (Tablo 4). Çeşitli etkinliklerin uygulanması yoluyla erken yaşlarda bilimin doğası anlayışlarının geliştirilebileceğine yönelik bu bulguyu destekleyen araştırmalar mevcuttur (Akerson ve ark., 2011; Can ve Şahin Pekmez, 2010;Erenoğlu, 2010).

Kontrol grubundaki öğrencilerin puanları incelendiğinde 3. (bilimsel bilginin değişebilir) ve 7. (hayal gücü ve yaratıcılığın rolü) soruda yetersiz görüşlerde artış olduğu görülmüştür. Bu durum fen dersinde kitaba dayalı yapılan öğretimin bu sonuca yol açmış olabileceğini akla getirmektedir. Özellikle bilimsel bilgilerin değişebilir doğası ile ilgili olarak öğrencilerin görüşlerini %50 oranında yetersize görüşe doğru değiştiği görülmektedir. Bunun nedeni anket uygulandıktan sonra öğrencilere anketteki soruların cevapları hakkında uygulamadan dolayı bir dönüt verilmemesi, öğrencilerin kendi aralarında ankette verdikleri cevaplar hakkında konuşmaları ve sonuçta da öğrencilerin verdikleri cevaplardan emin olamayıp görüş değişikliğine gitmeleri olabilir. Öğrencilerin görüşlerini etkileyecek bir başka neden olarak da fen bilimleri ders kitabında yer alan ifadelerin genellikle bilimsel bilginin kesinliğine işaret edecek biçimde yazılması gösterilebilir. Ancak kontrol grubundaki gibi sadece ders kitabındaki etkinliklere ve programdaki yaklaşıma bağlı olarak gerçekleştirilen öğretimin yenilenen fen bilimleri programında öngörüldüğü gibi bilimin doğası hakkındaki görüşleri geliştirmede yeterli olmadığı açıktır.

Deney grubundaki öğrencilerin bilimin doğası anlayışları farklı boyutlar açısından ele alındığında ise genel olarak tüm boyutlarda puan artışı olduğu ve yetersiz görüşlerin uygun ya da modern görüşlere doğru değiştiği gözlenmiştir. Bu durum uygulanan etkinliklerin beklenen düzeyde etkili olduğunu göstermektedir. Ancak en az puan artışının 'Bilimsel bilgi mantıksal, matematiksel ve deneysel çıkarımlar içerir' boyutunda olduğu görülmüştür. Etkinliklerde bu boyuta yer verilmesine rağmen gözlenen gelişimin az olmasının nedeni çıkarım yapmanın öğrencilere fazla soyut gelmesi olabilir. Bu çalışmada uygulanan etkinliklere ek olarak ünite ile ilgili kazanımları göz ardı etmeden, matematiksel işlem ve ifadelere yer verilen bir etkinliğe ya da deneye yer vermek bu boyutta görüşlerin daha çok geliştirilmesinde etkili olabilir. Bu boyutla ilgili olan anket sorularında öğrencilere bilimin tanımı ve bilimi diğer alanlarda farklı kılan özellikler sunulmuştur. Öğrenciler genellikle bilimi sadece sınıfta gördükleri fen dersleriyle ilişkilendirdiklerinden, ders bazında düşünüp ayrım yapmakta zorlanmış olabilirler. Bir başka neden ise bu boyutla ilgili soru sayısının göreli olarak daha az olmasıdır. Öğrencilerin görüşlerini açığa çıkarmada her boyutla ilgili daha fazla soru sorulması geçerliliği artırabilir. Soru bazında bakıldığında ise yetersiz görüşlerin, uygun ve modern görüşlere değişiminin göreli olarak en az olduğu soru 6. sorudur. Bu soruda öğrencilere meteoroloji uzmanlarının hava durumu ile ilgili verdikleri bilgilerin kesinliği hakkında yorum yapmaları beklenmiştir. Soru, gözlem ve çıkarım yapma boyutları ve bilimsel bilginin değişebilir olduğu ile ilgilidir. Etkinliklerde bu boyutlara yer verilmesine rağmen öğrenciler bu soruda yorum yapmada oldukça zorlanmışlardır. Bunun nedeni öğrencilere geçmiş öğrenimleri boyunca iklim ve hava durumu ile ilgili verilen bilgiler olabilir. Ayrıca 5. sınıf öğrencileri genellikle iklimi ve hava olaylarınıhava durumu ile karıştırma eğilimindedir ve bu konularla ilgili kavram yanılgılarına sahiptir. (Henriques, 2000; Doğar ve Başıbüyük, 2005). Bu da onların bu soruda doğru çıkarımlar yapmalarını engellemiş olabilir. Özellikle 5. sınıf düzeyinde bu boyuttaki görüşler öğrencilerin kavramada zorluk çekmediği bir konu ile ilgili olursa, öğrencilerden daha yüksek oranda uygun ve modern görüşler alınabilecektir.

SONUÇ VE ÖNERİLER

Bilimin doğası boyutuyla ilgili olarak yapılan gelişmeler kapsamındabilimin doğasını anlamaya yönelik etkinliklerin yeterli seviyede olmadığı düşünülerek 5.sınıf "Madde ve Değişim" ünitesi kapsamında yeni etkinlikler geliştirilmiş ve etkinliklerin etkililiği sınanmıştır. Araştırma bulgularından deney grubu öğrencilerinin, kontrol grubu öğrencilerine göre VNOS-E ölçeğinden daha yüksek puanlar aldığı belirlenmiştir. Bu doğrultuda, oluşturulan etkinlikler sayesinde deney grubu öğrencilerinin bilimin doğasını anlama konusunda kontrol grubu öğrencilerine göre daha fazla ilerleme gösterdiği tespit edilmiştir. Ayrıca, her iki grubun ön test – son test puanları kendi içinde incelendiğinde; her iki grubun da bilimin doğasını anlama becerilerinin arttığı, bu nedenle de her iki öğretimin (bilimin doğası etkinlikleri ve programdaki öğretimin) öğrencileri üzerinde bilimin doğasını anlamalarına katkı sağladığı söylenebilir. Gerçekleştirilen bu çalışmanın ışığında şu öneriler sunulabilir;

- Bilimin doğasını öğrencilerin anlaması için ders kitaplarına bu ve bunlara benzer etkinlikler yerleştirilmeli ve işlenen üniteye bu etkinlikler entegre edilmelidir.
- Fen ve Teknoloji/Fen Bilimleri öğretmenleri farklı üniteler işlerken ve farklı sınıflarda eğitim-öğretim yaparken bu etkinliklerden faydalanabilir.
- Alan araştırmacıları, hazırlanan bu etkinliklerle farklı sınıf seviyelerinde alan araştırması yapabilirler.
- Öğretmen adaylarına bilimin doğası etkinliklerinin nasıl hazırlanacağına ilişkin dersler verilebilir.
- Fen ve Teknoloji/Fen Bilimleri öğretmenlerine bilimin doğası etkinliklerinin nasıl hazırlanacağına yönelik hizmet içi seminerler düzenlenebilir.

ÖZET: Bu çalışmanın amacı, öğretmen eğitimi programında yer alan bilimsel araştırma yöntemleri dersi ile bu dersi alan ve aynı zamanda farklı bilimsel araştırmaları inceleyen ilköğretim matematik öğretmeni adaylarının bilimsel epistemolojik inançlarındaki değişimi incelemektir. Çalışma ön-test son test üç gruplu (iki deney bir kontrol) yarı-deneysel araştırma modeline göre yürütülmüştür. Araştırmada deney gruplarından biri (Deney-1) hem bilimsel araştırma yöntemleri dersini hem de beş farklı yüksek lisans ve doktora tezini incelemiş, diğer bir grup (Deney-2) sadece bilimsel araştırma yöntemleri dersini almış, son grup (Kontrol) ise ne bilimsel araştırma yöntemleri dersini almış ne de herhangi bir bilimsel çalışmayı incelememiştir. Çalışmanın örneklemini ülkemizin Ege bölgesindeki bir eğitim fakültesi ilköğretim sınıf öğretmenliği bölümünde okuyan 99 öğretmen adayı oluşturmaktadır. Veri toplama aracı olarak Pomeroy (1993) tarafından geliştirilen ve Deryakulu ve Bıkmaz (2003) tarafından Türkçe'ye uyarlanan "Bilimsel Epistemolojik İnançlar Ölçeği" kullanılmıştır. Elde edilen sonuçlar her bir gruptaki öğretmen adaylarının bilimsel epistemolojik inanç ölçeğinden aldıkları ön test ve son test puan ortalamaları arasında istatistiksel olarak anlamlı bir farklılığın olmadığını göstermektedir. Buna karşın her üç grubun son test puan ortalamaları karşılaştırıldığında ise Deney-1 ve Deney-2 lehine anlamlı bir farklılığın olduğu belirlenmiştir. Bu durum farklı bilimsel çalışmaları incelemenin ve bilimsel araştırma dersinin öğretmen adaylarının epistemolojik inançlarının geleneksel olmayan inanca doğru bir değişime neden olduğunu göstermektedir.

Anahtar sözcükler: İnanç, epistemolojik inanç, bilimsel epistemolojik inanç, öğretmen adayları, inançlardaki değişim

ABSTRACT: The aim of this study was to examine the effects of both scientific research method course and investigating different scientific research papers on the pre-service teachers' scientific epistemological beliefs. A quasi-experimental statistical design (two experimental groups and one control group) was used in the study. One of the experimental groups (Deney-1) took both scientific research method course and investigated five different research papers and other group (Deney-2) took only scientific research method course. The control group (Kontrol) took neither scientific research method course nor investigates research papers. The sample under investigation was comprised of 99 pre-service teachers from a university in the Aegean region of Turkey. In order to determine pre-service teachers' scientific epistemological beliefs the "The Scientific Epistemological Beliefs Survey" developed by Pomeroy (1993) and adapted to Turkish by Deryakulu and Bıkmaz (2003) was used. The finding showed that there was no any statistically meaningful difference between pre-service teachers' pre-test and post-test scientific epistemological beliefs scores. Moreover, comparing the post-test scores of the groups, there was a statistically meaningful difference in favor of both Deney-1 and Deney-2. This shows that both scientific research method course and investigating different scientific research papers had an effect on the pre-service teachers' scientific epistemological beliefs.

Keywords: Beliefs, epistemological beliefs, scientific epistemological beliefs, pre-service teachers, changing beliefs.

GİRİŞ

Bilim, olgular hakkında gözleme, deneye, akla dayanarak sistematik yollarla elde edilen bilgileri içermektedir. Bilimsel bilginin elde edilmesinde problemin fark edilmesi, problemin tanımlanması, çözüm önerilerinin tahmini, araştırma yöntemlerinin geliştirilmesi, verilerin toplanması ve analizi ile karar verme ve yorumlama aşamaları takip edilmektedir. Bu bağlamda bilimsel yöntemler betimleme ve açıklama yollarını içeren eylemsel ve aynı zamanda düşünsel süreçlerdir (Büyüköztürk, Çakmak, Akgün, Karadeniz ve Demirel, 2013). Bilginin ne olduğunu ve bireyin nasıl bildiği konusu epistemolojinin alanına girmektedir. Bireyin bilginin doğası ve bilginin öğrenilmesine yönelik inançları epistemolojik inançlar olarak adlandırılmaktadır (Hofer & Pintrich, 1997). Epistemolojik inançlar, özellikle bilginin tanımı, bilginin yapılanması, bilginin değerlendirilmesi, bilginin konumu ve bilginin oluşumu hakkındaki inançları içermektedir. Bu bağlamda bilimsel epistemolojik inançlar ise, bireyin bilimin ne olduğu, özellikleri, yöntemleri, oluşumu ve bilimin nasıl öğretilmesine yönelik inançlarını kapsamaktadır (Deryakulu & Bıkmaz, 2003). Bilimsel epistemolojik inançlara yönelik ilgi, geleneksel pozitivist bilim anlayışından, bireyi merkeze alan ve bireyin yaşadığı kültürün, inançların, değerlerin ve sezgilerin bilimsel araştırma sürecindeki önemini ve gerekliliğini vurgulayan post modern bilim anlayışına geçişin bir sonucu olarak ortaya çıktığı ifade edilmektedir.

Bilimsel epistemolojik inançların öğrenci ve öğretmenlerin öğrenme ve öğretme yaklaşımları, öğrenme ortamları, kullandıkları öğrenme stratejileri ve algılama ve yorumlama biçimleri üzerindeki etkilerini inceleyen çalışmalara rastlanmaktadır (bkz. Richardson, Anders, Tidwell, & Lloyd, 1991; Brownlee, Tickle & Nailon, 2004). Bu durum etkili öğretim uygulamalarının tasarlanması ve uygulanmasında öğretmen ve öğrencilerin bilimsel epistemolojik inançlarının oldukça önemli olduğunu göstermektedir. İnançlar geçmiş deneyimlerimiz sonucunda oluşur ve öğrenim hayatımız boyunca şekillenir. Öğretmen adayları mesleki gelişimlerine katkıda bulunacak bilimsel araştırmaları inceleyebilme, eleştirebilme ve bağımsız araştırma yapabilme yeterliliklerini geliştirmeye yönelik bilimsel araştırma yöntemleri ve araştırma projesi gibi dersleri öğretmen eğitimi programlarında almaktadırlar. Dolayısıyla bu derslerin öğretmen adaylarının bilimsel epistemolojik inançları üzerindeki etkilerinin incelenmesi önemlidir.

Çalışmanın amacı, öğretmen eğitimi programında yer alan bilimsel araştırma yöntemleri dersi ile bu dersi alan ve aynı zamanda farklı bilimsel araştırmaları inceleyen ilköğretim matematik öğretmeni adaylarının bilimsel epistemolojik inançlarındaki değişimi incelemektir.

YÖNTEM

Bu araştırma ön-test son test üç gruplu (iki deney bir kontrol) yarı-deneysel araştırma modeline göre yürütülmüştür. Araştırmada deney gruplarından biri (Deney-1) hem bilimsel araştırma yöntemleri dersini hem de beş farklı yüksek lisans ve doktora tezini incelemiş, diğer bir grup (Deney-2) sadece bilimsel araştırma yöntemleri dersini almış, son grup (Kontrol) ise ne bilimsel araştırma yöntemleri dersini almış ne de herhangi bir bilimsel çalışmayı incelememiştir. Öğretim her üç grupta da araştırmacılardan biri tarafından yürütülmüştür. Araştırmacıların yarı-deneysel araştırma modelini seçmelerinin nedeni bu modelin araştırmacılara bağımlı ve bağımsız değişkenler arasında neden-sonuç ilişkisi kurmasına izin vermesidir (Creswell, 2012).

Örneklem

Çalışmanın örneklemini ülkemizin Ege bölgesindeki bir eğitim fakültesi ilköğretim sınıf öğretmenliği bölümünde okuyan 99 öğretmen adayı oluşturmaktadır. Bu öğretmen adaylarından 36'sı Deney-1 grubunda, 31'i Deney-2 grubunda ve 32'si de Kontrol grubunda yer almaktadır.

Veri toplama aracı

Veri toplama aracı olarak Pomeroy (1993) tarafından geliştirilen ve Deryakulu ve Bıkmaz (2003) tarafından Türkçe'ye uyarlanan "Bilimsel Epistemolojik İnançlar Ölçeği" kullanılmıştır. Ölçek 5'li likert türünde olup 30 maddeden ve tek faktörden oluşmaktadır. Ölçeğin güvenirlik katsayısı (Cronbach Alfa) .91 olarak bulunmuştur. Ölçekte yer alan 30 maddenin geleneksel bilim anlayışını yansıtan 22 maddesi olumlu, geleneksel olmayan bilim anlayışını yansıtan 8 maddesi ise olumsuzdur. Bu anlamda ölçekten alınan yüksek puan geleneksel bilim anlayışına, düşük puan ise geleneksel olmayan bilim anlayışına yönelik inancı göstermektedir.

Verilerin analizi

Öğretmen adaylarının epistemolojik inanç ölçeğinden aldıkları ön-test ve son-test puanlarının aritmetik ortalamaları hesaplanmış ve sahip oldukları inanç düzeyleri Tekin'in (1996) formülü kullanılarak "1,00 - 1,79 = Kesinlikle Katılmıyorum", "1,80 - 2,59 = Katılmıyorum", "2,60 - 3,39 = Kararsızım", "3,40 - 4,19 = Katılıyorum" ve "4,20 - 5,00 = Kesinlikle Katılıyorum" şeklinde düzenlenmiştir. Deney ve Kontrol grubundaki öğretmen adaylarının epistemolojik inanç ölçeğinden aldıkları ön-test puanları arasında istatistiksel olarak anlamlı bir farklılığın olup olmadığını belirlemek için ($\propto = .05$) tek yönlü varyans analizi ANOVA yapılmıştır. Daha sonra her bir grup için epistemolojik inanç ölçeğinden aldıkları ön-test ve son-test puanları arasında istatistiksel olarak anlamlı bir farklılığın olup olmadığını belirlemek için ($\propto = .05$) paired sample t-testi yapılmıştır. Son olarak grupların ön-test puanları kontrol altına alınarak grupların epistemolojik inanç ölçeğinden aldıkları son-test puanları arasında istatistiksel olarak anlamlı bir farklılığın olup olmadığını belirlemek için (∝= .05) kovaryans analizi (ANCOVA) yapılmıştır.

BULGULAR

Deney ve Kontrol grubundaki öğretmen adaylarının ön-test ve son-test puanlarına ait betimsel istatistik sonuçları Tablo 1'de sunulmuştur.

Tablo 1. Bilimsel Epistemolojik İnanç Ölçeğinden Alınan Ön-Test Ve Son-Test Puanlarına İlişkin Betimsel İstatistik Sonuçları

Grup	Ön-test			Son-test		
	N	$\overline{X}$	S.S	N	$\overline{X}$	SS
Deney-1	36	2,78	,252	36	2,73	,239
Deney-2	31	3,23	,284	31	3,14	,343
Kontrol	32	3,32	,345	32	3,32	,222

Tablo 1'den her üç gruptaki öğretmen adaylarının ön-test puan ortalamalarına göre bilimsel epistemolojik inançlarının "kararsızım" seviyesinde olduğu görülmektedir. Bu grupların son-test puan ortalamalarına göre bilimsel epistemolojik inançlarının ise yine "kararsızım" seviyesinde olduğu görülmektedir. Bu durum bilimsel araştırma yöntemleri dersi ile farklı bilimsel araştırmaları incelemenin öğretmen adaylarının bilimsel epistemolojik inançlarını değiştirmede etkili olamadığını göstermektedir. Ancak her üç grubun ön ve son test puan ortalamalarına bakıldığında Deney-1 ve Deney-2 gruplarının puan ortalamalarının düştüğü, ancak Kontrol grubunun puan ortalamasının ise değişmediği belirlenmiştir. Bu durum Deney-1 ve Deney-2 gruplarının bilimsel epistemolojik inançlarının geleneksel olmayan bilim anlayışına doğru yöneldiğini göstermektedir.

Deney ve Kontrol grubundaki öğretmen adaylarının epistemolojik inanç ölçeğinden aldıkları ön-test puanları arasında istatistiksel olarak anlamlı bir farklılığın olup olmadığını belirlemek için (∝= .05) tek yönlü varyans analizi ANOVA sonuçları Tablo 2'de sunulmuştur.

Tablo 2. Epistemolojik inanç ölçeğinden alınan ön-test puanları için yapılan ANOVA testi sonuçları.

	Varyans Kaynağı	Kareler Toplamı	df	Kareler Ortalaması	F	p
Deney-1 Deney-2 Kontrol	Gruplar arası	5,622	2	2,811	32,454	,000**
	Grup içi	8,314	96	,087		

**P<0.01

Tablo 2'den her üç grubun bilimsel epistemolojik inanç ortalamaları arasında istatistiksel olarak bir farklılığın olduğu görülmektedir. Bu durum grupların çalışmaya benzer inanç seviyelerinde başlamadığını göstermektedir. Bu farklılığın hangi gruplar arasında olduğunu belirlemek için Tukey testi yapılmıştır. Ön-test puanlarına yönelik Tukey testi sonuçları Tablo 3'de sunulmuştur.

Tablo 3. Tukey testi sonuçları

	Grup değişkeni	Ortalamalar farkı	p
Deney-1	Deney-2	-,446*	,000
	Kontrol	-,533*	,000
Deney-2	Deney-1	,446*	,000
	Kontrol	-,086	,477
Kontrol	Deney-1	,533*	,000
	Deney-2	,086	,477

*p<0.01

Tablo 3'den Deney-1 ve Deney-2 grupları arasında Deney-2 lehine, Deney-1 ve Kontrol grupları arasında Kontrol grubu lehine istatistiksel olarak anlamlı bir farklılık olduğu görülmektedir. Buna karşın Deney-2 ile Kontrol grubunun inanç puan ortalamaları arasında ise istatistiksel olarak anlamlı bir farklılık bulunamamıştır.

Bu durum Deney-1 grubundaki öğrencilerin inançlarının Deney-2 ile Kontrol grubundaki öğrencilerin inançlarından geleneksel olmayan bilim anlayışına daha yakın olduğunu göstermektedir. Buna karşın Deney-2 ile Kontrol grubunun benzer inançlara sahip olduğu söylenebilir.

Her bir grup için epistemolojik inanç ölçeğinden aldıkları ön-test ve son-test puanları arasında istatistiksel olarak anlamlı bir farklılığın olup olmadığını belirlemek için ($\propto = .05$) yapılan paired sample t-testi sonuçları Tablo 4'de sunulmuştur.

Tablo 4.

Gruplar	Deney-1			Deney-2			Kontrol		
	df	t	p	Df	t	p	df	t	p
	35	1,356	,184	30	1,474	,151	31	-,120	,905

Tablo 4'den her bir gruptaki öğretmen adaylarının bilimsel epistemolojik inanç ölçeğinden aldıkları ön test ve son test puan ortalamaları arasında istatistiksel olarak anlamlı bir farklılığın olmadığı görülmektedir. Bu durum hem bilimsel araştırma yöntemleri dersi ile hem de farklı bilimsel çalışmaları incelemenin ya da sadece bilimsel araştırma dersinin öğretmen adaylarının bilimsel epistemolojik inançlarının değişimi üzerinde bir etkisinin olmadığını göstermektedir.

Grupların ön-test puanları kontrol altına alınarak epistemolojik inanç ölçeğinden alınan son-test puanları arasında istatistiksel olarak anlamlı bir farklılığın olup olmadığını belirlemek için ($\propto = .05$) yapılan kovaryans analizi sonuçları Tablo 5'de sunulmuştur.

Tablo 5. Bilimsel epistemolojik inanç ölçeğinden elde edilen puanlar için kovaryans analizi sonuçları

				LSD ikili karşılaştırma testi		
Ölçümler	F	df	p	Ortalama fark	p	Yön
Toplam	13,461	2	,000			
Deney-1-Deney-2				-,244	,001	Deney-2>Deney-1
Deney-1-Kontrol				-,390	,000	Kontrol>Deney-1
Deney-2- Kontrol				-,146	,022	Kontrol>Deney-2

Tablo 5'den Deney-1, Deney-2 ve Kontrol grubu öğrencilerinin bilimsel epistemolojik inanç ölçeğinin son-test sonuçları arasında istatistiksel olarak anlamlı bir farklılığın olduğunu göstermektedir. LSD ikili karşılaştırma testi sonuçları bu farklılığın Deney-1 ile Deney-2 arasında Deney-2 lehine, Deney-1 ile Kontrol arasında Kontrol lehine ve Deney-2 ile Kontrol arasında yine Kontrol lehine olduğu görülmektedir. Bu durum hem bilimsel araştırma dersini hem de farklı bilimsel çalışmaları inceleyen Deney-1 grubunun bilimsel epistemolojik inançlarının geleneksel olmayan bilim anlayışına diğer iki gruptan daha fazla yaklaştığını göstermektedir. Bunun yanında sadece bilimsel araştırma yöntemleri dersini alan Deney 2 grubunun ise bilimsel epistemolojik inançları ise Kontrol grubuna göre geleneksel olmayan bilim anlayışına daha fazla yaklaşmaktadır. Bu durum her iki deney grubunda yapılan etkinin bilimsel epistemolojik inançlarının geleneksel olmayan bilim anlayışına doğru olmasına yardımcı olduğunu göstermektedir.

TARTIŞMA VE SONUÇ

Her üç gruptaki öğretmen adaylarının ön-test ve son-test puan ortalamalarına göre bilimsel epistemolojik inançlarının "kararsızım" seviyesinde olduğu görülmektedir. Bu durum bilimsel araştırma yöntemleri dersi ile farklı bilimsel araştırmaları incelemenin öğretmen adaylarının bilimsel epistemolojik inançlarını değiştirmede etkili olamadığını göstermektedir. Ancak her üç grubun ön ve son test puan ortalamalarına bakıldığında Deney-1 ve Deney-2 gruplarının puan ortalamalarının düştüğü, ancak Kontrol grubunun puan ortalamasının ise değişmediği belirlenmiştir. Bu durum Deney-1 ve Deney-2 gruplarının bilimsel epistemolojik inançlarının geleneksel olmayan bilim anlayışına doğru yöneldiğini göstermektedir.

Her bir gruptaki öğretmen adaylarının bilimsel epistemolojik inanç ölçeğinden aldıkları ön test ve son test puan ortalamaları arasında istatistiksel olarak anlamlı bir farklılığın olmadığı görülmektedir. Bu durum hem bilimsel araştırma yöntemleri dersi ile hem de farklı bilimsel çalışmaları incelemenin ya da sadece bilimsel araştırma dersinin öğretmen adaylarının bilimsel epistemolojik inançlarının değişimi üzerinde bir etkisinin olmadığını göstermektedir.

Her üç grubun son test puan ortalamaları karşılaştırıldığında ise Deney-1, Deney-2 ve Kontrol grubu öğrencilerinin bilimsel epistemolojik inanç ölçeğinin son-test sonuçları arasında istatistiksel olarak anlamlı bir farklılığın olduğu bulunmuştur. Farklılığın Deney-1 ile Deney-2 arasında Deney-2 lehine, Deney-1 ile Kontrol arasında Kontrol lehine ve Deney-2 ile Kontrol arasında yine Kontrol lehine olduğu tespit edilmiştir. Bu durum hem bilimsel araştırma dersini hem de farklı bilimsel çalışmaları inceleyen Deney-1 grubunun bilimsel epistemolojik inançlarının geleneksel olmayan bilim anlayışına diğer iki gruptan daha fazla yaklaştığını göstermektedir. Bunun yanında sadece bilimsel araştırma yöntemleri dersini alan Deney-2 grubunun ise bilimsel epistemolojik inançları ise Kontrol grubuna göre geleneksel olmayan bilim anlayışına daha fazla yaklaşmaktadır. Bu durum her iki deney grubunda yapılan etkinin bilimsel epistemolojik inançlarının geleneksel olmayan bilim anlayışına doğru olmasına yardımcı olduğunu göstermektedir.

ÖZET: Eğitim öğretim sürecinde en önemli hususlardan biri öğrencilerin öğrenmeye istekli olmasıdır. Öğrencilerin öğrenmeye güdülenmelerini sağlamak, derse olan ilgilerini arttırmak ve güdülemek için öğrenme sürecinde yer alan kavramların günlük hayatla ilişkilendirilmesi etkili bir yoldur. Bu araştırmanın amacı, yaşam temelli öğrenme yaklaşımına uygun olarak ilköğretim 8. sınıf öğretim programında yer alan "Sıvıların ve Gazların Kaldırma Kuvveti" konusunun öğretiminin öğrencilerin anlama düzeylerine etkisini incelemektir. Çalışma Trabzon ilinde bir kırsal ortaokulunun 8. sınıf öğrencileri (N= 19) ile yürütülmüştür. Çalışma 6 ders saati boyunca bir eylem araştırması olarak yürütülmüştür. Veri toplama aracı olarak yarı yapılandırılmış mülakatlar ve araştırmacı günlüklerinden yararlanılmıştır. Araştırmacı günlüklerinden elde edilen veriler tümevarımsal bir yaklaşımla, yarı yapılandırılmış mülakatlardan elde edilen veriler ise tümdengelimsel bir yaklaşımla analiz edilmiştir.. Verilerin analizinden elde edilen bulgularda, öğrencilerin anlama düzeylerinin genellikle % 50'nin üzerinde olduğu görülmüştür.

Anahtar sözcükler: yaşam temelli öğrenme, hikâyeler, sıvıların ve gazların kaldırma kuvveti

ABSTRACT: One of the most important points in education is the willingness and engagement of students into teaching and learning activities. In order to motivate students and increase their interest to these kinds of activities, an effective method is to connect science concepts with daily life or students' everyday contexts. The aim of this research is to determine the effects of context based learning approach on students' understanding levels of "Buoyancy of Liquids and Gases" topic. The study was conducted as a form of action research with 8th grade students (N: 19) in a rural secondary school in Trabzon and lasted 6 hours. The data were collected from the researcher's journals and semi-structured interviews. The students' responses to the interviews were analyzed by utilizing pre-defined categories. The data from the journals are subjected to content analysis. The findings of the content analysis demonstrated that the students' understanding level is above 50 percent.

Key words: context based approach, stories, buoyancy of liquids and gases

GİRİŞ

Eğitim insanoğlunun varoluşu ile başlayan ve hayat boyu süren bir süreçtir. Bu sürecin en önemli amacı ise yaşam kalitesini arttırmaktır (Başkurt, 2009). Eğitim içersinde fen bilimleri eğitimi toplumların gelişmesi ve ilerlemesinde oldukça önemli bir yere sahiptir (Çepni & Çil, 2009). Günümüzde temel fen eğitiminin amacı bilimsel düşünebilen, araştıran, sorgulayan, sahip olduğu bilgileri kullanarak karşılaştığı sorunları çözebilen bireyler yetiştirmektir (MEB, 2013; Yücel, 2009). Bu amaca ulaşabilmek için öğrencileri öğrenmeye istekli hale getirmek ve öğrenmeyi öğretmek temel adım olarak görülmektedir.

Fen eğitiminin amaçlarına ulaşmada temel adımlardan bir diğeri ise kavram öğrenimi ve öğretimidir. Varlıklar, olaylar, düşünceler benzerlikleri veya farklılıklarına göre sınıflandırılarak oluşturulan kavramlar soyut birimlerdir (Yağbasan & Gülçiçek, 2003; Yelgün, 2009). Öğrenme sürecinde öğrenciler kavramları anlamlandırmaya çalışırlar. Yağbasan & Gülçiçek, (2003) kavramları bilginin yapıtaşları olarak nitelendirmektedir. Fen Bilimleri dersi iş, enerji, kuvvet ve hareket gibi pek çok soyut kavram içerdiğinden öğrenciler tarafından zor olarak nitelendirilen bir derstir (Aydoğmuş, Sarıkoç & Berber, 2010; Öztürk, 2007). Kavramların günlük hayattan uzak, olgu ve olaylara dayalı olarak öğretimi öğrencilerin derse olan ilgilerini azaltmaktadır (Yılmaz, 2013). Öğrencilerin Fen Bilimleri dersine yönelik ilgilerini arttırmak, olumlu tutum geliştirmelerini ve öğrenmeye güdülenmelerini sağlamak amacıyla, ders kapsamında yer alan soyut kavramları günlük hayatla ilişkilendirmek etkili bir yoldur (Demircioğlu, Demircioğlu & Ayas, 2006).

Yaşam temelli öğrenme yaklaşımının temel amacı öğrencilere bilimsel kavramları günlük yaşamdan seçilmiş olaylar ile sunmak ve böylece öğrencilerin motivasyonunu artırmak ve bu kavramları anlamlı bir şekilde yapılandırmalarını sağlamaktır (Barker & Millar, 2000). Bağlam öğrencilerin zihninde uygulama ve kavramların ilişkili konumlandırılmasıyla oluşur. Beyin ve öğrenme ile ilgili yapılan çalışmalar öğrenme ortamlarının bağlamdan kopuk olduğunu, buna karşın çok sayıdaki öğrencinin bilgiyi bağlam kurarak somutlaştırıldığında ancak öğrenebildiğini vurgulamaktadırlar. Yaşam temelli öğretme öğrencilerin fen bilimlerine karşı ilgilerini artırmak, gerçek yaşam konuları ile fen bilimleri arasındaki ilişkinin farkına varmalarını sağlamak ve bilimsel süreç becerilerini geliştirmek amaçlarını kapsamaktadır (Demircioğlu, 2008; Yılmaz, 2013). Yaşam temelli öğretimin sınıf içerisinde uygulanmasında, bir öğretim tekniği olarak hikâyelere yer verilebilmektedir. Demircioğlu, Demircioğlu & Ayas, (2006) hikâyelerle öğretimin amacını, "günlük yaşamla ilişki kurmak, fen bilimlerinin içerisine sosyal ve teknolojik yapıyı iyice yerleştirmek, günlük durumlarda bilimsel kavramların sunumu ile öğrencilerin fen bilimlerine yönelik tutum ve hayranlıklarının gelişmesine yardımcı olmak ve bilimsel okur-yazarlar yetiştirmek." olarak ifade etmektedir. Bu nedenle yaşam temelli öğrenme yaklaşımı ve hikâyelerin fen öğretiminde kullanım amaçlarının örtüştüğü anlaşılmaktadır.

Kavramlar arasında ilişkilendirmenin yapılabilmesi ve anlamlı öğrenme sağlanabilmesi için hikâyeler de etkili öğretim araçlarından biridir (Klassen, 2009). Hikâyeler gerçek veya gerçeğe uygun olay ve durumlardan esinlenerek yazılmaktadırlar. Bu nedenle öğrencilerin fen bilimlerinde yer alan soyut kavramları günlük hayatla ilişkilendirmelerini kolaylaştırıp anlamlı öğrenme sağlamak için kullanılabilecek etkili araçlardandır (Bertiz, 2005; Dincel, 2005). Ayrıca Hill & Baumgartner, (2009) hikâyeler ile öğrencilerin öğretim sürecindeki kavramları önce sorgulamaya başladıklarını ardından ise uygun şemalarda yapılandırdıklarını ifade etmektedir. Dolayısıyla hikâyelerin öğrencilerin anlamlı öğrenmesine yardımcı olacağı düşünülmüştür. Bu nedenlerle bu çalışmada 8. sınıf "Sıvıların ve Gazların Kaldırma Kuvveti" konusuna yönelik hazırlanan öğretim materyalinde hikâyelere de yer verilmiştir. Hikâyelerin kültürümüzün de bir parçası olarak öğrencilerin ilgi ve motivasyonunu attıracağı düşünülmüştür. Yücel, (2009) hikâyelerin öğretim sürecindeki en önemli etkilerinden birinin ise öğrencilerin derse olan ilgi ve motivasyonlarını arttırmaları olduğunu vurgulamaktadır. Fenle ilgili bilgileri ve olayları öğrenmeyi daha zevkli ve istenilir hale getirmek, öğrencilerin günlük hayatta karşılaştıkları olaylara yorum getirebilmelerini sağlamak ve çözüm bulma heyecanlarına katkıda bulunmak için fen derslerinde yaşam temelli öğretime dayalı hikâyeler kullanılmaktadır.

Bu bağlamda çalışmanın amacı yaşam temelli öğrenme yaklaşımına uygun olarak ilköğretim 8. sınıf öğretim programında yer alan "Sıvıların ve Gazların Kaldırma Kuvveti" konusunun öğretiminin öğrencilerin anlama düzeylerine etkisini incelemektir.

YÖNTEM

Çalışmanın belirtilen amacına ulaşmak için takip edilen yol ve yöntemler aşağıdaki detaylı olarak tasvir edilmiş ve gerekli açıklamalarda bulunulmuştur.

Araştırmanın Yöntemi

Bu araştırma 8. sınıf öğrencilerinin "Sıvıların ve Gazların Kaldırma Kuvveti" konularını anlama düzeylerini tespit etmek amacıyla eylem araştırması yöntemi esas alınarak yürütülmüştür. Kurnaz, (2010, s.182) aksiyon araştırmalarını ''Eğitim öğretimle ilgili sorunları ve yenilikleri öğretmenin kendi sınıfında araştırarak çözüm ürettiği sürece, aksiyon araştırması denir." şeklinde tanımlamaktadır. Collins & Spiegel'den (2001) aktaran Yıldırım & Şimşek (2006) ise aksiyon araştırması yöntemini dört aşamada incelemiştir.

1. Problemin Tanımlanması: Araştırmacı öğretmen beş yıllık deneyimi süresince 8. sınıf öğrencilerinin "Sıvıların ve Gazların Kaldırma Kuvveti" konusunu anlamlandırmakta güçlük çektiklerini görmüştür. Bu sorunu çözmeye yönelik bir çalışma yapmaya karar vermiştir.

2. Plan Yapma: Farklı bir öğretim yönteminin öğrencilerin öğrenmelerini olumlu etkileyebileceği düşünülmüştür. Araştırmacı öğretmen öğrencilerinin yaşları ve yaşadıkları çevreyi göz önünde bulundurarak hikâyelerin ve fen kavramlarının günlük hayatla ilişkilendirilmesinin öğrencilerinin ilgisini çekebileceğini ve öğrenmelerini kolaylaştırabileceğini düşünmüştür. Yaşam temelli öğrenme yaklaşımını temel alan materyal hazırlayarak, içerisinde hikâyeye yer vermiştir. "Sıvıların ve Gazların Kaldırma Kuvveti" konusuna dair ders planı hazırlanmıştır. Veri toplama aracı olarak araştırmacı günlükleri ve yarı yapılandırılmış mülakatlardan yararlanılmasına karar verilmiştir.

3. Planları Uygulama: Çalışma 6 ders saati süresinde fen ve teknoloji derslerinde "Sıvıların ve Gazların Kaldırma Kuvveti" konusunda yürütülmüştür. Uygulama sürecinde gerekli görülen değişiklikler yapılmıştır. Araştırmacı öğretmen, günlüklerini her dersin ardından yazılmıştır. Yarı yapılandırılmış mülakatlar ise uygulama süreci sonunda gerçekleştirilmiştir.

4. Uygulama Sürecinin Değerlendirilmesi: Süreç boyunca araştırmacı günlüklerinden elde edilen veriler doğrultusunda bazı değişiklikler ve konu tekrarlarına yer verilmiştir. Uygulama süreci sonunda elde edilen veriler analiz edilmiş ve değerlendirilmiştir. Bu değerlendirmeler göz önünde bulundurularak bir sonraki yıl gerçekleştirilecek olan "Sıvıların ve Gazların Kaldırma Kuvveti" konusunun öğretim planı şekillendirilecektir.

Bu araştırmanın örneklemini, 2012 – 2013 eğitim öğretim yılında Doğu Karadeniz Bölgesi'nde yer alan bir kırsal ortaokulda 8. sınıfa kayıtlı olan tüm öğrenciler (N: 19) oluşturmaktadır. Sınıfta 11 erkek, 8 kız öğrenci bulunmaktadır. Araştırma sonuçları genelleme amacı taşımamakta bunun yerine araştırmacı öğretmenin kendi sınıfında tespit ettiği problemi çözmeye vurgu yapmaktadır (Yıldırım & Şimşek, 2006).

Araştırma Süreci

Araştırma 6 ders saati süresince eylem araştırması olarak yürütülmüştür. Problemin daha açık ve net olarak tanımlanmasının ardından 8. sınıf fen ve teknoloji öğretim programının "Sıvıların ve Gazların Kaldırma Kuvveti" konusu kazanımlarına uygun, yaşam temelli öğrenme yaklaşımını temel alan yazılı materyal hazırlanmıştır. Bu materyal 2 öğretim üyesi tarafından incelenmiş ve gerekli görülen değişiklikler gerçekleştirilmiştir. Oluşturulan materyalde yer alan hikâye ve etkinliklerinin içerikler konu ve kavramlar Tablo 1'de görülmektedir.

Tablo 1: Araştırma Materyalinin İçerdiği Konu Ve Kavramlar

Bölüm	Konu içeriği
Hikâye (Yaz Tatili)	▪ Cisimlerin sıvı içersinde yüzme, batma veya askıda kalma durumları, ▪ Sıvı ve gazlarda kaldırma kuvveti ile yoğunluk ilişkisi, ▪ Sıvı ve gazlarda kaldırma kuvveti hacim ilişkisi
Etkinlik 1	▪ Sıvıların kaldırma kuvveti ▪ Sıvıların kaldırma kuvvetinin ile batan hacim ile ilişkisi
Etkinlik 2	▪ Cisimlerin sıvı içinde yüzmesi, batması veya askıda kalması ile yoğunluk ilişkisi ▪ Gemilerin nasıl yüzer,
Etkinlik 3 (Animasyon)	▪ Gazların kaldırma kuvveti ve günlük hayattan örnek durumlar ▪ Gazların kaldırma kuvveti ile hacim ilişkisi ▪ Gazların kaldırma kuvveti ve yoğunluk ilişkisi ▪ Gezi balonlarının çalışması

Öğrenciler ön bilgileri ve günlük hayat tecrübeleriyle bağlam kurarak öğrenirler. Öğrencilerin yeni fen kavramları ile bağlam oluşturabilmeleri için hazırlanan materyal konu içerisinde yer alan temel kavramların günlük hayatla ilişkilendirmeye yönelik bir hikâye ile başlamaktadır. Hikâyede bir çocuğun ailesi ile çıktığı tatilde yaşadıkları, gözlemleri, düşünceleri ve aklında oluşan bazı sorular yer almaktadır. Hikâye cisimlerin sıvı içersinde yüzme, batma veya askıda kalma durumlarına, sıvı ve gazlarda kaldırma kuvveti ile yoğunluk ve hacim ilişkisine yönelik bağlamlar içermektedir. Hikâyenin ardından, öğrencilerin gruplara ayrılarak işbirliği ile etkinlikler yapmaları sağlanmıştır. Etkinliğin gerçekleştirilmesiyle ulaşılan sonuçları yorumlamaları ve hikâyedeki durumlarla ilişkilendirebilmeleri beklenilmiştir. Oluşturulan yazılı materyal, konu içinde yer alan fen kavramlarına yönelik günlük hayattan örnekler içermektedir. Öğrencilerin öğrendikleri bilgileri farklı durumlar üzerinde uygulamaları, bilgilerini transfer edebilmeleri amaçlanmıştır. Farklı örnek durumların açıklanması veya problem çözme etkinlikleri sürecinde, 4 kişiden oluşan öğrenci gruplarının fikir paylaşımlarında bulunmaları için tartışma ortamı oluşturulmuştur.

Verilerin Toplanması ve Analizi

Araştırma nitel bir araştırma deseni olan eylem araştırması yöntemiyle yürütüldüğünden, çalışmada araştırmacı günlükleri ve öğrenci mülakatları gibi nitel veri toplama araçlarından yararlanılmıştır. Araştırmacı günlükleri her dersin ardından dijital olarak tutulmuştur. Araştırmacı günlüklerinde araştırmacı öğretmenin gözlemlerine ve öğrenciler ile arasında geçen diyaloglara; öğrencilerin konu, etkinlikler ve/veya hikâye ile ilgili düşünce ve yorumlarına yer verilmiştir.

Günlüklerden elde edilen veriler içerik analize tabi tutulmuştur. Öncelikle günlükler araştırmacı tarafından tekrar tekrar okunarak kodlanmıştır. Kodlar oluşturulurken öğrencilerin;

- Araştırmacı öğretmenin sınıfa yönelttiği sorulara cevap verebilmesi,
- Konu, hikâye veya materyale yönelik araştırmacıya merak ettikleri soruları sorması,
- Derse ve etkinliklere katılmaya ve görev almaya istekli olması.
- Öğretim materyalindeki hikâye ve örneklerden ve sınıfta yapılan etkinliklerden çıkarım yapabilmesi
- Derste yer alan kavram ve olayları birbirleri ve günlük hayattan örnekler ile ilişkilendirebilmesi
- Konu ve kavramları anlamlandırmakta güçlük çekip çekmemeleri, eksik ve yanlış öğrenmeleri göz önünde bulundurulmuştur.

Bu süreçte 10 adet kod oluşturulmuş ve bu kodlar olumlu ve olumsuz yönler olmak üzere 2 kategoriye ayrılmış ve her kodun sınıfta gerçekleşme sayısı parantez içinde belirtilmiştir. Olumlu yönler kategorisi “sorulara cevap verme”, “öğretmene soru sorma”, “derse ve etkinliklere katılmaya istekli olma”, “çıkarım yapma” ve “ilişkilendirme” kodlarını içermektedir. Olumsuz yönler kategorisinde ise “sorulara cevap verememe”, “anlama güçlüğü”, “ön bilgi eksikliği”, “yanlış anlama”, “bilginin transfer edilmesinde güçlük” kodları yer almaktadır. Ayrıca araştırmacının sürece yönelik düşünceleri de ayrı bir kategori olarak değerlendirilmiştir. Ayrıca araştırmacı öğretmen, öğretim süreci ile ilgili düşüncelerini bu sürecin aksayan yönlerini ve öğretimin kalitesini arttırmaya yönelik yapılabilecek yansıtıcı düşüncelerini de not almıştır.

Yarı yapılandırılmış mülakat soruları 2 öğretim üyesi tarafından incelenmiş, dönütlere göre gerekli düzeltmeler yapılmıştır. Mülakat yapılan öğrencileri belirlemek için, fen ve teknoloji dersi birinci sınav notlarına bakılmıştır. Sınav notları düşük (0-54), orta (54- 84) ve yüksek başarı (85-100) düzeyinden 1’er kız, 1’er erkek olmak üzere toplam 6 öğrenci belirlenmiştir. Mülakatlarda “Sıvıların ve Gazların Kaldırma Kuvveti” konusu ile ilgili toplam 10 açık uçlu sorulmuştur. İlk üç soruda öğrencilerden kaldırma kuvvetinin tanımlanması ve günlük hayattan örnekleri, kaldırma kuvveti ile yoğunluk ve kaldırma kuvveti ile cismin batan hacmi ilişkisine dair bildiklerini paylaşmaları istenilmiştir. Diğer sorularda ise şekiller üzerinde farklı konum ve durumlarda bulunan cisimler üzerinden kaldırma kuvvetinin hesaplanması, kaldırma kuvveti ile yoğunluk ve kaldırma kuvveti ile cismin batan hacmi ilişkisine yönelik yorum yapmaları beklenilmiştir. Son soruda ise sıvı dolu kapta yüzen bir cisim üzerine etki eden kuvvetleri çizmeleri ve nedenini açıklamaları istenilmiştir. Bazı öğrencilerin soruyu tam anlamadıklarını belirttiklerinde şekil veya örnek üzerinde ifade edebilmeleri için duruma uygun sorular eklenmiştir.

Yarı yapılandırılmış mülakatlardan elde edilen verilerin analizi için Abraham, Grzybowski, Renner & Marek, (1992) ve Coştu’nun (2002) çalışmalarında kullandıkları kategoriler dikkate alınarak Tablo 2’deki kategoriler çalışmaya uygun olarak düzenlenmiştir. Öğrencilerin mülakatlarda yer alan sorulara verdikleri cevaplar “Anlama,” “Kısmen Anlama,” “Anlamama,” “ Yanlış Anlama” ve “Cevapsız” olmak üzere 5 kategoride sınıflandırılmıştır. Mülakat verilerinin analizinde kullanılan anlama düzeylerine ilişkin değerlendirme ölçütleri Tablo 2’de gösterilmiştir.

Tablo 2: Mülakat Sorularını Analiz Etmede Kullanılan Kategoriler Ve Puanlama Ölçütleri

Anlama Düzeyleri	**Değerlendirme Kriterleri**
Anlama	▪ Geçerliliği olan cevabın bütün yönlerini içeren cevaplardır
Kısmen Anlama	▪ Geçerli olan cevabın bir yönün içeren fakat bütün yönlerini içermeyen cevaplardır ▪ Geçerli cevabın bazı yönleriyle birlikte bazı yanlış açıklamaları içeren cevaplardır
Yanlış Anlama	▪ Kavram yanılgısı içeren cevaplar
Anlamama	▪ İlgisiz ya da açık olmayan cevap verme ▪ Mantıksız ya da doğru olmayan bilgiler içeren cevaplar

Cevapsız	▪ "Bilimiyorum…", Fikrim yok…" şeklinde ifadelerin yer aldığı cevaplar ▪ Soruyu aynen tekrarlama

Puanlamanın güvenirliğini ortaya koymak amacıyla iki öğrenci mülakatı MEB'e bağlı bir ortaokulda 6 yıllık deneyime sahip bir Fen ve Teknoloji öğretmeni tarafından da puanlanmış, araştırmacının puanlamasıyla karşılaştırılmıştır. Tutarlılık oranı 0,87 olarak belirlenmiştir.

BULGULAR

Araştırma sürecinde elde edilen bulgulara, araştırmacı günlüklerinden elde edilen bulgular ve yarı yapılandırılmış mülakatlardan elde edilen bulgular olmak üzere iki başlık altında yer verilmiştir.

Araştırmacı Günlüklerinden Elde Edilen Bulgular

Araştırmacı günlüklerinde sınıf gözlemlerine, sınıfta yaşanan olay ve durumlara, bazı diyaloglara ve öğretim sürecine yönelik değerlendirmelere yer vermiştir. Günlüklerden elde edilen veriler incelendiğinde sınıfın yaklaşık yarısının derse aktif olarak katıldığı, soruları cevaplamaya ve etkinliklere katılmaya istekli oldukları görülmüştür. Günlüklerden elde edilen veriler doğrultusunda sınıfın genel durumunu yansıtmak amacıyla Tablo 3 oluşturulmuştur.

Tablo 3: Araştırmacı Günlüklerinden Elde Edilen Bulgular

Konu	Olumlu Yönler	Olumsuz Yönler
Sıvıların kaldırma kuvveti	▪ Sorulara cevap verme (12) ▪ Öğretmene soru sorma (5) ▪ Derse ve etkinliklere katılmaya istekli olma (9) ▪ Çıkarım yapma (4) ▪ İlişkilendirme (3)	▪ Sorulara cevap verememe (2) ▪ Anlama güçlüğü (4) ▪ Ön bilgi eksikliği (1) ▪ Yanlış anlama (4) ▪ Bilginin transfer edilmesinde güçlük (4)
Gazların kaldırma kuvveti	▪ Sorulara cevap verme (4) ▪ Öğretmene soru sorma (3) ▪ Derse ve etkinliklere katılmaya istekli olma (2) ▪ Çıkarım yapma (2) ▪ İlişkilendirme (3)	▪ Sorulara cevap verememe (1) ▪ Anlama güçlüğü (1) ▪ Yanlış anlama (2) ▪ Bilginin transfer edilmesinde güçlük (1)

Tablo 3'de görüldüğü gibi, öğrenciler bazen anlama güçlüğü çekmiş, eksik ve yanlış öğrenmeler gerçekleştirmiş veya bilginin transferinde zorlanmışlardır. Bunun yanında olumlu yönde gözlenen gelişim sayısı daha fazladır. Öğrencilerin hikâyede geçen cümlelerin ardından sorular sormaları, yorumlar yapmaları hikâyenin ilgilerini çektiğini göstermektedir. Örneğin "Oysa o dev gemiler nasıl oluyor da su üstünde kalabiliyordu?" cümlesinden sonra "Evet, hocam yaa nasıl oluyor?" sorusu yöneltmişlerdir. "Taş her defasında hemencecik dibe batıyordu. Oysaki boş plastik şişe hep su üstünde yüzüyordu." cümlesinden sonra hep bir ağızdan "Doğruuu…" tepkisi verildiği görülmüştür. Ayrıca bazı öğrenciler hikâyede geçen yamaç paraşütünün nasıl yapıldığını, Saklıkent'in nerede olduğunu sormuşlardır.

Sıvıların kaldırma kuvvetini kavramaya yönelik yapılan etkinlikte, öğrencilerin kendi grupları içerisinde dinamometreyi tutmak veya ölçümleri okumak için birbirleri ile yarışmaları ilgilerinin yüksek olduğunu göstermektedir. Benzer şekilde "Öğretmenim dinamometrede değer okumayı bize öğretir misiniz?" diye sormalarından yola çıkarak derse ve öğrenmeye istekli oldukları sonucuna ulaşılabilir. Dersler süresince öğrencilerin okudukları hikâyeden veya yapılan etkinliklerden çıkarımlarda bulunabildikleri gözlenmiştir. Örneğin; cismin havadaki ve sudaki ağırlıklarını dinamometre ile ölçerek yapılan etkinlikte, öğrencilerden taşın suya battıkça sıvı yüksekliğindeki değişimi gözlemlemeleri istenmiştir. Burada yaklaşık 8 – 10 öğrencide "Taş battıkça sıvı seviyesi artıyor" ifadesini kullanmıştır. Taş tamamen suya battığında ise sıvı yüksekliğindeki değişimin taşın hacmine eşit olduğu çıkarımını yapabilmişlerdir.

Araştırmacı günlüklerinde yer alan notlar incelendiğinde, öğrencilerin bazı yanlış anlamalara sahip oldukları görülmüştür. Yoğunluk kavramına gelindiğinde öğrencilerin kütle, hacim, yoğunluk, ağırlık kavramlarını birbirine karıştırmaları, bu duruma örnek verilebilir. Bazı öğrencilerin gemilerin altındaki boşluğun geminin yoğunluğunu azalttığını değil, ağırlığını azalttığını düşündükleri "…altında boşluk olunca gemi hafif olur, böylece suda yüzer….” vb. ifadelerinden anlaşılmaktadır. Benzer bir durum cisimlerin yoğunluklarına bağlı olarak sıvı içersinde bulundukları konumlarının açıklanması sırasında gerçekleşmiştir. Sıvı içersinde farklı oranlarda yüzen iki cisim ile ilgili bir öğrenci “Askıda kalan cisimlerin yoğunlukları eşit oluyorsa yüzen cisimlerin de öyle olmalı…” açıklamasında bulunmuştur. Öğrencilerin zaman zaman yanlış çıkarımlarda bulunabildiği görülmüştür.

Araştırmacı günlüklerde araştırmanın aksayan yönlerine, yapılabilecek değişikliklere, gözlemlerine yönelik çıkarımlara ve öğretim sürecinin kalitesini arttırmaya yönelik notlar almıştır. Öğrencilerin kütle – hacim – yoğunluk kavramları ile ilgili soruları cevaplamakta zorlandıkları görülmesi üzerine “Bu konular ile ilgili bir çalışma yaprağı veya örnek sorular içeren bir tekrar testi hazırlamanın faydalı olacağını düşünüyorum.” ifadesi yer almaktadır. Araştırmacı öğretmen uygulama sürecinde sıvının yoğunluğu – kaldırma kuvveti ilişkisini açıklarken “Denizde mi yüzmek daha kolaydır, gölde mi?” sorusunu yöneltmiştir. Soruya hiçbir öğrencinin cevap verememesi üzerine öğrencilerle geçen diyaloglarda öğrencilerden sadece birkaçının yüzme bildiğini ve bu öğrencilerin de sadece köydeki derede yüzdükleri anlaşılmıştır. Bu durumda araştırmacı “Öğrenciler denizin tuzlu su olduğundan yoğunluğunun fazla olacağı ile ilişkilendirememişlerdir. Bilgilerini farklı örnekler üzerinde uygulamakta zorlanmaktadırlar.” şeklinde not almıştır.

Mülakatlardan Elde Edilen Bulgular

Yarı yapılandırılmış mülakatta yer alan soruların “Anlama”, “Kısmen Anlama”, “Anlamama”, “ Yanlış Anlama ” ve “Cevapsız” kategorilerine göre cevaplandırılma frekans ve yüzde değerleri Tablo 4’te sunulmuştur. Mülakatlardan elde edilen bulgular yansıtılırken öğrenciler için takma isimler kullanılmıştır.

Tablo 4: Mülakatlardan elde edilen veriler.

Soru	Anlama	Kısmen Anlama	Anlamama	Yanlış Anlama	Cevapsız
1. Kaldırma kuvveti denilince aklına ne geliyor? Açıklar mısın?	3	1	1	1	0
2. Sıvı içindeki cisme uygulanan kaldırma kuvveti ile sıvının yoğunluğu arasında bir ilişki var mıdır? Nasıl bir ilişki olduğunu düşünüyorsun? Nedenini açıklar mısın?	5	0	1	0	0
3. Sıvı içersindeki cisme uygulanan kaldırma kuvveti ile cismin sıvıya batan hacmi arasında bir ilişki var mıdır? Nasıl bir ilişki olduğunu düşünüyorsun? Nedenini açıklar mısın?	3	0	2	0	1
4.  Eşit hacim bölmeli A, B, C, D ve E cisimleri sıvı dolu kapta şekildeki gibi dengededir. Buna göre cisimlerin yoğunluklarını kıyaslayınız. Nedenini açıklar mısınız?	1	5	0	0	0
5.  Eşit kütleli K, L ve M cisimleri suya bırakıldıklarında şekildeki gibi dengede kalmaktadır. Buna göre bu cisimlere etki eden kaldırma kuvvetlerini karşılaştırınız.	2	0	2	2	0
6.  Bir öğrenci şekildeki A cismini havadaki ve sudaki ağırlığını ölçmüştür. Öğrencinin bu etkinliği yapmaktaki amacı ne olabilir? Nasıl bir sonuca ulaşacağını düşünüyorsunuz?	4	2	0	0	0
7.  A balonunun hava bulunan ve bulunmayan iki farklı ortamdaki denge konumu şekildeki gibidir. Bu durumun sebebini nasıl açıklayabiliriz?	4	1	1	0	0
7.a. Bu balona etki eden kaldırma kuvveti ile havanın yoğunluğu arasında bir ilişki var mıdır? Nasıl bir ilişki olduğunu düşünüyorsun? Nedenini açıklar mısın?	5	0	1	0	0
7.b. Bu balona etki eden kaldırma kuvveti ile balonun hacmi arasında bir ilişki var mıdır? Nasıl bir ilişki olduğunu düşünüyorsun?	3	0	3	0	0

Nedenini açıklar mısın?					
8.  Şekildeki dalgıcın deniz içersinde yüzdüğü farklı konumlar şekil üzerinde numaralandırılmıştır. Buna göre 1, 2, 3 ve 4 konumlarında dalgıca etki eden kaldırma kuvvetlerini karşılaştırınız. Cevabınızın nedenini açıklar mısınız?	3	2	1	0	0
9.  Su içersinde boş şişe, yarısı su dolu şişe ve taş şekildeki konumlarda dengededir. Buna göre bu cisimlerin yoğunlukları ile sıvının yoğunluğu arasında nasıl bir ilişki vardır? Açıklar mısınız?	4	1	1	0	0
10.  Şekildeki su içerisinde yüzen cisme etki eden kuvvetleri şekil üzerine çizebilir misiniz? Nedenini açıklar mısınız?	4	2	0	0	0

Mülakatlardan elde edilen veriler incelendiğinde genellikle anlama düzeyinin % 50'nin üzerinde olduğu görülmektedir. İlk mülakat sorusu olan "Kaldırma kuvveti denilince aklına ne geliyor? Açıklar mısın?" sorusunda 3 öğrenci "Anlama", 1 öğrenci "Kısmen Anlama", 1 öğrenci "Anlamama", 1 öğrenci ise "Yanlış Anlama" kategorisinde yer almaktadır. "Yanlış Anlama" kategorisinde yer alan Arzu katılarında kaldırma kuvveti uyguladığını belirterek, sıkıştırılan bir yayın bırakıldığında cisme uyguladığı kuvvetin örnek olabileceğini belirtmiştir. Sıvının yoğunluğu ile kaldırma kuvveti ilişkisinin sorulduğu 2. mülakat sorusunda 5 öğrencinin cevapları "Anlama" kategorisinde yer almaktadır. "Anlamama" kategorisinde yer alan Fatma yoğunluğu az olan sıvının daha fazla kaldırma kuvveti uygulayacağını düşünmektedir. Cismin sıvıya batan hacmi ile kaldırma kuvveti ilişkisinin sorulduğu 3. mülakat sorusunda 3 öğrenci "Anlama", 2 öğrenci "Anlamama" kategorisindeyken 1 öğrenci ise soruyu cevapsız bırakmıştır.

En az tam olarak doğru cevaplanan soru olan 4. mülakat sorusu sıvı içersinde farklı denge konumlarında eşit hacim bölmeli cisimlerin yoğunluklarının kıyaslanmasını kapsamaktadır. Mülakatlardan elde edilen veriler ile Mustafa'nın bu soruda olduğu gibi birçok soruda kavramları açıklayamadığı, ayırt etmekte zorlandığı görülmüştür.

Araştırmacı: *Eşit hacim bölmeli cisimler sıvı içersinde şekildeki gibi dengededir. Buna göre cisimlerin yoğunluklarını kıyaslar mısın?*

Mustafa: $D > B = E > A = C$

Araştırmacı: *Neden böyle sıraladığını açıklar mısın?*

Mustafa: *En büyük D çünkü batmış. B ve E eşit çünkü askıda kalmış. A ve C de eşit çünkü ikisi de yüzüyo. A ve C, B ve E'den daha yoğun çünkü daha az batmışlar.*

Fatma'nın ise aynı soruda farklı bir yanlış anlamaya sahip olduğu aşağıdaki ifadelerinde görülmektedir.

Fatma: $D > B > E > C > A$

Araştırmacı: *Nedenini açıklar mısın?*

Fatma: *En büyük D en altta batmış. Sonra B, sonra E, sonra C yarısından fazlası battı. En az A çünkü 1 kutu battı.*

Araştırmacı: *Nasıl bir açıklama yaparsın o zaman?*

Fatma: *Yoğunluğu arttıkça daha fazla, daha dibe batıyor.*

Sıvı içerisinde farklı konumlarda dengede olan eşit kütleli cisimlerin kaldırma kuvvetlerini karşılaştırılmasını içeren 5. Mülakat sorusunun cevapların dağılımına bakılacak olursa 2 öğrenci "Anlama", 2 öğrenci "Anlamama", 2 öğrenci "Yanlış Anlama" şeklinde olduğu görülmektedir. "Yanlış Anlama" kategorisinde yer alan 2 öğrencinin "Yoğunluğu fazla olan cisme daha fazla kaldırma kuvveti uygulanır." yanılgısına sahip olduğu tespit edilmiştir. 6. mülakat sorusunda ise 4 öğrenci "Anlama", 2 öğrenci "Kısmen Anlama" kategorisinde yer almaktadır. Hava bulunan ve bulunmayan ortamlarda farklı konumlarda duran özdeş balonların yorumlanmasına yönelik 7. mülakat sorusunun cevapları incelendiğinde 4 öğrencinin "Anlama", 1 öğrencinin "Kısmen Anlama", 1 öğrencinin ise "Anlamama" kategorisinde olduğu görülmektedir. "Anlamama" kategorisinde yer alan Mustafa "Havasız ortamda yoğunluk daha fazla…" ifadesini kullanmıştır.

Cismin batan hacmi ile kaldırma kuvveti ilişkisine yönelik 8. mülakat sorusunda 3 öğrenci "Anlama", 2 öğrenci "Kısmen Anlama", 1 öğrenci ise "Anlamama" kategorisinde yer almaktadır. "Anlama" kategorisinde yer alan Emre'nin açıklamasına aşağıda yer verilmektedir.

> Araştırmacı: *Bir dalgıcın yüzdüğü noktalar şekilde görülmektedir. Bu dalgıca 1, 2, 3 ve 4 konularında etki eden kaldırma kuvvetlerini karşılaştırır mısın?*
>
> Emre: *1'de yüzüyo mu? Suya girdi mi?*
>
> Araştırmacı: *Hayır, henüz girmedi. Kaldırma kuvveti var mı?*
>
> Emre: *Var ama havanın, suyun yok.*
>
> Araştırmacı: *1,2,3 ve 4 konumlarındaki kaldırma kuvvetlerini karşılaştırır mısın?*
>
> Emre: *2 ve 3 eşit. 4 onlardan küçük, 1 en az.*
>
> Araştırmacı: *Nedenini açıklar mısın?*
>
> Emre: *2 ve 3'de batan hacimleri eşit, o yüzden kaldırma kuvvetleri eşit. 4'de batan hacim azalmış, o yüzden kaldırma kuvveti azalıyo. 1'de havanın kaldırma kuvveti suyunkinden az zaten.*
>
> Araştırmacı: *Neden havanın kaldırma kuvveti suyunkinden az?*
>
> Emre: *Çünkü havanın yoğunluğu daha az.*

Sıvı içersinde farklı konumlarda dengede olan cisimlerin yoğunlukları ile sıvının yoğunluğunun karşılaştırılmasını içeren 9. mülakat sorusunda 4 öğrenci "Anlama", 1 öğrenci "Kısmen Anlama" ve 1 öğrenci "Anlamama" kategorisinde yer almaktadır. Sıvının yoğunluğu ile yarısı su dolu şişenin yoğunluğunun kıyaslanması sırasında Merve "Yarısı su dolu şişe askıda kalmış. Burada kaldırma kuvveti kıyaslamadığımız için, bunun ki suyunkinden biraz daha fazla." açıklamasında bulunmuştur. 10. mülakat sorusunda ise öğrencilerden su içersinde yüzmekte olan bir tahta parçasının üzerine etki eden kuvvetleri çizmeleri ve çizimlerini açıklamaları beklenilmiştir. Bu soruda 4 öğrencinin "Anlama", 2 öğrencinin ise "Kısmen Anlama" kategorisinde yer aldığı görülmüştür. Tüm öğrencilerin sıvının kaldırma kuvvetini doğru şekilde çizdiği ve açıkladığı, ancak 2 öğrencinin ağırlığı çizemediği görülmüştür.

TARTIŞMA

Bu çalışmanın amacı yaşam temelli öğrenme yaklaşımına uygun olarak ilköğretim 8. sınıf öğretim programında yer alan "Sıvıların ve Gazların Kaldırma Kuvveti" konusunun öğretiminin öğrencilerin anlama düzeylerine etkisini incelemektir. 6 ders saati süresince yaşam temelli öğrenme yaklaşımı temel alınarak uygulama gerçekleştirilmiştir. Araştırma materyali kapsamında yer alan hikâye ile ilgili öğrencilerin sorular sormaları, hikâyede yer alan olay ve resimler üzerine yorumlar, şakalar yapmaları, hikâyeyi okumaya istekli olmaları hikâyenin öğrencilerde ilgi ve merak uyandırdığını göstermektedir. Nitekim Dincel, (2005); Frisch, (2010);

Klassen, (2009); Robertson & Blake, (2011), Kahraman (2012) hikâyelerin öğrencilerin derse olan ilgilerini arttırdığı ve onları güdülediği sonucuna ulaşmıştır.

Araştırma sürecinde öğrenciler, cismi sıvıya batırılarak dereceli kaptaki sıvı yüksekliğindeki değişimi incelemiş ve bu değişimin cismin sıvıya batan hacmine eşit olduğu çıkarımında bulunabilmişlerdir. MEB'in gerek 2006'da gerekse 2013'te yayımladığı ortaokul fen öğretim programlarında, öğrencilerin karşılaştırma yapma, gözlemelerini açıklama, yorumlama, gözlem ve deneyimlerinden çıkarım yapma gibi bilimsel süreç becerilerinin kazandırılması amaçlanmaktadır. Araştırmacı öğretmenin sınıf-içi yaptığı gözlemlere dayanarak öğrencilerin yapılan etkinlikler ve hikâyeden çıkarımlarda bulunabildiklerinin tespiti bu amaca ulaşmada önemli bir adım olarak nitelendirilmektedir. Bunun yanı sıra öğrencilerin "Askıda kalan cisimlerin yoğunlukları eşit oluyorsa (batan hacime bakılmaksızın) yüzen cisimlerin de öyle olmalı…" gibi yanlış çıkarımlarda da bulunabildikleri görülmüştür. Öğrencilerin öğrendikleri kavramları benzer durumlara genelleme çalıştıkları düşünülmektedir. Öğretmen kontrolünde gerçekleştirilen etkinlikler dâhil olmak üzere öğrencilerin yanlış yorumlamalar ve çıkarımlarda bulunabilmektedirler. Bir başka yanlış çıkarım olarak bazı öğrencilerin gemilerin altındaki boşluğun geminin yoğunluğunu değil, ağırlığını azalttığı için yüzebildiklerini düşüncesidir. Benzer olarak yapılan çalışmalardan öğrencilerin "Sıvılar hafif cisimlere kaldırma kuvveti uygulayabilir, ağır olan cisimlere uygulayamaz.", "Hafif olana daha çok kaldırma kuvveti etki eder" gibi fikirlere sahip oldukları görülmüştür (Çiğdem, 2010; Yelgün, 2009). Öğrencilerin günlük hayatta hafif cisimleri kaldırmanın daha kolay olduğundan yola çıkarak bu tür yanlış düşüncelere sahip olabilecekleri düşünülmektedir. Benzer şekilde Yelgün (2009) öğrencilerin yanlış yorum ve çıkarımlar yapabiliyor olmasının, önceki yaşantılarından, gözlemlerinden veya aşırı genellemelerinden kaynaklanabileceğini belirtmektedir.

Mülakatlardan elde edilen bulgularda görüldüğü gibi sıvı içersinde askıda kalan cisimler için öğrenci 1 *"Yoğunluğu arttıkça daha fazla, daha dibe batıyor."*ifadesini kullanmıştır. Yelgün, (2009) öğrencilerin *"Aynı sıvı içinde farklı derinliklerde asılı duran cisimlerin öz kütleleri farklıdır."* düşüncesine sahip olduklarına ulaşmıştır. Öğrencilerin yoğunluğu sıvının yoğunluğundan küçük cisimlerin sıvıda yüzerken, yoğunluğu sıvının yoğunluğundan büyük olan cisimlerin batması kavramından yola çıkarak genellemeye gittikleri düşünülmektedir. Bu konuda öğrencilerin en çok askıda kalan cisimlerin yoğunluklarının sıvının yoğunluğuna eşit olduğunu anlamlandırmakta zorlandıkları görülmektedir. Bunun nedeninin günlük hayatta sıvı içersinde askıda kalan cisim örneği ile pek karşılaşmamaları olduğunu düşünülmektedir. Hırça, Çalık & Seven (2011); Avcı & Yağbasan (2010) fen kavramlarının günlük hayatla ilişkilendirilmesi ile anlamlı öğrenmenin sağlanacağını vurgulamaktadır. Bu nedenle yaşam temelli öğrenme yaklaşımı temel alınan öğretim ortamları daha etkili öğrenme sağlayabilir.

Öğrencilerin kütle, hacim, yoğunluk, ağırlık gibi kavramları karıştırdıkları, bu kavramları birbirinden ayırt etmekte zorlandıkları araştırmacı günlüklerinden elde edilen bulgular arasında yer almaktadır. Günlükteki bulgulara benzer olarak 2 öğrencinin "Yoğunluğu fazla olan cisme daha fazla kaldırma kuvveti uygulanır." yanılgısına sahip olduğu mülakatlardan elde edilen veriler arasında yer almaktadır. Benzer şekilde Yelgün, (2009) ve Şahin, (2010) öğrencilerin yoğunluğa fazla olan cisimlere daha fazla kaldırma kuvveti uygulandığını düşündükleri sonucuna ulaşmışlardır. Eksik öğrenmeler nedeniyle veya yeni bilgiler ile ön bilgilerin çeliştiği durumlarda öğrencilerin kavram yanılgılarına sahip olabilecekleri görülmektedir. Fen ve Teknoloji dersinin sarmal yapısı nedeniyle bu durumun öğrencilerin yüzme, batma, sıvıların ve gazların kaldırma kuvveti gibi konuların anlamlı öğrenilmesinde güçlük yarattığı düşünülmektedir. Nitekim Özsevgeç ve Çepni (2006) öğrencilerin yoğunluk, kütle ve hacim kavramlarını anlamlı öğrenemediklerini, bu nedenle yoğunluk - kaldırma kuvveti – hacim kavramlarını ilişkilendirmekte zorlandıklarını ifade etmektedir. Bu nedenle öğretimin ilk kademelerinden itibaren bu tür soyut kavramların öğretiminde daha fazla etkinliğe yer verilmesinin uygun olacağı düşünülmektedir.

SONUÇ VE ÖNERİLER

Araştırma süreci sonucunda elde edilen bulgular doğrultusunda uygulama süresince sınıftaki öğrencilerin yaklaşık yarısının sıklıkla dersle, hikâyeyle, etkinliklerle ilgili sorular sordukları, yorumlar ve şakalar yaptıkları, etkinliklerde görev almaya istekli oldukları ifade edilebilir. Bu nedenle geliştirilen yaşam temelli öğretim materyalinin hedeflendiği gibi sınıftaki öğrencilerin ilgilerini genel olarak arttırdığı söylenebilir. Ancak, araştırmadan elde edilen sonuçlar doğrultusunda öğrencilerin derse olan ilgilerini arttırmaya ve derse güdülenmelerini sağlamaya yönelik hikâyelerin drama şeklinde canlandırılması gibi etkinlikler eklenebileceği düşünülmektedir.

Araştırmacı günlüklerinde yer alan notlardan yararlanılarak bazı öğrencilerin kütle, hacim, yoğunluk, ağırlık gibi soyut kavramları anlama güçlüğü çektikleri görülmektedir. Buna paralel olarak da yoğunluk – kaldırma kuvveti – hacim kavramlarını ilişkilendirmekte ve "Sıvıların ve Gazların Kaldırma Kuvveti" konusunu anlamlandırmakta zorlandıkları düşünülmektedir. Öğrenme güçlüğü yaşanan bu soyut kavramların öğretiminde yaşam temelli öğrenme yaklaşımı ile bilgilerin günlük hayatla ilişkilendirilerek daha kolay öğrenildiği sonucuna varılmıştır. Benzer uygulamaların diğer konular ve kavramlar ile yapılmasıyla benzer faydalar sağlanabilir. Bu uygulamalar veya materyaller geliştirilirken öncelikle öğrencilerin ön bilgilerinin yoklanması ve bu eksikliklerin giderilmesine yönelik alternatif etkinlikler eklenmesi, uygulamanın amaca daha iyi hizmet etmesini sağlayacağına inanılmaktadır.

Öğrencilerin uygulama süresinde yapılan etkinlikler ve hikâye ile ilgili yorum ve açıklamalar yapabildikleri ve çıkarımlarda bulunabildikleri görülmüştür. Bu süreçte öğrencilerin doğru sonuçlara ulaşabildikleri gibi bazı yanlış düşüncelere ve çıkarımlara ulaşabildikleri görülmüştür. Bu durumun öğrencilerin günlük hayattaki gözlemlerinden veya aşırı genelleme özelliklerinden kaynaklanabileceği düşünülmektedir. Öğrencilerin öğrendikleri bilgileri uygulama ve farklı durumlara transfer etmelerine yönelik daha fazla etkinlik ve proje çalışmasına katılmalarının yanlış öğrenmelerini azaltabileceği düşünülmektedir. Bu nedenle bir sonraki uygulama için basit araç gereçlerle yapılan öğretim etkinliklerine daha fazla yer verilmesi düşünülmektedir. Ayrıca basit araç gereçler kullanımı ile öğrencilerin modeller oluşturmasının öğrenmelerine katkı sağlayacağı düşünülmüştür.

Yarı yapılandırılmış mülakatlardan elde edilen bulgular incelendiğinde 2 soru hariç tüm sorularda "Anlama" kategorisindeki öğrenci sayısının %50 ve üzerinde olduğu görülmektedir. Tablo 4'ten yola çıkarak genel olarak öğrencilerin "Sıvıların ve Gazların Kaldırma Kuvveti" konusunu anlama düzeylerinin iyi olduğu ifade edilebilir. Ancak süreç boyunca öğrencilerin öğrenmeleri ve düşünceleri ile ilgili diyalog halinde olunarak, öğrencilerin sahip olabileceği yanlış anlamaların anında dönütler ile düzeltilmeye çalışılmasının anlama düzeylerinin daha da geliştirilmesi için etkili olabileceği düşünülmektedir. Bunun yanı sıra öğrencilerin yanlış anlamalarının giderilmesinde kavram karikatürleri veya kavramsal değişim metinlerinden yararlanılabilir.

Fatih KARAKUŞ
Afyon Kocatepe Üniversitesi
fkarakus@aku.edu.tr

ÖZET: Bu çalışmanın amacı, ilkokul öğrencilerine yönelik Padilla, Cronin ve Twiest (1985) tarafından geliştirilen "Temel Beceri Ölçeği'ni Türkçeye uyarlamaktır. Temel Beceri Ölçeği, gözlem, sınıflama, çıkarım yapma, ölçme, tahmin ve iletişim kurma becerilerinin her birine yönelik altışar sorudan ve toplamda 36 sorudan oluşan çoktan seçmeli bir ölçektir. Ölçeğin uyarlaması çalışmasında, dil geçerliği için öncelikle ölçek, uzmanlar tarafından Türkçeye çevrilmiştir. Üç uzman çevirisinin ortak noktaları dikkate alınarak ortaya çıkan Türkçe taslak ölçekte yer alan maddeler bir dil uzmanı tarafından tekrar İngilizceye çevrilmiştir. Ölçeğin orijinali ile İngilizceye tekrar çevrilmiş hali karşılaştırılarak ölçeğe son hali verilmiştir. Bu aşamadan sonra Afyonkarahisar ilinde yer alan 6 farklı okulda öğrenim gören 447 ilkokul (3. 4. ve 5. sınıf) öğrencisine ölçek uygulanmıştır. İstatistiksel analiz için Finesse Paket Programı kullanılarak madde analizi yapılmış ve her sorunun madde güçlüğü ile ayırt edicilik indeksleri hesaplanmıştır. 36 maddeden oluşan bilimsel süreç becerileri ölçeğinin güvenirlik katsayısı (KR–20) 0.81, ölçeğin ortalama güçlüğü ise 0.51 olarak belirlenmiştir. Dört sorunun ayırıcılık indeksinin 0.20'nin altında olduğu görülmüş ve bu yüzden dört soru ölçekten çıkarılmıştır. Kalan 32 maddelik ölçeğin güvenirliği (KR–20) 0.82 bulunmuştur.

.

ABSTRACT: The current research aimed to adaptation to Turkish of "Test of Basic Process Skills-BAPS" developed by Padilla, Cronin ve Twiest (1985) towards primary students. Basic skills scale consist of 36-item multiple choice i.e. observation, inference, prediction, measurement, communication, and classification (each of six questions). The basic skills scale for language validity was translated into Turkish by 3 experts. Draft scale has been translated again into English by a language expert. The scale was translated again into English by comparing with the original version. The revised scale was administered to 3th, 4th, and 4th grade primary students (n=447) attending 6 different elementary schools in Afyonkarahisar. Item analysis was undertaken using the Finesse Package Program for statistical analysis. Moreover, item difficulty and distinctiveness indexes of each question were calculated. As a result, the reliability coefficient was found to be (KR–20) 0.81, and the mean difficulty was found to be 0.51 for the 36 item basic skills scale. Four of the questions were found to have a distinctiveness index below 0.20; therefore, it was excluded from the scale. The reliability for the scale with the remaining 32 items was found to be (KR–20) 0.82.

ÖZET: Sosyal iletişim ağları, kullanıcılara kendilerini yeniden tanımladıkları ve çeşitli sosyal ilişkilere katıldıkları bir kimlik alanı olarak yapılanmaktadır. Özellikle de üniversite öğrencileri tarafından çok değişik amaçla ve yaygın bir biçimde kullanılan sanal ortam, üniversite öğrencilerinin yaşamlarındaki psikolojik ve çevresel faktörlerden kaçınma, diğer taraftan, karşı cinsten yaşıtları ile yakın ilişkiler kurma eğilimleri onlar için sosyal medya kullanımını cazip kılmaktadır. Çalışmanın amacı üniversite öğrencilerinin Facebook algılarını incelemektir. Bu kapsamda, Facebook algıları arasındaki ilişkiler ve Facebook algılarının çeşitli değişkenlere göre farklılık gösterip göstermediği araştırılmıştır. Üniversite öğrencileri ile yapılan bu araştırmada Sinop Üniversitesi öğrencilerinden 180 kişiye anket formu uygulanmıştır. Üniversite gençlerinin, Facebook'a yönelik algıları bazı değişkenlere göre incelenmiş ve anlamlı farklılıklar bulunmuştur. Öncelikle genel frekans dağılımları dikkate alınarak değerlendirilmiştir. İki farklı grubun ortalamalarını karşılaştırmak için t-testi kullanılmıştır. Üniversite öğrencilerinin Facebook sosyal paylaşım sitesine üye olma nedenlerinin farklılık gösterip göstermediğini test etmek için tek yönlü varyans analizi kullanılmıştır. Aradaki farkın rastlantısal mı, yoksa istatistiksel olarak anlamlı mı olduğuna karar verilmiştir.

Anahtar Kelimeler: Üniversite Gençliği, Facebook, Sanal Medya, Sosyal Paylaşım.

SUMMARY

The social networks are constructed as an identification that the users define again themselves and participate to various social relations. According to university students, the social environment that is used commonly by university students is desirabled to escape from psychological and environmental factors. The goal of this study investigates the Facebook sense of university students. Because of this aim, relation between the Facebook perceptions and whether the Facebook perceptions change according to various variables are searched. In this study, a survey is cunducted to 180 students who are from the Sinop University. They are chosen between active Facebook users to get a good result. The Facebook perceptions of university students are examined as a basing on some variables which are gender, place where is accessed to internet, reason to join Facebook and so on. First of all, the general frequency is considered. The t-test is used to compare avarages of the two groups. The one- way analysis of variance is used to test whether university students trust for internet, their reasons to use internet, their reasons to be a member of the Facebook are the same or not. Whether the diffrences coming from this analysis are accidential or statistically meaningful is decided.

Keywords: University Youth, Social Sharing, Facebook, Virtual Media.

GİRİŞ

[1] Not: Bu çalışma " Üniversite Öğrencilerinin Sosyal Paylaşım Sitelerine Yönelik Algılarının İncelenmesi" adlı yüksek lisans tezinden üretilmiştir.

Sosyal bir varlık olan insanın kendini ifade etme ve çevresi ile iletişim kurma ihtiyacı insanlık tarihi kadar eskidir. Bu ihtiyacın giderilmesinde ilk başvurulan yol yüz yüze, birebir iletişimdir. Buna ek olarak zaman ve mekâna göre değişkenlik gösteren çeşitli argümanlarla da bu gereksinim karşılanmaya çalışılmıştır.

Son yıllarda bilgi ve iletişim teknolojileri ışığında birçok farklı alanda dönüşümler meydana geldiği gibi, sosyal yaşamı ve ortamı, sosyal iletişimi, sosyal ilişkileri kapsayan bir sosyal dönüşüm de yaşanmaktadır. Yaşanmaya devam eden bu dönüşüm teknolojiyi ve teknoloji kullanımını da etkilemektedir (Çoklar, 2010). Modern dünyanın ortaya çıkardığı değişen iletişim biçimleri ve teknolojilerinin bireyin ve yine bu bireylerin oluşturduğu toplum üzerindeki etkileri kendini birçok alanda göstermektedir. Bunların başında hiç şüphesiz iletişim teknolojileri gelmektedir. Günümüzde teknolojinin gelişimine paralel olarak yaygınlaşan bilgisayar kullanımı ve internet bilgiye ulaşmada en çok tercih edilen kullanım araçları olarak ön plana çıkmaktadır. Kullanımının basit olması, kolay erişilebilirliği, her kesimden insanın kendine göre bir ilgi alanı bulabilmesi, yaş, cinsiyet sınırlamalarının bulunmaması gibi nedenlerle kısa sürede geniş halk kitleleri tarafından benimsenmiş ve tahmin edilemeyen bir hızla dünya çapında yaygınlaşmıştır.

Sanal topluluklar insanlara yeni aidiyet alanları yaratmaktadır. Geleneksel topluluklardan büyük ölçüde farklı olan sanal topluluklar içinde insanlar, yalnızlıklarını paylaşacakları, içlerini dökebilecekleri ya da işleri ile ilgili sorunun çözülmesi konusunda yardım alabilecekleri yeni dostlar bulmaktadırlar (Robins, 1999). Sanal topluluklar sayesinde insanların yalnızlık duygusu hafiflemektedir. İnternet, bir taraftan kullanıcıları belirli bir kimliğe ve kültüre davet ederken bir taraftan da etkileşime olanak tanıyan yapısıyla, katılımcıların kendilerini yeniden tanımladıkları ve sosyal ilişkilere katıldıkları bir kimlik mekânı olarak karşımıza çıkmaktadır. Özellikle sitelerdeki sohbet (chat) odalarında ve arkadaş arama linklerinde kullanıcılar kendilerine yeni kimlikler oluşturarak sanal mekâna dâhil olmaktadırlar (Güzel, 2006).
